CHAPTERS BASED ON CLASS 11th SYLLABUS

1. Trigonometric Functions & Equations  
2. Complex Numbers  
3. Quadratic Equation and Inequations (Inequalities)  
4. Permutations and Combinations  
5. Mathematical Induction and Binomial Theorem  
6. Sequences and Series  
7. Straight Lines and Pair of Straight Lines  
8. Circle  
9. Conic Sections

CHAPTERS BASED ON CLASS 12th SYLLABUS

10. Functions  
11. Limits, Continuity and Differentiability  
12. Differentiation  
13. Properties of Triangle  
14. Inverse Trigonometric Functions  
15. Matrices and Determinants  
16. Applications of Derivatives  
17. Indefinite Integrals  
18. Definite Integrals and Applications of Integrals  
19. Differential Equations  
20. Vector Algebra and Three Dimensional Geometry  
21. Probability  
22. Miscellaneous (Sets, Relations, Statistics & Mathematical Reasoning)
1. Trigonometric Functions & Equations 1 - 16
2. Complex Numbers 17 - 32
3. Quadratic Equation and Inequations (Inequalities) 33 - 49
4. Permutations and Combinations 50 - 56
5. Mathematical Induction and Binomial Theorem 57 - 70
6. Sequences and Series 71 - 85
7. Straight Lines and Pair of Straight Lines 86 - 105
8. Circle 106 - 127
9. Conic Sections 128 - 154
10. Functions 155 - 167
11. Limits, Continuity and Differentiability 168 - 193
12. Differentiation 194 - 201
13. Properties of Triangle 202 - 220
14. Inverse Trigonometric Functions 221 - 225
15. Matrices and Determinants 226 - 242
16. Applications of Derivatives 243 - 268
17. Indefinite Integrals 269 - 276
18. Definite Integrals and Applications of Integrals 277 - 316
19. Differential Equations 317 - 327
20. Vector Algebra and Three Dimensional Geometry 328 - 365
21. Probability 366 - 382
22. Miscellaneous (Sets, Relations, Statistics & Mathematical Reasoning) 383 - 394

* The chapters have been divided as per the Class 11th & 12th syllabus followed by the NCERT books. Some of the chapters which are split in the class 11th & 12th syllabus in NCERT have been combined. There might be certain topics/ chapters which are not covered in NCERT but are a part of JEE Advanced/IIT-JEE syllabus.
1. For a non-zero complex number \( z \), let \( \arg(z) \) denote the principal argument with \( -\pi < \arg(z) \leq \pi \). Then, which of the following statement(s) is (are) FALSE?

(A) \( \arg(-1-i) = \frac{\pi}{4} \), where \( i = \sqrt{-1} \)

(B) The function \( f: \mathbb{R} \to (-\pi, \pi] \), defined by \( f(t) = \arg(-1+it) \) for all \( t \in \mathbb{R} \), is continuous at all points of \( \mathbb{R} \), where \( i = \sqrt{-1} \)

(C) For any two non-zero complex numbers \( z_1 \) and \( z_2 \),

\[
\arg\left(\frac{z_1}{z_2}\right) = \arg(z_1) + \arg(z_2)
\]

is an integer multiple of \( 2\pi \)

(D) For any three given distinct complex numbers \( z_1, z_2, z_3 \), the locus of the point \( z \) satisfying the condition

\[
\arg\left(\frac{(z-z_1)(z_2-z_3)}{(z-z_2)(z_3-z_1)}\right) = \pi,
\]

lies on a straight line

2. In a triangle \( PQR \), let \( \angle PQR = 30^\circ \) and the sides \( PQ \) and \( QR \) have lengths \( 10\sqrt{3} \) and 10, respectively. Then, which of the following statement(s) is (are) TRUE?

(A) \( \angle QPR = 45^\circ \)

(B) The area of the triangle \( PQR \) is \( 25\sqrt{3} \) and \( \angle QRP = 120^\circ \)

(C) The radius of the incircle of the triangle \( PQR \) is \( 10\sqrt{3} - 15 \)

(D) The area of the circumcircle of the triangle \( PQR \) is \( 100\pi \)

3. Let \( P_1 : 2x + y - z = 3 \) and \( P_2 : x + 2y + z = 2 \) be two planes.

Then, which of the following statement(s) is (are) TRUE?

(A) The line of intersection of \( P_1 \) and \( P_2 \) has direction ratios \( 1, 2, -1 \)

(B) The line \( \frac{3x-4}{9} = \frac{1-3y}{9} = \frac{z}{3} \) is perpendicular to the line of intersection of \( P_1 \) and \( P_2 \)

(C) The acute angle between \( P_1 \) and \( P_2 \) is \( 60^\circ \).

(D) If \( P_3 \) is the plane passing through the point \( (4, 2, -2) \) and perpendicular to the line of intersection of \( P_1 \) and \( P_2 \), then the distance of the point \((2, 1, 1)\) from the plane \( P_3 \) is \( \frac{2}{\sqrt{3}} \)

4. For every twice differentiable function \( f: \mathbb{R} \to [-2, 2] \) with \( (f(0))^2 + (f'(0))^2 = 85 \), which of the following statement(s) is (are) TRUE?

(A) There exist \( r, s \in \mathbb{R} \), where \( r < s \), such that \( f \) is one-one on the open interval \( (r, s) \)

(B) There exists \( x_0 \in (-4, 0) \) such that \( |f'(x_0)| \leq 1 \)

(C) \( \lim_{x \to \infty} f(x) = 1 \)

(D) There exists \( \alpha \in (-4, 4) \) such that \( f(\alpha) + f^*(\alpha) = 0 \) and \( f'(\alpha) \neq 0 \)

5. Let \( f: \mathbb{R} \to \mathbb{R} \) and \( g: \mathbb{R} \to \mathbb{R} \) be two non-constant differentiable functions. If \( f'(x) = (e^{(f(x) - g(x))})g'(x) \) for all \( x \in \mathbb{R} \), and \( f(0) = g(0) = 0 \), then which of the following statement (s) is (are) TRUE?

(A) \( f(2) < 1 - \log_e 2 \) \hspace{1cm} (B) \( f(2) > 1 - \log_e 2 \)

(C) \( g(1) > 1 - \log_e 2 \) \hspace{1cm} (D) \( g(1) < 1 - \log_e 2 \)
6. Let $f : [0, \infty) \to \mathbb{R}$ be a continuous function such that
\[ f(x) = 1 - 2x + \int_0^x e^{x-t} f(t) \, dt \]
for all $x \in [0, \infty)$. Then, which of the following statement(s) is (are) TRUE?
(A) The curve $y = f(x)$ passes through the point $(1, 2)$
(B) The curve $y = f(x)$ passes through the point $(2, -1)$
(C) The area of the region \[ (x, y) \in [0, 1] \times \mathbb{R} : f(x) \leq y \leq \sqrt{1-x^2} \]
is $\frac{\pi-2}{4}$
(D) The area of the region \[ (x, y) \in [0, 1] \times \mathbb{R} : f(x) \leq y \leq \sqrt{1-x^2} \]
is $\frac{\pi-1}{4}$

SECTION - II

This section contains 8 questions. The answer to each question is a NUMERICAL VALUE. For each question, enter the correct numerical value (in decimal notation, truncated/rounded-off to the second decimal place; e.g., 6.25, 7.00, -0.33, -30.30, 30.27, -127.30)

7. The value of \( \frac{1}{\log_2 9} + \frac{1}{\log_3 8} \times (\sqrt{7})^{\log_4 7} \)
is __________.

8. The number of 5 digit numbers which are divisible by 4, with digits from the set \{1, 2, 3, 4, 5\} and the repetition of digits is allowed, is __________.

9. Let X be the set consisting of the first 2018 terms of the arithmetic progression 1, 6, 11, ..., and Y be the set consisting of the first 2018 terms of the arithmetic progression 9, 16, 23, .... Then, the number of elements in the set $X \cup Y$ is __________.

10. The number of real solutions of the equation
\[ \sin^{-1} \left( \sum_{i=1}^{\infty} x^{i+1} - \sum_{i=1}^{\infty} \left( \frac{x}{2} \right)^i \right) = \frac{\pi}{2} - \cos^{-1} \left( \sum_{i=1}^{\infty} \left( \frac{-x}{2} \right)^i - \sum_{i=1}^{\infty} (-x)^i \right) \]
lying in the interval \( \left( -\frac{1}{2}, \frac{1}{2} \right) \) is __________.

(Here, the inverse trigonometric functions $\sin^{-1} x$ and $\cos^{-1} x$ assume values in $\left[ -\frac{\pi}{2}, \frac{\pi}{2} \right]$ and $[0, \pi]$, respectively.)

11. For each positive integer $n$, let
\[ y_n = \frac{1}{n} \times (n+1)(n+2) \cdots (n+n) \]
For $x \in \mathbb{R}$, let $[x]$ be the greatest integer less than or equal to $x$. If \( \lim_{n \to \infty} y_n = L \), then the value of $[L]$ is __________.

12. Let $\vec{a}$ and $\vec{b}$ be two unit vectors such that $\vec{a} \cdot \vec{b} = 0$. For some $x, y \in \mathbb{R}$, let $\vec{c} = x\vec{a} + y\vec{b} + (\vec{a} \times \vec{b})$. If $|\vec{c}| = 2$ and the vector $\vec{c}$ is inclined at the same angle $\alpha$ to both $\vec{a}$ and $\vec{b}$, then the value of $8 \cos^2 \alpha$ is __________.

13. Let $a, b, c$ be three non-zero real numbers such that the equation \( \sqrt{3a} \cos x + 2b \sin x = c, x \in \left[ -\frac{\pi}{2}, \frac{\pi}{2} \right] \), has two distinct real roots $\alpha$ and $\beta$ with $\alpha + \beta = \frac{\pi}{3}$. Then, the value of $\frac{b}{a}$ is __________.

14. A farmer $F_1$ has a land in the shape of a triangle with vertices at P(0, 0), Q(1, 1) and R(2, 0). From this land, a neighbouring farmer $F_2$ takes away the region which lies between the side PQ and a curve of the form $y = x^n (n > 1)$. If the area of the region taken away by the farmer $F_2$ is exactly 30% of the area of $\Delta PQR$, then the value of $n$ is __________.

SECTION - I

This section contains 2 paragraphs. Based on each paragraph, there are 2 questions. Each question has four options (A), (B), (C) and (D) ONLY ONE of these four options is correct.

PARAGRAPH - X

Let $S$ be the circle in the xy-plane defined by the equation
\[ x^2 + y^2 = 4. \]
15. Let $E_1, E_2$ and $F_1, F_2$ be the chords of $S$ passing through the point $P_0(1, 1)$ and parallel to the x-axis and the y-axis, respectively. Let $G_1, G_2$ be the chord of $S$ passing through $P_0$ and having slope -1. Let the tangents to $S$ at $E_1$ and $E_2$ meet at $E_3$, the tangents to $S$ at $F_1$ and $F_2$ meet at $F_3$, and the tangents to $S$ at $G_1$ and $G_2$ meet at $G_3$. Then, the points $E_3, F_3, G_3$ lie on the curve
(A) $x + y = 4$
(B) $(x - 4)^2 + (y - 4)^2 = 16$
(C) $(x - 4)(y - 4) = 4$
(D) $xy = 4$
MATHEMATICS

16. Let P be a point on the circle S with both coordinates being positive. Let the tangent to S at P intersect the coordinate axes at the points M and N. Then, the mid-point of the line segment MN must lie on the curve
   (A) \((x + y)^2 = 3xy\)  \hspace{1cm}  \text{(B)} \(x^{2/3} + y^{2/3} = 2^{4/3}\)
   (C) \(x^2 + y^2 = 2xy\)  \hspace{1cm}  \text{(D)} \(x^2 + y^2 = x^2 y^2\)

PARAGRAPH - A

There are five students \(S_1, S_2, S_3, S_4\) and \(S_5\) in a music class and for them there are five seats \(R_1, R_2, R_3, R_4\) and \(R_5\) arranged in a row, where initially the seat \(R_i\) is allotted to the student \(S_i, i = 1, 2, 3, 4, 5\). But, on the examination day, the five students are randomly allotted the five seats.

17. The probability that, on examination day, the student \(S_1\) gets the previously allotted seat \(R_1\), and none of the remaining students gets the seat previously allotted to him/her is
   \begin{align*}
   &\text{(A)} \ \frac{3}{40} \hspace{1cm} \text{(B)} \ \frac{1}{8} \\
   &\text{(C)} \ \frac{7}{40} \hspace{1cm} \text{(D)} \ \frac{1}{5}
   \end{align*}

18. For \(i = 1, 2, 3, 4\), let \(T_i\) denote the event that the students \(S_i\) and \(S_{i+1}\) do not sit adjacent to each other on the day of the examination. Then, the probability of the event \(T_1 \cap T_2 \cap T_3 \cap T_4\) is
   \begin{align*}
   &\text{(A)} \ \frac{1}{15} \hspace{1cm} \text{(B)} \ \frac{1}{10} \\
   &\text{(C)} \ \frac{7}{60} \hspace{1cm} \text{(D)} \ \frac{1}{5}
   \end{align*}
SECTION - I

This section contains 6 questions. Each question has four options (A), (B), (C) and (D). ONE OR MORE THAN ONE of these four options is (are) correct.

1. For any positive integer $n$, define $f_n: (0, \infty) \to \mathbb{R}$ as

$$f_n(x) = \sum_{j=1}^{n} \tan^{-1} \left( \frac{1}{1+(x+j)(x+j-1)} \right) \text{ for all } x \in (0, \infty).$$

Then, which of the following statement(s) is (are) TRUE?

(A) $\sum_{j=1}^{5} \tan^2(f_j(0)) = 55$

(B) $\sum_{j=1}^{10} (1 + f'_j(0)) \sec^2(f_j(0)) = 10$

(C) For any fixed positive integer $n$, $\lim_{x \to \infty} \tan(f_n(x)) = \frac{1}{n}$

(D) For any fixed positive integer $n$, $\lim_{x \to \infty} \sec^2(f_n(x)) = 1$

2. Let $T$ be the line passing through the points $P(-2, 7)$ and $Q(2, -5)$. Let $F_1$, be the set of all pairs of circles $(S_1, S_2)$ such that $T$ is tangent to $S_1$ at $P$ and tangent to $S_2$ at $Q$, and also such that $S_1$ and $S_2$ touch each other at a point, say, $M$. Let $E_1$ be the set representing the locus of $M$ as the pair $(S_1, S_2)$ varies in $F_1$. Let the set of all straight line segments joining a pair of distinct points of $E_1$, and passing through the point $R(1, 1)$ be $E_2$. Let $E_3$ be the set of the mid-points of the line segments in the set $E_2$. Then, which of the following statement(s) is (are) TRUE?

(A) The point $(-2, 7)$ lies in $E_1$

(B) The point $\left(\frac{4}{5}, \frac{7}{5}\right)$ does NOT lie in $E_2$

(C) The point $\left(\frac{1}{2}, \frac{1}{2}\right)$ lies in $E_2$

(D) The point $\left(\frac{3}{2}, \frac{3}{2}\right)$ does NOT lie in $E_1$

3. Let $S$ be the set of all column matrices

$$\begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

such that $b_1, b_2, b_3 \in \mathbb{R}$ and the system of equations (in real variables)

$$-x + 2y + 5z = b_1$$

$$2x - 4y + 3z = b_2$$

$$x - 2y + 2z = b_3$$

has at least one solution. Then, which of the following system(s) (in real variables) has (have) at least one solution for each $\begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} \in S$?

(A) $x + 2y + 3z = b_1, 4y + 5z = b_2$ and $x + 2y + 6z = b_3$

(B) $x + y + 3z = b_1, 5x + 2y + 6z = b_2$ and $-2x - y - 3z = b_3$

(C) $x + 2y - 5z = b_1, 2x - 4y + 10z = b_2$ and $x - 2y + 5z = b_3$

(D) $x + 2y + 5z = b_1, 2x + 3z = b_2$ and $x + 4y - 5z = b_3$

4. Consider two straight lines, each of which is tangent to both the circle $x^2 + y^2 = \frac{1}{2}$ and the parabola $y^2 = 4x$. Let these lines intersect at the point $Q$. Consider the ellipse whose center is at the origin $O(0, 0)$ and whose semi-major axis is $OQ$. If the length of the minor axis of this ellipse is $\sqrt{2}$, then which of the following statement(s) is (are) TRUE?

(A) For the ellipse, the eccentricity is $\frac{1}{\sqrt{2}}$ and the length of the latus rectum is 1

(B) For the ellipse, the eccentricity is $\frac{1}{2}$ and the length of the latus rectum is $\frac{1}{2}$

(C) The area of the region bounded by the ellipse between the lines $x = \frac{1}{\sqrt{2}}$ and $x = 1$ is $\frac{1}{4\sqrt{2}}(\pi - 2)$

(D) The area of the region bounded by the ellipse between the lines $x = \frac{1}{\sqrt{2}}$ and $x = 1$ is $\frac{1}{16}(\pi - 2)$

5. Let $s, t, r$ be non-zero complex numbers and $L$ be the set of solutions $z = x + iy$ $(x, y, \in \mathbb{R}, i = \sqrt{-1})$ of the equation

$$sz + t \bar{z} + r = 0,$$

where $\bar{z} = x - iy$. Then, which of the following statement(s) is (are) TRUE?

(A) If $L$ has exactly one element, then $|s| \neq |t|

(B) If $|s| = |t|$, then $L$ has infinitely many elements

(C) The number of elements in $L \cap \{z : |z - 1 + i| = 5\}$ is at most 2

(D) If $L$ has more than one element, then $L$ has infinitely many elements
6. Let \( f : (0, \pi) \to \mathbb{R} \) be a twice differentiable function such that
\[
\lim_{t \to x} \frac{f(x) \sin t - f(t) \sin x}{t - x} = \sin^2 x \quad \text{for all } x \in (0, \pi).
\]
If \( f \left( \frac{\pi}{6} \right) = -\frac{\pi}{12} \), then which of the following statement(s) is (are) TRUE?
(A) \( f \left( \frac{\pi}{4} \right) = \frac{\pi}{4\sqrt{2}} \)
(B) \( f(x) < \frac{x^4}{6} - x^2 \) for all \( x \in (0, \pi) \)
(C) There exists \( \alpha \in (0, \pi) \) such that \( f''(\alpha) = 0 \)
(D) \( f'' \left( \frac{\pi}{2} \right) + f'' \left( \frac{\pi}{2} \right) = 0 \)

13. Consider the cube in the first octant with sides \( OP, OQ \) and \( OR \) of length 1, along the \( x \)-axis, \( y \)-axis and \( z \)-axis, respectively, where \( O(0, 0, 0) \) is the origin. Let \( S = \left( \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \right) \) be the centre of the cube and \( T \) be the vertex of the cube opposite to the origin \( O \) such that \( ST \) lies on the diagonal \( OT \).
If \( \vec{p} = \overrightarrow{SP} \), \( \vec{q} = \overrightarrow{SQ} \), \( \vec{r} = \overrightarrow{SR} \) and \( \vec{t} = \overrightarrow{ST} \), then the value of \( |(\vec{p} \times \vec{q}) \times (\vec{r} \times \vec{t})| \) is ____________.

14. Let
\[
X = (10C_1)^2 + 2(10C_2)^2 + 3(10C_3)^2 + \cdots + 10(10C_{10})^2,
\]
where \( 10C_r, r \in \{1, 2, \cdots, 10\} \) denote binomial coefficients.
Then, the value of \( \frac{1}{1430} X \) is ____________.

SECTION - II

This section contains 8 questions. The answer to each question is a NUMERICAL VALUE. For each question, enter the correct numerical value (in decimal notation, truncated/rounded-off to the second decimal place; e.g., 6.25, 7.00, -0.33, -0.30, 30.27, -127.30)

7. The value of the integral
\[
\int_{0}^{\frac{1}{4}} \frac{1 + \sqrt{3}}{((x+1)^2(1-x)^6)^\frac{1}{4}} \, dx
\]
is ____________.

8. Let \( P \) be a matrix of order \( 3 \times 3 \) such that all the entries in \( P \) are from the set \( \{-1, 0, 1\} \). Then, the maximum possible value of the determinant of \( P \) is ____________.

9. Let \( X \) be a set with exactly 5 elements and \( Y \) be a set with exactly 7 elements. If \( \alpha \) is the number of one-one functions from \( X \) to \( Y \) and \( \beta \) is the number of onto functions from \( Y \) to \( X \), then the value of \( \frac{1}{5!} (\beta - \alpha) \) is ____________.

10. Let \( f : \mathbb{R} \to \mathbb{R} \) be a differentiable function with \( f(0) = 0 \). If \( y = f(x) \) satisfies the differential equation
\[
\frac{dy}{dx} = (2 + 5y)(5y - 2),
\]
then the value of \( \lim_{x \to -\infty} f(x) \) is ____________.

11. Let \( f : \mathbb{R} \to \mathbb{R} \) be a differentiable function with \( f(0) = 1 \) and satisfying the equation
\[
f(x + y) = f(x)f'(y) + f'(x)f(y) \quad \text{for all } x, y \in \mathbb{R}
\]
Then, the value of \( \log_{e} f(4) \) is ____________.

12. Let \( P \) be a point in the first octant, whose image \( Q \) in the plane \( x + y = 3 \) (that is, the line segment \( PQ \) is perpendicular to the plane \( x + y = 3 \) and the mid-point of \( PQ \) lies in the plane \( x + y = 3 \)) lies on the \( z \)-axis. Let the distance of \( P \) from the \( x \)-axis be \( 5 \). If \( R \) is the image of \( P \) in the \( xy \)-plane, then the length of \( PR \) is ____________.

SECTION - I

This section contains 4 questions. Each question has 2 matching lists: \textsc{LIST-I} and \textsc{LIST-II}. Four options are given representing matching of elements from \textsc{LIST-I} and \textsc{LIST-II}. Only one of these four options corresponds to a correct matching.

15. Let \( E_1 = \left\{ x \in \mathbb{R} : x \neq 0 \text{ and } \frac{x}{x-1} > 0 \right\} \) and \( E_2 = \left\{ x \in E_1 : \sin^{-1} \left( \log_{e} \left( \frac{x}{x-1} \right) \right) \text{ is a real number} \right\} \).

(Here, the inverse trigonometric function \( \sin^{-1} x \) assumes values in \( \left[ -\frac{\pi}{2}, \frac{\pi}{2} \right] \)).

Let \( f : E_1 \to \mathbb{R} \) be the function defined by
\[
f(x) = \log_{e} \left( \frac{x}{x-1} \right)
\]
and \( g : E_2 \to \mathbb{R} \) be the function defined by \( g(x) = \sin^{-1} \left( \log_{e} \left( \frac{x}{x-1} \right) \right) \).

\textsc{LIST-I} \hspace{1cm} \textsc{LIST-II}

P. The range of \( f \) is
1. \( \left(-\infty, \frac{1}{1-e}\right] \cup \left[ e, e-1, \infty \right) \)

Q. The range of \( g \) contains
2. \( (0, 1) \)

R. The domain of \( f \) contains
3. \( \left[ -\frac{1}{2}, \frac{1}{2} \right] \)

S. The domain of \( g \) is
4. \( (-\infty, 0) \cup (0, \infty) \)

5. \( \left(-\infty, \frac{e}{e-1}\right] \)

6. \( (-\infty, 0) \cup \left( \frac{e}{2}, e-1 \right] \)
The correct option is:
(A) P → 4; Q → 2; R → 1; S → 1
(B) P → 3; Q → 3; R → 6; S → 5
(C) P → 4; Q → 2; R → 1; S → 6
(D) P → 4; Q → 3; R → 6; S → 5

16. In a high school, a committee has to be formed from a group of 6 boys \(M_1, M_2, M_3, M_4, M_5, M_6\) and 5 girls \(G_1, G_2, G_3, G_4, G_5\).

(i) Let \(\alpha_1\) be the total number of ways in which the committee can be formed such that the committee has 5 members, having exactly 3 boys and 2 girls.

(ii) Let \(\alpha_2\) be the total number of ways in which the committee can be formed such that the committee has at least 2 members, and having an equal number of boys and girls.

(iii) Let \(\alpha_3\) be the total number of ways in which the committee can be formed such that the committee has 5 members, at least 2 of them being girls.

(iv) Let \(\alpha_4\) be the total number of ways in which the committee can be formed such that the committee has 4 members, having at least 2 girls and such that both \(M_1\) and \(G_1\) are NOT in the committee together.

LIST - I

P. The value of \(\alpha_1\) is
1. 136
2. 189
3. 192
4. 200
5. 381
6. 461

The correct option is:
(A) P → 4; Q → 6; R → 2; S → 1
(B) P → 1; Q → 4; R → 2; S → 3
(C) P → 4; Q → 6; R → 5; S → 2
(D) P → 4; Q → 2; R → 3; S → 1

17. Let \(H: \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1\), where \(a > b > 0\), be a hyperbola in the \(xy\)-plane whose conjugate axis \(LM\) subtends an angle of 60° at one of its vertices \(N\). Let the area of the triangle \(LMN\) be \(4\sqrt{3}\).

LIST - I

P. The length of the conjugate axis of \(H\) is
1. 8
2. \(\frac{4}{\sqrt{3}}\)
3. \(\frac{2}{\sqrt{3}}\)
4. 4

Q. The eccentricity of \(H\) is

R. The distance between the foci of \(H\) is

S. The length of the latus rectum of \(H\) is

18. Let \(f_1: \mathbb{R} \rightarrow \mathbb{R}\), \(f_2: \left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \rightarrow \mathbb{R}\), \(f_3: \left(-1, e^2 - 2\right) \rightarrow \mathbb{R}\) and \(f_4: \mathbb{R} \rightarrow \mathbb{R}\) be functions defined by

(i) \(f_1(x) = \sin \left(\sqrt{1 - e^{-x^2}}\right)\),

(ii) \(f_2(x) = \begin{cases} \frac{\sin x}{\tan^{-1} x} & \text{if } x \neq 0 \\ 1 & \text{if } x = 0 \end{cases}\), where the inverse trigonometric function \(\tan^{-1} x\) assumes values in \(\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)\),

(iii) \(f_3(x) = [\sin (\log_2 (x + 2))]\), where, for \(t \in \mathbb{R}\), \([t]\) denotes the greatest integer less than or equal to \(t\),

(iv) \(f_4(x) = \begin{cases} x^2 \sin \left(\frac{1}{x}\right) & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}\)

LIST - I

P. The function \(f_1\) is
1. NOT continuous at \(x = 0\)
2. continuous at \(x = 0\) and NOT differentiable at \(x = 0\)
3. differentiable at \(x = 0\) and its derivative is NOT continuous at \(x = 0\)
4. differentiable at \(x = 0\) and its derivative is continuous at \(x = 0\)

Q. The function \(f_2\) is

R. The function \(f_3\) is

S. The function \(f_4\) is

The correct option is:
(A) P → 2; Q → 3; R → 1; S → 4
(B) P → 4; Q → 1; R → 2; S → 3
(C) P → 4; Q → 2; R → 1; S → 3
(D) P → 2; Q → 1; R → 4; S → 3
1. (A, B, D)

(A) \[ \arg (1 - i) = \frac{-3\pi}{4} \]
\[ \therefore \text{(A) is false} \]

(B) \[ f(t) = \arg (-1 + it) = \begin{cases} \pi - \tan^{-1}(t), t \geq 0 \\ -\pi + \tan^{-1}(t), t < 0 \end{cases} \]
\[ \lim_{t \to 0^+} f(t) = -\pi \quad \text{and} \quad \lim_{t \to 0^-} f(t) = \pi \]
LHL ≠ RHL \[ \Rightarrow f \text{ is discontinuous at } t = 0 \]
\[ \therefore \text{(B) is false} \]

(C) \[ \arg \left( \frac{z_1}{z_2} \right) = \arg z_1 + \arg z_2 \]
\[ = 2n\pi + \arg z_1 - \arg z_2 - \arg z_1 + \arg z_2 \]
\[ = 2n\pi, \text{ multiple of } 2\pi \]
\[ \therefore \text{(C) is true} \]

(D) \[ \arg \left( \frac{(z - z_1)(z_2 - z_3)}{(z - z_3)(z_2 - z_1)} \right) = \pi \]
\[ \Rightarrow \left( \frac{z - z_1}{z - z_3} \right) = k, \quad k \in R \]
\[ \Rightarrow \left( \frac{z - z_1}{z - z_3} \right) = \left( \frac{z_2 - z_1}{z_2 - z_3} \right) \]
\[ \Rightarrow z, z_1, z_2, z_3 \text{ are concyclic. i.e. } z \text{ lies on a circle} \]
\[ \therefore \text{(D) is false} \]

2. (B, C, D)

(A) \[ \cos 30^\circ = \frac{2PQ^2 + QR^2 - PR^2}{2PQ \cdot QR} \]
\[ \Rightarrow \frac{\sqrt{3}}{2} = \frac{(10\sqrt{3})^2 + 10^2 - PR^2}{2 \cdot 10 \cdot 10 \sqrt{3}} \]
\[ \Rightarrow PR^2 = 100 \quad \text{or} \quad PR = 10 \]
\[ \therefore \angle P = \angle Q = 30^\circ \]
\[ \therefore \text{(A) is false} \]

(B) Area of \( \triangle PQR \) = \( \frac{1}{2} \cdot PQ \cdot QR \cdot \sin 30^\circ \)
\[ = \frac{1}{2} \cdot 10 \sqrt{3} \cdot 10 \cdot \frac{1}{2} = 25\sqrt{3} \]

Also \( \angle R = 180^\circ - 30^\circ - 30^\circ = 120^\circ \)
\[ \therefore \text{(B) is true} \]

(C) \[ r = \frac{\Delta}{s} = \frac{25\sqrt{3}}{10 + 5\sqrt{3}} = \frac{25\sqrt{3}}{2 + \sqrt{3}} \]
\[ = 5\sqrt{3} (2 - \sqrt{3}) = 10\sqrt{3} - 15 \]
\[ \therefore \text{(C) is true} \]

(D) \[ R = \frac{abc}{4\Delta} = \frac{10 \sqrt{3} \times 10\sqrt{3}}{4 \times 25\sqrt{3}} = 10 \]
\[ \therefore \text{Area of circumcircle } = \pi R^2 = 100\pi \]
\[ \therefore \text{(D) is true} \]

3. (C, D)

(A) Direction ratios of line of intersection of two planes will be given by \( \vec{n}_1 \times \vec{n}_2 \).
\[ \vec{n}_1 \times \vec{n}_2 = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 2 & 1 \\ 2 & 1 & -1 \end{vmatrix} = 3\hat{i} - 3\hat{j} + 3\hat{k} \]
\[ \therefore \text{dr’s of line of intersection of } \mathbf{P}_1 \text{ and } \mathbf{P}_2 \text{ are } 1, -1, 1 \]
\[ \therefore \text{(A) is false} \]

(B) Given line can be written as
\[ \begin{align*}
\frac{x - 4}{3} &= \frac{y - 1}{-3} = \frac{z}{3} \\
\end{align*} \]
Clearly this line is parallel to line of intersection of \( \mathbf{P}_1 \) and \( \mathbf{P}_2 \)
\[ \therefore \text{(B) is false} \]

(C) If \( \theta \) is the angle between \( \mathbf{P}_1 \) and \( \mathbf{P}_2 \) then
\[ \cos \theta = \left| \frac{2 \times 1 + 1 \times 2 + (-1) \times 1}{\sqrt{6} \sqrt{6}} \right| = \frac{3}{6} = \frac{1}{2} \]
\[ \therefore \theta = 60^\circ \]
Hence (C) is true.

(D) Equation of plane \( \mathbf{P}_3 \):
\[ 1(x - 4) - 1(y - 2) + 1(z + 2) = 0 \]
or \[ x - y + z = 0 \]
Distance of \((2, 1, 1)\) from \( \mathbf{P}_3 \) = \( \frac{2 - 1 + 1}{\sqrt{1 + 1 + 1}} = \frac{2}{\sqrt{3}} \)
\[ \therefore \text{(D) is true} \]
4. (A, B, D)

(A) \( f(x) \) being twice differentiable, it is continuous but can’t be constant throughout the domain.
\[ \therefore \text{We can find } x \in (r, s) \text{ such that } f(x) \text{ is one one.} \]
Hence (A) is true.

(B) By Lagrange’s Mean Value theorem for \( f(x) \) in \([-4, 0] \), there exists \( x_0 \in (-4, 0) \) such that
\[ f'(x_0) = \frac{f(0) - f(-4)}{0 - (-4)} \]
\[ \Rightarrow |f'(x_0)| = \frac{|f(0) - f(-4)|}{4} \]
\[ \therefore -2 \leq f'(x) \leq 2 \]
\[ \therefore -4 \leq f(0) - f(-4) \leq 4 \]
\[ \Rightarrow |f'(x_0)| \leq 1 \]
\[ \therefore \text{ (B) is true.} \]

(C) If we consider \( f(x) = \sin(\sqrt{85x}) \) then \( f(x) \) satisfies the given condition \([f(0)]^2 + [f(0)]^2 = 1\]
But \( \lim_{x \to \infty} (\sin(\sqrt{85x})) \) does not exist
\[ \therefore \text{ (C) is false.} \]

(D) Let us consider \( g(x) = [f(x)]^2 + [f'(x)]^2 \)
By Lagrange’s Mean Value theorem
\[ |f(x)| \leq 1 \]
Also \( |f(x_1)| \leq 2 \) as \( f(x) \in [-2, 2] \)
\[ \therefore g(x) \leq 5, \text{ for same } x_1 \in (-4, 0) \]
Similarly \( g(x_2) \leq 5, \text{ for same } x_2 \in (0, 4) \)
Also \( g(0) = 85 \)
Hence \( g(x) \) has maxima in \( (x_1, x_2) \) say at \( \alpha \) such that
\[ g'(\alpha) = 0 \quad \text{and} \quad g(\alpha) \geq 85 \]
\[ g'(\alpha) = 0 \quad \Rightarrow \quad 2f(\alpha)f'(\alpha) + 2f'(\alpha)f''(\alpha) = 0 \]
\[ \Rightarrow 2f'(\alpha)[f(\alpha) + f'(\alpha)] = 0 \]
If \( f'(\alpha) = 0 \Rightarrow g(\alpha) = [f(\alpha)]^2 \)
and \([f(\alpha)]^2 \leq 4 \]
\[ \therefore g(\alpha) \geq 85 \quad \text{(is not possible.)} \]
Hence \( f(\alpha) + f'(\alpha) = 0 \) for \( \alpha \in (x_1, x_2) \in (-4, 4) \)
\[ \therefore \text{ (D) is true.} \]

5. (B, C)

Given \( f'(x) = e^{f(x)} - g(x) \), \( g'(x) \)
\[ \Rightarrow e^{-f(x)}f'(x) = e^{-g(x)}g'(x) \]
Integrating both sides, we get
\[ -e^{-f(x)} = -e^{-g(x)} + c \]
\[ \Rightarrow e^{-f(x)} + e^{-g(x)} = c \]
\[ \Rightarrow e^{-f(1)} + e^{-g(1)} = -e^{-f(2)} + e^{-g(2)} \]
But given that \( f(1) = g(2) = 1 \)
\[ \therefore e^{-f(2)} < \frac{2}{e} \quad \text{and} \quad e^{-g(1)} < \frac{2}{e} \]
\[ \Rightarrow f(2) > 1 - \ln 2 - 1 \quad \text{and} \quad g(1) > 1 - \ln 2 - 1 \]
\[ \therefore \text{ (B) and (C) are True.} \]

6. (B, C)

\[ f(x) = 1 - 2x + \int_0^x e^{x-t} f(t) \, dt \]
\[ \Rightarrow f(x) = 1 - 2x + e^x \int_0^x e^{-t} f(t) \, dt \]
\[ \Rightarrow f'(x) = -2 + e^x \int_0^x e^{-t} f(t) \, dt + e^x [e^{-x} f(x)] \]
\[ \Rightarrow f'(x) = -2 + [f(x) - 1 + 2x] + f(x) \]
\[ \Rightarrow f'(x) - 2f(x) = 2x - 3 \]
Its a linear differential equation.
\[ I.F. = e^{\int -2 \, dx} = e^{-2x} \]
Solution:
\[ f(x) \times e^{-2x} = \int e^{-2x} (2x - 3) \, dx \]
\[ f(x) = \frac{e^{-2x}}{-2} (2x - 3) - \frac{e^{-2x}}{-2} \times 2 \, dx \]
\[ e^{-2x} f(x) = \frac{e^{-2x}}{-2} (2x - 3) + \frac{e^{-2x}}{-2} + c \]
\[ f(x) = -x + \frac{3}{2} + \frac{1}{2} + ce^{2x} \]
\[ f(x) = -x + 1 + ce^{2x} \]
From definition of function, \( f(0) = 1 \)
\[ \therefore 1 = 1 + c \quad \Rightarrow \quad c = 0 \]
\[ \therefore f(x) = 1 - x \]
Clearly curve \( y = 1 - x \), does not pass through \((1, 2)\) but it passes through \((2, -1)\)
MATHEMATICS

\( \therefore (A) \text{ is false and (B) is true} \)
Also the area of the region
\( 1 - x \leq y \leq \sqrt{1-x^2} \), is shown in
the figure, is given by
\[
\frac{1}{4} \times \pi \times 1^2 - \frac{1}{2} \times 1 \times 1 = \frac{\pi - 2}{4}
\]
\( \therefore (C) \text{ is true and (D) is false}. \)

7. \( (8) \)
\[
\left( \log_2 9 \right)^2 \log_2 \left( \log_2 9 \right) \times \left( \sqrt{7} \right)^{\log_4 7}
\]
\[= \left( \log_2 9 \right)^2 \times \log_2 \left( \log_2 9 \right) \times \frac{1}{7} \times \log_2 7
\]
\[= \left( \log_2 9 \right)^2 \times \frac{1}{7} \times \log_2 7
\]
\[= 4 \times 2 = 8. \]

8. \( (625) \) The last 2 digits, in 5-digit number divisible by 4, can be 12, 24, 32, 44, or 52.
Also each of the first three digits can be any of
\( \{1, 2, 3, 4, 5\} \)
Hence 5 options for each of the first three digits and total 5 options for last 2-digits
\( \therefore \) Required number of 5 digit numbers are
\[5 \times 5 \times 5 \times 5 = 625 \]

9. \( (3748) \)
The given sequences upto 2018 terms are
\( 1, 6, 11, 16, \ldots, 10086 \)
and \( 9, 16, 23, \ldots, 14128 \)
The common terms are
\( 16, 15, 86, \ldots \) upto \( n \) terms, where \( T_n \leq 10086 \)
\[\Rightarrow 16 + (n-1) 35 \leq 10086 \]
\[\Rightarrow 35n - 19 \leq 10086 \]
\[\Rightarrow n \leq \frac{10105}{35} = 288.7 \]
\[\therefore n = 288 \]
\[\therefore n(X \cup Y) = n(X) + n(Y) - n(X \cap Y) \]
\[= 2018 + 2018 - 288 = 3748 \]

10. \( (2) \)
\[
\sin^{-1} \left( \frac{x^2}{1-x} - x \cdot \frac{2}{1-x} \right) = \sin^{-1} \left( \frac{x}{1-x} + \frac{x}{1+x} \right)
\]
\[\Rightarrow \frac{x^2}{1-x} - \frac{x^2}{2-x} = -\frac{x}{2+x} + \frac{x}{1+x}
\]
\[\Rightarrow \frac{x^2}{1-x} - \frac{x}{1+x} + \frac{x^2}{2-x} + \frac{x}{2+x} = 0
\]
\[\Rightarrow \frac{x(x^2-2x-x^2)}{1-x} + \frac{x(2-x-2x-x^2)}{4-x^2} = 0
\]
\[\Rightarrow x(x^2+2x-1) + x(2-3x-x^2) = 0
\]
\[\Rightarrow x(x^2+2x-1)(2-3x-x^2) = 0
\]
\[\Rightarrow x[x^3+2x^2+5x-2] = 0
\]
\[\Rightarrow x = 0 \text{ or } x^3+2x^2+5x-2 = 0 = p(x) \) (say)
We observe \( p(0) < 0 \) and \( p \left( \frac{1}{2} \right) > 0 \)
\( \therefore \) One root of \( p(x) \) lies in \( \left( 0, \frac{1}{2} \right) \).
Thus two solutions lie between \( -\frac{1}{2} \) and \( \frac{1}{2} \).

11. \( (1) \)
\[y_n = \left( \frac{n+1}{n} \right)^{\frac{n+2}{n}} \cdot \frac{n+3}{n} \ldots \frac{n+n}{n} \]
\[\Rightarrow \log y_n = \frac{1}{n} \sum_{r=0}^{n} \log \left( 1 + \frac{r}{n} \right)
\]
\[\Rightarrow \left( \lim_{n \to \infty} y_n \right) = \lim_{n \to \infty} \frac{1}{n} \sum_{r=0}^{n} \log \left( 1 + \frac{r}{n} \right)
\]
\[\Rightarrow \log L = \int_0^1 \log(1+x) \, dx = \left[ x \log(1+x) \right]_0^1 - \int_0^1 \frac{x}{1+x} \, dx
\]
\[= \log 2 - \left[ x - \log |1+x| \right]_0^1
\]
\[= \log 2 - 1 + \log 2 = 2 \log 2 - 1
\]
\[= \log 4 - \log e = \log \left( \frac{4}{e} \right)
\]
\[\therefore \quad L = \frac{4}{e} \quad \Rightarrow \quad [L] = \left[ \frac{4}{e} \right] = 1
\]

12. \( (3) \) Given \( |\vec{a}| = |\vec{b}| = 1, \quad \vec{a} \cdot \vec{b} = 0, \quad |\vec{c}| = 2 \)
\( \vec{c} \) makes angle \( \alpha \) with both \( \vec{a} \) and \( \vec{b} \)
Also, \( \vec{c} = x \vec{a} + y \vec{b} + \vec{a} \times \vec{b} \)
\( \vec{c} \cdot \vec{a} = 2 \cos \alpha \quad \Rightarrow \quad x = 2 \cos \alpha \)
\( \vec{c} \cdot \vec{b} = 2 \cos \alpha \quad \Rightarrow \quad y = 2 \cos \alpha \)
\( |\vec{c}|^2 = \vec{c} \cdot \vec{c} = |(2 \cos \alpha) \vec{a} + (2 \cos \alpha) \vec{b} + \vec{a} \times \vec{b}|^2 \)
13. (0.5) Given that the equation
\[ \sqrt{3} a \cos x + 2b \sin x = c \]
has two roots \( \alpha \) and \( \beta \), such that \( \alpha + \beta = \frac{\pi}{3} \)
:: \[ \sqrt{3} a \cos \alpha + 2b \sin \alpha = c \] \( \ldots(1) \)
and \[ \sqrt{3} a \cos \beta + 2b \sin \beta = c \] \( \ldots(2) \)
subtracting equation (2) from (1) we get
\[ \sqrt{3} a (\cos \alpha - \cos \beta) + 2b (\sin \alpha - \sin \beta) = 0 \]
\[ -\sqrt{3} a 2 \sin \frac{\alpha + \beta}{2} \sin \frac{\alpha - \beta}{2} + 2b 2 \cos \frac{\alpha + \beta}{2} \sin \frac{\alpha - \beta}{2} = 0 \]
\[ -2\sqrt{3} a \sin \frac{\pi}{6} + 4b \cos \frac{\pi}{6} = 0 \]
\[ -2\sqrt{3} a \times \frac{1}{2} + 4b \frac{\sqrt{3}}{2} = 0 \]
\[ \frac{b}{a} = \frac{1}{2} = 0.5 \]
14. (4)
\[ y = x^n \]
Shaded area = \( \frac{30}{100} \times \text{Ar}(\Delta PQR) \)
\[ \Rightarrow \int_0^1 (x - x^n)dx = \frac{3}{10} \times \frac{1}{2} \times 2 \times 1 \]
\[ = \left( \frac{2 - x^{n+1}}{2} \right)_0^n = \frac{3}{10} \]
\[ \Rightarrow \frac{1}{2} - \frac{1}{n+1} = \frac{3}{10} \]
\[ \Rightarrow \frac{1}{n+1} = \frac{1}{2} - \frac{3}{10} = \frac{1}{5} \Rightarrow n = 4 \]
15. (A)
Equation of \( E_1, E_2 \): \( y = 1 \)
Equation of \( F_1, F_2 \): \( x = 1 \)
Equation of \( G_1, G_2 \): \( x + y = 2 \)
By symmetry, tangents at \( E_1 \) and \( E_2 \) will meet on \( y \)-axis and tangents at \( F_1 \) and \( F_2 \) will meet on \( x \)-axis
\( E_1 = (\sqrt{3}, 1) \) & \( F_1 = (1, \sqrt{3}) \)
Equation of tangent at \( E_1 \): \( \sqrt{3} x + y = 4 \)
Equation of tangent at \( F_1 \): \( x + \sqrt{3} y = 4 \)
\[ \therefore \text{ Points } E_3(0, 4) \text{ and } F_3(4, 0) \text{ Tangents at } G_1 \text{ and } G_2 \text{ are } x = 2 \text{ and } y = 2 \text{ intersecting each other at } G_3(2, 2) \]
Clearly \( E_3, F_3 \) and \( G_3 \) lie on the curve \( x + y = 4 \).
16. (D)
Let point \( P \) be \((2 \cos \theta, 2 \sin \theta)\)
Tangent at \( P \): \( x \cos \theta + y \sin \theta = 2 \)
\[ \therefore M \left( \frac{2}{\cos \theta}, 0 \right) \text{ and } N \left( 0, \frac{2}{\sin \theta} \right) \]
Mid point of \( MN = \left( \frac{1}{\cos \theta}, \frac{1}{\sin \theta} \right) \)
For locus of mid point \((x, y)\) of \( MN \),
\[ x = \frac{1}{\cos \theta}, \quad y = \frac{1}{\sin \theta} \]
\[ \Rightarrow \frac{1}{x^2} + \frac{1}{y^2} = 1 \]
\[ \Rightarrow x^2 + y^2 = x^2y^2 \]
17. (A)
No. of rearrangements for 4 students
\[ = 4! \left( 1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} \right) \]
\[ = 12 - 4 + 1 = 9 \]
Total no. of arrangements of seating of 5 students
\[ = 5! = 120 \]
\[ \therefore \text{ required probability } = \frac{9}{120} = \frac{3}{40} \]
18. (C) Total cases = 5! = 120
Favourable cases:
\[
\begin{align*}
1, & \quad 3, 5, 2, 4 \\
1, & \quad 4, 2, 5, 3 \\
2, & \quad 4, 1, 3, 5 \\
2, & \quad 5, 3, 1, 4 \\
2, & \quad 4, 1, 5, 3 \\
3, & \quad 1, 4, 2, 5 \\
3, & \quad 5, 2, 4, 1 \\
3, & \quad 1, 5, 2, 4 \\
4, & \quad 2, 5, 1, 3 \\
4, & \quad 2, 4, 5, 3, 1 \\
4, & \quad 1, 3, 5, 2 \\
5, & \quad 2, 4, 1, 3 \\
5, & \quad 1, 3, 4, 2 \\
\end{align*}
\]
\[
\therefore \text{favourable cases} = 14
\]
\[
\therefore \text{required probability} = \frac{14}{120} = \frac{7}{60}
\]

1. (A, B, D) \( f_n(x) = \sum_{j=1}^{n} \tan^{-1}\left(\frac{1}{1 + (x+j)(x+j-1)}\right) \)

\[
= \sum_{j=1}^{n} \tan^{-1}(x+j) - \tan^{-1}(x+j-1)
\]
\[
\Rightarrow f_n(x) = \tan^{-1}(x+n) - \tan^{-1}(x)
\]
\[
= \tan^{-1}\left(\frac{n}{1+x(n+x)}\right)
\]
\[
\Rightarrow f'_n(x) = \frac{1}{1+(x+n)^2} \cdot \frac{-1}{1+x^2}
\]
and \( f'_n(0) = \tan^{-1}(n) \) \( \therefore \) \( \tan^2(\tan^{-1}(n)) = n^2 \)

(A) \( \sum_{j=1}^{5} \tan^2(f'_j(0)) = \sum_{j=1}^{5} \frac{5 \times 6 \times 11}{6} = 55 \)

(B) \( f'_n(0) = \frac{1}{1+n^2} - 1 \) \( \Rightarrow 1 + f'_n(0) = \frac{1}{1+n^2} \)
\[
\sec^2(f'_n(0)) = \sec^2(\tan^{-1}(n)) = 1+n^2
\]
\[
\Rightarrow 1 + f'_n(0) = \frac{1}{\sec^2(f'_n(0))}
\]

\[
\Rightarrow (1 + f'_n(0)) \cdot \sec^2(f'_n(0)) = 1
\]
\[
\Rightarrow \sum_{j=1}^{10} (1 + f'_j(0)) \sec^2(f'_j(0)) = \sum_{j=1}^{10} 1 = 10
\]

(C) \( \lim_{x \to \infty} \tan(f_n(x)) = \lim_{x \to \infty} \left(\frac{n}{1+x(n+x)}\right) = 0 \)

(D) \( \lim_{x \to \infty} \sec^2(f_n(x)) = \lim_{n \to \infty} (1 + \tan^2(f_n(x))) = 1 + \lim_{x \to \infty} \tan^2(f_n(x)) = 1 \)

2. (D)

3. (A, C, D) Here \( \Delta = 0 \) so for at least one solution, we have
\( \Delta_1 = \Delta_2 = \Delta_3 = 0 \)
\( \Rightarrow b_1 + 7b_2 = 13b_3 \)

(A) \( \Delta \neq 0 \)
\( \therefore \) The equations have unique solution
\( \therefore \) Option (A) is correct.

(D) \( \Delta \neq 0 \)
\( \therefore \) The equations have unique solution
\( \therefore \) option (D) is correct.

(C) \( \Delta = 0 \)
\( \Rightarrow \) equations are
\[
\begin{align*}
x - 2y + 5z &= -b_1 \\
x - 2y + 5z &= \frac{b_2}{2} \\
x - 2y + 5z &= b_3
\end{align*}
\]
The planes given in option (c) are parallel so they must be coincident.
\[ \Rightarrow -b_1 = \frac{b_2}{2} = b_3 \]  
\[ \therefore \quad \text{Equation (ii) satisfies equation (i) for all } b_1, b_2, b_3 \]  
\[ \therefore \quad \text{Option (C) is correct.} \]

(B) \[ \Delta = \begin{vmatrix} 1 & 1 & 3 \\ 5 & 2 & 6 \\ -2 & -1 & 3 \end{vmatrix} = -3 \begin{vmatrix} 1 & 1 \\ 2 & 1 \end{vmatrix} = 0 \]

Also \[ \Delta_1 = \begin{vmatrix} -1 & 1 & 3 \\ 2 & 2 & 6 \end{vmatrix} b_3 = 0 \]

For infinite solutions, \( \Delta_2 \) and \( \Delta_3 \) must be 0.

\[ \Rightarrow \begin{vmatrix} 1 & b_1 & 3 \\ 5 & b_2 & 6 \\ -2 & b_3 & 3 \end{vmatrix} = 0 \]

\[ \Rightarrow b_1 + b_2 + 3b_3 = 0 \] which does not satisfy (i) for all \( b_1, b_2, b_3 \) so option (B) is incorrect.

4. **(A, C)**

Let the equation of common tangent is: \( y = mx + \frac{1}{m} \)

\[ \Rightarrow m^4 + m^2 - 2 = 0 \Rightarrow m = \pm 1 \]

\[ \therefore \quad \text{Equation of common tangents are} \]

\[ y = x + 1 \text{ and } y = -x - 1 \]

\[ \therefore \quad Q = (-1, 0) \]

\[ \therefore \quad \text{Equation of ellipse is: } \frac{x^2}{1} + \frac{y^2}{1/2} = 1 \]

(A) \[ e = \sqrt{1 - \frac{1}{2}} = \frac{1}{\sqrt{2}} \]

and latus rectum = \[ \frac{2b^2}{a} = \frac{2 \left( \frac{1}{\sqrt{2}} \right)^2}{1} = 1 \]

5. **(A, C, D)**

\[ sz + t\bar{z} + r = 0 \]  
\[ \bar{s}z + \bar{t} \bar{z} + \bar{r} = 0 \]  
\[ \text{..(i)} \]

Adding (i) and (ii), we get:

\[ (t + \bar{s})z + (s + \bar{t})z + (r + \bar{r}) = 0 \]  
\[ \text{(1)} \]

Subtracting (ii) from (i), we get:

\[ (t - \bar{s})z + (s - \bar{t})z + (r - \bar{r}) = 0 \]  
\[ \text{(2)} \]

Equation (1) and (2) represent set of lines.

For equation (1) and (2) to have unique solution, we have:

\[ \frac{t + \bar{s}}{t - s} = \frac{s + \bar{t}}{s - t} \]

On solving the above equation we get

\[ |t| = |s| \]

\[ \therefore \quad \text{Option (A) is correct} \]

For equation (1) and (2) to have infinitely many solutions, we have:

\[ \frac{t + \bar{s}}{t - s} = \frac{\bar{t} + s}{s - \bar{t}} \Rightarrow |t| = |s| \]

and \[ \bar{t} - \bar{r} + s - r = s + r - \bar{t} - \bar{r} \]

\[ \Rightarrow 2\bar{r} = 2s \bar{r} \Rightarrow \bar{t} = s \bar{r} \]

\[ \therefore \quad |t||r| = |s||\bar{r}| \]

\[ \Rightarrow |t||r| = |s||r| \Rightarrow |t| = |s| \]

\[ \therefore \quad \text{If } |t| = |s|, \text{ lines will be parallel for sure but may not be coincident (i.e., does not have infinitely many solutions).} \]

(C): Locus of \( Z \) is a null set or singleton set or a line, in all these cases it will intersect given circle at most two points.

(D): in this case locus of \( Z \) is a line so \( L \) has infinite elements.
MATHEMATICS

6. \( (B, C, D) \)

\[
\lim_{t \to x} \frac{f(x) \sin t - f(t) \sin x}{t - x} = \sin^2 x
\]

\[
\Rightarrow \lim_{t \to x} \frac{f(x) \cos t - f'(t) \sin x}{1} = \sin^2 x
\]

(Using L'Hopital's Rule)

\[
\Rightarrow f(x) \cos x - f'(x) \sin x = \sin^2 x
\]

\[
\Rightarrow -\left( \frac{f'(x) \sin x - f(x) \cos x}{\sin^2 x} \right) = 1
\]

\[
\Rightarrow -d \left( \frac{f(x)}{\sin x} \right) = 1 \Rightarrow \frac{f(x)}{\sin x} = -x + c
\]

Now, \( x = \frac{\pi}{6} \) also it is given that \( f\left( \frac{\pi}{6} \right) = -\frac{\pi}{12} \)

\[
-\frac{\pi}{6} = -\frac{\pi}{12} + c \Rightarrow -\frac{\pi}{12} = -\frac{\pi}{12} + c
\]

\[
\Rightarrow c = 0 \Rightarrow f(x) = -x \sin x
\]

(A) \( f\left( \frac{\pi}{4} \right) = -\frac{\pi}{4} \sqrt{2} \)

(B) \( f(x) = -x \sin x \)

as \( \sin x > x - \frac{x^3}{6} \forall x \in (0, \pi) \)

\[
\Rightarrow -x \sin < -x^2 + \frac{x^4}{6}
\]

\[
\Rightarrow f(x) < -x^2 + \frac{x^4}{6} \forall x \in (0, \pi)
\]

(C) \( f'(x) = -\sin x - x \cos x \)

\[ f'(x) = 0 \Rightarrow \tan x = -x \]

\[
\Rightarrow \text{there exist } \alpha \in (0, \pi) \text{ for which } f'(x) = 0
\]

(D) Here, \( f''(x) = -2 \cos x + x \sin x \)

\[
\Rightarrow f''\left( \frac{\pi}{2} \right) = \frac{\pi}{2} \text{ and } f\left( \frac{\pi}{2} \right) = -\frac{\pi}{2}
\]

\[
\Rightarrow f''\left( \frac{\pi}{2} \right) + f\left( \frac{\pi}{2} \right) = 0
\]

7. \( (2) \) Let \[
I = \int \frac{(1+\sqrt{3}) \, dx}{(1+x)^2 \left( \frac{(1-x)^6}{2} \right)^{1/4}}
\]

\[
= \int_{0}^{t} \frac{(1+\sqrt{3}) \, dx}{(1+x)^2 \left( \frac{(1-x)^6}{2} \right)^{1/4}}
\]

Now put \( \frac{1-x}{1+x} = t \Rightarrow \frac{-2 \, dx}{(1+x)^2} = dt \)

\[
\Rightarrow I = \int_{1}^{1/3} \frac{(1+\sqrt{3}) \, dt}{2 \, \sqrt{t}} = \frac{-2}{\sqrt{t}} \Bigg|_{1}^{1/3} = 2
\]

8. \( (4) \) Suppose \( P = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix} \)

So, \( \det(P) = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} \)

\[
= a_1 (b_2 c_3 - b_3 c_2) - a_2 (b_1 c_3 - b_3 c_1) + a_3 (b_1 c_2 - b_2 c_1)
\]

Maximum value can be 6 when \( a_1 = 1, a_2 = -1, a_3 = 1 \)
and \( b_2 c_3 = b_1 c_2 = b_3 c_1 = b_2 c_1 = b_3 c_2 = b_1 c_3 = b_1 c_2 = b_2 c_1 = -1 \).
So, \( (b_2 c_3) (b_1 c_2) (b_2 c_1) = -1 \)
and \( (b_1 c_1) (b_2 c_1) (b_2 c_2) = 1 \).

Therefore \( b_1 b_2 b_3 c_1 c_2 c_3 \) has two values 1 and -1 which is not possible.

Contradiction also occurs if \( a_1 = 1, a_2 = 1, a_3 = 1 \) and \( b_2 c_3 = b_1 c_2 = b_3 c_1 = b_2 c_1 = b_3 c_2 = b_1 c_3 = b_1 c_2 = b_2 c_1 = -1 \).
For maximum value to be 5 one of the terms should be zero but this will make 2 terms zero therefore answer should not be 5.

\[
\begin{vmatrix} 1 & 0 & 1 \\ -1 & 1 & 1 \end{vmatrix} = 4.
\]

Hence maximum value of the determinant of \( P = 4. \)
9. (119) Here n(X) = 5 and n(Y) = 7
Number of one-one function = \( \alpha = 7 \binom{3}{2} \times 5! \)
and Number of onto function Y to X is given as:

\[
\begin{array}{c c}
\alpha & \beta \\
\begin{array}{c}
a_1 \\
a_2 \\
\cdot \\
a_5 \\
\end{array} & \begin{array}{c}
b_1 \\
b_2 \\
\cdot \\
b_5 \\
\end{array}
\end{array}
\]

\[
1, 1, 1, 1, 3 \quad 1, 1, 1, 2, 2
\]

\[
\beta = \frac{7!}{3!4!} \times 5! + \frac{7!}{(2!)3!} \times 5! = (7 \binom{3}{2} + 3 \times 7 \binom{3}{2}) 5!
\]

\[
= 4 \times 7 \binom{3}{2} \times 5! = \frac{\beta - \alpha}{5!} = 4 \times 7 \binom{3}{2} = 4 \times 35 - 21 = 119
\]

10. (0.4) \[
\frac{dy}{dx} = (5y + 2)(5y - 2) = 25 \left( y + \frac{2}{5} \right) \left( y - \frac{2}{5} \right)
\]

\[
= \frac{1}{25} \int \left( \frac{dy}{y + \frac{2}{5}} \right) - \left( \frac{dy}{y - \frac{2}{5}} \right) = \int dx
\]

\[
= \frac{1}{25} \int \left[ \frac{dy}{\frac{1}{4}(y - \frac{2}{5})} - \frac{dy}{\frac{1}{4}(y + \frac{2}{5})} \right] = \int dx
\]

\[
= \frac{1}{25} \times \frac{5}{4} \ln \left| \frac{y - \frac{2}{5}}{y + \frac{2}{5}} \right| = x + c, \text{ where } c \text{ is constant of integration.}
\]

\[
= \frac{1}{20} \ln \left| \frac{5y - 2}{5y + 2} \right| = x + c
\]

As, \( f(0) = 0 \) \( \Rightarrow \) at \( x = 0, y = 0 \) \( \Rightarrow \) \( 0 = 0 + c \) \( \Rightarrow \) \( c = 0 \)

Therefore, \( \left| \frac{5y - 2}{5y + 2} \right| = e^{20x} \)

\[
\lim_{x \to -\infty} \left| \frac{5 f(x) - 2}{5 f(x) + 2} \right| = \lim_{x \to -\infty} e^{20x} = e^{-\infty} = 0
\]

\[
5 \lim_{x \to -\infty} f(x) - 2 = 0 \Rightarrow \lim_{x \to -\infty} f(x) = \frac{2}{5} = 0.4
\]

11. (2) \( f(x + y) = f(x) f'(y) + f'(x) f(y) \) \( \quad (1) \)

After putting \( x = y = 0 \), we get

\[
f(0) = 2f'(0) f(0) \Rightarrow f'(0) = \frac{1}{2} \quad \left[ \because f(0) = 1 \right]
\]

Now putting \( y = 0 \) in equation (1), we get

\[
f(x) = f(x) f'(0) + f'(x) f(0)
\]

\[
f'(x) = \frac{f(x)}{2} \Rightarrow \int f'(x) \, dx = \frac{1}{2} \int dx
\]

\[
\left[ \because f(0) = 1 \text{ and } f'(0) = \frac{1}{2} \right]
\]

\[
\Rightarrow \ln f(x) = \frac{x}{2} + \ln c
\]

\[
f(x) = ce^{x/2} \Rightarrow f(x) = e^{x/2} \quad (\because f(0) = 1)
\]

\[
\Rightarrow \ln f(x) = \frac{x}{2} \Rightarrow \ln f(4) = 2
\]

12. (8) Suppose coordinates of \( P \) are \( (a, b, c) \).

So, coordinates of \( Q \) are \( (0, 0, c) \) and coordinates of \( R \) are \( (a, b, -c) \).

Here, \( PQ \) is perpendicular to the plane \( x + y = 3 \).

So, \( PQ \) is parallel to the normal of given plane

i.e. \( (\hat{i} + \hat{j}) \) is parallel to \( (\hat{i} + \hat{j}) \)

\[
\Rightarrow a = b
\]

As mid-point of \( PQ \) lies in the plane \( x + y = 3 \), so

\[
\frac{a + b}{2} = 3 \Rightarrow a + b = 6 \Rightarrow a = 3 = b
\]

Therefore, distance of \( P \) from the \( x \)-axis = \( \sqrt{b^2 + c^2} = 5 \) \( \text{ (given) } \)

\[
\Rightarrow b^2 + c^2 = 25 \Rightarrow c^2 = 25 - 9 = 16
\]

\[
\Rightarrow c = \pm 4
\]

Hence, \( PR = |2c| = 8 \)

13. (0.5)
Here, \( \ddot{p} = SP = \frac{i - j - \hat{k}}{2} \)

\( \ddot{q} = SQ = \frac{-i + j - \hat{k}}{2} \)

\( \ddot{r} = SR = \frac{-i - j + \hat{k}}{2} \)

\( \ddot{t} = ST = \frac{i + j + \hat{k}}{2} \)

So, \( \ddot{p} \times \ddot{q} = \frac{1}{4} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 1 & -1 \\ -1 & 1 & -1 \end{vmatrix} = \frac{2\hat{i} + 2\hat{j}}{4} = \frac{\hat{i} + \hat{j}}{2} \)

and, \( \ddot{r} \times \ddot{t} = \frac{1}{4} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -1 & -1 \\ 1 & 1 & 1 \end{vmatrix} = \frac{2\hat{i} + 2\hat{j}}{4} = \frac{-\hat{i} + \hat{j}}{2} \)

Hence, \( (\ddot{p} \times \ddot{q}) \times (\ddot{r} \times \ddot{t}) = \frac{1}{4} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 1 & 0 \\ -1 & 1 & 0 \end{vmatrix} = \frac{\hat{k}}{2} \)

\[ \Rightarrow |(\ddot{p} \times \ddot{q}) \times (\ddot{r} \times \ddot{t})| = \frac{1}{2} = 0.5 \]

14. (646)

\[ \sum_{r=0}^{n} r^{(n)}C_r^2 = n \sum_{r=0}^{n} nC_r^{n-1}C_{r-1} \]

\[ = n \sum_{r=1}^{n} nC_n^{r-n-1}C_{r-1} = n2^{n-1}C_{n-1} \]

So, \( X = 10C_0^2 + 2(10C_2)^2 + 3(10C_3)^2 + \ldots + 10(10C_{10})^2 \)

\[ = \sum_{r=0}^{10} r(10C_r)^2 = 10^9C_9 \]

Hence, \( \frac{X}{1430} = \frac{1}{143} C_9 = 646 \)

15. (A) For \( E_1, \frac{x}{x-1} > 0 \) and \( x \neq 1 \) \( \Rightarrow x \in (-\infty, 0) \cup (1, \infty) \)

For \( E_2, -1 \leq \log_e \left( \frac{x}{x-1} \right) \leq 1 \) \( \Rightarrow \frac{1}{e} \leq \frac{x}{x-1} \leq e \)

\[ \frac{1}{e-1} \leq \frac{1}{x-1} \leq e-1 \Rightarrow (x-1) \in \left( -\infty, \frac{e}{1-e} \right] \cup \left[ \frac{1}{e-1}, \infty \right) \]

\[ \Rightarrow x \in \left( -\infty, \frac{1}{1-e} \right] \cup \left[ \frac{e}{e-1}, \infty \right) \]

For \( E_1, \frac{x}{x-1} \in (0, \infty) - \{1\} \)

\[ \Rightarrow \log_e \left( \frac{x}{x-1} \right) \in (-\infty, \infty) - \{0\} \]

\[ \Rightarrow f(x) \in (-\infty, 0) \cup (0, \infty) \]

\[ g(x) = \sin^{-1} \left( \log_e \left( \frac{x}{x-1} \right) \right) \in \left( -\frac{\pi}{2}, \frac{\pi}{2} \right) - \{0\} \]

16. (C) Here, a committee has to be formed form a group of 6 Boys and 5 girls.
Total number of ways for selecting exactly 3 boys and 2 girls = \( ^6C_3 \times ^5C_2 = 20 \times 10 = 200 = \alpha_1 \).
Total number of ways for selecting at least 2 members with equal number of boys and girls
\[ = (^6C_1 \times ^5C_1) + (^6C_2 \times ^5C_2) + (^6C_3 \times ^5C_3) + (^6C_4 \times ^5C_4) + (^6C_5 \times ^5C_5) = 11C_5 - 1 = 461 = \alpha_2. \]
Total number of ways for selecting 5 members having at least 2 girls \( = ^{11}C_5 - ^6C_5 - ^6C_4 \times ^5C_1 = ^{11}C_5 - 81 = 385 = \alpha_3 \).
Total number of ways for selecting 4 members having at least 2 girls \( M_1 \) and \( G_1 \) are not selected together
\[ = n(M_1 \text{ selected} \& G_1 \text{ not selected}) + n(G_1 \text{ selected} \& M_1 \text{ not selected}) + n(M_1 \text{ and } G_1 \text{ both not selected}) \]
\[ = (^4C_2 \times ^5C_1 + ^4C_3) + (^4C_1 \times ^5C_2 + ^4C_2 \times ^5C_1 + ^4C_3) + ^4C_4 \times ^5C_3 + ^4C_2 \times ^5C_2 \]
\[ = 34 + 48 + 189 = 301 = \alpha_4 \]

17. (B)
Area of \( \Delta LMN = 4\sqrt{3} \) (given)

\[ \Rightarrow \frac{1}{2} \times LM \times ON = 4\sqrt{3} \]

\[ \Rightarrow \frac{1}{2} \times (2b)(\sqrt{3}b) = 4\sqrt{3} \]

\[ \Rightarrow b^2 = 4 \Rightarrow b = 2 \]

So, length of the conjugate axis of \( H = 2b = 4 \)

\[ \tan 30^\circ = \frac{OL}{ON} = \frac{b}{a} \Rightarrow a = \sqrt{3}b \Rightarrow a = 2\sqrt{3} \]

\[ \therefore b^2 = a^2 (e^2 - 1) \]

\[ \Rightarrow 4 = 12(e^2 - 1) \]

\[ \Rightarrow e^2 = 1 + \frac{1}{3} = \frac{4}{3} \]

\[ \Rightarrow \text{The eccentricity of } H = e = \frac{2}{\sqrt{3}} \text{ and} \]

The distance between the foci of \( H = 2ae \)

\[ = \frac{2}{2\sqrt{3}} \times \frac{2}{3} = 8 \]

and length of latus rectum of \( H = \frac{2b^2}{a} = \frac{2 \times 4}{\sqrt{3}} = \frac{4}{\sqrt{3}} \)

18. (D)

(i) \( f'(0) = \lim_{h \to 0} \left[ \frac{\sin \sqrt{1-e^{-h^2}} - 0}{h} \right] \)

\[ = \lim_{h \to 0} \left[ \frac{\sin \sqrt{1-e^{-h^2}} \times \sin \sqrt{1-e^{-h^2}}}{\sqrt{1-e^{-h^2}} \times h} \right] \]

\[ = \lim_{h \to 0} \left[ 1 \times 1 \times \frac{h}{h} \right] = \lim_{h \to 0} \frac{h}{h} \left[ \therefore \lim_{x \to 0} \frac{\sin x}{x} = 1 \right] \]

which does not exit.

(ii) \( \lim_{x \to 0} f_2(x) = \lim_{x \to 0} \left[ \frac{\sin x}{\tan^{-1} x} \right] \)

\[ = \lim_{x \to 0} \left[ \frac{\sin x}{x} \times \frac{x}{\tan^{-1} x} \times \frac{1}{x} \right] \]

\[ = \lim_{x \to 0} \left[ 1 \times 1 \times \frac{\sin x}{x} \right] = \lim_{x \to 0} \frac{\sin x}{x} \left[ \therefore \lim_{x \to 0} \frac{x}{\tan^{-1} x} = 1 \right] \]

which does not exist, so for Q. (1) is correct.

(iii) \( \lim_{x \to 0} f_3(x) = \lim_{x \to 0} [\sin(\log_e(x+2))] \)

if \( x \to 0 \Rightarrow (x+2) \to 2 \)

\[ \Rightarrow \log_e (x+2) \to \log_e 2 < 1 \]

\[ \Rightarrow 0 < \lim \sin(\log_e (x+2)) < \sin 1 \]

\[ \Rightarrow \lim [\sin(\log_e (x+2))] = 0 \]

\[ f_3(x) = 0 \quad \forall x \in [-1, e^{\pi/2} - 2) \]

\[ \Rightarrow f_3'(x) = 0 \quad \forall x \in (-1, e^{\pi/2} - 2) \]

\[ \Rightarrow f_3''(x) = 0 \quad \forall x \in (-1, e^{\pi/2} - 2) \]

So for (R), (4) is correct.

(iv) \( \lim_{x \to 0} f_4(x) = \lim_{x \to 0} \left( x^2 \sin \frac{1}{x} \right) = \lim_{x \to 0} x^2 \left( \sin \frac{1}{x} \right) = 0 \)

\[ f_4'(0) = \lim_{x \to 0} \frac{h^2 \sin \left( \frac{1}{x} \right) - 0}{h} = \lim_{x \to 0} h \sin \left( \frac{1}{x} \right) = 0 \]

\[ f_4'(x) = -\cos \frac{1}{x} + 2x \sin \frac{1}{x}, \quad x \neq 0 \]

\[ \lim_{x \to 0} f_4'(x) = \lim_{x \to 0} \left[ -\cos \frac{1}{x} + 2x \sin \frac{1}{x} \right] = -\lim_{x \to 0} \cos \frac{1}{x} \]

which does not exist

So for (S), (3) is correct.
1. The integral
\[
\int \frac{\sin^2 x \cos^2 x}{(\sin^2 x + \cos^2 x) \sin^2 x + \sin^2 x \cos^2 x + \cos^2 x)^2} \, dx
\]
is equal to:
(1) \(\frac{-1}{3(1 + \tan^3 x)} + C\)
(2) \(\frac{1}{1 + \cot^3 x} + C\)
(3) \(\frac{-1}{1 + \cot^3 x} + C\)
(4) \(\frac{1}{3(1 + \tan^3 x)} + C\)
(where \(C\) is a constant of integration).

2. Tangents are drawn to the hyperbola \(4x^2 - y^2 = 36\) at the points P and Q. If these tangents intersect at the point T(0, 3) then the area (in sq. units) of \(\Delta PTQ\) is:
(1) \(54\sqrt{3}\)
(2) \(60\sqrt{3}\)
(3) \(36\sqrt{5}\)
(4) \(45\sqrt{5}\)

3. Tangent and normal are drawn at P(16, 16) on the parabola \(y^2 = 16x\), which intersect the axis of the parabola at A and B, respectively. If C is the centre of the circle through the points P, A and B and \(\angle CPB = 0\), then a value of \(\tan \theta\) is:
(1) \(2\)
(2) \(3\)
(3) \(\frac{4}{3}\)
(4) \(\frac{1}{2}\)

4. Let \(\vec{u}\) be a vector coplanar with the vectors
\(\vec{a} = 2\hat{i} + 3\hat{j} - \hat{k}\) and \(\vec{b} = \hat{j} + \hat{k}\). If \(\vec{u}\) is perpendicular to \(\vec{a}\) and \(\vec{u} \cdot \vec{b} = 24\), then \(\|\vec{u}\|^2\) is equal to:
(1) \(315\)
(2) \(256\)
(3) \(84\)
(4) \(336\)

5. If \(\alpha, \beta \in C\) are the distinct roots, of the equation \(x^2 - x + 1 = 0\), then \(\alpha^{101} + \beta^{107}\) is equal to:
(1) \(0\)
(2) \(1\)
(3) \(2\)
(4) \(-1\)

6. Let \(g(x) = \cos^2 x, f(x) = \sqrt{x}\), and \(\alpha, \beta (\alpha < \beta)\) be the roots of the quadratic equation \(18x^2 - 9\pi x + \pi^2 = 0\). Then the area (in sq. units) bounded by the curve \(y = (gof)(x)\) and the lines \(x = \alpha, x = \beta\) and \(y = 0\) is:
(1) \(\frac{1}{2}(\sqrt{3} + 1)\)
(2) \(\frac{1}{2}(\sqrt{3} - \sqrt{2})\)
(3) \(\frac{1}{2}(\sqrt{2} - 1)\)
(4) \(\frac{1}{2}(\sqrt{3} - 1)\)

7. The sum of the co-efficients of all odd degree terms in the expansion of
\((x + x^3 - 1)^5 + (x - x^3 - 1)^5, (x > 1)\) is:
(1) \(0\)
(2) \(1\)
(3) \(2\)
(4) \(-1\)

8. Let \(a_1, a_2, a_3, ..., a_{49}\) be in A.P. such that \(\sum_{k=0}^{12} a_{4k+1} = 416\)
and \(a_9 + a_{43} = 66\). If \(a_1^2 + a_2^2 + ... + a_{17}^2 = 140m\), then \(m\) is equal to:
(1) \(68\)
(2) \(34\)
(3) \(33\)
(4) \(66\)

9. If \(\sum_{i=1}^{9} (x_i - 5)^2 = 9\) and \(\sum_{i=1}^{9} (x_i - 5)^2 = 45\), then the standard deviation of the 9 items \(x_1, x_2, ..., x_9\) is:
(1) \(4\)
(2) \(2\)
(3) \(3\)
(4) \(9\)

10. PQR is a triangular park with \(PQ = PR = 200\) m. A T.V. tower stands at the mid-point of QR. If the angles of elevation of the top of the tower at P, Q and R are respectively 45°, 30° and 30°, then the height of the tower (in m) is:
(1) \(50\)
(2) \(100\sqrt{3}\)
(3) \(50\sqrt{2}\)
(4) \(100\)

11. Two sets A and B are as under:
\(A = \{(a, b) \in R \times R : |a - 5| < 1\text{ and }|b - 5| < 1\}\);
\(B = \{(a, b) \in R \times R : 4(a - 6)^2 + 9(b - 5)^2 \leq 36\}\). Then:
(1) \(A \subset B\)
(2) \(A \cap B = \phi\) (an empty set)
(3) neither \(A \subset B\) nor \(B \subset A\)
(4) \(B \subset A\)

12. From 6 different novels and 3 different dictionaries, 4 novels and 1 dictionary are to be selected and arranged in a row on a shelf so that the dictionary is always in the middle. The number of such arrangements is:
(1) less than 500
(2) at least 500 but less than 750
(3) at least 750 but less than 1000
(4) at least 1000

13. Let \(f(x) = x^2 + \frac{1}{x^2}\) and \(g(x) = x - \frac{1}{x}\), \(x \in R - \{-1, 0, 1\}\). If
\(h(x) = \frac{f(x)}{g(x)}\), then the local minimum value of \(h(x)\) is:
(1) \(-3\)
(2) \(-2\sqrt{2}\)
(3) \(2\sqrt{2}\)
(4) \(3\)

14. For each \(t \in R\), let \([t]\) be the greatest integer less than or equal to \(t\). Then
\(\lim_{x \to 0^+} \left(\frac{1}{x} + \frac{2}{x} + ... + \frac{15}{x}\right)\)
(1) is equal to 15.
(2) is equal to 120.
(3) does not exist (in R).
(4) is equal to 0.
15. The value of \( \int_{-1}^{2} \frac{\pi}{2} \sin^2 x \, dx \) is:

\[
\begin{align*}
(1) \ & \frac{\pi}{2} \\
(2) \ & 4\pi \\
(3) \ & \frac{\pi}{4} \\
(4) \ & \frac{\pi}{8}
\end{align*}
\]

16. A bag contains 4 red and 6 black balls. A ball is drawn at random from the bag, its colour is observed and this ball along with two additional balls of the same colour are returned to the bag. If now a ball is drawn at random from the bag, then the probability that this drawn ball is red, is:

\[
\begin{align*}
(1) \ & \frac{2}{5} \\
(2) \ & \frac{1}{5} \\
(3) \ & \frac{3}{4} \\
(4) \ & \frac{3}{10}
\end{align*}
\]

17. The length of the projection of the line segment joining the points (5, -1, 4) and (4, -1, 3) on the plane, \( x + y + z = 7 \) is:

\[
\begin{align*}
(1) \ & \frac{2}{3} \\
(2) \ & \frac{1}{3} \\
(3) \ & \sqrt{\frac{2}{3}} \\
(4) \ & \frac{2}{\sqrt{3}}
\end{align*}
\]

18. If sum of all the solutions of the equation

\[8 \cos x \cdot \left( \cos \frac{\pi}{6} + x \right) \cdot \cos \left( \frac{\pi}{6} - x \right) - 1 = 0 \text{ in } [0, \pi] \text{ is } k\pi,
\]

then \( k \) is equal to:

\[
\begin{align*}
(1) \ & \frac{13}{9} \\
(2) \ & \frac{8}{9} \\
(3) \ & \frac{20}{9} \\
(4) \ & \frac{2}{3}
\end{align*}
\]

19. A straight line through a fixed point (2, 3) intersects the coordinate axes at distinct points P and Q. If O is the origin and the rectangle OPQR is completed, then the locus of R is:

\[
\begin{align*}
(1) \ & 2x + 3y = xy \\
(2) \ & 3x + 2y = xy \\
(3) \ & 3x + 2y = 6xy \\
(4) \ & 3x + 2y = 6
\end{align*}
\]

20. Let A be the sum of the first 20 terms and B be the sum of the first 40 terms of the series

\[1^2 + 2 \cdot 2^2 + 3^2 + 2 \cdot 4^2 + 5^2 + 2 \cdot 6^2 + \ldots \]

If \( B - 2A = 100\lambda \), then \( \lambda \) is equal to:

\[
\begin{align*}
(1) \ & 248 \\
(2) \ & 464 \\
(3) \ & 496 \\
(4) \ & 232
\end{align*}
\]

21. If the curves \( y^2 = 6x, 9x^2 + by^2 = 16 \) intersect each other at right angles, then the value of \( b \) is:

\[
\begin{align*}
(1) \ & \frac{7}{2} \\
(2) \ & 4 \\
(3) \ & \frac{9}{2} \\
(4) \ & 6
\end{align*}
\]

22. Let the orthocentre and centroid of a triangle be A(-3, 5) and B(3, 3) respectively. If C is the circumcentre of this triangle, then the radius of the circle having line segment AC as diameter, is:

\[
\begin{align*}
(1) \ & \frac{2\sqrt{10}}{3} \\
(2) \ & \frac{3\sqrt{3}}{2} \\
(3) \ & \frac{3\sqrt{5}}{2} \\
(4) \ & \sqrt{10}
\end{align*}
\]

23. Let \( S = \{ t \in R : f(x) ≠ x - \pi |(e^{x} - 1) \sin |x| \text{ is not differentiable at } t \} \). Then the set \( S \) is equal to:

\[
\begin{align*}
(1) \ & \{0\} \\
(2) \ & \pi \\
(3) \ & \{0, \pi\} \\
(4) \ & \phi \text{ (an empty set)}
\end{align*}
\]

24. If \[
\begin{vmatrix}
-4 & 2x & 2x \\
2x & x - 4 & 2x \\
2x & 2x & x - 4
\end{vmatrix}
\]

pair \( (A, B) \) is equal to:

\[
\begin{align*}
(1) \ & (-4, 3) \\
(2) \ & (-4, 5) \\
(3) \ & (4, 5) \\
(4) \ & (-4, -5)
\end{align*}
\]

25. The Boolean expression \( 
\overline{(p \lor q) \land \overline{(p \land q)}} \) is equivalent to:

\[
\begin{align*}
(1) \ & p \\
(2) \ & q \\
(3) \ & \overline{q} \\
(4) \ & \overline{p}
\end{align*}
\]

26. If the system of linear equations

\[
\begin{align*}
x + ky + 3z &= 0 \\
x + ky - 2z &= 0 \\
x + 4y - 3z &= 0
\end{align*}
\]

has a non-zero solution \( (x, y, z) \), then \( \frac{xz}{y^2} \) is equal to:

\[
\begin{align*}
(1) \ & 10 \\
(2) \ & -30 \\
(3) \ & 30 \\
(4) \ & -10
\end{align*}
\]

27. Let \( S = \{ x \in R : x \geq 0 \text{ and } 2 \sqrt{x - 3} + \sqrt{x(x - 6)} = 6 = 0 \text{. Then } S \}

\[
\begin{align*}
(1) \ & \text{contains exactly one element.} \\
(2) \ & \text{contains exactly two elements.} \\
(3) \ & \text{contains exactly four elements.} \\
(4) \ & \text{is an empty set.}
\end{align*}
\]

28. If the tangent at (1, 7) to the curve \( x^2 + y^2 = 9 \) touches the circle \( x^2 + y^2 + 16x + 12y + c = 0 \) then the value of \( c \) is:

\[
\begin{align*}
(1) \ & 185 \\
(2) \ & 85 \\
(3) \ & 95 \\
(4) \ & 195
\end{align*}
\]

29. Let \( y - y(x) \) be the solution of the differential equation

\[
\frac{dy}{dx} - y \cos x = 4x, x \in (0, \pi) \text{. If } y\left(\frac{\pi}{2}\right) = 0 \text{, then}
\]

\[
\frac{y\left(\frac{\pi}{6}\right)}{6} \text{ is equal to:
\]

\[
\begin{align*}
(1) \ & -\frac{8}{9\sqrt{3}} \pi^2 \\
(2) \ & -\frac{8}{9} \pi^2 \\
(3) \ & -\frac{4}{9} \pi^2 \\
(4) \ & \frac{4}{9\sqrt{3}} \pi^2 \n\end{align*}
\]

30. If \( L_1 \) is the line of intersection of the planes \( 2x - 2y + 3z - 2 = 0 \) and \( x - y + z + 1 = 0 \) and \( L_2 \) is the line of intersection of the planes \( x + 2y - z - 3 = 0 \) and \( 3x - y + 2z - 1 = 0 \), then the distance of the origin from the plane, containing the lines \( L_1 \) and \( L_2 \), is:

\[
\begin{align*}
(1) \ & \frac{1}{3\sqrt{2}} \\
(2) \ & \frac{1}{2\sqrt{2}} \\
(3) \ & \frac{1}{\sqrt{2}} \\
(4) \ & \frac{1}{4\sqrt{2}}
\end{align*}
\]
1. (1) Let I

\[
I = \int \frac{\sin^2 x \cos^2 x}{(\sin^2 x + \cos^2 x + \sin^3 x \cos^2 x + \cos^3 x)^2} \, dx
\]

\[
= \int \frac{\sin^2 x \cos^2 x}{(\sin^2 x + \cos^2 x)(\sin^3 x + \cos^3 x)^2} \, dx
\]

\[
= \int \frac{\sin^2 x \cos^2 x}{(\sin^3 x + \cos^3 x)^2} \, dx = \int \frac{\tan^2 x \cdot \sec^2 x}{(1 + \tan^2 x)^2} \, dx
\]

Now, put \(1 + \tan^2 x = t\)

\[\Rightarrow 3 \tan^2 x \sec^2 x \, dx = dt\]

\[\therefore I = \frac{1}{3} \int \frac{dt}{t^2} = -\frac{1}{3t} + C = -\frac{1}{3(1 + \tan^3 x)} + C\]

2. (4) Here the equation of hyperbola is \(\frac{x^2}{9} - \frac{y^2}{36} = 1\)

Now, PQ is the chord of contact

\[\therefore \text{Equation of PQ is: } \frac{x(0)}{9} - \frac{y(3)}{36} = 1\]

\[\Rightarrow y = -12\]

3. (1) Equation of tangent at \(P(16, 16)\) is given as:

\[x - 2y + 16 = 0\]

4. (4) \(\therefore \vec{a}, \vec{b} \text{ & } \vec{c} \) are coplanar

\[\therefore \vec{u} = \lambda (\vec{a} \times \vec{b}) \times \vec{a} = \lambda [\vec{a} \times (\vec{b} \times \vec{a})]\]

\[= \lambda (-4\vec{i} + 8\vec{j} + 16\vec{k}) = \lambda (-\hat{i} + 2\hat{j} + 4\hat{k})\]

Also, \(\vec{u} \cdot \vec{b} = 24 \Rightarrow \lambda = 4\)

\[\therefore \vec{u} = -4\hat{i} + 8\hat{j} + 16\vec{k}\]

\[\Rightarrow |\vec{u}|^2 = 336\]

5. (2) \(\alpha, \beta \) are roots of \(x^2 - x + 1 = 0\)

\[\therefore \alpha = -\omega \text{ and } \beta = -\omega^2\]

where \(\omega\) is the cube root of unity

\[\therefore \alpha^{101} + \beta^{107} = (-\omega)^{101} + (-\omega^2)^{107}\]

\[= [\omega^2 + \omega] = [-1] = 1\]

6. (4) Here, \(18\pi^2 - 9\pi x + \pi^2 = 0\)

\[\Rightarrow (3x - \pi)(6x - \pi) = 0\]

\[\Rightarrow \alpha = \frac{\pi}{6}, \beta = \frac{\pi}{3}\]

Also, \(g(x) = \cos x\)

\[\therefore \text{Req. area} = \int_{\pi/6}^{\pi/3} \cos x \, dx = \frac{\sqrt{3} - 1}{2}\]
7. Since we know that,
\[(x + a)^5 + (x - a)^5 = 2\left[5C_0 x^5 + 5C_2 x^3 \cdot a^2 + 5C_4 x \cdot a^4\right]\]
\[
\therefore \quad (x + \sqrt{x^3 - 1})^5 + (x - \sqrt{x^3 - 1})^5 = 2[5C_0 x^5 + 5C_2 x^3 (x^3 - 1) + 5C_4 x (x^3 - 1)^2]
\[
\Rightarrow 2[x^5 + 10x^6 - 10x^3 + 5x^7 - 10x^4 + 5x]
\]
\[
\therefore \quad \text{Sum of coefficients of odd degree terms} = 2.
\]

8. \[\sum_{k=0}^{12} a_{4k+1} = 416 \Rightarrow \frac{13}{2}[2a_1 + 48d] = 416\]
\[
\Rightarrow a_1 + 24d = 32 \quad \ldots (1)
\]
Now, \[a_2 + a_{43} = 66 \Rightarrow 2a_1 + 50d = 66 \quad \ldots (2)
\]
From eq. (1) & (2) we get; \[d = 1\] and \[a_1 = 8\]
Also, \[\sum_{r=1}^{17} a_r^2 = \sum_{r=1}^{17} [8 + (r-1)1]^2 = 140 \text{ m}
\]
\[
\Rightarrow \sum_{r=1}^{17} (r + 7)^2 = 140 \text{ m}
\]
\[
\Rightarrow \sum_{r=1}^{17} (r^2 + 14r + 49) = 140 \text{ m}
\]
\[
\Rightarrow \left(\frac{17 \times 18 \times 35}{6}\right) + 14\left(\frac{17 \times 18}{2}\right) + (49 \times 17) = 140
\]
\[
\Rightarrow m = 34
\]

9. Given \[\sum_{i=1}^{9} (x_i - 5) = 9 \Rightarrow \sum_{i=1}^{9} x_i = 54 \ldots (i)
\]
Also, \[\sum_{i=1}^{9} (x_i - 5)^2 = 45
\]
\[
\Rightarrow \sum_{i=1}^{9} x_i^2 - 10 \sum_{i=1}^{9} x_i + 9(25) = 45 \ldots (ii)
\]
From (i) and (ii) we get,
\[
\sum_{i=1}^{9} x_i^2 = 360
\]
Since, variance = \[\frac{\sum x_i^2}{9} - \left(\frac{\sum x_i}{9}\right)^2
\]
\[
= \frac{360}{9} - \frac{54}{9} = 40 - 36 = 4
\]
\[
\therefore \quad \text{Standard deviation} = \sqrt{\text{Variance}} = 2
\]

10. (4)
Let height of tower MN = h
In \(\triangle QMN\) we have
\[
\tan 30^\circ = \frac{MN}{QM}
\]
\[
\therefore \quad QM = \sqrt{3}h = MR \quad \ldots (1)
\]
Now in \(\triangle MNP\)
\[MN = PM \quad \ldots (2)
\]
In \(\triangle PMQ\) we have :
\[
MP = \sqrt{(200)^2 - (\sqrt{3}h)^2}
\]
\[
\therefore \quad \text{From (2), we get :}
\]
\[
\sqrt{(200)^2 - (\sqrt{3}h)^2} = h \Rightarrow h = 100 \text{m}
\]

11. (1) \[A = \{(a, b) \in R \times R : |a - 5| < 1, |b - 5| < 1\}
\]
Let \[a - 5 = x, b - 5 = y\]
Set \(A\) contains all points inside \(|x| < 1, |y| < 1\)
\[
B = \{(a, b) \in R \times R : 4(a - 6)^2 + 9(b - 5)^2 \leq 36\}
\]
Set \(B\) contains all points inside or on
\[
\frac{(x - 1)^2}{9} + \frac{y^2}{4} = 1
\]
\[
\therefore \quad (\pm 1, \pm 1) \text{ lies inside the ellipse.}
\]
Hence, \(A \subseteq B\).

12. Required number of ways = \[6C_4 \times 3C_1 \times 4!
\]
\[
= 15 \times 3 \times 24 = 1080
\]
13. (3) Here, \( h(x) = \frac{x^2 + \frac{1}{x}}{x - \frac{1}{x}} = \left( x - \frac{1}{x} \right) + \frac{2}{x - \frac{1}{x}} \)

When \( x - \frac{1}{x} < 0 \)

\[ \therefore \quad x - \frac{1}{x} + \frac{2}{x} \leq -2\sqrt{2} \]

Hence, \(-2\sqrt{2}\) will be local maximum value of \( h(x) \).

When \( x - \frac{1}{x} > 0 \)

\[ \therefore \quad x - \frac{1}{x} + \frac{2}{x} \geq 2\sqrt{2} \]

Hence, \(2\sqrt{2}\) will be local minimum value of \( h(x) \).

14. (2) Since, \( \lim_{x \to 0^+} x \left( \frac{1}{x} + \frac{2}{x} + \ldots + \frac{15}{x} \right) \)

\[ = \lim_{x \to 0^+} \frac{1 + 2 + 3 + \ldots + 15}{x} - \left( \left\{ \frac{1}{x} \right\} + \left\{ \frac{2}{x} \right\} + \ldots + \left\{ \frac{15}{x} \right\} \right) \]

\[ \therefore \quad 0 \leq \left\{ \frac{x}{r} \right\} \leq 1 \quad \Rightarrow \quad 0 \leq \frac{r}{x} < 1 \]

\[ \therefore \quad \lim_{x \to 0^+} \frac{1 + 2 + 3 + \ldots + 15}{x} = \frac{15 \times 16}{2} = 120 \]

15. (3) Let, \( I = \int_{-\pi/2}^{\pi/2} \frac{\sin^2 x}{1 + 2^x} \, dx \) \quad ...(i)

Using, \( \int f(x)dx = \int f(a + b - x)dx \), we get:

\[ I = \int_{-\pi/2}^{\pi/2} \frac{\sin^2 x}{1 + 2^{-x}} \, dx \quad \ldots \text{(ii)} \]

Adding (i) and (ii), we get:

\[ 2I = \int_{-\pi/2}^{\pi/2} \sin^2 x \, dx \Rightarrow 2I = 2 \int_{0}^{\pi/2} \sin^2 x \, dx \]

\[ \Rightarrow \quad 2I = 2 \times \frac{\pi}{4} \Rightarrow I = \frac{\pi}{4} \]

16. (1) Let \( R \) be the event of drawing red ball in \( i^{th} \) draw and \( B \) be the event of drawing black ball in \( i^{th} \) draw.

Now, in the given bag there are 4 red and 6 black balls.

\[ \therefore \quad P(R_1) = \frac{4}{10} \quad \text{and} \quad P(B_1) = \frac{6}{10} \]

And, \( P\left( \frac{R_2}{R_1} \right) = \frac{6}{12} \quad \text{and} \quad P\left( \frac{R_2}{B_1} \right) = \frac{4}{12} \)

Now, required probability

\[ = P(R_1) \times P\left( \frac{R_2}{R_1} \right) + P(B_1) \times P\left( \frac{R_2}{B_1} \right) \]

\[ = \left( \frac{4}{10} \times \frac{6}{12} \right) + \left( \frac{6}{10} \times \frac{4}{12} \right) = \frac{2}{5} \]

17. (3) \[ AC = AB \hat{A}C = (i + k) \left( \frac{i + j + k}{\sqrt{3}} \right) = \frac{2}{\sqrt{3}} \]

Now, \( A'B' = BC = \sqrt{AB^2 - AC^2} = \sqrt{2 - \frac{4}{3}} = \frac{2}{\sqrt{3}} \)

\[ \therefore \ \text{Length of projection} = \frac{2}{\sqrt{3}} \]

18. (1) \[ \therefore \quad 8 \cos x \left( \frac{\cos^2 \frac{\pi}{6} - \sin^2 x - \frac{1}{2}}{6} \right) = 1 \]

\[ \Rightarrow \quad 8 \cos x \left( \frac{3}{4} - \frac{1}{2} - \sin^2 x \right) = 1 \]

\[ \Rightarrow \quad 8 \cos x \left( \frac{1}{4} - (1 - \cos^2 x) \right) = 1 \]

\[ \Rightarrow \quad 8 \cos x \left( \frac{1}{4} - 1 + \cos^2 x \right) = 1 \]

\[ \Rightarrow \quad 8 \cos x \left( \cos^2 x - \frac{3}{4} \right) = 1 \]

\[ \Rightarrow \quad 8 \left( \frac{4 \cos^3 x - 3 \cos x}{4} \right) = 1 \]
21. (3) Let curve intersect each other at point \( P(x_1, y_1) \)

\[ y^2 = 6x \]

\[ 9x^2 + by^2 = 16 \]

Since, point of intersection is on both the curves, then
\[ y_1^2 = 6x_1 \] \hspace{1cm} ...(i)
and \[ 9x_1^2 + by_1^2 = 16 \] \hspace{1cm} ...(ii)

Now, find the slope of tangent to both the curves at the point of intersection \( P(x_1, y_1) \).

For slope of curves:

curve (i):
\[ \frac{dy}{dx}_{(x_1,y_1)} = m_1 = \frac{3}{y_1} \]

curve (ii):
\[ \frac{dy}{dx}_{(x_1,y_1)} = m_2 = \frac{9x_1}{by_1} \]

Since, both the curves intersect each other at right angle then,
\[ m_1m_2 = -1 \Rightarrow \frac{27x_1}{by_1^2} = 1 \Rightarrow b = \frac{27x_1}{y_1^2} \]

\[ 27 \times \frac{1}{6} = \frac{9}{2} \]

22. (2) Since Orthocentre of the triangle is \( A(-3, 5) \) and centroid of the triangle is \( B(3, 3) \), then
\[ AB = \sqrt{40} = 2\sqrt{10} \]

Centroid divides orthocentre and circumcentre of the triangle in ratio \( 2 : 1 \)
\[ AB : BC = 2 : 1 \]

Now, \[ AB = \frac{2}{3} AC \]
\[ AC = \frac{3}{2} AB = \frac{3}{2}(2\sqrt{10}) \Rightarrow AC = 3\sqrt{10} \]

:. Radius of circle with \( AC \) as diameter
\[ \frac{AC}{2} = \frac{3\sqrt{10}}{2} = \frac{3}{2} \sqrt{10} = 3 \sqrt{\frac{5}{2}} \]
23. \( f(x) = |x - \pi| (e^{|x|} - 1) \sin |x| \)

Check differentiability of \( f(x) \) at \( x = \pi \) and \( x = 0 \)

at \( x = \pi \):

\[
\text{R.H.D.} = \lim_{h \to 0} \frac{|\pi + h - \pi| (e^{|x+h|} - 1) \sin |\pi + h| - 0}{h}
\]

L.H.D. = \lim_{h \to 0} \frac{|\pi - h - \pi| (e^{-|h|} - 1) \sin |\pi - h| - 0}{-h} = 0

\( \therefore \) R.H.D = L.H.D

Therefore, function is differentiable at \( x = \pi \)

at \( x = 0 \):

\[
\text{R.H.D.} = \lim_{h \to 0} \frac{|h - \pi| (e^{h} - 1) \sin |h| - 0}{h}
\]

L.H.D. = \lim_{h \to 0} \frac{|-h - \pi| (e^{-h} - 1) \sin |-h| - 0}{-h} = 0

\( \therefore \) R.H.D = L.H.D

Therefore, function is differentiable.

Since, the function \( f(x) \) is differentiable at all the points including \( \pi \) and 0.

i.e., \( f(x) \) is everywhere differentiable.

Therefore, there is no element in the set \( S \).

\( \Rightarrow S = \phi \) (an empty set)

24. (2) Here,

\[
\begin{vmatrix}
 x - 4 & 2x & 2x \\
 2x & x - 4 & 2x \\
 2x & 2x & x - 4
\end{vmatrix} = (A+Bx)(x-A)^2
\]

Put \( x = 0 \) ⇒ \[
\begin{vmatrix}
 -4 & 0 & 0 \\
 0 & -4 & 0 \\
 0 & 0 & -4
\end{vmatrix} = A^3 \Rightarrow A^3 = (-4)^3
\]

\( \Rightarrow A = -4 \)

\[
\begin{vmatrix}
 x - 4 & 2x & 2x \\
 2x & x - 4 & 2x \\
 2x & 2x & x - 4
\end{vmatrix} = (Bx - 4)(x + 4)^2
\]

Now take \( x \) common from both the sides

\[
\begin{vmatrix}
 1 - \frac{4}{x} & 2x & 2x \\
 2x & 1 - \frac{4}{x} & 2x \\
 2x & 2x & 1 - \frac{4}{x}
\end{vmatrix} = (B - \frac{4}{x})(1 + \frac{4}{x})^2
\]

25. (4) \( (p \lor q) \land (\neg p \land q) \)

\( \neg (p \land q) \lor (\neg p \land q) \Rightarrow \neg p \land q \lor \neg q \Rightarrow \neg p\land \neg q \Rightarrow \neg p \)

26. (1) For non zero solution of the system of linear equations,

\[
\begin{vmatrix}
 1 & k & 3 \\
 3 & k & -2 \\
 2 & 4 & -3
\end{vmatrix} = 0
\]

\( \Rightarrow k = 11 \)

Now equations become

\[
\begin{align*}
3x + 11y + 3z &= 0 \\
3x + 11y - 2z &= 0 \\
2x + 4y - 3z &= 0
\end{align*}
\]

Adding equations (1) & (3) we get

\( 3x + 15y = 0 \Rightarrow x = -5y \)

Now put \( x = -5y \) in equation (1), we get

\( -5y + 11y + 3z = 0 \Rightarrow z = -2y \)

\( \therefore \frac{xz}{y^2} = \frac{(-5y)(-2y)}{y^2} = 10 \)

27. (2) Case-I: \( x \in [0, 9] \)

\( 2(3 - \sqrt{x}) + x - 6\sqrt{x} + 6 = 0 \)

\( \Rightarrow x - 8\sqrt{x} + 12 = 0 \Rightarrow \sqrt{x} = 4, 2 \Rightarrow x = 16, 4 \)

Since \( x \in [0, 9] \)

\( \therefore \) \( x = 4 \)

Case-II: \( x \in [9, \infty] \)

\( 2(\sqrt{x} - 3) + x - 6\sqrt{x} + 6 = 0 \)

\( \Rightarrow x - 4\sqrt{x} = 0 \Rightarrow x = 16, 0 \)

Since \( x \in [9, \infty] \)

\( \therefore \) \( x = 16 \)

Hence, \( x = 4 \& 16 \)

28. (3) Equation of tangent at \((1, 7)\) to \( x^2 = y - 6 \) is \( 2x - y + 5 = 0 \).
Now, perpendicular from centre O(-8, -6) to 
2x - y + 5 = 0 should be equal to radius of the circle

\[ \frac{-16 + 6 + 5}{\sqrt{5}} = \sqrt{64 + 36 - C} \]

\[ \Rightarrow \sqrt{5} = \sqrt{100 - c} \Rightarrow c = 95 \]

29. (2) Consider the given differential equation the
\[ \sin x \, dy + \cos x \, dx = 4 \, dx \]
\[ \Rightarrow \int \sin x \, dy = 4 \, dx \]
Integrate both sides
\[ \Rightarrow y \, \sin x = 2x^2 + C \ldots (1) \]

\[ \Rightarrow y(x) = \frac{2x^2}{\sin x} + c \ldots (2) \]

\[ \therefore \text{eq. (2) passes through } \left( \frac{\pi}{2}, 0 \right) \]

\[ \Rightarrow 0 = \frac{\pi^2}{2} + C \Rightarrow C = -\frac{\pi^2}{2} \]

Now, put the value of C in (1)

Then, \( y \sin x = 2x^2 - \frac{\pi^2}{2} \) is the solution

\[ \Rightarrow \left( \frac{\pi}{6} \right) = \left( \frac{2\pi^2}{36} - \frac{\pi^2}{2} \right) \frac{2}{9} = \frac{-8\pi^2}{9} \]

30. (1) Equation of plane passing through the line of intersection of first two planes is:
\[ (2x - 2y + 3z - 2) + \lambda(x - y + z + 1) = 0 \]
or \[ x(\lambda + 2) - y(2 + \lambda) + z(\lambda + 3) + (\lambda - 2) = 0 \ldots (i) \]
is having infinite number of solution with \[ x + 2y - z - 3 = 0 \text{ and } 3x - y + 2z - 1 = 0, \text{ then} \]
\[ \begin{vmatrix} \lambda + 2 & -\lambda + 2 & \lambda + 3 \\ 1 & 2 & -1 \\ 3 & -1 & 2 \end{vmatrix} = 0 \]

\[ \Rightarrow \lambda = 5 \]

Now put \( \lambda = 5 \) in (i), we get
\[ 7x - 7y + 8z + 3 = 0 \]
Now perpendicular distance from \( (0, 0, 0) \) to the place
containing \( L_1 \) and \( L_2 = \frac{3}{\sqrt{162}} = \frac{1}{3\sqrt{2}} \)
SECTION - I

This section contains 7 questions. Each question has 4 options (A), (B), (C) and (D). ONE OR MORE THAN ONE of these four options is (are) correct.

1. If \(2x - y + 1 = 0\) is a tangent to the hyperbola \(\frac{x^2}{a^2} - \frac{y^2}{16} = 1\), then which of the following cannot be sides of a right angled triangle?
   - (A) \(a, 4, 1\)
   - (B) \(a, 4, 2\)
   - (C) \(2a, 8, 1\)
   - (D) \(2a, 4, 1\)

2. If a chord, which is not a tangent, of the parabola \(y^2 = 16x\) has the equation \(2x + y = p\), and midpoint (h, k), then which of the following is (are) possible value(s) of p, h and k?
   - (A) \(p = -2, h = 2, k = -4\)
   - (B) \(p = -1, h = 1, k = -3\)
   - (C) \(p = 2, h = 3, k = -4\)
   - (D) \(p = 5, h = 4, k = -3\)

3. Let \([x]\) be the greatest integer less than or equals to x. Then, at which of the following point(s) the function \(f(x) = x \cos(\pi(x + [x]))\) is discontinuous?
   - (A) \(x = -1\)
   - (B) \(x = 0\)
   - (C) \(x = 1\)
   - (D) \(x = 2\)

4. Let \(f: \mathbb{R} \rightarrow (0, 1)\) be a continuous function. Then, which of the following function(s) has (have) the value zero at some point in the interval \((0, 1)\)?
   - (A) \(x^9 - f(x)\)
   - (B) \(x - \int_0^\frac{\pi}{2} f(t) \cos t \, dt\)
   - (C) \(e^x - \int_0^\pi f(t) \sin t \, dt\)
   - (D) \(f(x) + \int_0^\frac{\pi}{2} f(t) \sin t \, dt\)

5. Which of the following is (are) not the square of a \(3 \times 3\) matrix with real entries?
   - (A) \[
   \begin{pmatrix}
   1 & 0 & 0 \\
   0 & 1 & 0 \\
   0 & 0 & 1 \\
   \end{pmatrix}
   \]
   - (B) \[
   \begin{pmatrix}
   1 & 0 & 0 \\
   0 & 1 & 0 \\
   0 & 0 & -1 \\
   \end{pmatrix}
   \]
   - (C) \[
   \begin{pmatrix}
   1 & 0 & 0 \\
   0 & 1 & 0 \\
   0 & 0 & -1 \\
   \end{pmatrix}
   \]
   - (D) \[
   \begin{pmatrix}
   -1 & 0 & 0 \\
   0 & -1 & 0 \\
   0 & 0 & -1 \\
   \end{pmatrix}
   \]

6. Let \(a, b, x\) and \(y\) be real numbers such that \(a - b = 1\) and \(y \neq 0\). If the complex number \(z = x + iy\) satisfies
   \[
   \text{Im} \left( \frac{az + b}{z + 1} \right) = y,
   \]
   then which of the following is (are) possible value(s) of \(x\)?
   - (A) \(-1 + \sqrt{1 - y^2}\)
   - (B) \(-1 - \sqrt{1 - y^2}\)
   - (C) \(1 + \sqrt{1 + y^2}\)
   - (D) \(1 - \sqrt{1 + y^2}\)

7. Let \(X\) and \(Y\) be two events such that \(P(X) = \frac{1}{3}\), \(P(X|Y) = \frac{1}{2}\) and \(P(Y|X) = \frac{2}{5}\). Then
   - (A) \(P(Y) = \frac{4}{15}\)
   - (B) \(P(X|Y) = \frac{1}{2}\)
   - (C) \(P(X \cap Y) = \frac{1}{5}\)
   - (D) \(P(X \cup Y) = \frac{2}{5}\)

SECTION - I

This section contains 5 questions. The answer to each question is a SINGLE DIGIT INTEGER ranging from 0 to 9, both inclusive.

8. For how many values of \(p\), the circle \(x^2 + y^2 + 2x + 4y - p = 0\) and the coordinate axes have exactly three common points?

9. Let \(f: \mathbb{R} \rightarrow \mathbb{R}\) be a differentiable function such that \(f(0) = 0\),
   \[
   f' \left( \frac{\pi}{2} \right) = 3 \text{ and } f'(0) = 1.
   \]
   If \(g(x) = \int_x^\frac{\pi}{2} \left[ f'(t) \csc t - \cot t \cot f(t) \right] dt\) for
   \[
   x \in \left( 0, \frac{\pi}{2} \right],
   \]
   then \(\lim_{x \to 0^+} g(x) = \).
10. For a real number \( \alpha \), if the system
\[
\begin{bmatrix}
1 & \alpha & \alpha^2 \\
\alpha & 1 & \alpha \\
\alpha^2 & \alpha & 1
\end{bmatrix}
\begin{bmatrix}
x \\
y \\
z
\end{bmatrix}
= \begin{bmatrix}
1 \\
-1 \\
1
\end{bmatrix}
\] of linear equations, has infinitely many solutions, then \( 1 + \alpha + \alpha^2 = \) 

11. Words of length 10 are formed using the letters A, B, C, D, E, F, G, H, I, J. Let \( x \) be the number of such words where no letter is repeated; and let \( y \) be the number of such words where exactly one letter is repeated twice and no other letter is repeated. Then, \( \frac{y}{9x} = \) 

12. The sides of a right angled triangle are in arithmetic progression. If the triangle has area 24, then what is the length of its smallest side?

SECTION - III

This section contains 6 questions of matching type. This section contains two tables each having 3 columns and 4 rows. Based on each table, there are three questions. Each question has four options (A), (B), (C) and (D) only ONE OF these four option is correct.

(Qs. 13-15) : By appropriately matching the information given in the three columns of the following table. Column 1, 2, and 3 contain conics, equations of tangents to the conics and points of contact, respectively.

<table>
<thead>
<tr>
<th>Column 1</th>
<th>Column 2</th>
<th>Column 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>(I) ( x^2 + y^2 = a^2 )</td>
<td>(i) ( my = m^2 x + a )</td>
<td>(P) ( \left( \frac{a}{m^2}, \frac{2a}{m} \right) )</td>
</tr>
<tr>
<td>(II) ( x^2 + a^2 y^2 = a^2 )</td>
<td>(ii) ( y = mx + a \sqrt{m^2 + 1} )</td>
<td>(Q) ( \left( \frac{-ma}{\sqrt{m^2 + 1}}, \frac{a}{\sqrt{m^2 + 1}} \right) )</td>
</tr>
<tr>
<td>(III) ( y^2 = 4ax )</td>
<td>(iii) ( y = mx + \frac{\sqrt{a^2 m^2 - 1}}{1} )</td>
<td>(R) ( \left( \frac{-a^2 m}{\sqrt{a^2 m^2 + 1}}, \frac{1}{\sqrt{a^2 m^2 + 1}} \right) )</td>
</tr>
<tr>
<td>(IV) ( x^2 - a^2 y^2 = a^2 )</td>
<td>(iv) ( y = mx + \frac{\sqrt{a^2 m^2 + 1}}{1} )</td>
<td>(S) ( \left( \frac{-a^2 m}{\sqrt{a^2 m^2 + 1}}, \frac{-1}{\sqrt{a^2 m^2 + 1}} \right) )</td>
</tr>
</tbody>
</table>

13. For \( a = \sqrt{2} \), if a tangent is drawn to a suitable conic (Column 1) at the point of contact \((-1, 1)\), then which of the following options is the only correct combination for obtaining its equation?
(A) (I)(i)(P) (B) (I)(ii)(Q) (C) (II)(ii)(Q) (D) (III)(i)(P)

14. If a tangent to a suitable conic (Column 1) is found to be \( y = x + 8 \) and its point of contact is \((8, 16)\), then which of the following options is the only correct combination?
(A) (I)(ii)(Q) (B) (II)(iv)(R) (C) (III)(i)(P) (D) (III)(ii)(Q)

15. The tangent to a suitable conic (Column 1) at \( \left( \sqrt{3}, \frac{1}{2} \right) \) is found to be \( \sqrt{3} x + 2 y = 4 \), then which of the following options is the only correct combination?
(A) (IV)(iii)(S) (B) (IV)(iv)(S) (C) (II)(iii)(R) (D) (II)(iv)(R)

(Qs. 16-18) : By appropriately matching the information given in the three columns of the following table.
Let \( f(x) = x + \log_3 x - x \log_3 x, x \in (0, \infty) \)

Column 1 contains information about zeros of \( f(x) \), \( f'(x) \) and \( f''(x) \).
Column 2 contains information about the limiting behaviour of \( f(x) \), \( f'(x) \) and \( f''(x) \) at infinity.
Column 3 contains information about increasing/decreasing nature of \( f(x) \) and \( f'(x) \).
<table>
<thead>
<tr>
<th>Column 1</th>
<th>Column 2</th>
<th>Column 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>(I) ( f(x) = 0 ) for some ( x \in (1, e^2) )</td>
<td>(i) ( \lim_{x \to -\infty} f(x) = 0 )</td>
<td>(P) ( f ) is increasing in ((0, 1))</td>
</tr>
<tr>
<td>(II) ( f'(x) = 0 ) for some ( x \in (1, e) )</td>
<td>(ii) ( \lim_{x \to -\infty} f(x) = -\infty )</td>
<td>(Q) ( f ) is increasing in ((e, e^2))</td>
</tr>
<tr>
<td>(III) ( f'(x) = 0 ) for some ( x \in (0, 1) )</td>
<td>(iii) ( \lim_{x \to -\infty} f'(x) = -\infty )</td>
<td>(R) ( f' ) is increasing in ((0, 1))</td>
</tr>
<tr>
<td>(IV) ( f''(x) = 0 ) for some ( x \in (1, e) )</td>
<td>(iv) ( \lim_{x \to -\infty} f''(x) = 0 )</td>
<td>(S) ( f' ) is decreasing in ((e, e^2))</td>
</tr>
</tbody>
</table>

16. Which of the following options is the only correct combination?
   (A) (I)(i)(P)  (B) (II)(ii)(Q)  (C) (III)(iii)(R)  (D) (IV)(iv)(S)

17. Which of the following options is the only correct combination?
   (A) (I)(i)(R)  (B) (II)(iii)(S)  (C) (III)(iv)(P)  (D) (IV)(i)(S)

18. Which of the following options is the only incorrect combination?
   (A) (I)(iii)(P)  (B) (II)(iv)(Q)  (C) (III)(i)(R)  (D) (II)(iii)(P)
SECTION - I

This section contains 7 questions. Each question has 4 options (A), (B), (C) and (D). ONLY ONE of these four options is correct.

1. The equation of the plane passing through the point (1, 1, 1) and perpendicular to the planes \(2x + y - 2z = 5\) and \(3x - 6y - 2z = 7\), is
   (A) \(14x + 2y - 15z = 1\)
   (B) \(14x - 2y + 15z = 27\)
   (C) \(14x + 2y + 15z = 31\)
   (D) \(-14x + 2y + 15z = 3\)

2. Let \(O\) be the origin and let \(PQR\) be an arbitrary triangle. The point \(S\) is such that
   \[\overrightarrow{OP} \cdot \overrightarrow{OQ} + \overrightarrow{OQ} \cdot \overrightarrow{OS} = \overrightarrow{OR} \cdot \overrightarrow{OP} + \overrightarrow{OQ} \cdot \overrightarrow{OS} = \overrightarrow{OR} \cdot \overrightarrow{OP} + \overrightarrow{OP} \cdot \overrightarrow{OS}\]
   Then the triangle \(PQR\) has \(S\) as its
   (A) Centroid (B) Circumcentre (C) Incentre (D) Orthocenter

3. If \(y = y(x)\) satisfies the differential equation
   \[8\sqrt{x} \left(\sqrt{9 + \sqrt{x}}\right) dy = \left(\sqrt{4 + \sqrt{9 + \sqrt{x}}}\right)^{-1} dx, x > 0\]
   and \(y(0) = \sqrt{7}\), then \(y(256) = \)
   (A) 3 (B) 9 (C) 16 (D) 80

4. If \(f : R \rightarrow R\) is a twice differentiable function such that \(f''(x) > 0\) for all \(x \in R\), and \(f\left(\frac{1}{2}\right) = \frac{1}{2}, f(1) = 1\), then
   (A) \(f'(1) \leq 0\) (B) \(0 < f'(1) \leq \frac{1}{2}\) (C) \(\frac{1}{2} < f'(1) \leq 1\) (D) \(f'(1) > 1\)

5. How many \(3 \times 3\) matrices \(M\) with entries from \(\{0, 1, 2\}\) are there, for which the sum of the diagonal entries of \(M^T M\) is 5?
   (A) 126 (B) 198 (C) 162 (D) 135

6. Let \(S = \{1, 2, 3, ..., 9\}\). For \(k = 1, 2, ..., 5\), let \(N_k\) be the number of subsets of \(S\) which contains exactly \(k\) elements out of which exactly \(k\) are odd. Then \(N_1 + N_2 + N_3 + N_4 + N_5 = \)
   (A) 210 (B) 252 (C) 125 (D) 126

7. Three randomly chosen non-negative integers \(x, y\) and \(z\) are found to satisfy the equation \(x + y + z = 10\). Then the probability that \(z\) is even, is
   (A) \(\frac{36}{55}\) (B) \(\frac{6}{11}\) (C) \(\frac{1}{2}\) (D) \(\frac{5}{11}\)

SECTION - II

This section contains 7 questions. Each question has 4 options (A), (B), (C) and (D). ONE OR MORE THAN ONE of these four options is (are) correct.

8. If \(g(x) = \int_{\sin x}^{\sin 2x} \sin^{-1}(t) dt\), then
   (A) \(g'(\frac{\pi}{2}) = -2\pi\) (B) \(g'(\frac{\pi}{2}) = 2\pi\)
   (C) \(g'(\frac{\pi}{2}) = 2\pi\) (D) \(g'(\frac{\pi}{2}) = -2\pi\)

9. Let \(\alpha\) and \(\beta\) be non-zero real numbers such that \(2(\cos \beta - \cos \alpha) + \cos \alpha \cos \beta = 1\). Then which of the following is/are true?
   (A) \(\tan \left(\frac{\alpha}{2}\right) + \sqrt{3} \tan \left(\frac{\beta}{2}\right) = 0\)
   (B) \(\sqrt{3} \tan \left(\frac{\alpha}{2}\right) - \tan \left(\frac{\beta}{2}\right) = 0\)
   (C) \(\tan \left(\frac{\alpha}{2}\right) - \sqrt{3} \tan \left(\frac{\beta}{2}\right) = 0\)
   (D) \(\sqrt{3} \tan \left(\frac{\alpha}{2}\right) + \tan \left(\frac{\beta}{2}\right) = 0\)

10. If \(f : R \rightarrow R\) is a differentiable function such that \(f''(x) > 2f(x)\) for all \(x \in R\), and \(f(0) = 1\), then
    (A) \(f(x)\) is increasing in \((0, \infty)\)
    (B) \(f(x)\) is decreasing in \((0, \infty)\)
    (C) \(f(x) > e^{2x}\) in \((0, \infty)\)
    (D) \(f''(x) < e^{2x}\) in \((0, \infty)\)

11. Let \(f(x) = \frac{1 - x(1 + |1 - x|)}{|1 - x|} \cos \left(\frac{1}{1 - x}\right)\) for \(x \neq 1\). Then
    (A) \(\lim_{x \to 1^-} f(x) = 0\)
    (B) \(\lim_{x \to 1^-} f(x)\) does not exist
    (C) \(\lim_{x \to 1^+} f(x) = 0\)
    (D) \(\lim_{x \to 1^+} f(x)\) does not exist

12. If \(f(x) = \frac{-\cos x}{\sin x}\), then
    (A) \(f'(x) = 0\) at exactly three points in \((-\pi, \pi)\)
    (B) \(f'(x) = 0\) at more than three points in \((-\pi, \pi)\)
    (C) \(f(x)\) attains its maximum at \(x = 0\)
    (D) \(f(x)\) attains its minimum at \(x = 0\)
13. If the line $sx = \alpha$ divides the area of region $R = \{(x,y) \in \mathbb{R}^2 : x^2 \leq y \leq x, 0 \leq x \leq 1\}$ into two equal parts, then
   \begin{align*}
   (A) & \quad 0 < \alpha \leq \frac{1}{2} \\
   (B) & \quad \frac{1}{2} < \alpha < 1 \\
   (C) & \quad 2x^4 - 4x^2 + 1 = 0 \\
   (D) & \quad x^4 + 4x^2 - 1 = 0
   \end{align*}

14. If $I = \sum_{k=1}^{98} \int_{k}^{k+1} \frac{k+1}{x(x+1)} \, dx$, then
   \begin{align*}
   (A) & \quad 1 > \log_e 99 \\
   (B) & \quad 1 < \log_e 99 \\
   (C) & \quad 1 < \frac{49}{50} \\
   (D) & \quad 1 > \frac{49}{50}
   \end{align*}

15. $|\overline{OX} \times \overline{OY}| =
   \begin{align*}
   (A) & \quad \sin (P + Q) \\
   (B) & \quad \sin 2R \\
   (C) & \quad \sin (P + R) \\
   (D) & \quad \sin (Q + R)
   \end{align*}

16. If the triangle PQR varies, then the minimum value of $\cos (P + Q) + \cos (Q + R) + \cos (R + P)$ is
   \begin{align*}
   (A) & \quad -\frac{5}{3} \\
   (B) & \quad -\frac{3}{2} \\
   (C) & \quad \frac{3}{2} \\
   (D) & \quad \frac{5}{3}
   \end{align*}

**PARAGRAPH II**

Let $p, q$ be integers and let $\alpha, \beta$ be the roots of the equation, $x^2 - x - 1 = 0$, where $\alpha \neq \beta$. For $n = 0, 1, 2, \ldots$, let $a_n = p\alpha^n + q\beta^n$.

**FACT** : If $a$ and $b$ are rational numbers and $a + b\sqrt{5} = 0$, then $a = 0 = b$.

17. $a_{12} =
   \begin{align*}
   (A) & \quad a_{11} - a_{10} \\
   (B) & \quad a_{11} + a_{10} \\
   (C) & \quad 2a_{11} + a_{10} \\
   (D) & \quad a_{11} + 2a_{10}
   \end{align*}

18. If $a_4 = 28$, then $p + 2q =
   \begin{align*}
   (A) & \quad 21 \\
   (B) & \quad 14 \\
   (C) & \quad 7 \\
   (D) & \quad 12
   \end{align*}

**SECTION - III**

This section contains 2 paragraphs. Based on each paragraph, there are 2 questions. Each question has four options (A), (B), (C) and (D) ONLY ONE of these four options is correct.

**PARAGRAPH I**

Let $O$ be the origin, and $\overline{OX}, \overline{OY}, \overline{OZ}$ be three unit vectors in the directions of the sides $\overline{QR}, \overline{RP}, \overline{PQ}$ respectively, of a triangle PQR.
1. \((a, b, c)\)

\[
\begin{align*}
\therefore 2x - y + 1 &= 0 \text{ i.e. } y = 2x + 1 \text{ is a tangent to hyperbola} \\
\frac{x^2}{a^2} - \frac{y^2}{16} &= 1 \\
\therefore \quad c^2 &= a^2m^2 - b^2 \\
1 &= a^2 \times 2^2 - 16 \\
\therefore \quad a &= \sqrt{\frac{17}{2}} \\
\therefore \quad a &= \sqrt{\frac{17}{2}}, \sqrt{4}, 1; \sqrt{\frac{17}{2}}, \sqrt{4}, 2; \sqrt{17}, 8, 1 \\
i.e. \quad \sqrt{\frac{17}{2}}, \sqrt{4}, 1; \sqrt{\frac{17}{2}}, \sqrt{4}, 2; \sqrt{17}, 8, 1 \\
cannot be the sides of a right triangle.
\end{align*}
\]

2. \((C)\)

If \((h, k)\) is the mid point of chord of parabola \(y^2 = 16x\), then equation of chord will be given by

\[
T = S_1 \\
\implies yk - 8(x + h) = k_x^2 - 16h \\
\implies 8x - ky - 8h - k^2 = 0 \quad \text{...(1)}
\]

But given, the equation of chord is

\[
2x + y = p \quad \text{...(2)}
\]

\[
\therefore \quad (1) \text{ and } (2) \text{ are identical lines}
\]

\[
\frac{8}{2} = \frac{-k}{1} = \frac{8h - k^2}{p} \\
\implies k = -4 \text{ and } 8h - 16 = 4p \\
\implies k = -4 \text{ and } p = 2h - 4
\]

which are satisfied by option \((C)\).

3. \((A, C, D)\)

Let \(x = n\) be any integer not equal to zero.

Then

\[
\lim_{x \to n} x \cos(\pi(x + [x])) = n \cos(\pi(n + n - 1)) = n \cos(2(n - 1)\pi) = -n
\]

\[
\lim_{x \to n} x \cos(\pi(x + [x])) = n \cos(n(n + n)) = n \cos(n(n + n)) = n \cos(2n\pi) = n
\]

LHL \(\neq\) RHL \(\implies\) limit does not exist at any non zero integer \(n\).

\[
\therefore \quad f \text{ is discontinuous at } x = -1, 1, 2
\]

At \(x = 0\), LHL = RHL = 0 = \(f(0)\)

\[
\therefore \quad f \text{ is continuous at } x = 0.
\]

4. \((A, B)\)

Let us check the given options one by one.

\[
\begin{align*}
(A) \quad & \text{Let } g(x) = x^2 - f(x) \\
\implies g(0) = -f(0) < 0 \quad \implies f(x) \in (0, 1) \\
\text{Also } g(1) = 1 - f(1) > 0 \\
\implies x^2 - f(x) = 0 \text{ for some } x \in (0, 1)
\end{align*}
\]

\[
(B) \quad \text{Let } h(x) = x - \int_0^x f(t) \cos t \, dt \\
h(x) = -\int_0^x f(t) \cos t \, dt < 0
\]

\[
\text{and } h(1) = 1 - \int_0^1 f(t) \cos t \, dt > 0
\]

\[
\therefore \quad h(x) = x - \int_0^x f(t) \cos t \, dt = 0 \text{ at some } x \in (0, 1)
\]

\[
(C) \quad e^x - \int_0^x f(t) \sin t \, dt \\
\therefore \quad x \in (0, 1) \implies e^x \in (1, e) \\
\text{and } 0 < f(t) < 1 \text{ and } 0 < \sin t < 1, \forall \ x \in (0, 1)
\]

\[
\therefore \quad 0 < \int_0^x f(t) \sin t \, dt < 1
\]

\[
\therefore \quad e^x - \int_0^x f(t) \sin t \, dt = 0 \text{ for any } x \in (0, 1)
\]

\[
(D) \quad f(x) + \int_0^x f(t) \sin t \, dt > 0 \text{ for any } x \in (0, 1)
\]

5. \((B, D)\)

In options \((A)\) and \((C)\) \(|A|^2 = 1\)

and in option \((B)\) and \((D)\) \(|A|^2 = -1\)

We know \(|A|^2 = |A|^2\) and \(|A|^2 \neq -1 \implies\) matrices given in options B & D cannot be the squares of any \(3 \times 3\) matrix with real entries.

6. \((A, B)\)

\[
a - b = 1, y \neq 0
\]

\[
\text{Im} \left( \frac{az + b}{z + 1} \right) = y
\]

\[
\implies \text{Im} \left[ \frac{a(x + iy) + b}{(x + 1) + iy} \times \frac{(x + 1) - iy}{(x + 1) - iy} \right] = y
\]

\[
\implies \frac{-(ax + b)y + ay(x + 1)}{(x + 1)^2 + y^2} = y
\]

\[
\implies \frac{-axy - by + axy + ay}{(x + 1)^2 + y^2} = y
\]

\[
\implies a - b = (x + 1)^2 + y^2
\]
MATHEMATICS

7. (A, B) $P(X) = \frac{1}{3}$, $P(X/Y) = \frac{1}{2}$, $P(Y/X) = \frac{2}{5}$

$P(X \cap Y) = P(Y/X)P(X) = \frac{2}{5} \times \frac{1}{3} = \frac{2}{15}$

$P(Y) = \frac{P(X \cap Y)}{P(X/Y)} = \frac{2}{15} \times \frac{1}{2} = \frac{4}{15}$

$P(X/Y) = \frac{P(X \cap Y)}{P(Y)} = \frac{P(X) - P(X \cap Y)}{P(Y)}$

$= 1 - P(Y/X)$

$= \frac{1}{2}$

$P(X \cup Y) = \frac{1}{3} + \frac{2}{15} = \frac{7}{15}$

∴ A and B are the correct options.

8. (2) Centre $(1, -2)$

Geometrically, circle will have exactly 3 common points with axes in the cases

(i) Passing through origin $\Rightarrow p = 0$

(ii) Touching x-axis and intersecting y-axis at two points i.e. $f^2 > C$ and $g^2 > C$

i.e. $4 > p$ and $1 > -p$

$\Rightarrow p > -4$ and $p = -1$

$\Rightarrow p = -1$

(iii) Touching y-axis and intersecting x-axis at two points i.e. $f^2 = c$ and $g^2 > C$

$\Rightarrow 4 = -p$ and $1 > -p$

$\Rightarrow p = -4$ and $p > -1$

which is not possible.

∴ Only two values of $p$ are possible.

9. (2) Given $f(0) = 0$, $f\left(\frac{\pi}{2}\right) = 3$, $f(0) = 1$

$g(x) = \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} f'(t) \csc t - \cot t \sec t f(t) \, dt$

$g(x) = \lim_{x \to 0} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \frac{d}{dt} (f(t) \sec t) \, dt$

$= f\left(\frac{\pi}{2}\right) \sec \frac{\pi}{2} - f(x) \sec x$

$= 3 - f(x) \csc x = 3 - \frac{f(x)}{\sin x}$

$\lim_{x \to 0} g(x) = \lim_{x \to 0} 3 - \frac{f(x)}{\sin x} = 3 - \lim_{x \to 0} \frac{f(x)}{\sin x}$

$= 3 - \lim_{x \to 0} \frac{f'(x)}{\cos x} = 3 - f'(0) = 3 - 1 = 2$

10. (1) For infinite many solutions

$\begin{vmatrix} 1 & \alpha & \alpha^2 \\ \alpha & 1 & \alpha \\ \alpha^2 & \alpha & 1 \end{vmatrix} = 0$ $\Rightarrow (1 - \alpha^2)^2 = 0$ $\Rightarrow \alpha = \pm 1$

For $\alpha = 1$, the system will have no solution and for $\alpha = -1$, all three equations reduce to $x - y + z = 1$

giving infinite many dependent solutions.

∴ $1 + \alpha + \alpha^2 = 1 - 1 + 1 = 1$

11. (5) $x = 10!$ and $y = 10 \cdot 10! = 50 \times 9!$

$\Rightarrow \frac{y}{9x} = \frac{50 \times 9!}{10!} = 5$

12. (6) Let the sides be $a - d$, $a$, $a + d$ where $d$ is positive.

Using Pythagoras theorem,

$(a + d)^2 = (a - d)^2 + a^2$

$\Rightarrow a = 4d$

∴ Sides are 3d, 4d, 5d

Area $= 24$ $\Rightarrow \frac{1}{2} \times 3d \times 4d = 24$

$\Rightarrow d = 2$

∴ Sides are 6, 8, 10.

∴ Smallest side $= 6$.

13. (B) For $a = \sqrt{2}$ and point of contact $(-1, 1)$.

Equation of circle is satisfied

$x^2 + y^2 = 2$

then eqn. of tangent is

$-x + y = 2$ $\Rightarrow m = 1$

and point of contact

$\left(\frac{-ma}{\sqrt{m^2 + 1}}, \frac{a}{\sqrt{m^2 + 1}}\right) = \left(\frac{-\sqrt{2}}{\sqrt{2}}, \frac{\sqrt{2}}{\sqrt{2}}\right) = (-1, 1)$

∴ (I) (ii), (Q) is the correct combination.

14. (C) Tangent $y = x + 8$ $\Rightarrow m = 1$

point $(8, 16)$

∴ both the coordinates as well as $m$, are positive,

the only possibility of point is $\left(\frac{a}{m^2 + 1}, \frac{2a}{m^2 + 1}\right) = (8, 16)$

$\Rightarrow a = 8$

Also it satisfies the equation of curve.

$y^2 = 4ax$ for the point $(8, 16)$

And equation of tangent $my = m^2x + a$ is satisfied by $m = 1$ and $a = 8$

∴ (III), (i), (P) is the correct combination.

15. (D) Point of contact $\left(\sqrt{3}, \frac{1}{2}\right)$ and tangent $\sqrt{3}x + 2y = 4$. 
\[ \therefore \quad m = -\frac{\sqrt{3}}{2} \]
\[ \therefore \quad \text{Both the coordinates are positive and } m \text{ is negative the possibilities for points are} \]
\[ Q \left( -\frac{ma}{\sqrt{m^2 + 1}}, \frac{a}{\sqrt{m^2 + 1}} \right) \quad \text{OR} \]
\[ R \left( -\frac{a^2 m}{\sqrt{a^2 m^2 + 1}}, \frac{1}{\sqrt{a^2 m^2 + 1}} \right) \]
\[ \text{For point } Q \left( \frac{\sqrt{3}a}{\sqrt{7}}, \frac{2a}{\sqrt{7}} \right) = \left( \frac{\sqrt{3}}{2}, 1 \right) \]
\[ \text{We get } a = \sqrt{7} \text{ and } a = \frac{\sqrt{7}}{4} \]
\[ \text{which is not possible.} \]
\[ \text{For point } R \left( \frac{a^2 \sqrt{3}}{3a^2 + 4}, \frac{2}{3a^2 + 4} \right) = \left( \frac{\sqrt{3}}{2}, 1 \right) \]
\[ \Rightarrow \quad \frac{a^2}{3a^2 + 4} = 1 \quad \text{and} \quad \frac{2}{3a^2 + 4} = \frac{1}{2} \]
\[ \Rightarrow \quad a^4 - 3a^2 - 4 = 0 \quad \text{and} \quad 3a^2 = 12 \]
\[ \Rightarrow \quad a^2 = 4 \]
\[ \text{Also for } a^2 = 4 \text{ equation of ellipse } \]
\[ x^2 + a^2y^2 = a^2 \text{ is satisfied for the point } \left( \frac{\sqrt{3}}{2}, 1 \right) \]
\[ \therefore \quad \text{I, (iv), R is the correct combination.} \]

(For questions 16-18) : We observe the following, in the given table.
\[ f(x) = x + \log_e x - x \log_e x, \quad x \in (0, \infty) \]
\[ \Rightarrow \quad f'(x) = 1 - \frac{\log_e x}{x} \quad \text{and} \quad f''(x) = \frac{1+x}{x^2} \]
\[ f(1) = 1 > 0 \quad \text{and} \quad f'(e^2) = e^2 + 2 - 2e^2 = 2 - e^2 < 0 \]
\[ \therefore \quad f(x) = 0 \text{ for some } x \in (1, e^2) \]
\[ \therefore \quad (I) \text{ is true.} \]
\[ f'(1) = 1 > 0 \quad \text{and} \quad f'(e) = \frac{1}{e} - 1 < 0 \]
\[ \therefore \quad f'(x) = 0 \text{ for some } x \in (1, e) \]
\[ \therefore \quad (II) \text{ is true.} \]
\[ \text{If } x \in (0, 1), \quad \frac{1}{x} > 0 \quad \text{and} \quad \log_e x < 0 \]
\[ \therefore \quad f'(x) = \frac{1}{x} - \log_e x > 0 \quad \Rightarrow \quad f \text{ is increasing on } (0, 1) \]
\[ \therefore \quad f'(x) \neq 0 \text{ for some } x \in (0, 1) \]
\[ \therefore \quad (III) \text{ is false.} \]

JEE Advanced 2017 Solved Paper

If \( x \in (1, e) \), \( f''(x) < 0 \Rightarrow f' \) is decreasing on \( (1, e) \)
\[ \therefore \quad f''(x) \neq 0 \text{ for some } x \in (1, e) \]
\[ \therefore \quad (IV) \text{ is false.} \]

Also \( \lim_{x \to \infty} f(x) = \lim_{x \to \infty} x + (1-x) \log_e x = -\infty \)
\[ \therefore \quad (i) \text{ is false and (ii) is true.} \]
\[ \lim_{x \to \infty} f'(x) = \lim_{x \to \infty} \frac{1}{x} - \log_e x = -\infty \]
\[ \therefore \quad (iii) \text{ is true} \]
\[ \lim_{x \to \infty} f''(x) = \lim_{x \to \infty} \frac{1}{x^2} - \frac{1}{x} = 0 \]
\[ \therefore \quad (iv) \text{ is true.} \]
\[ f \text{ is increasing on } (0, 1) \text{ already discussed} \]
\[ \therefore \quad (P) \text{ is true.} \]
\[ \text{If } x \in (e, e^2) \text{ then} \]
\[ f'(x) = \frac{1}{x} - \log_e x < 0 \]
\[ \Rightarrow \quad f \text{ is decreasing in } (e, e^2) \]
\[ \therefore \quad (Q) \text{ is true.} \]
\[ \text{For } x \in (0, 1), f'(x) < 0 \]
\[ \Rightarrow \quad f \text{ is decreasing in } (0, 1) \]
\[ \therefore \quad R \text{ is false.} \]
\[ \text{For } x \in (e, e^2), f''(x) < 0 \]
\[ \Rightarrow \quad f' \text{ decreasing in } (e, e^2) \]
\[ \therefore \quad (S) \text{ is true.} \]
16. (B) \text{ The only correct combination is (II), (ii), (Q)}
17. (B) \text{ The only correct combination is (II), (iii), (S)}
18. (C) \text{ The only incorrect combination is (III), (i), (R).}

Paper - 2

1. (c) \text{ The required equation of plane is given by} \]
\[ \begin{vmatrix} x - 1 & y - 1 & z - 1 \\ 2 & 1 & -2 \\ 3 & -6 & -2 \end{vmatrix} = 0 \]
\[ \Rightarrow \quad (x - 1)(-14 - (y - 1)(2) + (z - 1)(-15)) = 0 \]
\[ \Rightarrow \quad 14x - 14 + 2y - 2 + 15z - 15 = 0 \]
\[ \Rightarrow \quad 14x + 2y + 15z = 31 \]
\[ \text{OP} \cdot \text{OQ} + \text{OR} \cdot \text{OS} = \text{OR} \cdot \text{OP} + \text{OQ} \cdot \text{OS} \]
\[ \Rightarrow \quad \left( \text{OQ} - \text{OR} \right) \cdot \text{OP} - \left( \text{OQ} - \text{OR} \right) \cdot \text{OS} = 0 \]
\[ \Rightarrow \quad \left( \text{OQ} - \text{OR} \right) \cdot \left( \text{OP} - \text{OS} \right) = 0 \]
\[ \Rightarrow \quad \text{RQ} \cdot \text{SP} = 0 \]
\[ \Rightarrow \quad \text{RQ} \perp \text{SP ....(I)} \]
\[ \text{Also } \text{OR} \cdot \left( \text{OP} - \text{OQ} \right) - \text{OS} \cdot \left( \text{OP} - \text{OQ} \right) = 0 \]
\[ \Rightarrow \quad \left( \text{OP} - \text{OQ} \right) \cdot \left( \text{OR} - \text{OS} \right) = 0 \]
3. (A) Given DE can be written as
\[
\int dy = \int \frac{1}{\sqrt{4 + \sqrt{9 + \sqrt{x}}}} \left(\sqrt{9 + \sqrt{x}}\right) \frac{8}{8\sqrt{x}} dx
\]
Putting \(\sqrt{4 + \sqrt{9 + \sqrt{x}}} = t\)
We get
\[
\frac{1}{2\sqrt{4 + \sqrt{9 + \sqrt{x}}} \cdot 2\sqrt{9 + \sqrt{x}} \cdot 2\sqrt{x}} dx = dt
\]
\[
\therefore \int dy = \int dt \implies y = t + c
\]
or
\[
y = \sqrt{4 + \sqrt{9 + \sqrt{x}}} + C
\]
\[
y(0) = \sqrt{7} \implies C = 0
\]
\[
\therefore y(256) = 3
\]
4. (D) \(f''(x) > 0, \forall x \in R\)
\[
f\left(\frac{1}{2}\right) = \frac{1}{2}, \quad f(1) = 1
\]
\[
\therefore f''(x) \text{ is an increasing function on } R.
\]
By Lagrange's Mean Value theorem.
\[
f'(x) = \frac{f(1) - f\left(\frac{1}{2}\right)}{1 - \frac{1}{2}}, \quad x \in \left(\frac{1}{2}, 1\right)
\]
\[
\implies f'(x) = 1 \text{ for some } x \in \left(\frac{1}{2}, 1\right)
\]
\[
\therefore f'(1) > 1
\]
5. (B) Let \(M = \begin{bmatrix} a_1 & a_2 & a_3 \\ a_4 & a_5 & a_6 \\ a_7 & a_8 & a_9 \end{bmatrix}\) where \(a_i \in \{0, 1, 2\}\)
Then \(M^T M = \begin{bmatrix} a_1 & a_4 & a_7 \\ a_2 & a_5 & a_8 \\ a_3 & a_6 & a_9 \end{bmatrix}\)
Sum of the diagonal entries in \(M^T M = 5\)
\[
\implies (a_1^2 + a_2^2 + a_3^2) + (a_4^2 + a_5^2 + a_6^2) + (a_7^2 + a_8^2 + a_9^2) = 5
\]
It is possible when
Case I: 5 \(a_i\)'s are 1 and 4 \(a_i\)'s are zero
Which can be done in
\[
9 \times 8 \times 7 \times 6 = 36
\]
\[
\therefore 126
\]
Case II: 1 \(a_i\) is 1 and 1 \(a_i\) is 2 and rest.
7 \(a_i\)'s are zero
It can be done in \(9 \times 8 = 72\) ways
\[
\therefore \text{Total no. of ways} = 126 + 72 = 198.
\]
6. (D) \(N_1 = 3 \times 4 \times 4 = 5\)
\[
N_2 = 3 \times 4 \times 4 = 40
\]
\[
N_3 = 3 \times 4 \times 4 = 60
\]
\[
N_4 = 3 \times 4 \times 4 = 20
\]
\[
N_5 = 3 \times 4 = 1
\]
\[
\therefore N_1 + N_2 + N_3 + N_4 + N_5 = 126
\]
7. (B) Total number of non-negative solutions of \(x + y + z = 10\) are \(2 \times 6 = 66\) (using \(\binom{n+r-1}{r-1}\))
If \(z\) is even then there can be following cases:
\[
z = 0 \implies \text{No. of ways of solving } x + y = 10 \implies 10 \times C_1 = 66
\]
\[
z = 2 \implies \text{No. of ways of solving } x + y = 8 \implies 9 \times C_1 = 66
\]
\[
z = 4 \implies \text{No. of ways of solving } x + y = 6 \implies 7 \times C_1 = 66
\]
\[
z = 6 \implies \text{No. of ways of solving } x + y = 4 \implies 5 \times C_1 = 66
\]
\[
z = 8 \implies \text{No. of ways of solving } x + y = 2 \implies 3 \times C_1 = 66
\]
\[
z = 10 \implies \text{No. of ways of solving } x + y = 0 \implies 1
\]
\[
\therefore \text{Total ways when } z \text{ is even} = 11 + 9 + 7 + 5 + 3 + 1 = 36
\]
\[
\therefore \text{Required probability} = \frac{36}{66} = \frac{6}{11}
\]
8. \(g(x) = \int_{\sin x}^{\sin 2x} \sin^{-1}(t) dt\)
\[
\implies g'(x) = \sin^{-1}(2x) \cdot 2 \cos 2x - \sin^{-1}(\sin x) \cdot \cos x
\]
\[
g\left(\frac{\pi}{2}\right) = \sin^{-1}(\sin(\pi)) \cdot 2 \cos(\pi) - \sin^{-1}\left(\sin\left(\frac{\pi}{2}\right)\right) \cdot \cos\left(\frac{\pi}{2}\right) = 0
\]
\[
\therefore \text{None of the options are matching here.}
\]
9. (A, C) If we consider \(\tan \alpha/2 = x\) and \(\tan \beta/2 = y\), then
\[
2(\cos \beta - \cos \alpha) + \cos \alpha \cos \beta = 1
\]
\[
\implies 2 \left(\frac{1}{x^2 - y^2} - \frac{1}{x^2} - \frac{1}{y^2}\right) = 1 - \left(\frac{1}{x^2} - \frac{1}{y^2}\right)
\]
\[
\implies 2[(1 + x^2)(1 - y^2) - (1 - x^2)(1 + y^2)]
\]
\[
\implies 4(x^2 - y^2) = 2(x^2 + y^2)
\]
\[
\therefore x = \pm \sqrt{3} y
\]
\[
\therefore \tan \frac{\alpha}{2} = \pm \sqrt{3} \tan \frac{\beta}{2} = 0
\]
10. (A, C) \(f'(x) - 2f(x) > 0\)
\[
\implies e^{-2x}df(x) > 2e^{-2x}f(x) > 0
\]
\[
\therefore \frac{d}{dx} \left(e^{-2x}f(x)\right) > 0
\]
\[ e^{-2x} f(x) \text{ is an increasing function.} \]
\[ \therefore \text{ for } x > 0 \]
\[ f(x) > f(0) \]
\[ \Rightarrow e^{-2x} f(x) > 1 \]
\[ \Rightarrow f(x) > e^{2x} \text{ in } (0, \infty) \]
\[ \text{Also } f'(x) > 2e^{2x} > 0 \]
\[ \therefore \text{ is an increasing function in } (0, \infty) \]

11. \( \text{(A, D)} \)
\[ \lim_{x \to 1^+} f(x) = \lim_{h \to 0} \frac{1}{h} - \frac{(1-h)(1+h)}{h} \cos \left( \frac{1}{h} \right) \]
\[ = \lim_{h \to 0} \frac{1 - 1 + h^2}{h} \cos \left( \frac{1}{h} \right) \]
\[ = \lim_{h \to 0} h \cos \left( \frac{1}{h} \right) = 0 \]
\[ \lim_{x \to 1^+} f(x) = \lim_{h \to 0} \frac{1 - (1+h)(1+h)}{h} \cos \left( \frac{1}{h} \right) \]
\[ = \lim_{h \to 0} \frac{-2h - h^2}{h} \cos \left( \frac{1}{h} \right) \]
\[ = \lim_{h \to 0} (-2 - h) \cos \left( \frac{1}{h} \right) \]
\[ = -2 \times (\text{Some value oscillating between } -1 \text{ and } 1) \]
\[ \therefore \text{ does not exist.} \]

12. \( \text{(B, C)} \)
\[ f(x) = \begin{vmatrix} \cos 2x & \cos 2x & \sin 2x \\ -\cos x & \cos x & -\sin x \\ \sin x & \sin x & \cos x \end{vmatrix} \]

Operating \( C_1 \rightarrow C_1 - C_2 \)
\[ \Rightarrow f(x) = \begin{vmatrix} 0 & \cos 2x & \sin 2x \\ -2 \cos x & \cos x & -\sin x \\ 0 & \sin x & \cos x \end{vmatrix} \]
\[ \Rightarrow f(x) = 2 \cos 3x \cos x \]
\[ \Rightarrow f(x) = \cos 4x + \cos 2x \]
\[ f_{\text{max}} = 2 \text{ at } x = 0 \]
\[ f'(x) = -4 \sin 4x - 2 \sin 2x \]
\[ = -2 \sin 2x [4 \cos 2x + 1] \]
\[ f''(x) = 0 \Rightarrow \sin 2x = 0 \text{ or } \cos 2x = -\frac{1}{4} \]
\[ \Rightarrow x = -\frac{\pi}{2}, 0, \frac{\pi}{2} \text{ which is true for some } x \in (-\pi, \pi) \]
\[ \therefore f'(x) = 0 \text{ at more than three points in } (-\pi, \pi) \]

13. \( \text{(B, C)} \)
\[ \int_0^\alpha (x - x^2) \, dx = \frac{1}{2} \int_0^\alpha (x - x^2) \, dx \]

\[ \Rightarrow \left( \frac{x^2}{2} - \frac{x^4}{4} \right)_0^\alpha = \frac{1}{2} \left( \frac{x^2}{2} - \frac{x^4}{4} \right)_0^1 \]
\[ \Rightarrow \frac{\alpha^2}{2} - \frac{\alpha^4}{4} = \frac{1}{2} \left( \frac{1}{2} - \frac{1}{4} \right) \]
\[ \Rightarrow \frac{\alpha^2}{2} - \frac{\alpha^4}{4} = \frac{1}{2} \cdot \frac{1}{4} \text{ or } 4 \alpha^2 - 2 \alpha^4 = 1 \]
\[ \Rightarrow 2 \alpha^2 - \alpha^4 = \frac{1}{8} \]
\[ \Rightarrow 2 \alpha^2 - 2 \alpha^4 + 1 = 0 \]
\[ \Rightarrow \alpha^2 = \frac{4 \pm \sqrt{16 - 8}}{4} = 1 \pm \frac{1}{\sqrt{2}} \]
\[ \therefore 0 < \alpha < 1 \Rightarrow \alpha^2 = 1 - \frac{1}{\sqrt{2}} \]
\[ \Rightarrow \alpha = \sqrt{1 - 0.71} = \sqrt{0.29} > \sqrt{0.25} = \frac{1}{2} \text{ also } \alpha < 1 \]
\[ \Rightarrow \frac{1}{2} < \alpha < 1 \]

14. \( \text{(B, D)} \)
\[ I = \sum_{k=1}^{98} \int_k^{k+1} \frac{k+1}{x(x+1)} \, dx \]

Let \( x - k = t \Rightarrow dx = dt \)
\[ \therefore I = \sum_{k=1}^{98} \int_0^1 \frac{k+1}{(t+k)(t+k+1)} \, dt \]
\[ \Rightarrow I > \sum_{k=1}^{98} \int_0^1 \frac{k+1}{(t+k+1)^2} \, dt \]
\[ \Rightarrow I > \sum_{k=1}^{98} \left[ (k+1) \left( \frac{-1}{t+k+1} \right)_0^1 \right] \]
\[ \Rightarrow I > \sum_{k=1}^{98} \left[ (k+1) \left( \frac{1}{k+1} - \frac{1}{k+2} \right) \right] \]
16. (B) \[
\cos (P + Q) + \cos (Q + R) + \cos (R + P) = \cos (180 - R) + \cos (180 - P) + \cos (180 - Q)
\]
\[
= -[\cos P + \cos Q + \cos R]
\]

In any \(\Delta PQR\), \(\cos P + \cos Q + \cos R \leq \frac{3}{2}\)

\[
\Rightarrow - (\cos P + \cos Q + \cos R) \geq - \frac{3}{2}
\]

\[
\therefore \text{Required minimum value} = - \frac{3}{2}
\]

17. (B) \[
\alpha, \beta \text{ are roots of } x^2 - x - 1 = 0
\]
\[
\therefore \alpha^2 - \alpha - 1 = 0, \beta^2 - \beta - 1 = 0
\]
\[
\Rightarrow \alpha^2 = \alpha + 1 \text{ and } \beta^2 = \beta + 1
\]

Also \(a_n = p\alpha^n + q\beta^n\)

\[
\Rightarrow a_0 = p + q
\]
\[
a_1 = p\alpha + q\beta
\]
\[
a_2 = p\alpha^2 + q\beta^2 = p(\alpha + 1) + q(\beta + 1)
\]
\[
= (p\alpha + q\beta) + (p + q) = a_1 + a_0
\]
\[
a_3 = p\alpha^3 + q\beta^3 = p\alpha(\alpha + 1) + q\beta(\beta + 1)
\]
\[
= (p\alpha^2 + q\beta^2) + (p\alpha + q\beta)
\]
\[
= a_2 + a_1
\]

Proceeding in the same manner, we get

\[
a_{12} = a_{11} + a_{10}
\]

18. (D) \[
a_4 = a_3 + a_2 = a_2 + a_1 + a_2 = 2a_2 + a_1
\]
\[
= 2a_1 + 2a_0 + a_1 = 3a_1 + 2a_0
\]
\[
= 3(p\alpha + q\beta) + 2(p + q)
\]
\[
= 3\left[p\left(1 + \frac{\sqrt{5}}{2}\right) + q\left(1 - \frac{\sqrt{5}}{2}\right)\right] + 2(p + q)
\]
\[
= \frac{7}{2}(p + q) + \frac{3}{2}(p - q)\sqrt{5} = 28
\]
\[
\Rightarrow p = q = 4 \quad \therefore p + 2q = 12
\]
1. Let \( k \) be an integer such that triangle with vertices 
\((k, -3k), (5, k)\) and \((-k, 2)\) has area 28 sq. units. Then the orthocentre of this triangle is at the point:
\[
\begin{align*}
(1) & \quad \left(2, \frac{3}{4}\right) \\
(2) & \quad \left(2, -\frac{1}{2}\right) \\
(3) & \quad \left(1, \frac{3}{4}\right) \\
(4) & \quad \left(1, -\frac{3}{4}\right)
\end{align*}
\]

2. If, for a positive integer \( n \), the quadratic equation,
\[x(x + 1) + (x + 1)(x + 2) + \ldots + (x + n - 1)(x + n) = 10n\]
has two consecutive integral solutions, then \( n \) is equal to:
\[
\begin{align*}
(1) & \quad 11 \\
(2) & \quad 12 \\
(3) & \quad 9 \\
(4) & \quad 10
\end{align*}
\]

3. The function \( f: \mathbb{R} \to \mathbb{R} \) defined as \( f(x) = \frac{x}{1 + x^2} \), is:
\[
\begin{align*}
(1) & \quad \text{neither injective nor surjective} \\
(2) & \quad \text{invertible} \\
(3) & \quad \text{injective but not surjective} \\
(4) & \quad \text{surjective but not injective}
\end{align*}
\]

4. The following statements
\( (p \to q) \Rightarrow (\neg p \to q) \Rightarrow q \) is:
\[
\begin{align*}
(1) & \quad \text{a fallacy} \\
(2) & \quad \text{a tautology} \\
(3) & \quad \text{equivalent to } \neg p \Rightarrow q \\
(4) & \quad \text{equivalent to } p \Rightarrow \neg q
\end{align*}
\]

5. If \( S \) is the set of distinct values of \( b \) for which the following system of linear equations
\[
x + y + z = 1 \\
x + ay + z = 1 \\
ax + by + z = 0
\]
has no solution, then \( S \) is:
\[
\begin{align*}
(1) & \quad \text{a singleton} \\
(2) & \quad \text{an empty set} \\
(3) & \quad \text{an infinite set} \\
(4) & \quad \text{a finite set containing two or more elements}
\end{align*}
\]

6. The area (in sq. units) of the region:
\[
\{(x, y) : x \geq 0, x + y \leq 3, x^2 \leq 4y \text{ and } y \leq 1 + \sqrt{x}\}
\]
is:
\[
\begin{align*}
(1) & \quad \frac{5}{2} \\
(2) & \quad \frac{59}{12} \\
(3) & \quad \frac{3}{2} \\
(4) & \quad \frac{7}{3}
\end{align*}
\]

7. For any three positive real numbers \( a, b \) and \( c \),
\[
9(25a^2 + b^2) + 25(c^2 - 3ac) = 15b(3a + c).
\]
Then:
\[
\begin{align*}
(1) & \quad a, b \text{ and } c \text{ are in G.P.} \\
(2) & \quad b, c \text{ and } a \text{ are in G.P.} \\
(3) & \quad b \text{ and } a \text{ are in A.P.} \\
(4) & \quad a, b \text{ and } c \text{ are in A.P.}
\end{align*}
\]

8. A man \( X \) has 7 friends, 4 of them are ladies and 3 are men. His wife \( Y \) also has 7 friends, 3 of them are ladies and 4 are men. Assume \( X \) and \( Y \) have no common friends. Then the total number of ways in which \( X \) and \( Y \) together can throw a party inviting 3 ladies and 3 men, so that 3 friends of each of \( X \) and \( Y \) are in this party, is:
\[
\begin{align*}
(1) & \quad 484 \\
(2) & \quad 485 \\
(3) & \quad 468 \\
(4) & \quad 469
\end{align*}
\]

9. The normal to the curve \( y(x - 2)(x - 3) = x + 6 \) at the point where the curve intersects the y-axis passes through the point:
\[
\begin{align*}
(1) & \quad \left(\frac{1}{2}, -\frac{1}{2}\right) \\
(2) & \quad \left(\frac{1}{2}, \frac{1}{2}\right) \\
(3) & \quad \left(\frac{1}{3}, \frac{1}{3}\right) \\
(4) & \quad \left(\frac{1}{3}, -\frac{1}{3}\right)
\end{align*}
\]

10. A hyperbola passes through the point \( P(\sqrt{2}, \sqrt{3}) \) and has foci at \((\pm 3, 0)\). Then the tangent to this hyperbola at \( P \) also passes through the point:
\[
\begin{align*}
(1) & \quad (-\sqrt{2}, -\sqrt{3}) \\
(2) & \quad (3\sqrt{2}, 2\sqrt{3}) \\
(3) & \quad (2\sqrt{2}, 3\sqrt{3}) \\
(4) & \quad (\sqrt{3}, \sqrt{2})
\end{align*}
\]

11. Let \( a, b, c \in \mathbb{R} \). If \( f(x) = ax^2 + bx + c \) is such that \( a + b + c = 3 \) and
\[
f(x + y) = f(x) + f(y) + xy, \forall x, y \in \mathbb{R}, \text{ then } \sum_{n=1}^{10} f(n) \text{ is equal to:}
\[
\begin{align*}
(1) & \quad 255 \\
(2) & \quad 330 \\
(3) & \quad 165 \\
(4) & \quad 190
\end{align*}
\]

12. Let \( \vec{a} = 2\hat{i} + 3\hat{j} - 2\hat{k} \) and \( \vec{b} = \hat{i} + \hat{j} + \hat{k} \). Let \( \vec{c} \) be a vector such that \( |\vec{c} - \vec{a}| = 3 \), \( |(\vec{a} \times \vec{b}) \times \vec{c}| = 3 \) and the angle between \( \vec{a} \) and \( \vec{b} \) be 30°. Then \( \vec{a} \cdot \vec{c} \) is equal to:
\[
\begin{align*}
(1) & \quad \frac{1}{8} \\
(2) & \quad \frac{25}{8} \\
(3) & \quad 2 \\
(4) & \quad 5
\end{align*}
\]

13. Let a vertical tower AB have its end A on the level ground. Let C be the mid-point of AB and P be a point on the ground such that AP = 2AB. If \( \angle BPC = \beta \), then tan \( \beta \) is equal to:
\[
\begin{align*}
(1) & \quad \frac{4}{9} \\
(2) & \quad \frac{6}{7} \\
(3) & \quad \frac{1}{4} \\
(4) & \quad \frac{2}{9}
\end{align*}
\]

14. Twenty metres of wire is available for fencing off a flower-bed in the form of a circular sector. Then the maximum area (in sq. m) of the flower-bed, is:
\[
\begin{align*}
(1) & \quad 30 \\
(2) & \quad 12.5 \\
(3) & \quad 10 \\
(4) & \quad 25
\end{align*}
\]

15. The integral \( \int_{0}^{\frac{3\pi}{4}} \frac{dx}{1 + \cos x} \) is equal to:
\[
\begin{align*}
(1) & \quad -1 \\
(2) & \quad \frac{1}{4} \\
(3) & \quad 2 \\
(4) & \quad 4
\end{align*}
\]
16. If \((2 + \sin x) \frac{dy}{dx} + (y + 1) \cos x = 0\) and \(y(0) = 1\), then \(y\left(\frac{\pi}{2}\right)\) is equal to:

\[
(1) \quad \frac{4}{3} \quad (2) \quad \frac{1}{3} \\
(3) \quad -\frac{2}{3} \quad (4) \quad -\frac{1}{3}
\]

17. Let \(I_n = \int \tan^n x \, dx, (n > 1)\). \(I_4 + I_6 = \tan^2 x + bx^5 + C\), where \(C\) is constant of integration, then the ordered pair \((a, b)\) is equal to:

\[
(1) \quad \left(-\frac{1}{5}, 0\right) \quad (2) \quad \left(-\frac{1}{5}, 1\right) \\
(3) \quad \left(\frac{1}{5}, 0\right) \quad (4) \quad \left(\frac{1}{5}, -1\right)
\]

18. Let \(\omega\) be a complex number such that \(2\omega + 1 = z\) where \(z = \sqrt{3} + 1\omega - 1\omega^2\). If \(|1 - \omega - 1\omega^2\omega^3| = 3k\), then \(k\) is equal to:

\[
(1) \quad 1 \quad (2) \quad -z \\
(3) \quad 0 \quad (4) \quad -1
\]

19. The value of

\[
(21C_1 - 10C_2) + (21C_2 - 10C_3) + (21C_3 - 10C_4) + \ldots + (21C_{10} - 10C_{10})\]

is:

\[
(1) \quad 2^{20} - 2^{10} \quad (2) \quad 2^{41} - 2^{11} \\
(3) \quad 2^{21} - 2^{10} \quad (4) \quad 2^{20} - 2^9
\]

20. \(\lim_{x \to \frac{\pi}{2}} \cot x - \cos x\) equals:

\[
(1) \quad \frac{1}{4} \quad (2) \quad \frac{1}{24} \quad (3) \quad \frac{1}{16} \quad (4) \quad \frac{1}{8}
\]

21. If \(5(\tan^2 x - \cos^2 x) = 2\cos 2x + 9\), then the value of \(\cos 4x\) is:

\[
(1) \quad -\frac{7}{9} \quad (2) \quad -\frac{3}{5} \quad (3) \quad \frac{1}{3} \quad (4) \quad \frac{2}{9}
\]

22. If the image of the point \(P(1, -2, 3)\) in the plane,

\(2x + 3y - 4z + 22 = 0\) measured parallel to line, \(\frac{x}{1} = \frac{y}{4} = \frac{z}{5}\) is \(Q\), then \(PQ\) is equal to:

\[
(1) \quad 6\sqrt{5} \quad (2) \quad 3\sqrt{5} \\
(3) \quad 2\sqrt{42} \quad (4) \quad \sqrt{42}
\]

23. The distance of the point \((1, 3, -7)\) from the plane passing through the point \((1, -1, -1)\), having normal perpendicular to both the lines

\[
\frac{x - 1}{1} = \frac{y + 2}{-2} = \frac{z - 4}{3} \quad \text{and} \quad \frac{x - 2}{3} = \frac{y + 1}{-1} = \frac{z + 7}{-1}
\]

is:

\[
(1) \quad \frac{10}{\sqrt{74}} \quad (2) \quad \frac{20}{\sqrt{74}} \\
(3) \quad \frac{10}{\sqrt{83}} \quad (4) \quad \frac{5}{\sqrt{83}}
\]

24. If \(x \in \left(0, \frac{1}{4}\right]\), the derivative of \(\tan^{-1}\left(\frac{6x\sqrt{x}}{1 - 9x^3}\right)\) is \(\sqrt{x}\cdot g(x)\), then \(g(x)\) equals:

\[
(1) \quad \frac{3}{1 + 9x^3} \quad (2) \quad \frac{9}{1 + 9x^3} \\
(3) \quad \frac{3x\sqrt{x}}{1 - 9x^3} \quad (4) \quad \frac{3x}{1 - 9x^3}
\]

25. The radius of a circle, having minimum area, which touches the curve \(y = 4 - x^2\) and the lines, \(y = \sqrt{x}\) is:

\[
(1) \quad 4(\sqrt{2} + 1) \quad (2) \quad 2(\sqrt{2} + 1) \\
(3) \quad 2(\sqrt{2} - 1) \quad (4) \quad 4(\sqrt{2} - 1)
\]

26. A box contains 15 green and 10 yellow balls. If 10 balls are randomly drawn, one-by-one, with replacement, then the variance of the number of green balls drawn is:

\[
(1) \quad \frac{6}{25} \quad (2) \quad \frac{12}{5} \quad (3) \quad 6 \quad (4) \quad 4
\]

27. The eccentricity of an ellipse whose centre is at the origin is \(\frac{1}{2}\). If one of its directices is \(x = -4\), then the equation of the normal to it at \(\left(1, \frac{3}{2}\right)\) is:

\[
(1) \quad x + 2y = 4 \quad (2) \quad 2y - x = 2 \\
(3) \quad 4x - 2y = 1 \quad (4) \quad 4x + 2y = 7
\]

28. If two different numbers are taken from the set \(\{0, 1, 2, 3, \ldots, 10\}\), then the probability that their sum as well as absolute difference are both multiple of 4, is:

\[
(1) \quad \frac{7}{55} \quad (2) \quad \frac{6}{55} \\
(3) \quad \frac{12}{55} \quad (4) \quad \frac{14}{55}
\]

29. For three events \(A, B, C\),

\[
P(\text{Exactly one of } A \text{ or } B \text{ occurs}) = P(\text{Exactly one of } B \text{ or } C \text{ occurs})
\]

\[
P(\text{All the three events occur simultaneously}) = \frac{1}{16}
\]

Then the probability that at least one of the events occurs, is:

\[
(1) \quad \frac{3}{16} \quad (2) \quad \frac{7}{32} \\
(3) \quad \frac{7}{16} \quad (4) \quad \frac{7}{64}
\]

30. If \(A = \begin{bmatrix} 2 & -3 \\ -4 & 1 \end{bmatrix}\), then \(\text{adj}(3A^2 + 12A)\) is equal to:

\[
(1) \quad \begin{bmatrix} 72 & -63 \\ -84 & 51 \end{bmatrix} \quad (2) \quad \begin{bmatrix} 72 & -84 \\ -63 & 51 \end{bmatrix} \\
(3) \quad \begin{bmatrix} 51 & 63 \\ 84 & 72 \end{bmatrix} \quad (4) \quad \begin{bmatrix} 51 & 84 \\ 63 & 72 \end{bmatrix}
\]
SOLUTIONS

1. (1) We have

\[ \frac{k}{2} - \frac{3k}{1} = 28 \]

\[ \Rightarrow 5k^2 + 13k - 46 = 0 \]

or \[ 5k^2 + 13k + 66 = 0 \]

Now, \( 5k^2 + 13k - 46 = 0 \)

\[ \Rightarrow k = \frac{-13 \pm \sqrt{1089}}{10} \]

\[ \Rightarrow k = \frac{-13 \pm \sqrt{1151}}{10} \]

So no real solution exist

For orthocentre

\[ BH \perp AC \]

\[ \Rightarrow \frac{\beta - 2}{\alpha - 5} \left( \frac{8}{3} \right) = -1 \]

\[ \Rightarrow \alpha - 2\beta = 1 \]

Also \( CH \perp AB \)

\[ \Rightarrow \frac{\beta - 2}{\alpha + 2} \left( \frac{8}{3} \right) = -1 \]

Solving (1) and (2), we get

\[ \alpha = 2, \beta = \frac{1}{2} \]

orthocentre is \( \left( \frac{21}{2}, \frac{1}{2} \right) \)

2. (1) We have

\[ \sum_{r=1}^{n} (x + r - 1)(x + r) = 10n \]

\[ \sum_{r=1}^{n} (x^2 + xr + (r - 1)x + r^2 - r) = 10n \]

\[ \Rightarrow \sum_{r=1}^{n} (x^2 + (2r - 1)x + r(r - 1)) = 10n \]

\[ \Rightarrow nx^2 + \left\{ 1 + 3 + 5 + \ldots + (2n - 1) \right\}x + \left\{ 1.2 + 2.3 + \ldots + (n - 1) \right\}n = 10n \]

3. (4) we have \( f: R \to \left[ \frac{-1}{2}, \frac{1}{2} \right] \),

\[ f(x) = \frac{x}{1 + x^2} \quad \forall x \in R \]

\[ \Rightarrow f'(x) = \frac{(1 + x^2)(1 - 2x) - x(2x)}{(1 + x^2)^2} = \frac{-x(x + 1)(x - 1)}{(1 + x^2)^2} \]

\[ \Rightarrow f'(x) \text{ changes sign in different intervals.} \]

\[ \Rightarrow \text{not injective} \]

4. (2) We have

\[
\begin{array}{|c|c|c|c|c|c|}
\hline
p & q & \neg p & p \Rightarrow q & \neg p \Rightarrow q & (p \Rightarrow q) \Rightarrow q \\
\hline
T & F & F & T & F & T \\
T & T & F & T & T & T \\
F & F & T & T & T & T \\
F & T & T & T & T & T \\
\hline
\end{array}
\]
5. \( \text{It is tautology.} \)

\[ \begin{vmatrix} 1 & 1 & 1 \\ 1 & a & 1 \\ a & b & 1 \end{vmatrix} = 0 \]

\[ \Rightarrow 1[a - b] - 1[1 - a] + 1[b - a^2] = 0 \Rightarrow (a - 1)^2 = 0 \]
\[ \Rightarrow a = 1 \]

For \( a = 1 \), first two equations are identical
ie. \( x + y + z = 1 \)
To have no solution with \( x + y + z = 0 \)
\( b = 1 \)
So \( b = \{1\} \Rightarrow \text{It is singleton set.} \)

6. \( \text{(1)} \)

\[ x + y = 3 \]
\[ y = 1 + \sqrt{x} \]
\[ 4y = x^2 \]

Area of shaded region

\[ = \int_{0}^{1} (1 + \sqrt{x}) \, dx + \int_{1}^{2} (3 - x) \, dx - \frac{2}{3} \int_{0}^{1} x^2 \, dx \]
\[ = \left[ x + \frac{x^{3/2}}{2/2} \right]_{0}^{1} + \left[ 3x - \frac{x^2}{2} \right]_{1}^{2} - \frac{2}{3} \left[ \frac{x^3}{3} \right]_{0}^{1} = \frac{5}{2} \text{ sq units} \]

7. \( \text{(3)} \)

We have
\[ 9(25a^2 + b^2) + 25(c^2 - 3ac) = 15b(3a + c) \]
\[ \Rightarrow 225a^2 + 9b^2 + 25c^2 - 75ac = 45ab + 15bc \]
\[ \Rightarrow (15a)^2 + (3b)^2 + (5c)^2 - 75ac = 45ab + 15bc = 0 \]
\[ \Rightarrow \frac{1}{2} [(15a - 3b)^2 + (3b - 5c)^2 + (5c - 15a)^2] = 0 \]

It is possible when \( 15a - 3b = 0, 3b - 5c = 0, \) and \( 5c - 15a = 0 \)
\[ \Rightarrow 15a = 3b = 5c \]
\[ \Rightarrow b = \frac{5c}{3}, a = \frac{c}{3} \]
\[ \Rightarrow a + b = \frac{c}{3} + \frac{5c}{3} = \frac{6c}{3} = 2c \]
\[ \Rightarrow a + b = 2c \]
\[ \Rightarrow b, c, a \text{ are in A.P.} \]

8. \( \text{(2)} \)

Possible cases for \( X \) are
(1) 3 ladies, 0 man
(2) 2 ladies, 1 man
(3) 1 lady, 2 men
(4) 0 ladies, 3 men
Possible cases for \( Y \) are
(1) 0 ladies, 3 men
(2) 1 lady, 2 men
(3) 2 ladies, 1 man
(4) 3 ladies, 0 man

No. of ways = \( 4C_3 \cdot 4C_3 + (4C_2 \cdot 3C_1)^2 + (4C_1 \cdot 3C_2)^2 + (3C_3)^2 \)
\[ = 16 + 24 + 144 + 1 = 175 \]

9. \( \text{(3)} \)

We have \( y = \frac{x + 6}{x - 2}(x - 3) \)
At \( y \)-axis, \( x = 0 \Rightarrow y = 1 \)
On differentiating, we get
\[ \frac{dy}{dx} = \frac{(x^2 - 5x + 6)(1) - (x + 6)(2x - 5)}{(x^2 - 5x + 6)^2} \]
\[ \frac{dy}{dx} = 1 \text{ at point } (0, 1) \]
\[ . \cdot \text{ Slope of normal = } -1 \]
Now equation of normal is \( y - 1 = -1(x - 0) \)
\[ \Rightarrow y - 1 = -x \]
\[ x + y = 1 \]
\[ \Rightarrow \left( \frac{1}{2}, \frac{1}{2} \right) \text{ satisfy it.} \]

10. \( \text{(3)} \)

Equation of hyperbola is \( \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \)
Foci is \( (\pm 2, 0) \Rightarrow ae = 2 \Rightarrow a^2e^2 = 4 \)
Since \( b^2 = a^2(c^2 - 1) \)
\[ b^2 = a^2(e^2 - 1) \]
\[ \Rightarrow a^2 + b^2 = 4 \]
\[ \Rightarrow 2 \cdot \frac{3}{b^2} = 1 \]
\[ \Rightarrow 2 \cdot \frac{3}{b^2} = 1 \]
\[ \Rightarrow b^2 + a^2 = 12 \]
\[ \Rightarrow (b^2 - 3)(b^2 + 4) = 0 \]
\[ \Rightarrow b^2 = 3 \]
\[ \Rightarrow b^2 = -4 \]
(Not possible)
For \( b^2 = 3 \)
Let \( \angle APC = \alpha \)

\[
\tan \alpha = \frac{AC}{AP} = \frac{1}{2} \cdot \frac{AB}{AP} = \frac{1}{4} \quad (\because \text{C is the mid point})
\]

\[
\Rightarrow \tan \alpha = \frac{1}{4}
\]

As \( \tan (\alpha + \beta) = \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta} \)

\[
\Rightarrow \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta} = \frac{1}{2} \left[ \frac{\tan(\alpha + \beta)}{\tan(\alpha + \beta)} = \frac{AB}{AP} \right]
\]

\[
\Rightarrow \frac{1 + \tan \beta}{1 - \frac{\tan \alpha \tan \beta}{2}} = \frac{1}{2}
\]

\[
\Rightarrow \frac{1 + \tan \beta}{1 - \frac{1}{4} \tan \beta} = \frac{1}{2}
\]

\[
\therefore \tan \beta = \frac{2}{9}
\]

14. (4) Given:

\[
\theta = \frac{20 - 2r}{r}
\]

We have

\[
A = \text{Area} = \frac{\theta}{2\pi} \times \pi r^2 = \frac{1}{2} r^2 \theta = \frac{1}{2} r^2 \left( \frac{20 - 2r}{r} \right)
\]

A = 10r - r^2

For A to be maximum

\[
\frac{dA}{dr} = 0 \Rightarrow 10 - 2r = 0
\]

\[
\Rightarrow r = 5
\]

\[
\frac{d^2A}{dr^2} = -2 < 0
\]

\( \therefore \) For \( r = 5 \) A is maximum

From (1)

\[
\theta = \frac{20 - 2(5)}{5} = \frac{10}{5} = 2
\]

\[
A = \frac{2}{2\pi} \times \pi (5)^2 = 25 \text{ sq. m.}
\]
15. (3) \[ I = \int_\pi^{3\pi} \frac{dx}{1 + \cos x} \]
\[ \frac{3\pi}{4} \]
\[ \frac{3\pi}{4} \int_\pi^4 \frac{dx}{1 - \cos x} \]
\[ \text{Using } \int_a^b f(x)dx = \int_a^b f(a + b - x) \quad \text{dx} \]
Adding (i) and (ii)
\[ 2I = \int_\pi^4 \frac{2}{\sin^2 x} \quad \text{dx} \]
\[ \frac{3\pi}{4} \]
\[ I = \int_\pi^4 \cosec^2 x \quad \text{dx} \]
\[ \frac{3\pi}{4} \]
\[ I = - \left( \cot x \right)^{3\pi/4} = - \left[ \cot \frac{3\pi}{4} - \cot \frac{\pi}{4} \right] = 2 \]

16. (2) We have \( (2 + \sin x) \frac{dy}{dx} + (y + 1) \cos x = 0 \)
\[ \frac{d}{dx} (2 + \sin x)(y + 1) = 0 \]
On integrating, we get
\[ (2 + \sin x)(y + 1) = C \]
At \( x = 0 \), \( y = 1 \) we have
\[ (2 + \sin 0)(1 + 1) = C \]
\[ C = 4 \]
\[ y + 1 = \frac{4}{2 + \sin x} \]
\[ y = \frac{4}{2 + \sin x} - 1 \]
Now \( y \left( \frac{\pi}{2} \right) = \frac{4}{2 + \sin \frac{\pi}{2}} \]
\[ = \frac{4}{3} - 1 = \frac{1}{3} \]

17. (3) \[ I_n = \int \tan^n x \quad \text{dx}, n > 1 \]
Let \( I = I_4 + I_6 \)
\[ = \int (\tan^4 x + \tan^6 x) \quad \text{dx} = \int \tan^4 x \quad \sec^2 x \quad \text{dx} \]
Let \( \tan x = t \)
\[ \Rightarrow \sec^2 x \quad \text{dx} = dt \]

18. (2) Given \( 2\omega + 1 = z ; \)
\[ z = \sqrt{3}i \]
\[ \Rightarrow \omega = \frac{\sqrt{3}i - 1}{2} \]
\[ \Rightarrow \omega \text{ is complex cube root of unity} \]
Applying \( R_1 \to R_1 + R_2 + R_3 \)
\[ \begin{vmatrix} 3 & 0 & 0 \\ 1 & -\omega^2 & 1 \\ 1 & \omega^2 & \omega \end{vmatrix} \]
\[ = 3 (1 - \omega - \omega) = -3 (1 + 2\omega) = -3z \]
\[ \Rightarrow k = -z \]

19. (1) We have \( \binom{21}{C_1} + \binom{21}{C_9} \)
\[ - \left( \binom{10}{C_1} + \binom{10}{C_2} + \binom{10}{C_3} \right) \]
\[ = \frac{1}{2} \left[ \left( \binom{21}{C_1} + \binom{21}{C_9} \right) + \left( \binom{10}{C_1} + \binom{10}{C_2} + \binom{10}{C_3} \right) \right] \]
\[ = \frac{1}{2} \left[ 2^{21} - 2 \right] - \left( 2^{10} - 1 \right) \]
\[ = 2^{20} - 1 - 2^{10} - 1 \]
\[ = 2^{20} - 2^{10} - 2 \]

20. (3) \[ \lim_{x \to \frac{\pi}{2}} \cot x \left( 1 - \sin x \right) = \lim_{x \to \frac{\pi}{2}} \cot x \left( 1 - \sin x \right) \]
\[ = \lim_{x \to \frac{\pi}{2}} \frac{\pi - x}{8} \left( \frac{\pi^2}{2} - x \right) \]
\[ = \lim_{t \to 0} \frac{\cot \left( \frac{\pi}{2} - t \right) \left( 1 - \sin \left( \frac{\pi}{2} - t \right) \right)}{8t^3} \]
\[ = \lim_{t \to 0} \frac{\tan t \left( 1 - \cos t \right)}{8t^3} \]
\[ = \lim_{t \to 0} \frac{\tan t \left( 1 - \cos t \right)}{8t^3} \]
\[ = \lim_{t \to 0} \frac{\tan t}{8t} \cdot \frac{1 - \cos t}{t^2} \]
\[ = \frac{1 \cdot 1}{8 \cdot 2} = \frac{1}{16} \]

21. (1) We have
\[ 5 \tan^2 x - 5 \cos^2 x = 2 (2 \cos^2 x - 1) + 9 \]
\[ \Rightarrow 5 \tan^2 x - 5 \cos^2 x = 4 \cos^2 x - 2 + 9 \]
\[ \Rightarrow 5 \tan^2 x = 9 \cos^2 x + 7 \]
\[ 5 \sec^2 x - 1 = 9 \cos^2 x + 7 \]

Let \( \cos^2 x = t \)

\[ \frac{5}{t} - 9t - 12 = 0 \]

\[ 9t^2 + 12t - 5 = 0 \]

\[ 9t^2 + 15t - 3t - 5 = 0 \]

\[ (3t-1)(3t+5) = 0 \]

\[ t = \frac{1}{3} \text{ as } t \neq -\frac{5}{3}. \]

\[ \cos 2x = 2 \cos^2 x - 1 = 2 \left( \frac{1}{3} \right) - 1 = -\frac{1}{3} \]

\[ \cos 4x = 2 \cos^2 2x - 1 = 2 \left( -\frac{1}{3} \right)^2 - 1 = -\frac{7}{9} \]

22. (3)

Equation of line PQ is \( \frac{x - 1}{1} = \frac{y + 2}{4} = \frac{z - 3}{5} \)

Let F be \( (\lambda + 1, 4\lambda - 2, 5\lambda + 3) \)

\[
\begin{align*}
\text{Since F lies on the plane} & \\
\therefore & 2(\lambda + 1) + 3(4\lambda - 2) - 4(5\lambda + 3) + 22 = 0 \\
& 2\lambda + 2 + 12\lambda - 6 - 20\lambda - 12 + 22 = 0 \\
& -6\lambda + 6 = 0 \Rightarrow \lambda = 1 \\
& \therefore \text{F is (2, 2, 8)} \\
PQ = 2P\text{F} = 2 \sqrt{1^2 + 4^2 + 5^2} = 2\sqrt{42} \]

23. (3)

Let the plane be \( a(x - 1) + b(y + 1) + c(z + 1) = 0 \)

Normal vector \( \begin{bmatrix} i & j & k \end{bmatrix} = 5i + 7j + 3k \)

So plane is \( 5(x - 1) + 7(y + 1) + 3(z + 1) = 0 \)

\[ 5x + 7y + 3z + 5 = 0 \]

Distance of point \( (1, 3, -7) \) from the plane is \( \frac{5 + 21 - 21 + 5}{\sqrt{25 + 49 + 9}} = \frac{10}{\sqrt{83}} \)

24. (2)

Let \( F(x) = \tan^{-1} \left( \frac{6x \sqrt{x}}{1 - 9x} \right) \) where \( x \in \left( 0, \frac{1}{4} \right) \).

\[ = \tan^{-1} \left( \frac{2(3x^{3/2})}{1-(3x^{3/2})^2} \right) = 2 \tan^{-1} (3x^{3/2}) \]

As \( 3x^{3/2} \in \left( 0, \frac{3}{8} \right) \)

\[ \Rightarrow 0 < x < \frac{1}{4} \Rightarrow 0 < x^{3/2} < \frac{1}{8} \Rightarrow 0 < 3x^{3/2} < \frac{3}{8} \]

\[ \text{So } \frac{dF(x)}{dx} = 2 \times \frac{1}{1 + 9x^3} \times 3 \times \frac{3}{2} \times x^{1/2} \]

\[ = \frac{9 \sqrt{x}}{1 + 9x^3} \]

On comparing \( \therefore g(x) = \frac{9 \sqrt{x}}{1 + 9x^3} \)

25. (None)

Let the equation of circle be \( x^2 + (y - k)^2 = r^2 \)

It touches \( x - y = 0 \)

\[ \Rightarrow \left| \frac{0 - k}{\sqrt{2}} \right| = r \]

\[ \Rightarrow k = r\sqrt{2} \]

\[ \therefore \text{Equation of circle becomes } x^2 + (y - k)^2 = \frac{k^2}{2} \quad \text{(i)} \]

It touches \( y = 4 - x^2 \) as well

\[ \therefore \text{Solving the two equations } \]

\[ \Rightarrow 4 - y + (y - k)^2 = \frac{k^2}{2} \]

\[ \Rightarrow y^2 - y(2k + 1) + \frac{k^2}{2} + 4 = 0 \]

It will give equal roots \( \therefore D = 0 \)

\[ \Rightarrow (2k + 1)^2 = 4 \left( \frac{k^2}{2} + 4 \right) \]
26. (2) We can apply binomial probability distribution
We have n = 10

\[ p = \text{Probability of drawing a green ball} = \frac{15}{25} = \frac{3}{5} \]

Also \( q = 1 - \frac{3}{5} = \frac{2}{5} \)

Variance = npq

\[ = 10 \times \frac{3}{5} \times \frac{2}{5} = \frac{12}{5} \]

27. (3) Eccentricity of ellipse = \( \frac{1}{2} \)

Now, \( \frac{a}{e} = -4 \Rightarrow a = 4 \times \frac{1}{2} = 2 \Rightarrow a = 2 \)

We have \( b^2 = a^2 (1 - e^2) = a^2 \left(1 - \frac{1}{4}\right) = 4 \times \frac{3}{4} = 3 \)

\( \therefore \) Equation of ellipse is

\[ \frac{x^2}{4} + \frac{y^2}{3} = 1 \]

Now differentiating, we get

\[ \Rightarrow \frac{x}{2} + \frac{2y}{3} \times y' = 0 \Rightarrow y' = -\frac{3x}{4y} \]

\( y'|_{(1,3/2)} = -\frac{3}{4} \times \frac{2}{3} = \frac{1}{2} \)

Slope of normal = 2

\( \therefore \) Equation of normal at \( \left(1, \frac{3}{2}\right) \) is

\[ y - \frac{3}{2} = 2(x - 1) \Rightarrow 2y - 3 = 4x - 4 \]

\( \therefore 4x - 2y = 1 \)

28. (2) 
Let \( A = \{0, 1, 2, 3, 4, \ldots, 10\} \)
\( n(S) = 11C_2 = 55 \) where 'S' denotes sample space
Let E be the given event
\( \therefore E = \{(0,4), (0,8), (2,6), (2,10), (4,8), (6,10)\} \)
\( \Rightarrow n(E) = 6 \)

\[ P(E) = \frac{n(E)}{n(S)} = \frac{6}{55} \]

29. (3) 
\( P(\text{exactly one of A or B occurs}) \)

\( = P(A) + P(B) - 2P(A \cap B) = \frac{1}{4} \) \( \ldots \text{(1)} \)

\( P(\text{Exactly one of B or C occurs}) \)

\( = P(B) + P(C) - 2P(B \cap C) = \frac{1}{4} \) \( \ldots \text{(2)} \)

\( P(\text{Exactly one of C or A occurs}) \)

\( = P(C) + P(A) - 2P(C \cap A) = \frac{1}{4} \) \( \ldots \text{(3)} \)

Adding (1), (2) and (3), we get

\( 2\Sigma P(A) - 2\Sigma P(A \cap B) = \frac{3}{4} \)

\( \therefore \Sigma P(A) - \Sigma P(A \cap B) = \frac{3}{8} \)

Now, \( P(A \cap B \cap C) = \frac{1}{16} \)

\( \therefore \) \( P(A \cup B \cup C) = \Sigma P(A) - \Sigma P(A \cap B) + P(A \cap B \cap C) \)

\( = \frac{3}{8} + \frac{1}{16} = \frac{7}{16} \)

30. (3) We have \( A = \begin{bmatrix} 2 & -3 \\ -4 & 1 \end{bmatrix} \)

\( \Rightarrow A^2 = \begin{bmatrix} 16 & -9 \\ -12 & 13 \end{bmatrix} \)

\( \Rightarrow 3A^2 = \begin{bmatrix} 48 & -27 \\ -36 & 39 \end{bmatrix} \)

Also \( 12A = \begin{bmatrix} 24 & -36 \\ -48 & 12 \end{bmatrix} \)

\( \therefore 3A^2 + 12A = \begin{bmatrix} 48 & -27 \\ -36 & 39 \end{bmatrix} + \begin{bmatrix} 24 & -36 \\ -48 & 12 \end{bmatrix} = \begin{bmatrix} 72 & -63 \\ -84 & 51 \end{bmatrix} \)

adj \( (3A^2 + 12A) = \begin{bmatrix} 51 & 63 \\ 84 & 72 \end{bmatrix} \)
Chapter 1

Trigonometric Functions & Equations

Section A

A. Fill in the Blanks

1. Suppose \( \sin^3 x \cos x = \sum_{m=0}^{n} C_m \cos mx \) is an identity in \( x \), where \( C_0, C_1, ..., C_n \) are constants, and \( C_n \neq 0 \). Then the value of \( n \) is _________. (1981 - 2 Marks)

2. The solution set of the system of equations \( x + y = \frac{2\pi}{3} \), \( \cos x + \cos y = \frac{3}{2} \), where \( x \) and \( y \) are real, is _________. (1987 - 2 Marks)

3. The set of all \( x \) in the interval \([0, \pi]\) for which \( 2 \sin^2 x - 3 \sin x + 1 \geq 0 \), is _________. (1987 - 2 Marks)

4. The sides of a triangle inscribed in a given circle subtend angles \( \alpha, \beta \) and \( \gamma \) at the centre. The minimum value of the arithmetic mean of \( \cos (\alpha + \frac{\pi}{2}), \cos (\beta + \frac{\pi}{2}) \) and \( \cos (\gamma + \frac{\pi}{2}) \) is equal to _________. (1987 - 2 Marks)

5. The value of \( \sin \frac{\pi}{14} \sin \frac{3\pi}{14} \sin \frac{5\pi}{14} \sin \frac{7\pi}{14} \sin \frac{9\pi}{14} \sin \frac{11\pi}{14} \sin \frac{13\pi}{14} \) is equal to _________. (1991 - 2 Marks)

6. If \( K = \sin(\pi/18) \sin(5\pi/18) \sin(7\pi/18) \), then the numerical value of \( K \) is _________. (1993 - 2 Marks)

7. If \( A > 0, B > 0 \) and \( A + B = \pi/3 \), then the maximum value of \( \tan A \tan B \) is _________. (1993 - 2 Marks)

8. General value of \( \theta \) satisfying the equation \( \tan^2 \theta + \sec 2\theta = 1 \) is _________. (1996 - 1 Mark)

9. The real roots of the equation \( \cos^7 x + \sin^4 x = 1 \) in the interval \((-\pi, \pi)\) are ____, ____, and ________. (1997 - 2 Marks)

B. True / False

1. If \( \tan A = (1 - \cos B)/\sin B \), then \( \tan 2A = \tan B \). (1983 - 1 Mark)

2. There exists a value of \( \theta \) between 0 and \( 2\pi \) that satisfies the equation \( \sin^4 \theta - 2\sin^2 \theta - 1 = 0 \). (1984 - 1 Mark)

C. MCQs with One Correct Answer

1. If \( \tan \theta = -\frac{4}{3} \), then \( \sin \theta \) is
   (a) \( \frac{-4}{5} \) but not \( \frac{4}{5} \) (b) \( -\frac{4}{5} \) or \( \frac{4}{5} \)
   (c) \( \frac{4}{5} \) but not \( -\frac{4}{5} \) (d) None of these. (1979)

2. If \( \alpha + \beta + \gamma = 2\pi \), then
   (a) \( \tan \frac{\alpha}{2} + \tan \frac{\beta}{2} + \tan \frac{\gamma}{2} = \tan \frac{\alpha}{2} \tan \frac{\beta}{2} \tan \frac{\gamma}{2} \)
   (b) \( \tan \frac{\alpha}{2} \tan \frac{\beta}{2} + \tan \frac{\beta}{2} \tan \frac{\gamma}{2} + \tan \frac{\gamma}{2} \tan \frac{\alpha}{2} = 1 \)
   (c) \( \tan \frac{\alpha}{2} + \tan \frac{\beta}{2} + \tan \frac{\gamma}{2} = -\tan \frac{\alpha}{2} \tan \frac{\beta}{2} \tan \frac{\gamma}{2} \)
   (d) None of these. (1979)

3. Given \( A = \sin^2 \theta + \cos^4 \theta \) then for all real values of \( \theta \)
   (a) \( 1 \leq A \leq 2 \) (b) \( \frac{3}{4} \leq A \leq 1 \)
   (c) \( \frac{13}{16} \leq A \leq 1 \) (d) \( \frac{3}{4} \leq A \leq \frac{13}{16} \)
   (1980)

4. The equation \( 2\cos^2 \frac{x}{2} \sin^3 x = x^2 - x^2 \), \( 0 < x \leq \pi/2 \) has
   (a) no real solution (b) one real solution
   (c) more than one solution (d) none of these (1980)

5. The general solution of the trigonometric equation \( \sin x \cos x = 1 \) is given by:
   (a) \( x = 2n\pi, n = 0, \pm 1, \pm 2 \ldots \)
   (b) \( x = 2n\pi + \pi/2, n = 0, \pm 1, \pm 2 \ldots \)
   (c) \( x = n\pi + (-1)^n \frac{\pi}{4} - \frac{\pi}{4} \)
   (d) None of these \( n = 0, \pm 1, \pm 2 \ldots \)
   (1981 - 2 Marks)
6. The value of the expression \( \sqrt{3} \cos \text{sec} 20^\circ - \sec 20^\circ \) is equal to \( (1988 - 2 \text{ Marks}) \)
   (a) 2 \quad (b) 2 \sin 20^\circ \sin 40^\circ \quad (c) 4 \quad (d) 4 \sin 20^\circ \sin 40^\circ

7. The general solution of sin \( x - 3 \sin 2x + \sin 3x = \cos x - 3 \cos 2x + \cos 3x \) is \( (1989 - 2 \text{ Marks}) \)
   (a) \( n\pi + \frac{\pi}{8} \) \quad (b) \( n\pi + \frac{\pi}{2} \)
   (c) \( -1 \cdot n\pi + \frac{\pi}{8} \) \quad (d) \( 2n\pi + \cos^{-1} \frac{3}{2} \)

8. The equation \((\cos p - 1) x^2 + (\cos p)x + \sin p = 0\) in the variable \( x \), has real roots. Then \( p \) can take any value in the interval \( (1990 - 2 \text{ Marks}) \)
   (a) \((0, 2\pi)\) \quad (b) \((-\pi, 0)\)
   (c) \(\left( -\frac{\pi}{2}, \frac{\pi}{2} \right)\) \quad (d) \((0, \pi)\)

9. Number of solutions of the equation \((1993 - 1 \text{ Mark})\)
   \( \tan x + \sec x = 2 \cos x \) lying in the interval \([0, 2\pi)\] is:
   (a) 0 \quad (b) 1 \quad (c) 2 \quad (d) 3

10. Let \( 0 < \theta < \frac{\pi}{4} \) then \((\sec 2\theta - \tan 2\theta)\) equals \( (1994) \)
    (a) \( \tan \left( \frac{\pi - \theta}{4} \right) \) \quad (b) \( \tan \left( \frac{\pi}{4} - x \right) \)
    (c) \( \tan \left( \frac{\pi + \theta}{4} \right) \) \quad (d) \( \tan^2 \left( \frac{\pi + \theta}{4} \right) \)

11. Let \( n \) be a positive integer such that \( \sin \frac{\pi}{2n} + \cos \frac{\pi}{2n} = \frac{\sqrt{n}}{2} \). Then \( (1994) \)
    (a) \( 6 \leq n \leq 8 \) \quad (b) \( 4 < n \leq 8 \)
    (c) \( 4 < n \leq 8 \) \quad (d) \( 4 < n < 8 \)

12. If \( \omega \) is an imaginary cube root of unity then the value of
    \( \sin \left\{ (\omega^{10} + \omega^{23})\pi - \frac{\pi}{4} \right\} \) is \( (1994) \)
    (a) \( -\frac{\sqrt{3}}{2} \) \quad (b) \( -\frac{1}{\sqrt{2}} \)
    (c) \( \frac{1}{\sqrt{2}} \) \quad (d) \( \frac{\sqrt{3}}{2} \)

13. \( 3(\sin x - \cos x)^4 + 6(\sin x + \cos x)^2 + 4(\sin^6 x + \cos^6 x) = \) \( (1995S) \)
    (a) 11 \quad (b) 12 \quad (c) 13 \quad (d) 14

14. The general values of \( \theta \) satisfying the equation \( 2\sin^2 \theta - 3\sin \theta - 2 = 0 \) is \( (1995S) \)
    (a) \( n\pi + (-1)^n \frac{\pi}{6} \) \quad (b) \( n\pi + (-1)^n \frac{\pi}{2} \)
    (c) \( n\pi + (-1)^n \frac{5\pi}{6} \) \quad (d) \( n\pi + (-1)^n \frac{7\pi}{6} \)

15. \( \sec^2 \theta = \frac{4xy}{(x+y)^2} \) is true if and only if \( (1996 - 1 \text{ Mark}) \)
    (a) \( x+y \neq 0 \) \quad (b) \( x = y, x \neq 0 \)
    (c) \( x = y \) \quad (d) \( x \neq 0, y \neq 0 \)

16. In a triangle \( \triangle PQR \), \( \angle R = \frac{\pi}{2} \). If \( \tan \frac{P}{2} \) and \( tan \left( \frac{Q}{2} \right) \) are the roots of the equation \( ax^2 + bx + c = 0 \) \((a \neq 0)\) then \( (1999 - 2 \text{ Marks}) \)
    (a) \( a + b = c \) \quad (b) \( b + c = a \)
    (c) \( a + c = b \) \quad (d) \( b = c \)

17. Let \( f(\theta) = \sin \theta \cos \theta + \sin 3\theta \). Then \( f(\theta) \) is \( (2000S) \)
    (a) \( \geq 0 \) only when \( \theta \geq 0 \) \quad (b) \( \leq 0 \) for all real \( \theta \)
    (c) \( \geq 0 \) for all real \( \theta \) \quad (d) \( \leq 0 \) only when \( \theta \leq 0 \)

18. The number of distinct real roots of \( \frac{\sin x}{\cos x} \) is \( (2001S) \)
    (a) 0 \quad (b) 2 \quad (c) 1 \quad (d) 3

19. The maximum value of \((\cos \alpha_1)(\cos \alpha_2)\ldots(\cos \alpha_n)\), under the restrictions
    \( 0 \leq \alpha_1, \alpha_2, \ldots, \alpha_n \leq \frac{\pi}{2} \) and \((\cot \alpha_1)(\cot \alpha_2)\ldots(\cot \alpha_n) = 1 \) is \( (2002S) \)
    (a) \( \frac{1}{2^n} \) \quad (b) \( \frac{1}{2^n} \)
    (c) \( \frac{1}{2^n} \) \quad (d) \( \frac{1}{2^n} \)

20. If \( \alpha + \beta = \pi/2 \) and \( \beta + \gamma = \alpha \), then \( \tan \alpha \) equals \( (2004S) \)
    (a) \( 2(\tan \beta + \tan \gamma) \) \quad (b) \( \tan \beta + \tan \gamma \)
    (c) \( \tan \beta + 2\tan \gamma \) \quad (d) \( 2\tan \beta + \tan \gamma \)

21. The number of integral values of \( k \) for which the equation \( 7 \cos^2 x + 5 \cos x = 2k + 1 \) has a solution is \( (2002S) \)
    (a) 4 \quad (b) 8 \quad (c) 10 \quad (d) 12

22. Given both \( \theta \) and \( \phi \) are acute angles and \( \sin \theta = \frac{1}{2} \),\n    \( \cos \phi = \frac{1}{3} \), then the value of \( \theta + \phi \) belongs to \( (2004S) \)
    (a) \( \left[ \frac{\pi}{3}, \frac{\pi}{2} \right] \) \quad (b) \( \left[ \frac{\pi}{2}, \frac{2\pi}{3} \right] \)
    (c) \( \left[ \frac{\pi}{2}, \frac{2\pi}{3} \right] \) \quad (d) \( \left[ \frac{5\pi}{6}, \pi \right] \)

23. \( \cos(\alpha - \beta) = 1 \) and \( \cos(\alpha + \beta) = 1/e \) where \( \alpha, \beta \in [-\pi, \pi] \). Pairs of \( \alpha, \beta \) which satisfy both the equations is/are \( (2005S) \)
    (a) 0 \quad (b) 1 \quad (c) 2 \quad (d) 4

24. The values of \( \theta \in (0, 2\pi) \) for which \( 2\sin^2 \theta - 5\sin \theta + 2 > 0 \), are \( (2006 - 3M, -1) \)
    (a) \( \left[ 0, \frac{\pi}{6} \right) \cup \left( \frac{5\pi}{6}, 2\pi \right) \) \quad (b) \( \left[ \frac{\pi}{6}, \frac{5\pi}{6} \right) \)
    (c) \( \left[ \frac{\pi}{8}, \frac{5\pi}{8} \right) \cup \left( \frac{5\pi}{6}, 2\pi \right) \) \quad (d) \( \left[ \frac{4\pi}{6}, \frac{4\pi}{6} \right) \)
25. Let \( \theta \in \left( 0, \frac{\pi}{4} \right) \) and \( t_1 = (\tan \theta)^{\tan \theta} \), \( t_2 = (\tan \theta)^{\cot \theta} \), \( t_3 = (\cot \theta)^{\tan \theta} \) and \( t_4 = (\cot \theta)^{\cot \theta} \), then \(2006 - 3M, -1\)
(a) \( t_1 > t_2 > t_3 > t_4 \)
(b) \( t_2 > t_1 > t_4 > t_3 \)
(c) \( t_3 > t_1 > t_4 > t_2 \)
(d) \( t_4 > t_1 > t_3 > t_2 \)

26. The number of solutions of the pair of equations \(2 \sin^2 \theta - \cos 2\theta = 0\)
\(2 \cos^2 \theta - 3 \sin \theta = 0\)
in the interval \([0, 2\pi]\) is \(2007 - 3M\)
(a) zero (b) one (c) two (d) four

27. For \( x \in (0, \pi) \), the equation \( \sin x + 2 \sin 2x - \sin 3x = 3 \) has \(JEE Adv. 2014\)
(a) infinitely many solutions (b) three solutions (c) one solution (d) no solution

28. Let \( S = \left\{ x \in (-\pi, \pi): x \neq 0, \pm \frac{\pi}{2} \right\} \). The sum of all distinct \(JEE Adv. 2016\)
solutions of the equation \( \sqrt{3} \sec x + \csc x + 2(\tan x - \cot x) = 0 \) in the set \( S \) is equal to
(a) \( \frac{-7\pi}{9} \) (b) \( \frac{-2\pi}{9} \) (c) 0 (d) \( \frac{5\pi}{9} \)

29. The value of \( \sum_{k=1}^{11} \frac{1}{\sin \left( \frac{\pi}{4} + \frac{k-1}{6} \pi \right)} \) is equal to \(JEE Adv. 2016\)
(a) \( 3 - \sqrt{3} \) (b) \( 2(3 - \sqrt{3}) \) (c) \( 2(\sqrt{3} - 1) \) (d) \( 2(2 - \sqrt{3}) \)

**MCQs with One or More than One Correct**

1. \( \left( 1 + \cos \frac{\pi}{8} \right) \left( 1 + \cos \frac{3\pi}{8} \right) \left( 1 + \cos \frac{5\pi}{8} \right) \left( 1 + \cos \frac{7\pi}{8} \right) \) is equal to \(1984 - 3M\)
(a) \( \frac{1}{2} \) (b) \( \cos \frac{\pi}{8} \) (c) \( \frac{1}{8} \) (d) \( \frac{1 + \sqrt{2}}{2\sqrt{2}} \)

2. The expression \( 3 \left[ \sin \left( \frac{3\pi}{2} - \alpha \right) + \sin \left( 3\pi + \alpha \right) \right] - \left[ \sin \left( \alpha + \frac{\pi}{2} \right) + \sin \left( 5\pi - \alpha \right) \right] \) is equal to \(1986 - 2M\)
(a) 0 (b) 1 (c) 3 (d) \( \sin 4\alpha + \cos 6\alpha \)

3. The number of all possible triplets \( (a_1, a_2, a_3) \) such that \( a_1 + a_2 \cos(2x) + a_3 \sin^2(x) = 0 \) for all \( x \) is \(1987 - 2M\)
(a) zero (b) one (c) three (d) infinite (e) none

4. The values of \( \theta \) lying between \( 0 = \theta = \pi/2 \) and satisfying the equation \(1988 - 2M\)
\[
\begin{array}{|l|l|l|}
\hline
1 + \sin^2 \theta & \cos^2 \theta & 4 \sin 4 \theta \\
\sin^2 \theta & 1 + \cos^2 \theta & 4 \sin 4 \theta \\
\cos^2 \theta & \cos^2 \theta & 1 + 4 \sin 4 \theta \\
\hline
\end{array}
\]
(a) \( \frac{7\pi}{24} \) (b) \( \frac{5\pi}{24} \) (c) \( \frac{11\pi}{24} \) (d) \( \frac{\pi}{24} \)

5. Let \( 2 \sin^2 x + 3 \sin x - 2 > 0 \) and \( x^2 - x - 2 < 0 \) (\( x \) is measured in radians). Then \( x \) lies in the interval \(1994\)
(a) \( \left( \frac{\pi}{6}, \frac{5\pi}{6} \right) \) (b) \( (-1, 2) \) (c) \( \left( \pi, \frac{\pi}{6} \right) \) (d) \( \left( \frac{\pi}{6}, 2 \right) \)

6. The minimum value of the expression \( \sin \alpha + \sin \beta + \sin \gamma \), where \( \alpha, \beta, \gamma \) are real numbers satisfying \( \alpha + \beta + \gamma = \pi \) is \(1995\)
(a) positive (b) zero (c) negative (d) \( -3 \)

7. The number of values of \( x \) in the interval \([0, 5\pi]\) satisfying the equation \( 3 \sin^2 x - 7 \sin x + 2 = 0 \) is \(1998 - 2M\)
(a) 0 (b) 5 (c) 6 (d) 10

8. Which of the following number(s) is/are rational? \(1998 - 2M\)
(a) \( \sin 15^\circ \) (b) \( \cos 15^\circ \) (c) \( \sin 15^\circ \cos 15^\circ \) (d) \( \sin 15^\circ \cos 75^\circ \)

9. For a positive integer \( n \), let \(1999 - 3M\)
\[
f_n(\theta) = \left( \tan \frac{\theta}{2} \right) \left( 1 + \sec \theta \right) \left( 1 + \sec 2\theta \right) \ldots \left( 1 + \sec 2^n \theta \right).
\]
Then
(a) \( f_2 \left( \frac{\pi}{16} \right) = 1 \) (b) \( f_5 \left( \frac{\pi}{32} \right) = 1 \)
(c) \( f_4 \left( \frac{\pi}{64} \right) = 1 \) (d) \( f_5 \left( \frac{\pi}{128} \right) = 1 \)

10. If \( \frac{\sin^4 x + \cos^4 x}{2} = \frac{1}{5} \), then \(2009\)
(a) \( \tan^2 x = \frac{2}{3} \) (b) \( \frac{\sin^8 x + \cos^8 x}{27} = \frac{1}{125} \)
(c) \( \tan^2 x = \frac{1}{3} \) (d) \( \frac{\sin^8 x + \cos^8 x}{27} = \frac{2}{125} \)
11. For $0 < \theta < \frac{\pi}{2}$, the solution(s) of
$$\sum_{m=1}^{6} \csc \left( \theta + \frac{(m-1)\pi}{4} \right) \csc \left( \theta + \frac{m\pi}{4} \right) = 4\sqrt{2}$$
is (arc)..............(2009)
(a) $\frac{\pi}{4}$  (b) $\frac{\pi}{6}$  (c) $\frac{\pi}{12}$  (d) $\frac{5\pi}{12}$
12. Let $\theta, \varphi \in [0, 2\pi]$ be such that $2 \cos \theta (1 - \sin \varphi) = \sin^2 \theta$
$$\left( \tan \frac{\theta}{2} + \cot \frac{\theta}{2} \right) \cos \varphi - 1, \tan (2\pi - \theta) > 0$$
and
$$-1 < \sin \theta < -\frac{3\sqrt{2}}{2}, \text{ then } \varphi \text{ cannot satisfy}$$..............(2012)
(a) $0 < \varphi < \frac{\pi}{2}$  (b) $\frac{\pi}{2} < \varphi < \frac{4\pi}{3}$
(c) $\frac{4\pi}{3} < \varphi < \frac{3\pi}{2}$  (d) $\frac{3\pi}{2} < \varphi < 2\pi$
13. The number of points in $(\infty, \infty)$, for which
$$x^2 - x \sin x - \cos x = 0,$$ is..............(JEE Adv. 2013)
(a) 6  (b) 4  (c) 2  (d) 0
14. Let $f(x) = x \sin x$, $x > 0$. Then for all natural numbers $n$, $f^n(x)$ vanishes at
$$\left( n + \frac{1}{2} \right)$$..............(JEE Adv. 2013)
(a) A unique point in the interval $(n, n + \frac{1}{2})$
(b) A unique point in the interval $(n + \frac{1}{2}, n + 1)$
(c) A unique point in the interval $(n, n + 1)$
(d) Two points in the interval $(n, n + 1)$

E. Subjective Problems

1. If $\tan \alpha = \frac{m}{m+1}$ and $\tan \beta = \frac{1}{2m+1}$, find the possible values of $(\alpha + \beta)$..............(1978)
2. (a) Draw the graph of $y = \frac{1}{\sqrt{2}} (\sin x + \cos x)$ from $x = -\frac{\pi}{2}$ to $x = \frac{\pi}{2}$.
(b) If $\cos (\alpha + \beta) = \frac{4}{5}$, $\sin (\alpha - \beta) = \frac{5}{13}$, and $\alpha, \beta$ lies
between 0 and $\pi$, find $\tan 2\alpha$..............(1979)
3. Given $\alpha + \beta + \gamma = \pi$, prove that
$$\sin^2 \alpha + \sin^2 \beta - \sin^2 \gamma = 2 \sin \alpha \sin \beta \cos \gamma$$..............(1980)
4. Given $A = \left\{ x : \frac{\pi}{6} < x \leq \frac{\pi}{3} \right\}$ and
$$f(x) = \cos x - x (1 + x); \text{ find } f(A).$$..............(1980)
5. For all $\theta$ in $[0, \pi/2]$ show that, $\cos (\sin \theta) \geq \sin (\cos \theta)$..............(1981 - 4 Marks)
6. Without using tables, prove that
$$\sin (12\theta) \sin (48\theta) \sin (54\theta) = \frac{1}{8}.$$..............(1982 - 2 Marks)
7. Show that
$$16 \cos \left( \frac{2\pi}{15} \right) \cos \left( \frac{4\pi}{15} \right) \cos \left( \frac{8\pi}{15} \right) \cos \left( \frac{16\pi}{15} \right) = 1$$..............(1983 - 2 Marks)
8. Find all the solution of $4 \cos^2 x \sin x - 2 \sin^2 x = 3 \sin x$..............(1983 - 2 Marks)
9. Find the values of $x \in (\pi, +\pi)$ which satisfy the equation
$$2 (1 + \cos x + \cos^2 x + \cos^3 x + \cdots) = 4^3$$..............(1984 - 2 Marks)
10. Prove that $\tan \alpha + 2 \tan 2 \alpha + 4 \tan 4 \alpha + 8 \cot 8 \alpha = \cot \alpha$..............(1988 - 2 Marks)
11. $ABC$ is a triangle such that
$$\sin (2A + B) = \sin (C - A) = -\sin (B + 2C) = \frac{1}{2}.$$..............(1990 - 5 Marks)
If $A$, $B$ and $C$ are in arithmetic progression, determine the values of $A$, $B$ and $C$.
12. If $\exp \left( \sin^2 x + \sin^6 x + \sin^8 x + \cdots \right)$ is $2$, satisfies the equation $x^2 - 9x + 8 = 0$, find the value of
$$\frac{\cos x}{\cos x + \sin x}, \quad 0 < x < \frac{\pi}{2}.$$..............(1991 - 4 Marks)
13. Show that the value of $\frac{\tan x}{\tan 3x}$, wherever defined never lies
between $\frac{1}{3}$ and 3..............(1992 - 4 Marks)
14. Determine the smallest positive value of $x$ (in degrees) for which
$$\tan (x + 100^\circ) = \tan (x + 50^\circ) \tan (x) \tan (x - 50^\circ).$$..............(1993 - 5 Marks)
15. Find the smallest positive number $p$ for which the equation
$$\cos (p \sin x) = \sin (p \cos x)$$ has a solution $x \in [0, 2\pi]$..............(1995 - 5 Marks)
16. Find all values of $\theta$ in the interval $\left( -\frac{\pi}{2}, \frac{\pi}{2} \right)$ satisfying the
equation $(1 - \tan \theta) (1 + \tan \theta) \sec^2 \theta = 2 \tan^2 \theta = 0.$..............(1996 - 2 Marks)
17. Prove that the values of the function
$$\frac{\sin x \cos 3x}{\sin 3x \cos x}$$ do not lie
between $\frac{1}{3}$ and 3 for any real $x.$..............(1997 - 5 Marks)
18. Prove that
$$\sum_{k=1}^{n-1} \frac{(n-k) \cos \frac{2k\pi}{n}}{n} = -\frac{n}{2}, \text{ where } n \geq 3 \text{ is an integer.}$$..............(1997 - 5 Marks)
19. In any triangle $ABC$, prove that
$$\cot \frac{A}{2} + \cot \frac{B}{2} + \cot \frac{C}{2} = \cot \frac{A}{2} \cot \frac{B}{2} \cot \frac{C}{2}.$$..............(2000 - 3 Marks)
20. Find the range of values of $t$ for which
$$2 \sin t = \frac{1 - 2x + 5x^2}{3x^2 - 2x - 1},$$
t $\in \left[ -\frac{\pi}{2}, \frac{\pi}{2} \right].$..............(2005 - 2 Marks)
**Match the Following**

**DIRECTIONS (Q. 1):** Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. In this questions there are entries in columns 1 and 2. Each entry in column 1 is related to exactly one entry in column 2. Write the correct letter from column 2 against the entry number in column 1 in your answer book.

\[
\frac{\sin 3\alpha}{\cos 2\alpha} \text{ is} \]

**Column I**

(A) positive

(B) negative

**Column II**

(p) \(\frac{13\pi}{48}, \frac{14\pi}{48}\)

(q) \(\frac{14\pi}{48}, \frac{18\pi}{48}\)

(r) \(\frac{18\pi}{48}, \frac{23\pi}{48}\)

(s) \(\frac{0, \pi}{2}\)

\((1992 - 2 \text{ Marks})\)

**Integer Value Correct Type**

1. The number of all possible values of \(\theta\) where \(0 < \theta < \pi\), for which the system of equations

\[(y + z) \cos 3\theta = (x+y) \sin 3\theta\]

\[x \sin 3\theta = \frac{2 \cos 3\theta}{y} + \frac{2 \sin 3\theta}{z}\]

\[(xyz) \sin 3\theta = (y + 2z) \cos 3\theta + y \sin 3\theta\]

have a solution \((x_0, y_0, z_0)\) with \(y_0 \neq 0\), is \((2010)\)

2. The number of values of \(\theta\) in the interval, \(\left(\frac{-\pi}{2}, \frac{\pi}{2}\right)\) such that \(\theta \neq \frac{n\pi}{5}\) for \(n = 0, \pm 1, \pm 2\) and \(\tan \theta = \cot 5\theta\) as well as \(\sin 2\theta = \cos 40\) is \((2010)\)

3. The maximum value of the expression

\[\frac{1}{\sin^{2} \theta + 3 \sin \theta \cos \theta + 5 \cos^{2} \theta}\]

\(4.\) Two parallel chords of a circle of radius 2 are at a distance \(\sqrt{3} + 1\) apart. If the chords subtend at the center, angles of \(\frac{\pi}{k}\) and \(\frac{2\pi}{k}\), where \(k > 0\), then the value of \([k]\) is \((2010)\)

[Note : \([k]\) denotes the largest integer less than or equal to \(k\)]

5. The positive integer value of \(n > 3\) satisfying the equation

\[\frac{1}{\sin \left(\frac{\pi}{n}\right)} = \frac{1}{\sin \left(\frac{2\pi}{n}\right)} + \frac{1}{\sin \left(\frac{3\pi}{n}\right)}\]

is \((2011)\)

6. The number of distinct solutions of the equation

\[\frac{5}{4} \cos^{2} 2x + \cos^{4} x + \sin^{4} x + \cos^{6} x + \sin^{6} x = 2\]

in the interval \([0, 2\pi]\) is \((JEE \text{ Adv. 2015})\)
Section-B

1. The period of $\sin^2 \theta$ is
   (a) $\pi^2$  (b) $\pi$  (c) $2\pi$  (d) $\pi/2$  [2002]

2. The number of solution of $\tan x + \sec x = 2\cos x$ in $[0, 2\pi]$ is
   (a) 2  (b) 3  (c) 0  (d) 1  [2002]

3. Which one is not periodic
   (a) $|\sin 3x| + \sin^2 x$  (b) $\cos \sqrt{x} + \cos^2 x$  (c) $\cos 3x + \tan^2 x$  (d) $\cos 2x + \sin x$  [2002]

4. Let $\alpha, \beta$ be such that $\pi < \alpha, \beta < 3\pi$.
   If $\sin \alpha + \sin \beta = -\frac{21}{65}$ and $\cos \alpha + \cos \beta = -\frac{27}{65}$, then the value of $\frac{\alpha - \beta}{2}$ is
   (a) $\frac{-6}{65}$  (b) $\frac{3}{\sqrt{130}}$  (c) $\frac{6}{65}$  (d) $-\frac{3}{\sqrt{130}}$  [2004]

5. If $u = \sqrt{a^2 \cos^2 \theta + b^2 \sin^2 \theta} + \sqrt{a^2 \sin^2 \theta + b^2 \cos^2 \theta}$
   then the difference between the maximum and minimum values of $u^2$ is given by
   (a) $(a-b)^2$  (b) $2\sqrt{a^2 + b^2}$  (c) $(a+b)^2$  (d) $2(a^2 + b^2)$  [2004]

6. A line makes the same angle $\theta$, with each of the x and y axis.
   If the angle $\beta$, which it makes with y-axis, is such that
   $\sin^2 \beta = 3 \sin^2 \theta$, then $\cos^2 \theta$ equals
   (a) $\frac{2}{5}$  (b) $\frac{1}{5}$  (c) $\frac{3}{5}$  (d) $\frac{2}{3}$  [2004]

7. The number of values of x in the interval $[0, 3\pi]$ satisfying the equation $2 \sin^2 x + 5 \sin x - 3 = 0$ is
   (a) 4  (b) 6  (c) 1  (d) 2  [2006]

8. If $0 < x < \pi$ and $\cos x + \sin x = \frac{1}{2}$, then $x = \frac{1}{2}$
   (a) $\frac{1-\sqrt{7}}{4}$  (b) $\frac{4-\sqrt{7}}{3}$  (c) $\frac{4+\sqrt{7}}{3}$  (d) $\frac{1+\sqrt{7}}{4}$  [2006]

9. Let $A$ and $B$ denote the statements
   $A: \cos \alpha + \cos \beta + \cos \gamma = 0$
   $B: \sin \alpha + \sin \beta + \sin \gamma = 0$
   If $\cos(\beta - \gamma) + \cos(\gamma - \alpha) + \cos(\alpha - \beta) = \frac{3}{2}$, then:
   (a) $A$ is false and $B$ is true  (b) both $A$ and $B$ are true
   (c) both $A$ and $B$ are false  (d) $A$ is true and $B$ is false  [2009]

10. Let $\cos(\alpha + \beta) = \frac{4}{5}$ and $\sin(\alpha - \beta) = \frac{5}{13}$, where
    $0 \leq \alpha, \beta \leq \frac{\pi}{4}$. Then tan $2\alpha = \frac{56}{33}$
    (a) $\frac{19}{12}$  (b) $\frac{19}{12}$  (c) $\frac{20}{7}$  (d) $\frac{25}{16}$  [2010]

11. If $A = \sin^2 x + \cos^4 x$, then for all real $x$:
    (a) $\frac{13}{16} \leq A \leq 1$  (b) $1 \leq A \leq 2$
    (c) $\frac{3}{4} \leq A \leq \frac{13}{16}$  (d) $\frac{3}{4} \leq A \leq 1$  [2011]

12. In a $\triangle PQR$, if $3\sin P + 4\cos Q = 6$ and $4\sin Q + 3\cos P = 1$, then the angle $R$ is equal to:
    (a) $\frac{5\pi}{6}$  (b) $\frac{\pi}{6}$  (c) $\frac{\pi}{4}$  (d) $\frac{3\pi}{4}$  [2012]

13. ABCD is a trapezium such that AB and CD are parallel and $BC \perp CD$. If $\angle ADB = \theta$, $BC = p$ and $CD = q$, then
    AB is equal to:
    (a) $\frac{(p^2 + q^2) \sin \theta}{p \cos \theta + q \sin \theta}$  (b) $\frac{p^2 + q^2 \cos \theta}{p \cos \theta + q \sin \theta}$
    (c) $\frac{p^2 + q^2}{p^2 \cos \theta + q^2 \sin \theta}$  (d) $\frac{(p^2 + q^2) \sin \theta}{(p \cos \theta + q \sin \theta)^2}$  [JEE M 2013]

14. The expression $\frac{\tan A}{1 - \cot A} + \frac{\cot A}{1 - \tan A}$ can be written as:
    (a) $\sin A \cos A + 1$  (b) $\sec A \cosec A + 1$
    (c) $\tan A + \cot A$  (d) $\sec A \cosec A$  [JEE M 2013]

15. Let $f_k(x) = \frac{1}{k} \left(\sin^k x + \cos^k x\right)$ where $x \in R$ and $k \geq 1$.
    Then $f_4(x) - f_6(x)$ equals
    (a) $\frac{1}{4}$  (b) $\frac{1}{12}$  (c) $\frac{1}{6}$  (d) $\frac{1}{3}$  [JEE M 2014]

16. If $0 \leq x < 2\pi$, then the number of real values of x, which satisfy the equation $\cos x + \cos 2x + \cos 3x + \cos 4x = 0$ is:
    (a) 7  (b) 9  (c) 3  (d) 5  [JEE M 2016]
CHAPTER 2

Complex Numbers

Section-A

A. Fill in the Blanks

1. If the expression
   \[ \frac{\sin \left( \frac{x}{2} \right) + \cos \left( \frac{x}{2} \right) + i \tan (x)}{1 + 2i \sin \left( \frac{x}{2} \right)} \]
   is real, then the set of all possible values of x is .......... (1987 - 2 Marks)

2. For any two complex numbers \( z_1, z_2 \) and any real number a and b.
   \[ |az_1 - bz_2|^2 + |bz_1 + az_2|^2 = ............. \] (1988 - 2 Marks)

3. If \( a, b, c \) are the numbers between 0 and 1 such that the points
   \( z_1 = a + i, z_2 = 1 + bi \) and \( z_3 = 0 \) form an equilateral triangle,
   then \( a = ........... \) and \( b = ........... \) (1989 - 2 Marks)

4. \( ABCD \) is a rhombus. Its diagonals \( AC \) and \( BD \) intersect at
   the point \( M \) and satisfy \( BD = 2AC \). If the points \( D \) and \( M \)
   represent the complex numbers \( 1 + i \) and \( 2 - i \) respectively,
   then \( A \) represents the complex number ...........or .......... (1993 - 2 Marks)

5. Suppose \( Z_1, Z_2, Z_3 \) are the vertices of an equilateral triangle
   inscribed in the circle \( |z| = 2 \). If \( Z_1 = 1 + i \sqrt{3} \) then \( Z_2 = ........... \)
   \( Z_3 = ........... \) (1994 - 2 Marks)

6. The value of the expression
   \[ 1 \cdot (2 - \omega)(2 - \omega^2) + 2 \cdot (3 - \omega)(3 - \omega^2) + .... + (n - 1) \cdot (n - \omega)(n - \omega^2) \]
   where \( \omega \) is an imaginary cube root of unity, is ....... (1996 - 2 Marks)

B. True / False

1. For complex number \( z_1 = x_1 + i\gamma_1 \) and \( z_2 = x_2 + i\gamma_2 \), we
   write \( z_1 \cap z_2 \), if \( x_1 \leq x_2 \) and \( \gamma_1 \leq \gamma_2 \). Then for all complex
   numbers \( z \) with \( 1 \cap z \), we have \( \frac{1 - z}{1 + z} \) \( \cap 0 \). (1980 - 2 Marks)

2. If the complex numbers, \( z_1, z_2 \) and \( z_3 \) represent the vertices
   of an equilateral triangle such that
   \[ |z_1| = |z_2| = |z_3| \] then \( z_1 + z_2 + z_3 = 0 \). (1984 - 1 Mark)

3. If three complex numbers are in A.P. then they lie on a circle
   in the complex plane. (1985 - 1 Mark)

4. The cube roots of unity when represented on Argand diagram form the vertices of an equilateral triangle. (1988 - 1 Mark)

C. MCQs with One Correct Answer

1. If the cube roots of unity are \( 1, \omega, \omega^2 \), then the roots of the equation \( (x - 1)^3 + 8 = 0 \) are
   (1979)
   (a) \(-1, 1 + 2\omega, 1 + 2\omega^2\) (b) \(-1, 1 - 2\omega, 1 - 2\omega^2\)
   (c) \(-1, 1, -1\) (d) None of these

2. The smallest positive integer \( n \) for which
   \[ \left( \frac{1 + i}{1 - i} \right)^n = 1 \] is
   (a) \( n = 8 \) (b) \( n = 16 \)
   (c) \( n = 12 \) (d) none of these

3. The complex numbers \( z = x + iy \) which satisfy the equation
   \[ \frac{|z - 5i|}{|z + 5i|} = 1 \] lie on
   (1981 - 2 Marks)
   (a) the x-axis (b) the straight line \( y = 5 \)
   (c) a circle passing through the origin (d) none of these

4. If \( z = \left( \frac{\sqrt{3}}{2} + i \cdot \frac{1}{2} \right)^5 + \left( \frac{\sqrt{3}}{2} - i \cdot \frac{1}{2} \right)^5 \), then
   (1982 - 2 Marks)
   (a) \( \text{Re}(z) = 0 \) (b) \( \text{Im}(z) = 0 \)
   (c) \( \text{Re}(z) > 0, \text{Im}(z) > 0 \) (d) \( \text{Re}(z) > 0, \text{Im}(z) < 0 \)

5. The inequality \( |z - 4| < |z - 2| \) represents the region given by
   (1982 - 2 Marks)
   (a) \( \text{Re}(z) \geq 0 \) (b) \( \text{Re}(z) < 0 \)
   (c) \( \text{Re}(z) > 0 \) (d) none of these

6. If \( z = x + iy \) and \( \omega = (1 - iz)/(z - i) \), then \( |\omega| = 1 \) implies that, in the complex plane,
   (1983 - 1 Mark)
   (a) \( z \) lies on the imaginary axis (b) \( z \) lies on the real axis
   (c) \( z \) lies on the unit circle (d) None of these
7. The points \( z_1, z_2, z_3, z_4 \) in the complex plane are the vertices of a parallelogram taken in order if and only if

\[ z_1 + z_4 = z_2 + z_3 \]

(a) \( z_1 + z_3 = z_2 + z_4 \)
(b) \( z_1 + z_3 = z_2 + z_4 \)
(c) None of these

8. If \( a, b, c \) and \( u, v, w \) are complex numbers representing the vertices of two triangles such that

\[ c = (1 - r)a + rb \quad \text{and} \quad w = (1 - r)u + rv, \]

where \( r \) is a complex number, then the two triangles (1985 - 2 Marks)

(a) have the same area (b) are similar
(c) are congruent (d) none of these

9. If \( \omega (\neq 1) \) is a cube root of unity and \( (1 + \omega)^2 = A + B \omega \) then \( A \) and \( B \) are respectively (1995 S)

(a) 0, 1 (b) 1, 1 (c) 1, 0 (d) 1, 1

10. Let \( z \) and \( \omega \) be two non zero complex numbers such that \( |z| = |\omega| \) and \( \arg z + \arg \omega = \pi \), then \( z \) equals (1995 S)

(a) \( \omega \) (b) \( -\omega \) (c) \( \frac{1}{\omega} \) (d) \( -\frac{1}{\omega} \)

11. Let \( z \) and \( \omega \) be two complex numbers such that \( |z| \leq 1 \), \( \arg z \leq \pi \) and \( |z + i\omega| = |z - i\omega| = 2 \) then \( z \) equals (1997 S)

(a) 1 or -i (b) i or -i (c) 1 or -1 (d) i or 1

12. For positive integers \( n_1, n_2 \), the value of the expression

\[ (1 + i)^{n_1} + (1 + i^3)^{n_2} + (1 + i^7)^{n_2} \]

is real number if and only if (1996 - 1 Marks)

(a) \( n_1 = n_2 - 1 \) (b) \( n_1 = n_2 - 1 \)
(c) \( n_1 = n_2 \) (d) \( n_1 > 0, n_2 > 0 \)

13. If \( i = \sqrt{-1} \), then \( 4 + 5 \left( \frac{1}{2} + i \frac{\sqrt{3}}{2} \right)^{345} + 3 \left( \frac{1}{2} + i \frac{\sqrt{3}}{2} \right)^{365} \)

is equal to (1998 - 2 Marks)

(a) \( 1 - i\sqrt{3} \) (b) \(-1 + i\sqrt{3} \) (c) \( i\sqrt{3} \) (d) \(-i\sqrt{3} \)

14. If \( \arg(z) < 0 \), then \( \arg(-z) = \arg(z) \) (2000 S)

(a) \( \pi \) (b) \(-\pi \) (c) \( -\frac{\pi}{2} \) (d) \( \frac{\pi}{2} \)

15. If \( z_1, z_2 \) and \( z_3 \) are complex numbers such that (2000 S)

\[ |z_1| = |z_2| = |z_3| = \frac{1}{z_1 + \frac{1}{z_2} + \frac{1}{z_3}} = 1, \]

(a) equal to 1 (b) less than 1
(c) greater than 1 (d) equal to 2

16. Let \( z_1 \) and \( z_2 \) be \( n \)th roots of unity which subtend a right angle at the origin. Then \( n \) must be of the form (2001 S)

(a) \( 4k + 1 \) (b) \( 4k + 2 \) (c) \( 4k + 3 \) (d) \( 4k \)

17. The complex numbers \( z_1, z_2 \) and \( z_3 \) satisfying

\[ \frac{z_1 - z_3}{z_2 - z_3} = \frac{1 - i\sqrt{3}}{2} \]

are the vertices of a triangle which is (2001 S)

(a) of area zero (b) right-angled isosceles
(c) equilateral (d) obtuse-angled isosceles

18. For all complex numbers \( z_1, z_2 \) satisfying \( |z_1| = 12 \) and \( |z_2 - 3 - 4i| = 5 \), the minimum value of \( |z_1 - z_2| \) is (2002 S)

(a) 0 (b) 2 (c) 7 (d) 17

19. If \( |z| = 1 \) and \( \omega = \frac{z - 1}{z + 1} \) (where \( z \neq -1 \)), then \( \text{Re}(\omega) \) is (2003 S)

(a) 0 (b) \( -\frac{1}{|z + 1|^2} \)
(c) \( \frac{z}{z + 1} \) (d) \( \frac{\sqrt{2}}{|z + 1|^2} \)

20. If \( \omega (\neq 1) \) be a cube root of unity and \( (1 + \omega^2)^n = (1 + \omega^4)^n \), then the least positive value of \( n \) is (2004 S)

(a) 2 (b) 3 (c) 5 (d) 6

21. The locus of \( z \) which lies in shaded region (excluding the boundaries) is best represented by (2005 S)

\[ z : |z + 1| > 2 \quad \text{and} \quad \arg(z + 1) < \pi/4 \]

(a) \( z : \arg(z + 1) < \pi/4 \) (b) \( z : \arg(z + 1) < \pi/4 \)
(c) \( z : |z + 1| > 2 \quad \text{and} \quad \arg(z + 1) < \pi/2 \)
(d) \( z : |z + 1| > 2 \quad \text{and} \quad \arg(z - 1) < \pi/2 \)

22. \( a, b, c \) are integers, not all simultaneously equal and \( \omega \) is cube root of unity \( (\omega \neq 1) \), then minimum value of \( \arg(a + b\omega + c\omega^2) \) is (2005 S)

(a) 0 (b) 1 (c) \( \frac{\sqrt{3}}{2} \) (d) \( \frac{1}{2} \)

23. Let \( \omega = \frac{-1 + i\sqrt{3}}{2} \), then the value of the det.

\[ \begin{vmatrix} 1 & 1 & 1 \\ 1 & -\omega & \omega^2 \\ 1 & \omega^2 & \omega \end{vmatrix} \]

is (2002 - 2 Marks)

(a) \( 3\omega \) (b) \( 3\omega(\omega - 1) \)
(c) \( 3\omega^2 \) (d) \( 3\omega(1 - \omega) \)

24. If \( \frac{w - wz}{1 - z} \) is purely real where \( w = \alpha + \beta \), \( \beta \neq 0 \) and \( z \neq 1 \), then the set of the values of \( z \) is (2006 - 3M, -1)

(a) \( \{ z : |z| = 1 \} \) (b) \( \{ z : z = \bar{z} \} \)
(c) \( \{ z : z \neq 1 \} \) (d) \( \{ z : |z| = 1, z \neq 1 \} \)
25. A man walks a distance of 3 units from the origin towards the north-east (N 45° E) direction. From there, he walks a distance of 4 units towards the north-west (N 45° W) direction to reach a point $P$. Then the position of $P$ in the Argand plane is (2007 - 3 marks)
(a) $3e^{i\pi/4} + 4i$ (b) $(3 - 4i)e^{i\pi/4}$
(c) $(4 + 3i)e^{i\pi/4}$ (d) $(3 + 4i)e^{i\pi/4}$

26. If $|z| = 1$ and $z \neq \pm 1$, then all the values of $\frac{z}{1 - z^2}$ lie on
(a) a line not passing through the origin (2007 - 3 marks)
(b) $|z| = \sqrt{2}$
(c) the x-axis
(d) the y-axis

27. A particle $P$ starts from the point $z_0 = 1 + 2i$, where $i = \sqrt{-1}$. It moves horizontally away from origin by 5 units and then vertically away from origin by 3 units to reach a point $z_1$. From $z_1$, the particle moves $\sqrt{2}$ units in the direction of the vector $\hat{i} + \hat{j}$ and then it moves through an angle $\pi/2$ in anticlockwise direction on a circle with centre at origin, to reach a point $z_2$. The point $z_2$ is given by (2008)
(a) $6 + 7i$ (b) $-7 + 6i$
(c) $7 + 6i$ (d) $-6 + 7i$

28. Let $z = \cos \theta + i \sin \theta$. Then the value of $\sum_{m=1}^{15} \text{Im}(z^{2m-1})$ at $\theta = 2^\circ$ is (2009)
(a) $\frac{1}{\sin 2^\circ}$ (b) $\frac{1}{3 \sin 2^\circ}$
(c) $\frac{1}{2 \sin 2^\circ}$ (d) $\frac{1}{4 \sin 2^\circ}$

29. Let $z = x + iy$ be a complex number where $x$ and $y$ are integers. Then the area of the rectangle whose vertices are the roots of the equation: $z z^3 + \bar{z} z^3 = 350$ is (2009)
(a) 48 (b) 32 (c) 40 (d) 80

30. Let $z$ be a complex number such that the imaginary part of $z$ is non-zero and $a = z^2 + z + 1$ is real. Then it cannot take the value (2012)
(a) $-1$ (b) $\frac{1}{3}$ (c) $\frac{1}{2}$ (d) $\frac{3}{4}$

31. Let complex numbers $\alpha$ and $\frac{1}{\alpha}$ lie on circles $(x - x_0)^2 + (y - y_0)^2 = r^2$ and $(x - x_0)^2 + (y - y_0)^2 = 4r^2$ respectively. If $z_0 = x_0 + iy_0$ satisfies the equation $2|z_0|^2 = r^2 + 2$, then $|\alpha| = (JEE Adv. 2013)$
(a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{2}$ (c) $\frac{1}{\sqrt{7}}$ (d) $\frac{1}{3}$

32. MCQs with One or More than One Correct

1. If $z_1 = a + ib$ and $z_2 = c + id$ are complex numbers such that $|z_1| = |z_2| = 1$ and $\text{Re}(z_1 \bar{z}_2) = 0$, then the pair of complex numbers $w_1 = a + ic$ and $w_2 = b + id$ satisfies (1985 - 2 Marks)
(a) $|w_1| = 1$ (b) $|w_2| = 1$
(c) $\text{Re}(w_1 \bar{w}_2) = 0$ (d) none of these

2. Let $z_1$ and $z_2$ be complex numbers such that $z_1 \neq z_2$ and $|z_1| = |z_2|$. If $z_1$ has positive real part and $z_2$ has negative imaginary part, then $\frac{z_1 + z_2}{z_1 - z_2}$ may be (1986 - 2 Marks)
(a) zero (b) real and positive
(c) real and negative (d) purely imaginary
(e) none of these.

3. If $z_1$ and $z_2$ are two nonzero complex numbers such that $|z_1 + z_2| = |z_1| + |z_2|$, then $\arg z_1 - \arg z_2$ is equal to (1987 - 2 Marks)
(a) $-\pi$ (b) $\pi/2$
(c) $0$ (d) $\pi/2$
(e) $\pi$

4. The value of $\sum_{k=1}^{6} (\cos \frac{2\pi k}{7} + i \cos \frac{2\pi k}{7})$ is (1987 - 2 Marks)
(a) $-1$ (b) 0 (c) $-i$ (d) $i$
(e) None

5. If $\omega$ is an imaginary cube root of unity, then $(1 + \omega - \omega^2)^7$ equals (1998 - 2 Marks)
(a) $128\omega$ (b) $-128\omega$ (c) $128\omega^2$ (d) $-128\omega^2$

6. The value of the sum $\sum_{n=1}^{13} (i^n + i^{n+1})$, where $i = \sqrt{-1}$, equals (1998 - 2 Marks)
(a) $i$ (b) $i - 1$ (c) $-i$ (d) 0

7. If $\begin{vmatrix} 4 & 3i & -1 \\ 20 & 3 & i \\ 6i & -3i & 1 \end{vmatrix}$, then (1998 - 2 Marks)
\[
\begin{vmatrix} x & 3, y = 2 \\ x = 1, y = 3 \\ x = 0, y = 0 \end{vmatrix}
\]
\[
\begin{vmatrix} x & 0, y = 0 \\ x = 0, y = 0 \end{vmatrix}
\]

8. Let $z_1$ and $z_2$ be two distinct complex numbers and let $z = (1 + i)z_1 + iz_2$ for some real number $t$ with $0 < t < 1$. If $\text{Arg}(w)$ denotes the principal argument of a non-zero complex number $w$, then (2010)
(a) $|z - z_1| + |z - z_2| = |z_1 - z_2|
(b) $\text{Arg}(z - z_1) = \text{Arg}(z - z_2)$
(c) $\text{Arg}(z - z_1) = \text{Arg}(z - z_2)$
(d) $\text{Arg}(z - z_1) = \text{Arg}(z - z_2)$
9. Let \( w = \frac{\sqrt{3} + i}{2} \) and \( P = \{w^n : n = 1, 2, 3,...\} \). Further \( H_1 = \left\{ z \in \mathbb{C} : \text{Re} z \leq \frac{1}{2} \right\} \) and \( H_2 = \left\{ z \in \mathbb{C} : \text{Re} z < -\frac{1}{2} \right\} \), where \( c \) is the set of all complex numbers. If \( z_1 \) is a point in \( H_1 \) and \( z_2 \) is a point in \( H_2 \), then \( \angle z_1 O z_2 = \) (JEE Adv. 2013)
   (a) \( \frac{p}{2} \)  (b) \( \frac{p}{6} \)  (c) \( \frac{2p}{3} \)  (d) \( \frac{5p}{6} \)

10. Let \( a, b \in \mathbb{R} \) and \( a^2 + b^2 \neq 0 \).
    Suppose \( S = \left\{ z \in \mathbb{C} : z = \frac{-1}{a + ibt} , + \in \mathbb{R} , t \neq 0 \right\} \), where \( i = \sqrt{-1} \). If \( z = x + iy \) and \( z \in S \), then \((x, y)\) lies on \( \) (JEE Adv. 2016)
    (a) the circle with radius \( \frac{1}{2a} \) and centre \( \left( \frac{1}{2a}, 0 \right) \) for \( a > 0 \), \( b \neq 0 \)
    (b) the circle with radius \( \frac{1}{2a} \) and centre \( \left( \frac{1}{2a}, 0 \right) \) for \( a < 0 \), \( b \neq 0 \)
    (c) the x-axis for \( a \neq 0 \), \( b = 0 \)
    (d) the y-axis for \( a = 0 \), \( b \neq 0 \)

**E** Subjective Problems

1. Express \( \frac{1}{1 - \cos \theta + 2i \sin \theta} \) in the form \( x + iy \). \((1978)\)

2. If \( x = a + b \), \( y = \gamma + \beta \) and \( z = a + i \beta \) where \( \gamma \) and \( \beta \) are the complex cube roots of unity, show that \( xyz = a^3 + b^3 \). \((1978)\)

3. If \( x + iy = \frac{a + ib}{\sqrt{c + id}} \), prove that \( (x^2 + y^2)^2 = \frac{a^2 + b^2}{c^2 + d^2} \). \( (1979)\)

4. Find the real values of \( x \) and \( y \) for which the following equation is satisfied \( \frac{(1+i)x-2i}{3+i} + \frac{(2-3i)y+t}{3-i} = i \) \( (1980)\)

5. Let the complex numbers \( z_1 \), \( z_2 \), and \( z_3 \) be the vertices of an equilateral triangle. Let \( z_0 \) be the circumcentre of the triangle. Then prove that \( z_0^2 + z_2^2 + z_3^2 = 3z_0^2 \). \( (1981 - 4 Marks)\)

6. Prove that the complex numbers \( z_1 \), \( z_2 \) and the origin form an equilateral triangle only if \( z_1^2 + z_2^2 - z_1z_2 = 0 \). \( (1983 - 3 Marks)\)

7. If \( a_1, a_2, ..., a_{n-1} \) are the \( n \) roots of unity, then show that \( (1-a_1)(1-a_2)(1-a_3)....(1-a_{n-1}) = n \) \( (1984 - 2 Marks)\)

8. Show that the area of the triangle on the Argand diagram formed by the complex numbers \( z, iz \) and \( z + iz \) is \( \frac{1}{2} |z|^2 \). \( (1986 - 2\frac{1}{2} Marks)\)

9. Let \( Z_1 = 10 + 6i \) and \( Z_2 = 4 + 6i \). If \( Z \) is any complex number such that the argument of \( \frac{(Z - Z_1)}{(Z - Z_2)} \) is \( \frac{\pi}{4} \), then prove that \( |Z - 9i| = 3\sqrt{2} \). \( (1990 - 4 Marks)\)

10. If \( iz^3 + z^2 - z + i = 0 \), then show that \( |z| = 1 \). \( (1995 - 5 Marks)\)

11. If \( |Z| \leq 1 \), \( |W| \leq 1 \), show that \( |Z - W|^2 \leq (|Z| - |W|)^2 + (\text{Arg } Z - \text{Arg } W)^2 \) \( (1995 - 5 Marks)\)

12. Find all non-zero complex numbers \( Z \) satisfying \( \overline{Z} = iz^2 \). \( (1996 - 2 Marks)\)

13. Let \( z_1 \) and \( z_2 \) be roots of the equation \( z^2 + pz + q = 0 \), where the coefficients \( p \) and \( q \) may be complex numbers. Let \( A \) and \( B \) represent \( z_1 \) and \( z_2 \) in the complex plane. If \( \angle AOB = \alpha \neq 0 \) and \(OA = OB\), where \(O\) is the origin, prove that \( p^2 = 4q \cos^2 \left( \frac{\alpha}{2} \right) \). \( (1997 - 5 Marks)\)

14. For complex numbers \( z \) and \( w \), prove that \( |z|^2 + |w|^2 \) if and only if \( z = w \) or \( z = \overline{w} \). \( (1999 - 10 Marks)\)

15. Let a complex number \( \alpha, \alpha \neq 1 \), be a root of the equation \( z^n - \alpha z^{n-1} + 1 = 0 \), where \( p, q \) are distinct primes. Show that either \( 1 + \alpha + \alpha^2 + ... + \alpha^{n-1} = 0 \) or \( 1 + \alpha + \alpha^2 + ... + \alpha^{n-1} = 0 \), but not both together. \( (2002 - 5 Marks)\)

16. If \( z_1 \) and \( z_2 \) are two complex numbers such that \( |z_1| < 1 < |z_2| \), then prove that \( \left| \frac{1 - z_1z_2}{z_1 - z_2} \right| < 1 \). \( (2003 - 2 Marks)\)

17. Prove that there exists no positive integer \( n \) such that \( \frac{(1+i)x-2i}{3+i} + \frac{(2-3i)y+t}{3-i} < 0 \) \( (2003 - 2 Marks)\)

18. Find the centre and radius of circle given by \( \frac{z - \alpha}{z - \beta} = k, k \neq 1 \) \( (2004 - 2 Marks)\), where \( z = x + iy \), \( \alpha = \alpha_1 + i\alpha_2 \), \( \beta = \beta_1 + i\beta_2 \).

19. If one of the vertices of the square circumscribing the circle \( |z - 1| = \sqrt{2} \) is \( 2 + \sqrt{3} i \). Find the other vertices of the square. \( (2005 - 4 Marks)\)
**Complex Numbers**

**F**

**Match the Following**

**DIRECTIONS (Q. 1 and 2) :** Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:
If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. \( z \neq 0 \) is a complex number

   **Column I**
   
   (A) \( \text{Re} \ z = 0 \)
   
   (B) \( \text{Arg} \ z = \frac{\pi}{4} \)

   **Column II**
   
   (p) \( \text{Re} \ z^2 = 0 \)
   
   (q) \( \text{Im} \ z^2 = 0 \)
   
   (r) \( \text{Re} \ z^2 = \text{Im} \ z^2 \)

   **(1992 - 2 Marks)**

2. Match the statements in Column I with those in Column II.

   **Note:** Here \( z \) takes values in the complex plane and \( \text{Im} \ z \) and \( \text{Re} \ z \) denote, respectively, the imaginary part and the real part of \( z \).

   **Column I**
   
   (A) The set of points \( z \) satisfying \( |z - i| = |z + i| \) is contained in or equal to
   
   (B) The set of points \( z \) satisfying \( |z + 4| + |z - 4| = 10 \) is contained in or equal to
   
   (C) If \( |w| = 2 \), then the set of points \( z = w - \frac{1}{w} \) is contained in or equal to
   
   (D) If \( |w| = 1 \), then the set of points \( z = w + \frac{1}{w} \) is contained in or equal to.

   **Column II**
   
   (p) an ellipse with eccentricity \( \frac{4}{5} \)
   
   (q) the set of points \( z \) satisfying \( \text{Im} \ z = 0 \)
   
   (r) the set of points \( z \) satisfying \( |\text{Im} \ z| \leq 1 \)
   
   (s) the set of points \( z \) satisfying \( |\text{Re} \ z| < 2 \)
   
   (t) the set of points \( z \) satisfying \( |z| \leq 3 \)

   **(2010)**

**DIRECTIONS (Q. 3) :** Following question has matching lists. The codes for the list have choices (a), (b), (c) and (d) out of which ONLY ONE is correct.

3. Let \( z_k = \cos \left( \frac{2k\pi}{10} \right) + i\sin \left( \frac{2k\pi}{10} \right) \); \( k = 1, 2, ..., 9 \).

   **List-I**
   
   P. For each \( z_k \) there exists as \( z_j \) such that \( z_k \cdot z_j = 1 \)
   
   Q. There exists a \( k \in \{1, 2, ..., 9\} \) such that \( z_1 \cdot z = z_k \)

   **List-II**
   
   1. True
   
   2. False

   has no solution \( z \) in the set of complex numbers

   \[ \frac{|1-z_1||1-z_2|...|1-z_9|}{10} \]

   3. 1

   \[ 1 - \sum_{k=1}^{9} \cos \left( \frac{2k\pi}{10} \right) \]

   4. 2

   **P Q R S**
   
   (a) 1 2 4 3
   
   (b) 2 1 3 4
   
   (c) 1 2 3 4
   
   **(JEE Adv. 2014)**
Comprehension Based Questions

PASSAGE-1
Let \( A, B, C \) be three sets of complex numbers as defined below
\[ \begin{align*}
A &= \{ z : \text{Im } z \geq 1 \} \\
B &= \{ z : |z - 2 - i| = 3 \} \\
C &= \{ z : \text{Re}((1 - i)z) = \sqrt{2} \}
\end{align*} \]

1. The number of elements in the set \( A \cap B \cap C \) is \( \boxed{2008} \)
   (a) 0 (b) 1 (c) 2 (d) \( \infty \)

2. Let \( z \) be any point in \( A \cap B \cap C \).
   Then, \( |z + 1 - i|^2 + |z - 5 - i|^2 \) lies between \( \boxed{2008} \)
   (a) 25 and 29 (b) 30 and 34 (c) 35 and 39 (d) 40 and 44

3. Let \( z \) be any point \( A \cap B \cap C \) and let \( w \) be any point
   satisfying \( |w - 2 - i| < 3 \). Then, \( |z| - |w| + 3 \) lies between
   \( \boxed{2008} \)
   (a) \(-6\) and \(3\) (b) \(-3\) and \(6\) (c) \(-6\) and \(6\) (d) \(-3\) and \(9\)

PASSAGE-2
Let \( S = S_1 \cap S_2 \cap S_3 \), where
\[ \begin{align*}
S_1 &= \{ z \in \mathbb{C} : |z| < 4 \} \\
S_2 &= \left\{ z \in \mathbb{C} : \text{Im} \left( \frac{z - 1 + \sqrt{3}i}{1 - \sqrt{3}i} \right) > 0 \right\} \\
S_3 &= \{ z \in \mathbb{C} : \text{Re } z > 0 \}
\end{align*} \]

4. Area of \( S \) = \( \boxed{2013} \)
   (a) \(\frac{10\pi}{3}\) (b) \(\frac{20\pi}{3}\) (c) \(\frac{16\pi}{3}\) (d) \(\frac{32\pi}{3}\)

Section-B

JEE Main/AIEEE

1. \( z \) and \( w \) are two nonzero complex numbers such that \( |z| = |w| \)
   and \( \text{Arg } z + \text{Arg } w = \pi \) then \( z \) equals \( \boxed{2002} \)
   (a) \(\frac{z}{\bar{w}}\) (b) \(-\bar{w}\) (c) \(\omega\) (d) \(-\omega\)

2. If \( |z - 4| < |z - 2| \), its solution is given by \( \boxed{2002} \)
   (a) \(\text{Re}(z) > 0\) (b) \(\text{Re}(z) < 0\) (c) \(\text{Re}(z) > 3\) (d) \(\text{Re}(z) > 2\)

3. The locus of the centre of a circle which touches the circle \( |z - z_1| = a \) and \( |z - z_2| = b \)
   externally \( (z, z_1 \text{ & } z_2 \text{ are complex numbers}) \) will be \( \boxed{2002} \)
   (a) an ellipse (b) a hyperbola (c) a circle (d) none of these

4. If \( z \) and \( \omega \) are two non-zero complex numbers such that \( |z\omega| = 1 \)
   and \( \text{Arg}(z) - \text{Arg}(\omega) = \frac{\pi}{2} \), then \( z \omega \) is equal to \( \boxed{2003} \)
   (a) \(-i\) (b) \(1\) (c) \(-1\) (d) \(i\)

5. Let \( Z_1 \) and \( Z_2 \) be two roots of the equation
   \( Z^2 + aZ + b = 0 \), \( Z \) being complex. Further, assume that
   the origin, \( Z_1 \) and \( Z_2 \) form an equilateral triangle. Then \( \boxed{2003} \)
   (a) \(a^2 = 4b\) (b) \(a^2 = b\) (c) \(a^2 = 2b\) (d) \(a^2 = 3b\)

6. If \( \left( \frac{1 + i}{1 - i} \right)^3 = 1 \) then \( \boxed{2003} \)
   (a) \(x = 2n + 1\), where \( n \) is any positive integer
   (b) \(x = 4n\), where \( n \) is any positive integer
   (c) \(x = 2n\), where \( n \) is any positive integer
   (d) \(x = 4n + 1\), where \( n \) is any positive integer

7. Let \( z \) and \( w \) be complex numbers such that \( \bar{z} + i\bar{w} = 0 \) and
   \( \text{arg } z\omega = \pi \). Then \( \text{arg } z \) equals \( \boxed{2004} \)
   (a) \(\frac{5\pi}{4}\) (b) \(\frac{\pi}{2}\) (c) \(\frac{3\pi}{4}\) (d) \(\frac{\pi}{4}\)
CHAPTER 1

Trigonometric Functions & Equations

Section-A

A Fill in the Blanks

1. Suppose \( \sin^3 x \sin 3x = \sum_{m=0}^{n} C_m \cos mx \) is an identity in \( x \), where \( C_0, C_1, \ldots, C_n \) are constants, and \( C_n \neq 0 \) then the value of \( n \) is __________.  
   \( 1981 - 2 \text{ Marks} \)

2. The solution set of the system of equations \( x + y = \frac{2\pi}{3} \), \( \cos x + \cos y = \frac{3}{2} \), where \( x \) and \( y \) are real, is __________.  
   \( 1987 - 2 \text{ Marks} \)

3. The set of all \( x \) in the interval \( [0, \pi] \) for which \( 2 \sin^2 x - 3 \sin x + 1 \geq 0 \), is __________.  
   \( 1987 - 2 \text{ Marks} \)

4. The sides of a triangle inscribed in a given circle subtend angles \( \alpha, \beta \) and \( \gamma \) at the centre. The minimum value of the arithmetic mean of \( \cos \left( \frac{\alpha + \pi}{2} \right), \cos \left( \beta + \frac{\pi}{2} \right) \) and \( \cos \left( \gamma + \frac{\pi}{2} \right) \) is equal to __________.  
   \( 1987 - 2 \text{ Marks} \)

5. The value of \( \frac{\pi}{14} \sin \frac{3\pi}{14} \sin \frac{5\pi}{14} \sin \frac{7\pi}{14} \sin \frac{9\pi}{14} \sin \frac{11\pi}{14} \sin \frac{13\pi}{14} \) is equal to __________.  
   \( 1991 - 2 \text{ Marks} \)

6. If \( K = \sin(\pi/18) \sin(5\pi/18) \sin(7\pi/18) \), then the numerical value of \( K \) is __________.  
   \( 1993 - 2 \text{ Marks} \)

7. If \( A > 0, B > 0 \) and \( A + B = \pi/3 \), then the maximum value of \( \tan A \tan B \) is __________.  
   \( 1993 - 2 \text{ Marks} \)

8. General value of \( \theta \) satisfying the equation \( \tan^2 \theta + \sec^2 \theta = 1 \) is __________.  
   \( 1996 - 1 \text{ Mark} \)

9. The real roots of the equation \( \cos^7 x + \sin^4 x = 1 \) in the interval \( (-\pi, \pi) \) are ..., ..., and __________.  
   \( 1997 - 2 \text{ Marks} \)

B True / False

1. If \( \tan A = (1 - \cos B) / \sin B \), then \( 2A = \tan B \).  
   \( 1983 - 1 \text{ Mark} \)

2. There exists a value of \( \theta \) between 0 and \( 2\pi \) that satisfies the equation \( \sin^4 \theta - 2 \cos^2 \theta - 1 = 0 \).  
   \( 1984 - 1 \text{ Mark} \)

C MCQs with One Correct Answer

1. If \( \tan \theta = -\frac{4}{3} \), then \( \sin \theta \) is  
   (a) \( -\frac{4}{5} \) but not \( \frac{4}{5} \)  
   (b) \( -\frac{4}{5} \) or \( \frac{4}{5} \)  
   (c) \( \frac{4}{5} \) but not \( -\frac{4}{5} \)  
   (d) None of these.  
   \( 1979 \)

2. If \( \tan \frac{\alpha}{2} + \tan \frac{\beta}{2} + \tan \frac{\gamma}{2} = \tan \frac{\alpha}{2} \tan \frac{\beta}{2} \tan \frac{\gamma}{2} \), then  
   (a) \( \tan \frac{\alpha}{2} + \tan \frac{\beta}{2} + \tan \frac{\gamma}{2} = \tan \frac{\alpha}{2} \tan \frac{\beta}{2} \tan \frac{\gamma}{2} \)  
   (b) \( \tan \frac{\alpha}{2} \tan \frac{\beta}{2} + \tan \frac{\gamma}{2} = \tan \frac{\alpha}{2} \tan \frac{\beta}{2} \tan \frac{\gamma}{2} \)  
   (c) \( \tan \frac{\alpha}{2} \tan \frac{\beta}{2} + \tan \frac{\gamma}{2} = -\tan \frac{\alpha}{2} \tan \frac{\beta}{2} \tan \frac{\gamma}{2} \)  
   (d) None of these.  
   \( 1979 \)

3. Given \( A = \sin^2 \theta + \cos^4 \theta \) then for all real values of \( \theta \)  
   (a) \( 1 \leq A \leq 2 \)  
   (b) \( \frac{3}{4} \leq A \leq 1 \)  
   (c) \( \frac{13}{16} \leq A \leq 1 \)  
   (d) \( \frac{3}{4} \leq A \leq \frac{13}{16} \)  
   \( 1980 \)

4. The equation \( 2 \cos^2 \frac{x}{2} \sin^2 x = x^2 + x^2 \), \( 0 < x \leq \frac{\pi}{2} \) has  
   (a) no real solution  
   (b) one real solution  
   (c) more than one solution  
   (d) none of these  
   \( 1980 \)

5. The general solution of the trigonometric equation \( \sin x + \cos x = 1 \) is given by:  
   (a) \( x = 2n\pi + \frac{\pi}{4} \), \( n = 0, \pm 1, \pm 2, \ldots \)  
   (b) \( x = 2n\pi + \frac{\pi}{2} \), \( n = 0, \pm 1, \pm 2, \ldots \)  
   (c) \( x = n\pi + (-1)^n \frac{\pi}{4} \), \( n = 0, \pm 1, \pm 2, \ldots \)  
   (d) none of these  
   \( 1981 - 2 \text{ Marks} \)
6. The value of the expression $\sqrt{3} \cos 20^\circ - \sec 20^\circ$ is equal to
(a) 2 (b) 2 sin $20^\circ \sin 40^\circ$ (c) 4 (d) 4 sin $20^\circ \sin 40^\circ$

7. The general solution of $\sin x - 3 \sin 2x + \sin 3x = \cos x - 3 \cos 2x + \cos 3x$ is
(a) $n\pi + \frac{\pi}{8}$ (b) $n\pi + \frac{\pi}{2}$ (c) $(-1)^n \frac{n\pi}{2} + \frac{\pi}{8}$ (d) $2n\pi + \cos^{-1} \frac{3}{2}$

8. The equation $(\cos p - 1)x^2 + (\cos p)x + \sin p = 0$ in the variable $x$, has real roots. Then $p$ can take any value in the interval
(a) $0, 2\pi$ (b) $(-\pi, 0)$ (c) $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ (d) $0, \pi$

9. Number of solutions of the equation $\tan x + \sec x = 2\cos x$ lying in the interval $[0, 2\pi]$ is:
(a) 0 (b) 1 (c) 2 (d) 3

10. Let $0 < x < \frac{\pi}{4}$ then $(\sec 2x - \tan 2x)$ equals
(a) $\tan \left(\frac{x - \pi}{4}\right)$ (b) $\tan \left(\frac{\pi}{4} - x\right)$ (c) $\tan \left(\frac{x + \pi}{4}\right)$ (d) $\tan^2 \left(\frac{x + \pi}{4}\right)$

11. Let $n$ be a positive integer such that
$\sin \frac{\pi}{2n} + \cos \frac{\pi}{2n} = \frac{\sqrt{n}}{2}$. Then
(a) $6 \leq n \leq 8$ (b) $4 < n \leq 8$ (c) $4 \leq n \leq 8$ (d) $4 < n < 8$

12. If $\omega$ is an imaginary cube root of unity then the value of $\sin \left(\omega^{10} + \omega^{23}\pi - \frac{\pi}{4}\right)$ is
(a) $-\frac{\sqrt{3}}{2}$ (b) $-\frac{1}{\sqrt{2}}$ (c) $\frac{1}{\sqrt{2}}$ (d) $\frac{\sqrt{3}}{2}$

13. $3(\sin x - \cos x)^4 + 6(\sin x + \cos x)^2 + 4(\sin^6 x + \cos^6 x) = \text{(1995S)}$
(a) 11 (b) 12 (c) 13 (d) 14

14. The general values of $\theta$ satisfying the equation $2\sin^2 \theta - 3\sin \theta - 2 = 0$ is
(a) $n\pi + \frac{(-1)^n \pi}{6}$ (b) $n\pi + \frac{(-1)^n \pi}{2}$ (c) $n\pi + \frac{(-1)^n 5\pi}{6}$ (d) $n\pi + \frac{(-1)^n 7\pi}{6}$

15. $\sec^2 \theta = \frac{4\sin \phi}{(x + y)^2}$ is true if and only if
(a) $x + y \neq 0$ (b) $x = y, x \neq 0$ (c) $x = y$ (d) $x \neq 0, y \neq 0$

16. In a triangle $PQR$, $\angle R = \pi/2$. If $\tan(P/2)$ and $\tan(Q/2)$ are the roots of the equation $ax^2 + bx + c = 0 (a \neq 0)$ then
$a + b = c$ (b) $b + c = a$ (c) $c + a = b$ (d) $b = c$

17. Let $f(\theta) = \sin \theta_1(\sin \theta_2 + \sin \theta_3)$. Then $f(\theta)$ is
(a) $\geq 0$ only when $\theta \geq 0$ (b) $\leq 0$ for all real $\theta$ (c) $\geq 0$ for all real $\theta$ (d) $\leq 0$ only when $\theta \leq 0$

18. The number of distinct real roots of
$\frac{\sin x}{\cos x} \frac{\cos x}{\cos x}$
$\frac{\cos x}{\cos x} \frac{\cos x}{\sin x}$
$\frac{\cos x}{\cos x} \frac{\cos x}{\cos x}$

is 0 in the interval $-\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$
(a) 0 (b) 2 (c) 1 (d) 3

19. The maximum value of $(\cos \alpha_1)(\cos \alpha_2)\ldots(\cos \alpha_n)$, under the restrictions
$0 \leq \alpha_1, \alpha_2, \ldots, \alpha_n \leq \frac{\pi}{2}$ and $(\cot \alpha_1)(\cot \alpha_2)\ldots(\cot \alpha_n) = 1$ is
(a) $1/2^n$ (b) $1/2^n$ (c) $1/2^n$ (d) $1$

20. If $\alpha + \beta = \pi/2$ and $\beta + \gamma = \alpha$, then $\tan \alpha$ equals
(a) $2(\tan \beta + \tan \gamma)$ (b) $\tan \beta + \tan \gamma$ (c) $\tan \beta + 2\tan \gamma$ (d) $2\tan \beta + \tan \gamma$

21. The number of integral values of $k$ for which the equation $7 \cos x + 5 \sin x = 2k + 1$ has a solution is
(a) 4 (b) 8 (c) 10 (d) 12

22. Given both $\theta$ and $\phi$ are acute angles and $\sin \theta = \frac{1}{2}$, $\cos \phi = \frac{1}{3}$, then the value of $\theta + \phi$ belongs to

(a) $\left(\frac{\pi}{3}, \frac{\pi}{2}\right)$ (b) $\left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$ (c) $\left(\frac{2\pi}{3}, \frac{5\pi}{6}\right)$ (d) $\left(\frac{5\pi}{6}, \pi\right)$

23. $\cos(\alpha - \beta) = 1$ and $\cos(\alpha + \beta) = 1/e$ where $\alpha, \beta \in [-\pi, \pi]$. Pairs of $\alpha, \beta$ which satisfy both the equations is/are

(a) $0$ (b) $1$ (c) $2$ (d) $4$

24. The values of $\theta \in (0, 2\pi)$ for which $2\sin^2 \theta - 5 \sin \theta + 2 > 0$, are

(a) $0, \frac{\pi}{6} \cup \left(\frac{5\pi}{6}, \frac{7\pi}{6}\right)$ (b) $\left(\frac{5\pi}{8}, \frac{7\pi}{6}\right)$ (c) $\left(0, \frac{\pi}{6}\right) \cup \left(\frac{\pi}{6}, \frac{5\pi}{6}\right) \cup \left(\frac{4\pi}{3}, \pi\right)$

25. $\frac{\pi}{8}$ $\frac{5\pi}{6}$ $\pi$
25. Let \( \theta \in \left(0, \frac{\pi}{4}\right) \) and \( t_1 = (\tan \theta)^{\tan \theta}, t_2 = (\tan \theta)^{\cot \theta}, \) \( t_3 = (\cot \theta)^{\tan \theta} \) and \( t_4 = (\cot \theta)^{\cot \theta}, \) then \( (2006 - 3M, -1) \)
(a) \( t_1 > t_2 > t_3 > t_4 \)  (b) \( t_4 > t_3 > t_1 > t_2 \)
(c) \( t_3 > t_1 > t_4 > t_2 \)  (d) \( t_2 > t_3 > t_4 > t_1 \)
26. The number of solutions of the pair of equations \( 2 \sin^2 \theta - \cos 2 \theta = 0 \) \( 2 \cos^2 \theta - 3 \sin \theta = 0 \) in the interval \([0, 2\pi]\) is \( (2007 - 3 \text{ Marks}) \)
(a) zero  (b) one  (c) two  (d) four
27. For \( x \in (0, \pi) \), the equation \( \sin x + 2 \sin 2x - \sin 3x = 3 \) has \( (JEE \text{ Adv. } 2014) \)
(a) infinitely many solutions  (b) three solutions
(c) one solution  (d) no solution
28. Let \( S = \left\{ x \in (-\pi, \pi) : x \neq 0, \pm \frac{\pi}{2} \right\} \). The sum of all distinct solutions of the equation \( \sqrt{3} \sec x + \csc x + 2(\tan x - \cot x) = 0 \) in the set \( S \) is equal to \( (JEE \text{ Adv. } 2016) \)
(a) \(-\frac{7\pi}{9}\)  (b) \(-\frac{2\pi}{9}\)
(c) \(0\)  (d) \(\frac{5\pi}{9}\)
29. The value of \( \sum_{k=1}^{13} \frac{1}{\sin \left(\pi + \frac{(k-1)\pi}{6}\right) \sin \left(\frac{\pi + k\pi}{4}\right)} \) is equal to \( (JEE \text{ Adv. } 2016) \)
(a) \(3 - \sqrt{3}\)  (b) \(2\left(3 - \sqrt{3}\right)\)
(c) \(2\left(\sqrt{3} - 1\right)\)  (d) \(2\left(2 - \sqrt{3}\right)\)

D MCQs with One or More than One Correct

1. \( \left(1 + \cos \frac{\pi}{8}\right) \left(1 + \cos \frac{3\pi}{8}\right) \left(1 + \cos \frac{5\pi}{8}\right) \left(1 + \cos \frac{7\pi}{8}\right) \) is equal to \( (1984 - 3 \text{ Marks}) \)
(a) \(\frac{1}{2}\)  (b) \(\cos \frac{\pi}{8}\)
(c) \(\frac{1}{8}\)  (d) \(\frac{1 + \sqrt{2}}{2\sqrt{2}}\)
2. The expression \( 3 \left[ \sin^4 \left(\frac{3\pi}{2} - \alpha\right) + \sin^4 (3\pi + \alpha) \right] - 2 \left[ \sin^6 \left(\frac{\pi}{2} + \alpha\right) + \sin^6 (5\pi - \alpha) \right] \) is equal to \( (1986 - 2 \text{ Marks}) \)
(a) \(0\)  (b) \(1\)
(c) \(3\)  (d) \(\sin 4\alpha + \cos 6\alpha\)
(e) none of these
3. The number of all possible triplets \( (a_1, a_2, a_3) \) such that \( a_1 + a_2 \cos (2x) + a_3 \sin^2 (x) = 0 \) for all \( x \) is \( (1987 - 2 \text{ Marks}) \)
(a) zero  (b) one  (c) three
(d) infinite  (e) none
4. The values of \( \theta \) lying between \( 0 = \theta = \pi/2 \) and satisfying the equation \( (1988 - 2 \text{ Marks}) \)
\[
\begin{array}{ccc}
1 + \sin^2 \theta & \cos^2 \theta & 4 \sin 40 \\
\sin^2 \theta & 1 + \cos^2 \theta & 4 \sin 40 \\
\cos^2 \theta & \sin^2 \theta & 1 + 4 \sin 40 \\
\end{array}
\]
= 0 are
(a) \(7\pi/24\)  (b) \(5\pi/24\)  (c) \(11\pi/24\)  (d) \(\pi/24\).
5. Let \( 2 \sin^2 x + 3 \sin x - 2 > 0 \) and \( x^2 - x - 2 < 0 \) (\( x \) is measured in radians). Then \( x \) lies in the interval \( (1994) \)
(a) \(\left(\frac{\pi}{6}, \frac{5\pi}{6}\right)\)  (b) \((-1, \frac{5\pi}{6})\)
(c) \((-1/2, \frac{5\pi}{6})\)  (d) \(\left(\frac{\pi}{6}, 2\right)\)
6. The minimum value of the expression \( \sin \alpha \sin \beta + \sin \gamma \), where \( \alpha, \beta, \gamma \) are real numbers satisfying \( \alpha + \beta + \gamma = \pi \) is \( (1995) \)
(a) positive  (b) zero
(c) negative  (d) \(-3\)
7. The number of values of \( x \) in the interval \([0, 5\pi]\) satisfying the equation \( 3 \sin^2 x - 7 \sin x + 2 = 0 \) is \( (1998 - 2 \text{ Marks}) \)
(a) 0  (b) 5  (c) 6  (d) 10
8. Which of the following number(s) is/are rational? \( (1998 - 2 \text{ Marks}) \)
(a) \(\sin 15^\circ\)  (b) \(\cos 15^\circ\)
(c) \(\sin 15^\circ \cos 15^\circ\)  (d) \(\sin 15^\circ \cos 75^\circ\)
9. For a positive integer \( n \), let \( (1999 - 3 \text{ Marks}) \)
\[ f_n (\theta) = \left(\tan \frac{\theta}{2}\right) \left(1 + \sec \theta\right) \left(1 + \sec 2\theta\right) \left(1 + \sec 4\theta\right) \ldots \left(1 + \sec 2^n\theta\right). \]
Then
(a) \( f_2 \left(\frac{\pi}{16}\right) = 1 \)  (b) \( f_3 \left(\frac{\pi}{32}\right) = 1 \)
(c) \( f_4 \left(\frac{\pi}{64}\right) = 1 \)  (d) \( f_5 \left(\frac{\pi}{128}\right) = 1 \)
10. If \( \frac{\sin^4 x + \cos^4 x}{2} = \frac{1}{5} \), then \( (2009) \)
(a) \(\tan^2 x = \frac{2}{3}\)  (b) \(\frac{\sin^8 x + \cos^8 x}{8} = \frac{1}{125}\)
(c) \(\tan^2 x = \frac{1}{3}\)  (d) \(\frac{\sin^8 x + \cos^8 x}{27} = \frac{2}{125}\)
11. For \( 0 < \theta < \frac{\pi}{2} \), the solution (s) of
\[
\sum_{m=1}^{6} \csc \left( \theta + \frac{(m-1)\pi}{4} \right) \csc \left( \theta + \frac{m\pi}{4} \right) = 4\sqrt{2}
\]
is (are) \((2009)\)
(a) \(\frac{\pi}{4}\) (b) \(\frac{\pi}{6}\) (c) \(\frac{\pi}{12}\) (d) \(\frac{5\pi}{12}\)

12. Let \(\theta, \phi \in [0, 2\pi]\) be such that \(2 \cos \theta (1 - \sin \phi) = \sin^2 \theta\)
\[
\left( \tan \frac{\theta}{2} + \cot \frac{\theta}{2} \right) \cos \phi - 1, \tan (2\pi - \theta) > 0 \text{ and} \]
\(-1 < \sin \theta < -\frac{\sqrt{3}}{2}\), then \(\phi\) cannot satisfy \((2012)\)
(a) \(0 < \phi < \frac{\pi}{2}\) (b) \(\frac{\pi}{2} < \phi < \frac{4\pi}{3}\)
(c) \(\frac{4\pi}{3} < \phi < 2\pi\) (d) \(\frac{3\pi}{2} < \phi < 2\pi\)

13. The number of points in \((\infty, \infty)\), for which \(x^2 - x \cos x - \cos x = 0\), is \((JEE \text{ Adv. 2013})\)
(a) 6 (b) 4 (c) 2 (d) 0

14. Let \(f(x) = x \sin \pi x\), \(x > 0\). Then for all natural numbers \(n, f^n(x)\) vanishes at \((JEE \text{ Adv. 2013})\)
(a) A unique point in the interval \(\left( n, n + \frac{1}{2} \right) \)
(b) A unique point in the interval \(\left( n + \frac{1}{2}, n + 1 \right) \)
(c) A unique point in the interval \((n, n + 1)\)
(d) Two points in the interval \((n, n + 1)\)

\section*{Subjective Problems}

1. If \(\tan \alpha = \frac{m}{m + 1}\) and \(\tan \beta = \frac{1}{2m + 1}\), find the possible values of \((\alpha + \beta)\). \((1978)\)

2. (a) Draw the graph of \(y = \frac{1}{\sqrt{2}} (\sin x + \cos x)\) from \(x = -\frac{\pi}{2}\) to \(x = \frac{\pi}{2}\).

(b) If \(\cos (\alpha + \beta) = \frac{4}{5}\), \(\sin (\alpha - \beta) = \frac{5}{13}\), and \(\alpha, \beta\) lies between 0 and \(\frac{\pi}{4}\), find tan2\(\alpha\). \((1979)\)

3. Given \(\alpha + \beta - \gamma = \pi\), prove that \(\sin^2 \alpha + \sin^2 \beta - \sin^2 \gamma = 2 \sin \alpha \sin \beta \cos \gamma\). \((1980)\)

4. Given \(A = \left[ \frac{\pi}{6} \leq x \leq \frac{\pi}{3} \right]\) and \(f(x) = \cos x - x (1 + x)\); find \(f(A)\). \((1980)\)

5. For all \(\theta \in [0, \pi/2]\) show that, \(\cos (\sin \theta) \geq \sin \left( \cos \theta \right)\). \((1981 - 4 \text{ Marks})\)

[Continues with more questions and solutions related to mathematics problems.]
Match the Following

**DIRECTIONS (Q. 1):** Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. In this question there are entries in columns 1 and 2. Each entry in column 1 is related to exactly one entry in column 2. Write the correct letter from column 2 against the entry number in column 1 in your answer book.

   \[
   \frac{\sin 3\alpha}{\cos 2\alpha}
   \]

   **Column I**
   
   (A) positive
   
   (B) negative

   **Column II**
   
   (p) \( \left( \frac{13\pi}{48}, \frac{14\pi}{48} \right) \)
   
   (q) \( \left( \frac{14\pi}{48}, \frac{18\pi}{48} \right) \)
   
   (r) \( \left( \frac{18\pi}{48}, \frac{23\pi}{48} \right) \)
   
   (s) \( \left( 0, \frac{\pi}{2} \right) \)

**Integer Value Correct Type**

1. The number of all possible values of \( \theta \) where \( 0 < \theta < \pi \), for which the system of equations
   \[
   (y + z) \cos 3\theta = (xyz) \sin 3\theta
   \]
   \[
   x \sin 3\theta = \frac{2 \cos 3\theta}{y} + \frac{2 \sin 3\theta}{z}
   \]
   \[(xyz) \sin 3\theta = (y + 2z) \cos 3\theta + y \sin 3\theta
   \]
   have a solution \((x_0, y_0, z_0)\) with \(y_0 z_0 \neq 0\), is \(1920\) \(2010\)

2. The number of values of \( \theta \) in the interval, \( \left( -\frac{\pi}{2}, \frac{\pi}{2} \right) \) such that \( \theta \neq \frac{n\pi}{5} \) for \( n = 0, \pm 1, \pm 2 \) and \( \tan \theta = \cot 5\theta \) as well as \( \sin 2\theta = \cos 40 \) is \(2010\)

3. The maximum value of the expression

4. Two parallel chords of a circle of radius 2 are at a distance \( \sqrt{3} + 1 \) apart. If the chords subtend at the center, angles of \( \frac{\pi}{k} \) and \( \frac{2\pi}{k} \), where \( k > 0 \), then the value of \( [k] \) is \(2010\)

[Note : \( [k] \) denotes the largest integer less than or equal to \( k \)]

5. The positive integer value of \( n > 3 \) satisfying the equation

6. The number of distinct solutions of the equation

\[
\frac{1}{\sin \left( \frac{\pi}{n} \right)} = \frac{1}{\sin \left( \frac{2\pi}{n} \right)} + \frac{1}{\sin \left( \frac{3\pi}{n} \right)}
\]

\[
\frac{5}{4} \cos^2 2x + \cos^4 x + \sin^4 x + \cos^6 x + \sin^6 x = 2
\]

in the interval \([0, 2\pi]\) is \(2011\) \(JEE \text{ Adv. 2015}\)
Section-B

1. The period of $\sin^2 \theta$ is [2002]
   (a) $\pi^2$ (b) $\pi$ (c) $2\pi$ (d) $\pi/2$

2. The number of solution of $\tan x + \sec x = 2\cos x$ in $[0, 2\pi]$ is [2002]
   (a) 2 (b) 3 (c) 0 (d) 1

3. Which one is not periodic [2002]
   (a) $|\sin 3x| + \sin^2 x$ (b) $\cos \sqrt{x} + \cos^2 x$
   (c) $\cos 4x + \tan^2 x$ (d) $\cos 2x + \sin x$

4. Let $\alpha, \beta$ be such that $\pi < \alpha - \beta < 3\pi$.
   If $\sin \alpha + \sin \beta = \frac{-21}{65}$ and $\cos \alpha + \cos \beta = \frac{-27}{65}$, then the
   value of $\cos \frac{\alpha - \beta}{2}$ [2004]
   (a) $\frac{-6}{65}$ (b) $\frac{3}{\sqrt{130}}$
   (c) $\frac{6}{65}$ (d) $\frac{-3}{\sqrt{130}}$

5. If $u = \sqrt{a^2 \cos^2 \theta + b^2 \sin^2 \theta + a^2 \sin^2 \theta + b^2 \cos^2 \theta}$
   then the difference between the maximum and minimum
   values of $u^2$ is given by [2004]
   (a) $(a - b)^2$ (b) $2\sqrt{a^2 + b^2}$
   (c) $(a + b)^2$ (d) $2(a^2 + b^2)$

6. A line makes the same angle $\theta$, with each of the $x$ and $y$ axis.
   If the angle $\beta$, which it makes with $y$-axis, is such that
   $\sin^2 \beta = 3\sin^2 \theta$, then $\cos^2 \theta$ equals [2004]
   (a) $\frac{2}{5}$ (b) $\frac{1}{5}$ (c) $\frac{3}{5}$ (d) $\frac{2}{3}$

7. The number of values of $x$ in the interval $[0, 3\pi]$ satisfying
   the equation $2\sin^3 x + 5\sin x - 3 = 0$ is [2006]
   (a) 4 (b) 6 (c) 1 (d) 2

8. If $0 < x < \pi$ and $\cos x + \sin x = \frac{1}{2}$, then $\tan x$ is [2006]
   (a) $\frac{(1-\sqrt{7})}{4}$ (b) $\frac{(4-\sqrt{7})}{3}$
   (c) $-\frac{(4+\sqrt{7})}{3}$ (d) $\frac{(1+\sqrt{7})}{4}$

9. Let $A$ and $B$ denote the statements
   $A : \cos \alpha + \cos \beta + \cos \gamma = 0$
   $B : \sin \alpha + \sin \beta + \sin \gamma = 0$
   Then $f_A(x) = \frac{1}{k} \left( \sin^k x + \cos^k x \right)$ where $x \in R$ and $k \geq 1$.
   Then $f_4(x) - f_6(x)$ equals [JEE M 2014]
   (a) $\frac{1}{4}$ (b) $\frac{1}{12}$ (c) $\frac{1}{6}$ (d) $\frac{1}{3}$

10. Let $\cos (\alpha + \beta) = \frac{4}{5}$ and $\sin (\alpha - \beta) = \frac{5}{13}$, where
    $0 \leq \alpha, \beta \leq \frac{\pi}{4}$. Then $\tan 2\alpha =$ [2010]
    (a) $\frac{56}{33}$ (b) $\frac{19}{12}$ (c) $\frac{20}{7}$ (d) $\frac{25}{16}$

11. If $A = \sin^2 x + \cos^2 x$, then for all real $x$:
    (a) $\frac{13}{16} \leq A \leq 1$ (b) $1 \leq A \leq 2$
    (c) $\frac{3}{4} \leq A \leq \frac{13}{16}$ (d) $\frac{3}{4} \leq A \leq 1$

12. In a $\triangle PQR$, if $3 \sin P + 4 \cos Q = 6$ and $4 \sin Q + 3 \cos P = 1$, then the angle $R$ is equal to:
    [2012]
    (a) $\frac{5\pi}{6}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{4}$ (d) $\frac{3\pi}{4}$

13. ABCD is a trapezium such that AB and CD are parallel and BC $\perp$ CD. If $\angle ADB = \theta$, $BC = p$ and $CD = q$, then
    AB is equal to:
    [JEE M 2013]
    (a) $\frac{(p^2 + q^2) \sin \theta}{p \cos \theta + q \sin \theta}$ (b) $\frac{p^2 + q^2 \cos \theta}{p \cos \theta + q \sin \theta}$
    (c) $\frac{p^2 + q^2}{p^2 \cos \theta + q^2 \sin \theta}$ (d) $\frac{(p^2 + q^2) \sin \theta}{(p \cos \theta + q \sin \theta)^2}$

14. The expression $\frac{\tan A}{1 - \cot A} + \frac{\cot A}{1 - \tan A}$ can be written as:
    [JEE M 2013]
    (a) $\sin A \cos A + 1$ (b) $\sec A \cosec A + 1$
    (c) $\tan A + \cot A$ (d) $\sec A + \cosec A$

15. Let $f_k(x) = \frac{1}{k} \left( \sin^k x + \cos^k x \right)$ where $x \in R$ and $k \geq 1$.
    Then $f_4(x) - f_6(x)$ equals [JEE M 2014]
    (a) $\frac{1}{4}$ (b) $\frac{1}{12}$ (c) $\frac{1}{6}$ (d) $\frac{1}{3}$

16. If $0 \leq x < 2\pi$, then the number of real values of $x$, which
    satisfy the equation $\cos x + \cos 2x + \cos 3x + \cos 4x = 0$ is:
    [JEE M 2016]
    (a) 7 (b) 9 (c) 3 (d) 5
CHAPTER 2
Complex Numbers

A  Fill in the Blanks

1. If the expression \( \sin \left( \frac{x}{2} \right) + \cos \left( \frac{x}{2} \right) + i \tan(x) \) \[1 + 2i \sin \left( \frac{x}{2} \right) \]
is real, then the set of all possible values of \( x \) is ..............

2. For any two complex numbers \( z_1, z_2 \) and any real number \( a \) and \( b \)
\[|az_1 - bz_2|^2 + |bz_1 + az_2|^2 = .............\]
is real, then the set of all possible values of \( x \) is ..............

3. If \( a, b, c \) are the numbers between 0 and 1 such that the points
\( z_1 = a + bi, z_2 = 1 + bi \) and \( z_3 = 0 \) form an equilateral triangle, then \( a = ............ \) and \( b = ............ \)

4. \( ABCD \) is a rhombus. Its diagonals \( AC \) and \( BD \) intersect at the point \( M \) and satisfy \( BD = 2AC \). If the points \( D \) and \( M \) represent the complex numbers \( 1 + i \) and \( 2 - i \) respectively, then \( A \) represents the complex number ................ \( \) or ............

5. Suppose \( Z_1, Z_2, Z_3 \) are the vertices of an equilateral triangle inscribed in the circle \( |Z| = 2 \). If \( Z_1 = 1 + i \sqrt{3} \) then \( Z_2 = ............ \), \( Z_3 = ............ \)

6. The value of the expression
\[ 1 \cdot (2 - \omega)(2 - \omega^2) + 2 \cdot (3 - \omega)(3 - \omega^2) + \ldots + (n - 1)(n - \omega)(n - \omega^2), \]
where \( \omega \) is an imaginary cube root of unity, is .......

(96 - 2 Marks)

B  True / False

1. For complex number \( z_1 = x_1 + iy_1 \) and \( z_2 = x_2 + iy_2 \), we write \( z_1 \cap z_2 \), if \( x_1 \leq x_2 \) and \( y_1 \leq y_2 \). Then for all complex numbers \( z \) with \( 1 \cap z \), we have \( \frac{1 - z}{1 + z} \in \theta \).

2. If the complex numbers, \( Z_1, Z_2, Z_3 \) represent the vertices of an equilateral triangle such that \( |Z_1| = |Z_2| = |Z_3| \) then \( Z_1 + Z_2 + Z_3 = 0 \).

(94 - 2 Marks)

3. If three complex numbers are in A.P. then they lie on a circle in the complex plane.

(98 - 1 Mark)

4. The cube roots of unity when represented on Argand diagram form the vertices of an equilateral triangle.

(88 - 1 Mark)

C  MCQs with One Correct Answer

1. If the cube roots of unity are \( 1, \omega, \omega^2 \), then the roots of the equation \( (x - 1)^3 + 8 = 0 \) are
\( \) (1979)
(a) \( -1, 1 + 2\omega, 1 + 2\omega^2 \) \hspace{1cm} (b) \( -1, 1 - 2\omega, 1 - 2\omega^2 \)
(c) \( -1, -1, -1 \) \hspace{1cm} (d) None of these

2. The smallest positive integer \( n \) for which \( \frac{1 + i}{1 - i} = 1 \) is
\( \) (1980)
(a) \( n = 8 \) \hspace{1cm} (b) \( n = 16 \)
(c) \( n = 12 \) \hspace{1cm} (d) None of these

3. The complex numbers \( z = x + iy \) which satisfy the equation \( \frac{|z - 5i|}{|z + 5i|} = 1 \) lie on \( \) (1981 - 2 Marks)
(a) the x-axis \hspace{1cm} (b) the straight line \( y = 5 \)
(c) a circle passing through the origin \hspace{1cm} (d) none of these

4. If \( z = \left( \frac{\sqrt{3}}{2} + \frac{i}{2} \right)^5 + \left( \frac{\sqrt{3}}{2} - \frac{i}{2} \right)^5 \), then \( \) (1982 - 2 Marks)
(a) \( \text{Re}(z) = 0 \) \hspace{1cm} (b) \( \text{Im}(z) = 0 \)
(c) \( \text{Re}(z) > 0, \text{Im}(z) > 0 \) \hspace{1cm} (d) \( \text{Re}(z) > 0, \text{Im}(z) < 0 \)

5. The inequality \( |z - 4| < |z - 2| \) represents the region given by \( \) (1982 - 2 Marks)
(a) \( \text{Re}(z) \geq 0 \) \hspace{1cm} (b) \( \text{Re}(z) < 0 \)
(c) \( \text{Re}(z) > 0 \) \hspace{1cm} (d) None of these

6. If \( z = x + iy \) and \( \omega = (1 - iz)/(z - i) \), then \( |\omega| = 1 \) implies that, in the complex plane, \( \) (1983 - 1 Mark)
(a) \( z \) lies on the imaginary axis \hspace{1cm} (b) \( z \) lies on the real axis
(c) \( z \) lies on the unit circle \hspace{1cm} (d) None of these
7. The points \( z_1, z_2, z_3, z_4 \) in the complex plane are the vertices of a parallelogram taken in order if and only if

\[
(1983 - 1 \text{ Mark})
\]

(a) \( z_1 + z_2 = z_3 + z_4 \)  
(b) \( z_1 + z_3 = z_2 + z_4 \)  
(c) \( z_1 + z_2 = z_3 + z_4 \)  
(d) None of these

8. If \( a, b, c \) and \( u, v \) are complex numbers representing the vertices of two triangles such that \( c = (1 - r)a + rb \) and \( w = (1 - r)u + rv \), where \( r \) is a complex number, then the two triangles \( (1985 - 2 \text{ Marks}) \)

(a) have the same area  
(b) are similar  
(c) are congruent  
(d) none of these

9. If \( \omega (\neq 1) \) is a cube root of unity and \( (1 + \omega)^3 = A + B \omega \) then \( A \) and \( B \) are respectively \( (1995 \text{ S}) \)

(a) 0, 1  
(b) 1, 1  
(c) 1, 0  
(d) -1, 1

10. Let \( z \) and \( \omega \) be two non zero complex numbers such that \( |z| = |\omega| \) and \( \arg z + \arg \omega = \pi \), then \( z \) equals \( (1995 \text{ S}) \)

(a) \( \omega \)  
(b) \( -\omega \)  
(c) \( \bar{\omega} \)  
(d) \( -\bar{\omega} \)

11. Let \( z \) and \( \omega \) be two complex numbers such that \( |z| \leq 1 \), \( |\omega| \leq 1 \) and \( |z + i\omega| = |z - i\bar{\omega}| = 2 \), then \( z \) equals \( (1999 \text{ S}) \)

(a) \( 1 + i \)  
(b) \( i - 1 \)  
(c) \( 1 - i \)  
(d) \( i + 1 \)

12. For positive integers \( n_1, n_2 \), the value of the expression

\[
(1 + i)^n + (1 + i)^n + (1 + i)^n + (1 + i)^n
\]

is real if and only if \( (1996 - 1 \text{ Marks}) \)

(a) \( n_1 = n_2 + 1 \)  
(b) \( n_1 = n_2 - 1 \)  
(c) \( n_1 = n_2 \)  
(d) \( n_1 > 0, n_2 > 0 \)

13. If \( i = \sqrt{-1} \), then \( 4 + 5 \left( \frac{1 + i\sqrt{3}}{2} \right)^{334} + 3 \left( \frac{1 - i\sqrt{3}}{2} \right)^{365} \)

is equal to \( (1999 - 2 \text{ Marks}) \)

(a) \( 1 - i\sqrt{3} \)  
(b) \(-1 + i\sqrt{3} \)  
(c) \( i\sqrt{3} \)  
(d) \(-i\sqrt{3} \)

14. If \( \arg(z) < 0 \), then \( \arg(-z) - \arg(z) = \) \( (2000 \text{ S}) \)

(a) \( \pi \)  
(b) \(-\pi \)  
(c) \(-\frac{\pi}{2} \)  
(d) \(\frac{\pi}{2} \)

15. If \( z_1, z_2, z_3 \) are complex numbers such that \( (2000 \text{ S}) \)

\[
|z_1| = |z_2| = |z_3| = \frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3} = 1, \text{ then } |z_1 + z_2 + z_3| \text{is}
\]

(a) equal to 1  
(b) less than 1  
(c) greater than 3  
(d) equal to 3

16. Let \( z_1 \) and \( z_2 \) be \( n \text{th} \) roots of unity which subtend a right angle at the origin. Then \( n \) must be of the form \( (2001 \text{ S}) \)

(a) \( 4k + 1 \)  
(b) \( 4k + 2 \)  
(c) \( 4k + 3 \)  
(d) \( 4k \)

17. The complex numbers \( z_1, z_2, z_3 \) satisfying

\[
\frac{z_1 - z_2}{z_2 - z_3} \text{ are the vertices of a triangle which is}
\]

(a) of area zero \( (2001 \text{ S}) \)  
(b) right-angled isosceles  
(c) equilateral  
(d) obtuse-angled isosceles

18. For all complex numbers \( z_1, z_2 \) satisfying \( |z_1| = 12 \) and \( |z_2 - 3 - 4i| = 5 \), the minimum value of \( |z_1 - z_2| \) is \( (2002 \text{ S}) \)

(a) 0  
(b) 2  
(c) 7  
(d) 17

19. If \( |z| = 1 \) and \( \omega = \frac{z - 1}{z + 1} \) (where \( z \neq -1 \)), then \( \text{Re}(\omega) \) is \( (2003 \text{ S}) \)

(a) 0  
(b) \(-\frac{1}{|z + 1|^2} \)  
(c) \(\frac{z}{|z + 1|^2} \)  
(d) \(\frac{\sqrt{2}}{|z + 1|^2} \)

20. If \( \omega (\neq 1) \) be a cube root of unity and \( (1 + \omega^2)^n = (1 + \omega^3)^n \), then the least positive value of \( n \) is \( (2004 \text{ S}) \)

(a) 2  
(b) 3  
(c) 5  
(d) 6

21. The locus of \( z \) which lies in shaded region (excluding the boundaries) is best represented by \( (2005 \text{ S}) \)

22. \( a, b, c \) are integers, not all simultaneously equal and \( \omega \) is cube root of unity \( (\omega \neq 1) \), then minimum value of \( |a + b\omega + c\omega^2| \) is \( (2005 \text{ S}) \)

(a) 0  
(b) 1  
(c) \(\frac{\sqrt{3}}{2} \)  
(d) \(\frac{1}{2} \)

23. Let \( \omega = -\frac{1}{2} + i\frac{\sqrt{3}}{2} \), then the value of the det.

\[
\begin{vmatrix}
1 & 1 & 1 \\
1 & 1 - \omega^2 & \omega^2 \\
1 & \omega^2 & \omega^4
\end{vmatrix}
\]

(a) \(3\omega \)  
(b) \(3\omega(\omega - 1) \)  
(c) \(3\omega^2 \)  
(d) \(3\omega(1 - \omega) \)

24. If \( \frac{w - \bar{w}}{1 - z} \) is purely real where \( w = \alpha + i\beta, \beta \neq 0 \) and \( z \neq 1 \), then the set of the values of \( z \) is \( (2006 - 3 \text{ M}, -1) \)

(a) \{z : |z| = 1\}  
(b) \{z : z = \bar{z}\}  
(c) \{z : z \neq 1\}  
(d) \{z : |z| = 1, z \neq 1\}
25. A man walks a distance of 3 units from the origin towards the north-east (N 45° E) direction. From there, he walks a distance of 4 units towards the north-west (N 45° W) direction to reach a point \( P \). Then the position of \( P \) in the Argand plane is \((2007 - 3\) marks) 
(a) \(3e^{i\theta} + 4i\)  
(b) \((3 - 4i)e^{i\theta}\)  
(c) \((4 + 3i)e^{i\theta}\)  
(d) \((3 + 4i)e^{i\theta}\)

26. If \(|z| = 1\) and \(z \neq \pm 1\), then all the values of \(\frac{z}{1 - z^2}\) lie on (2007 - 3 marks) 
(a) a line not passing through the origin (2007 - 3 marks) 
(b) \(|z| = \sqrt{2}\) 
(c) the x-axis 
(d) the y-axis

27. A particle \( P \) starts from the point \( z_0 = 1 + 2i \), where \(i = \sqrt{-1}\). It moves horizontally away from origin by 5 units and then vertically away from origin by 3 units to reach a point \( z_1 \). From \( z_1 \) the particle moves \(\sqrt{2}\) units in the direction of the vector \( \hat{i} + \hat{j} \) and then it moves through an angle \(\frac{\pi}{2}\) in anticlockwise direction on a circle with centre at origin, to reach a point \( z_2 \). The point \( z_2 \) is given by (2008) 
(a) \(6 + 7i\)  
(b) \(-7 + 6i\)  
(c) \(7 + 6i\)  
(d) \(-6 + 7i\)

28. Let \( z = \cos \theta + i \sin \theta \). Then the value of \(\sum_{m=1}^{15} \text{Im}(z^{2m-1})\) at \(\theta = 2^\circ\) is (2009) 
(a) \(\frac{1}{\sin 2^\circ}\)  
(b) \(\frac{1}{3\sin 2^\circ}\)  
(c) \(\frac{1}{2\sin 2^\circ}\)  
(d) \(\frac{1}{4\sin 2^\circ}\)

29. Let \( z = x + iy \) be a complex number where \( x \) and \( y \) are integers. Then the area of the rectangle whose vertices are the roots of the equation : \( z z^3 + \overline{z} \bar{z}^3 = 350 \) is (2009) 
(a) 48  
(b) 32  
(c) 40  
(d) 80

30. Let \( z \) be a complex number such that the imaginary part of \( z \) is non-zero and \( a = z^2 + z + 1 \) is real. Then a cannot take the value (2012) 
(a) \(-1\)  
(b) \(\frac{1}{3}\)  
(c) \(\frac{1}{2}\)  
(d) \(\frac{3}{4}\)

31. Let complex numbers \( \alpha \) and \( \frac{1}{\alpha} \) lie on circles \((x - x_0)^2 + (y - y_0)^2 = r^2 \) and \((x - x_0)^2 + (y - y_0)^2 = 4r^2 \) respectively. If \( z_0 = x_0 + iy_0 \) satisfies the equation \(2|z_0|^2 = r^2 + 2\), then \(|\alpha| = \) (JEE Adv. 2013) 
(a) \(\frac{1}{\sqrt{2}}\)  
(b) \(\frac{1}{2}\)  
(c) \(\frac{1}{\sqrt{7}}\)  
(d) \(\frac{1}{3}\)

32. MCQs with One or More than One Correct

1. If \( z_1 = a + ib \) and \( z_2 = c + id \) are complex numbers such that \(|z_1| = |z_2| = 1\) and \(\text{Re}(z_1 \bar{z}_2) = 0\), then the pair of complex numbers \( w_1 = a + ic \) and \( w_2 = b + id \) satisfies – (1985 - 2 Marks) 
(a) \(|w_1| = 1\)  
(b) \(|w_2| = 1\)  
(c) \(\text{Re}(w_1 \bar{w}_2) = 0\)  
(d) none of these

2. Let \( z_1 \) and \( z_2 \) be complex numbers such that \( z_1 \neq z_2 \) and \(|z_1| = |z_2|\). If \( z_1 \) has positive real part and \( z_2 \) has negative imaginary part, then \(\frac{z_1 + z_2}{z_1 - z_2} \) may be (1986 - 2 Marks) 
(a) zero  
(b) real and positive  
(c) real and negative  
(d) purely imaginary  
(e) none of these.

3. If \( z_1 \) and \( z_2 \) are two nonzero complex numbers such that \(|z_1 + z_2| = |z_1| + |z_2|\), then \(\text{Arg}\ z_1 - \text{Arg}\ z_2\) is equal to (1987 - 2 Marks) 
(a) \(-\pi\)  
(b) \(\frac{-\pi}{2}\)  
(c) 0  
(d) \(\frac{\pi}{2}\)  
(e) \(\pi\)

4. The value of \(\sum_{k=1}^{6} \left(\frac{\sin \frac{2\pi k}{7} i}{\cos \frac{2\pi k}{7}}\right)\) is (1987 - 2 Marks) 
(a) \(-1\)  
(b) 0  
(c) \(-i\)  
(d) \(i\)  
(e) None

5. If \( w \) is an imaginary cube root of unity, then \((1 + w - w^2)^7\) equals (1998 - 2 Marks) 
(a) \(128w\)  
(b) \(-128w\)  
(c) \(128w^2\)  
(d) \(-128w^2\)

6. The value of the sum \(\sum_{n=1}^{13} (p^n + q^{n+1})\), where \(i = \sqrt{-1}\), equals (1998 - 2 Marks) 
(a) \(i\)  
(b) \(i - 1\)  
(c) \(-i\)  
(d) 0

7. If \(\begin{vmatrix} 6i & -3i & 1 \\ 4 & 3i & -1 \end{vmatrix} = x + iy\), then \(\begin{vmatrix} 20 & 3i \\ 2 & i \end{vmatrix}\) (1998 - 2 Marks) 
(a) \(x = 3, y = 2\)  
(b) \(x = 1, y = 3\)  
(c) \(x = 0, y = 3\)  
(d) \(x = 0, y = 0\)

8. Let \( z_1 \) and \( z_2 \) be two distinct complex numbers and let \( z = (1 - t)z_1 + tz_2 \) for some real number \( t \) with \(0 < t < 1\). If Arg \((w)\) denotes the principal argument of a non-zero complex number \( w \), then \(\text{Arg}(z - z_1) = \text{Arg}(z - z_2)\) (2010) 
(a) \(|z - z_1| + |z - z_2| = |z_1 - z_2|\)  
(b) \(\text{Arg}(z - z_1) = \text{Arg}(z - z_2)\)  
(c) \(\frac{|z - z_1|}{|z_2 - z_1|} = \frac{|z - z_1|}{|z_2 - z_1|}\)  
(d) \(\text{Arg}(z - z_1) = \text{Arg}(z - z_2)\)

9. Let \( w = \frac{\sqrt{3} + i}{2} \) and \( P = \{ w^n : n = 1, 2, 3, ... \} \). Further \( H_1 = \{ z \in \mathbb{C} : \text{Re} z = \frac{1}{2} \} \) and \( H_2 = \{ z \in \mathbb{C} : \text{Re} z < -\frac{1}{2} \} \), where \( c \) is the set of all complex numbers. If \( z_1 \in P \cap H_1, z_2 \in P \cap H_2 \) and \( O \) represents the origin, then \( \angle z_1 Oz_2 = (JEE \ \text{Adv. 2013}) \)
   (a) \( \frac{\pi}{2} \)  
   (b) \( \frac{\pi}{6} \)  
   (c) \( \frac{2\pi}{3} \)  
   (d) \( \frac{5\pi}{6} \)

10. Let \( a, b \in \mathbb{R} \) and \( a^2 + b^2 \neq 0 \).

Suppose \( S = \left\{ Z \in \mathbb{C} : Z = \frac{1}{a + ib}, \ + \in \mathbb{R}, t \neq 0 \right\} \), where \( i = \sqrt{-1} \). If \( z = x + iy \) and \( z \in S \), then \((x, y)\) lies on \( (JEE \ \text{Adv. 2016}) \)
   (a) the circle with radius \( \frac{1}{2a} \) and centre \( \left( \frac{1}{2a}, 0 \right) \) for \( a > 0, b \neq 0 \)
   (b) the circle with radius \( \frac{1}{2a} \) and centre \( \left( \frac{-1}{2a}, 0 \right) \) for \( a < 0, b \neq 0 \)
   (c) the x-axis for \( a \neq 0, b = 0 \)
   (d) the y-axis for \( a = 0, b \neq 0 \)

**E Subjective Problems**

1. Express \( \frac{1}{1 - \cos \theta + 2i \sin \theta} \) in the form \( x + iy \). \( (1978) \)

2. If \( x = a + b, y = ay + b \beta \) and \( z = a\beta + by \) where \( \gamma \) and \( \beta \) are the complex cube roots of unity, show that \( xyz = a^3 + b^3 \). \( (1978) \)

3. If \( x + iy = \sqrt{\frac{a + ib}{c + id}} \), prove that \( (x^2 + y^2) = \frac{a^2 + b^2}{c^2 + d^2} \). \( (1979) \)

4. Find the real values of \( x \) and \( y \) for which the following equation is satisfied \( \frac{(1+i)x-2i}{3+i} + \frac{(2-3i)y+i}{3-i} = i \). \( (1980) \)

5. Let the complex number \( z_1, z_2 \) and \( z_3 \) be the vertices of an equilateral triangle. Let \( \omega \) be the circumcentre of the triangle. Then prove that \( z_1^2 + z_2^2 + z_3^2 = 3z_1^2 \). \( (1981 - 4 \text{ Marks}) \)

6. Prove that the complex numbers \( z_1, z_2 \) and the origin form an equilateral triangle only if \( z_1^2 + z_2^2 - z_1z_2 = 0 \). \( (1983 - 3 \text{ Marks}) \)

7. If \( 1, a_1, a_2, ..., a_{n-1} \) are the \( n \) roots of unity, then show that \( (1-a_1)(1-a_2)(1-a_3)...(1-a_{n-1}) = n \). \( (1984 - 2 \text{ Marks}) \)

8. Show that the area of the triangle on the Argand diagram formed by the complex numbers \( z, iz \) and \( z + iz \) is \( \frac{1}{2} \text{Im} z^2 \). \( (1986 - 2.5 \text{ Marks}) \)

9. Let \( Z_1 = 10 + 6i \) and \( Z_2 = 4 + 6i \). If \( Z \) is any complex number such that the argument of \( \frac{Z - Z_1}{Z - Z_2} \) is \( \frac{\pi}{4} \), then prove that \( |Z - 7 - 9i| = 3\sqrt{2} \). \( (1990 - 4 \text{ Marks}) \)

10. If \( iz^3 + z^2 - z + i = 0 \), then show that \( |z| = 1 \). \( (1995 - 5 \text{ Marks}) \)

11. If \( |Z| \leq 1, |W| \leq 1 \), show that

\[
|Z - W|^2 \leq (|Z| - |W|)^2 + (\text{Arg} Z - \text{Arg} W)^2
\]

\( (1995 - 5 \text{ Marks}) \)

12. Find all non-zero complex numbers \( Z \) satisfying \( \bar{Z} = Z^2 \). \( (1996 - 2 \text{ Marks}) \)

13. Let \( z_1 \) and \( z_2 \) be roots of the equation \( z^2 + pz + q = 0 \), where the coefficients \( p \) and \( q \) may be complex numbers. Let \( A \) and \( B \) represent \( z_1 \) and \( z_2 \) in the complex plane. If \( \angle AOB = \alpha \neq 0 \) and \( OA = OB \), where \( O \) is the origin, prove that

\[
p^2 = 4q \cos^2 \left( \frac{\alpha}{2} \right)
\]

\( (1997 - 5 \text{ Marks}) \)

14. For complex numbers \( z \) and \( w \), prove that \( |z|^2 |w|^2 z = z - w \) if and only if \( z = w \) or \( z = w^* \). \( (1999 - 10 \text{ Marks}) \)

15. Let a complex number \( \alpha, \alpha \neq 1 \), be a root of the equation \( z^p - z^q - 1 = 0 \), where \( p, q \) are distinct primes. Show that either \( 1 + \alpha + \alpha^2 + ... + \alpha^{p-1} = 0 \) or \( 1 + \alpha + \alpha^q + ... + \alpha^{q-1} = 0 \), but not both together. \( (2002 - 5 \text{ Marks}) \)

16. If \( z_1 \) and \( z_2 \) are two complex numbers such that \( |z_1| < 1 \), \( |z_2| \geq 1 \), then prove that \( \frac{1 - z_1z_2}{z_1 - z_2} < 1 \). \( (2003 - 2 \text{ Marks}) \)

17. Prove that there exists no complex number \( z \) such that

\[
|z| < \frac{1}{3} \text{ and } \sum_{r=1}^{n} |a_r z^r| = 1 \text{ where } |a_r| < 2.
\]

\( (2003 - 2 \text{ Marks}) \)

18. Find the centre and radius of circle given by

\[
\frac{z - \alpha}{z - \beta} = k, k \neq 1
\]

where, \( z = x + iy, \alpha = \alpha_1 + i\alpha_2, \beta = \beta_1 + i\beta_2 \). \( (2004 - 2 \text{ Marks}) \)

19. If one of the vertices of the square circumscribing the circle \( |z - 1| = \sqrt{2} \) is \( 2 + \sqrt{3} i \). Find the other vertices of the square. \( (2005 - 4 \text{ Marks}) \)
**Match the Following**

**DIRECTIONS (Q. 1 and 2):** Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r and s. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. $z \neq 0$ is a complex number
   
   **Column I**
   - (A) $\text{Re } z = 0$
   - (B) $\text{Arg } z = \frac{\pi}{4}$
   
   **Column II**
   - (p) $z^2 = 0$
   - (q) $\text{Im } z^2 = 0$
   - (r) $\text{Re } z^2 = \text{Im } z^2$

2. Match the statements in Column I with those in Column II.
   **[Note: Here $z$ takes values in the complex plane and $\text{Im } z$ and $\text{Re } z$ denote, respectively, the imaginary part and the real part of $z$.]**
   
   **Column I**
   - (A) The set of points $z$ satisfying $|z - i| = |z + i||z||$ is contained in or equal to
   - (B) The set of points $z$ satisfying $|z + 4| + |z - 4| = 10$ is contained in or equal to
   - (C) If $\left| w \right| = 2$, then the set of points $z = w - \frac{1}{w}$ is contained in or equal to
   - (D) If $\left| w \right| = 1$, then the set of points $z = w + \frac{1}{w}$ is contained in or equal to
   
   **Column II**
   - (p) an ellipse with eccentricity $\frac{4}{5}$
   - (q) the set of points $z$ satisfying $\text{Im } z = 0$
   - (r) the set of points $z$ satisfying $|\text{Im } z| \leq 1$
   - (s) the set of points $z$ satisfying $|\text{Re } z| < 2$
   - (t) the set of points $z$ satisfying $|z| \leq 3$

**DIRECTIONS (Q. 3):** Following question has matching lists. The codes for the list have choices (a), (b), (c) and (d) out of which ONLY ONE is correct.

3. Let $z_k = \cos \left( \frac{2k\pi}{10} \right) + i \sin \left( \frac{2k\pi}{10} \right); k = 1, 2, ..., 9$.
   
   **List-I**
   - P. For each $z_k$ there exists as $z_j$ such that $z_k \cdot z_j = 1$
   - Q. There exists a $k \in \{1, 2, ..., 9\}$ such that $z_1 \cdot z = z_k$
   - R. $\frac{|1 - z_1||1 - z_2|...|1 - z_9|}{10}$ equals
   - S. $1 - \sum_{k=1}^{9} \cos \left( \frac{2k\pi}{10} \right)$ equals

   **List-II**
   - 1. True
   - 2. False
   - 3. 1
   - 4. 2

   **P Q R S**
   - (a) 1 2 4 3
   - (b) 2 1 3 4
   - (c) 1 2 3 4
   - (d) 2 1 4 3
Comprehension Based Questions

PASSAGE-1
Let \( A, B, C \) be three sets of complex numbers as defined below:
\[
A = \{ z : \text{Im} \, z \geq 1 \} \\
B = \{ z : |z - 2 - i| = 3 \} \\
C = \{ z : \text{Re}((1-i)z) = \sqrt{2} \}
\]
1. The number of elements in the set \( A \cap B \cap C \) is \((2008)\) 
   (a) 0  (b) 1  (c) 2  (d) \( \infty \)
2. Let \( z \) be any point in \( A \cap B \cap C \). Then, \( |z + 1 - i|^2 + |z - 5 - i|^2 \) lies between
   \((2008)\) 
   (a) 25 and 29  (b) 30 and 34  (c) 35 and 39  (d) 40 and 44
3. Let \( z \) be any point \( A \cap B \cap C \) and let \( w \) be any point satisfying \( |w - 2 - i| < 3 \). Then, \( |z - w| + 3 \) lies between
   \((2008)\) 
   (a) \(-6\) and 3  (b) \(-3\) and 6  (c) \(-6\) and 6  (d) \(-3\) and 9

PASSAGE-2
Let \( S = S_1 \cap S_2 \cap S_3 \), where
\[
S_1 = \{ z \in \mathbb{C} : |z| < 4 \} \\
S_2 = \left\{ z \in \mathbb{C} : \text{Im} \left( \frac{z - 1 + \sqrt{3}i}{1 - \sqrt{3}i} \right) > 0 \right\} \\
S_3 = \{ z \in \mathbb{C} : \text{Re} \, z > 0 \}
\]
4. Area of \( S = \) \((2008)\) 
   (a) \(\frac{10\pi}{3}\)  (b) \(\frac{20\pi}{3}\)  (c) \(\frac{16\pi}{3}\)  (d) \(\frac{32\pi}{3}\)

Section-B

JEE Main / AIEEE

1. \( z \) and \( w \) are two nonzero complex numbers such that \( |z| = |w| \) and \( \arg z + \arg w = \pi \) then \( z \) equals \((2002)\) 
   (a) \( z \) \( \bar{z} \)  (b) \( -\bar{z} \)  (c) \( z \)  (d) \( -\bar{z} \)
2. If \( |z - 4| < |z - 2| \), its solution is given by \((2002)\) 
   (a) \( \text{Re}(z) > 0 \)  (b) \( \text{Re}(z) < 0 \)  (c) \( \text{Re}(z) > 3 \)  (d) \( \text{Re}(z) > 2 \)
3. The locus of the centre of a circle which touches the circle \( |z - z_1| = a \) and \( |z - z_2| = b \) externally \((2002)\) 
   (a) an ellipse  (b) a hyperbola  (c) a circle  (d) none of these
4. If \( z \) and \( \omega \) are two non-zero complex numbers such that \( |\omega| = 1 \) and \( \arg(z) - \arg(\omega) = \frac{\pi}{2} \), then \( z \omega \) is equal to \((2003)\) 
   (a) \(-i\)  (b) 1  (c) \(-1\)  (d) \( i \)
5. Let \( Z_1 \) and \( Z_2 \) be two roots of the equation \( Z^2 + aZ + b = 0 \), \( Z \) being complex. Further, assume that the origin, \( Z_1 \) and \( Z_2 \) form an equilateral triangle. Then \((2003)\) 
   (a) \( a^2 = 4b \)  (b) \( a^2 = b \)  (c) \( a^2 = 2b \)  (d) \( a^2 = 3b \)
6. If \( \frac{(1+i)^2}{1-i} = 1 \) then \((2003)\) 
   (a) \( x = 2n + 1 \), where \( n \) is any positive integer 
   (b) \( x = 4n \), where \( n \) is any positive integer 
   (c) \( x = 2n \), where \( n \) is any positive integer 
   (d) \( x = 4n + 1 \), where \( n \) is any positive integer.
7. Let \( z \) and \( w \) be complex numbers such that \( \overline{z} + i \overline{w} = 0 \) and \( \arg zw = \pi \). Then \( z \) equals \((2004)\) 
   (a) \(\frac{5\pi}{4}\)  (b) \(\frac{\pi}{2}\)  (c) \(\frac{3\pi}{4}\)  (d) \(\frac{\pi}{4}\)
8. If \( z = x - iy \) and \( z^3 = p + iq \), then \( \left( \frac{x + i}{p + q} \right) \left( \frac{p^2 + q^2}{z^2} \right) \) is equal to (a) \(-2\) (b) \(-1\) (c) \(2\) (d) \(1\) [2004]

9. If \( |z^2 - 1| = |z|^2 + 1 \), then \( z \) lies on (a) an ellipse (b) the imaginary axis (c) a circle (d) the real axis [2004]

10. If the cube roots of unity are \( 1, \omega, \omega^2 \) then the roots of the equation \( (x-1)^3 + 8 = 0 \), are (a) \(-1, -1 + 2\omega, -1 - 2\omega\) (b) \(-1, -1, -1\) (c) \(-1, -1 + 2\omega, -1 - 2\omega\) (d) \(-1, 1 + 2\omega, -1 + 2\omega\) [2005]

11. If \( z_1 \) and \( z_2 \) are two non-zero complex numbers such that \( |z_1 + z_2| = |z_1| + |z_2| \), then \( \arg z_1 - \arg z_2 \) is equal to (a) \(\frac{\pi}{2}\) (b) \(\pi\) (c) \(0\) (d) \(-\frac{\pi}{2}\) [2005]

12. If \( \omega = \frac{z}{z - \frac{1}{3}i} \) and \( |\omega| = 1 \), then \( z \) lies on (a) an ellipse (b) a circle (c) a straight line (d) a parabola [2005]

13. The value of \( \sum_{k=1}^{10} \left( \sin \frac{2k\pi}{11} + i \cos \frac{2k\pi}{11} \right) \) is (a) \(i\) (b) 1 (c) \(-1\) (d) \(-i\) [2006]

14. If \( z^2 + z + 1 = 0 \), where \( z \) is complex number, then the value of \( \left( z + \frac{1}{z} \right)^2 + \left( z^2 + \frac{1}{z^2} \right)^2 + \left( z^3 + \frac{1}{z^3} \right)^2 + \ldots \) is (a) 18 (b) 54 (c) 6 (d) 12 [2006]

15. If \( |z + 1| \leq 3 \), then the maximum value of \( |z + 1| \) is (a) 6 (b) 0 (c) 4 (d) 10 [2007]

16. The conjugate of a complex number is \( \frac{1}{i-1} \) then that complex number is (a) \(\frac{1}{i-1}\) (b) \(\frac{1}{i+1}\) (c) \(\frac{-1}{i+1}\) (d) \(\frac{1}{i-1}\) [2008]

17. Let \( R \) be the real line. Consider the following subsets of the plane \( R \times R \):
\( S = \{(x, y) : y = x + 1 \text{ and } 0 < x < 2\} \)
\( T = \{(x, y) : x - y \text{ is an integer}\} \)
Which one of the following is true? (a) Neither \( S \) nor \( T \) is an equivalence relation on \( R \) (b) Both \( S \) and \( T \) are equivalence relation on \( R \) (c) \( S \) is an equivalence relation on \( R \) but \( T \) is not (d) \( T \) is an equivalence relation on \( R \) but \( S \) is not [2008]

18. The number of complex numbers \( z \) such that \( |z - 1| = |z + 1| = |z - i| \) equals (a) 1 (b) 2 (c) \(\infty\) (d) 0 [2010]

19. Let \( \alpha, \beta \) be real and \( z \) be a complex number. If \( z^2 + \alpha z + \beta = 0 \) has two distinct roots on the line \( \text{Re} z = 1 \), then it is necessary that : (a) \(\beta \in (-1, 0)\) (b) \(|\beta| = 1\) (c) \(\beta \in (1, \infty)\) (d) \(\beta \in (0, 1)\) [2011]

20. If \( \omega(\neq 1) \) is a cube root of unity, and \((1 + \omega)^7 = A + B\omega\). Then \((A, B)\) equals (a) \((1, 1)\) (b) \((1, 0)\) (c) \((-1, 1)\) (d) \((0, 1)\) [2011]

21. If \( z \neq 1 \) and \( \frac{z^2}{z-1} \) is real, then the point represented by the complex number \( z \) lies : (a) either on the real axis or on a circle passing through the origin. (b) on a circle with centre at the origin (c) either on the real axis or on a circle not passing through the origin. (d) on the imaginary axis. [2012]

22. If \( z \) is a complex number of unit modulus and argument \( \theta \), then \( \arg \left( \frac{1+z}{1+z} \right) \) equals: [JEE M 2013]
(a) \(-\theta\) (b) \(\frac{\pi}{2} - \theta\) (c) \(\theta\) (d) \(\pi - \theta\)

23. If \( z \) is a complex number such that \( |z| \geq 2 \), then the minimum value of \( |z + \frac{1}{2}| \) : [JEE M 2014]
(a) is strictly greater than \(\frac{5}{2}\) (b) is strictly greater than \(\frac{3}{2}\) but less than \(\frac{5}{2}\) (c) is equal to \(\frac{5}{2}\) (d) lie in the interval \((1, 2)\)
24. A complex number $z$ is said to be unimodular if $|z| = 1$.

Suppose $z_1$ and $z_2$ are complex numbers such that $\frac{z_1 - 2z_2}{2 - z_1 \overline{z_2}}$ is unimodular and $z_2$ is not unimodular. Then the point $z_1$ lies on a:

(a) circle of radius 2.
(b) circle of radius $\sqrt{2}$.
(c) straight line parallel to x-axis
(d) straight line parallel to y-axis.

25. A value of $\theta$ for which $\frac{2 + 3i \sin \theta}{1 - 2i \sin \theta}$ is purely imaginary, is:

[JEE M 2015]

(a) $\sin^{-1} \left( \frac{\sqrt{3}}{4} \right)$
(b) $\sin^{-1} \left( \frac{1}{\sqrt{5}} \right)$
(c) $\frac{\pi}{3}$
(d) $\frac{\pi}{6}$
CHAPTER 3

Quadratic Equation and Inequations (Inequalities)

Section-A

A Fill in the Blanks

1. The coefficient of $x^{99}$ in the polynomial 
   $(x-1)(x-2)...(x-100)$ is .................  (1982 - 2 Marks)

2. If $2+i\sqrt{3}$ is a root of the equation $x^2 + px + q = 0$, where 
   $p$ and $q$ are real, then $(p, q) =$ (..................., ...................).  
   (1982 - 2 Marks)

3. If the product of the roots of the equation 
   $x^2 - 3kx + 2 e^{2\ln k} - 1 = 0$ is 7, then the roots are real for 
   $k =$ ..........................  (1984 - 2 Marks)

4. If the quadratic equations $x^2 + ax + b = 0$ and $x^2 + bx + a = 0$ 
   ($a \neq b$) have a common root, then the numerical value of 
   $a + b =$ .......................  (1986 - 2 Marks)

5. The solution of equation $\log_7 \log_5 (\sqrt{x+5} + \sqrt{x}) = 0$ is 
   ..........................  (1986 - 2 Marks)

6. If $x < 0, y < 0, \frac{x}{y} = \frac{1}{2}$ and $(x+y) \frac{x}{y} = -\frac{1}{2}$, then 
   $x =$ ....... and $y =$ .......  (1990 - 2 Marks)

7. Let $n$ and $k$ be positive such that $n \geq \frac{k(k+1)}{2}$. The number 
   of solutions $(x_1, x_2,...,x_k), x_1 \geq 1, x_2 \geq 2, ..., x_k \geq k$, all 
   integers, satisfying $x_1 + x_2 + ... + x_k = n$, is ...................  
   (1996 - 2 Marks)

8. The sum of all the real roots of the equation 
   $|x-2|^2 + |x-2| - 2 = 0$ is ....................  (1997 - 2 Marks)

B True / False

1. For every integer $n > 1$, the inequality $n^{1/n} < \frac{n+1}{2}$ holds.  
   (1981 - 2 Marks)

2. The equation $2x^2 + 3x + 1 = 0$ has an irrational root.  
   (1983 - 1 Mark)

3. If $a < b < c < d$, then the roots of the equation 
   $(x-a)(x-c)+2(x-b)(x-d)=0$ are real and distinct.  
   (1984 - 1 Mark)

4. If $n_1, n_2, ..., n_p$ are $p$ positive integers, whose sum is an 
   even number, then the number of odd integers among them 
   is odd.  (1985 - 1 Mark)

5. If $P(x) = ax^2 + bx + c$ and $Q(x) = -ax^2 + dx + c$, where $ac \neq 0$, 
   then $P(x)Q(x) = 0$ has at least two real roots.  
   (1985 - 1 Mark)

6. If $x$ and $y$ are positive real numbers and $m, n$ are any positive 
   integers, then $\left(\frac{x^m y^m}{1+x^{2n}(1+y^{2m})}\right) > \frac{1}{4}$  
   (1989 - 1 Mark)

C MCQs with One Correct Answer

1. If $\ell, m, n$ are real, $\ell \neq m$, then the roots by the equation: 
   $(\ell - m)x^2 - 5(\ell + m)x - 2(\ell - m) = 0$ are  (1979) 
   (a) Real and equal  (b) Complex  
   (c) Real and unequal  (d) None of these.

2. The equation $x + 2y + 2z = 1$ and $2x + 4y + 4z = 9$ have 
   (a) Only one solution  (b) Only two solutions  
   (c) Infinite number of solutions  (d) None of these.

3. If $x, y$ and $z$ are real and different and 
   $u = x^2 + 4y^2 + 9z^2 - 6yz - 3zx - 2xy$, then $u$ is always. 
   (a) non negative  (b) zero  
   (c) non positive  (d) none of these

4. Let $a > 0, b > 0$ and $c > 0$. Then the roots of the equation 
   $ax^2 + bx + c = 0$  (1979)  
   (a) are real and negative  (b) have negative real parts  
   (c) both (a) and (b)  (d) none of these.

5. Both the roots of the equation 
   $(x-b)(x-c) + (x-a)(x-c) + (x-a)(x-b) = 0$ are always 
   (a) positive  (b) real  
   (c) negative  (d) none of these.

6. The least value of the expression $2 \log_{10} x - \log_{10}(0.01)$, for 
   $x > 1$, is  (1980)  
   (a) 10  (b) 2  
   (c) -0.01  (d) none of these.

7. If $(x^2 + px + 1)$ is a factor of $(ax^3 + bx + c)$, then  (1980)  
   (a) $a^2 + c^2 = -ab$  (b) $a^2 - c^2 = -ab$  
   (c) $a^2 - c^2 = ab$  (d) none of these.
8. The number of real solutions of the equation \( x^2 - 3|x| + 2 = 0 \) is \((1982 - 2 \text{ Marks})\)
(a) 4  (b) 1  (c) 3  (d) 2

9. Two towns \( A \) and \( B \) are 60 km apart. \( A \) school is to be built to serve 150 students in town \( A \) and 50 students in town \( B \). If the total distance to be travelled by all 200 students is to be as small as possible, then the school should be built at \((1982 - 2 \text{ Marks})\)
(a) town \( B \)  (b) 45 km from town \( A \)
(c) town \( A \)  (d) 45 km from town \( B \)

10. If \( p, q, r \) are any real numbers, then \((1982 - 2 \text{ Marks})\)
(a) \( \max (p, q) < \max (p, q, r) \)
(b) \( \min (p, q) = \frac{1}{2}(p + q - |p - q|) \)
(c) \( \min (p, q) < \min (p, q, r) \)
(d) none of these

11. The largest interval for which \( x^{12} - x^9 + x^4 - x + 1 > 0 \) is \((1982 - 2 \text{ Marks})\)
(a) \( -4 < x \leq 0 \)  (b) \( 0 < x < 1 \)
(c) \( -100 < x < 100 \)  (d) \( -\infty < x < \infty \)

12. The equation \( x - \frac{\sqrt{2}}{x-1} = 1 - \frac{\sqrt{2}}{x-1} \) has \((1984 - 2 \text{ Marks})\)
(a) no root  (b) one root
(c) two equal roots  (d) infinitely many roots

13. If \( a^2 + b^2 + c^2 = 1 \), then \( ab + bc + ca \) lies in the interval \((1984 - 2 \text{ Marks})\)
(a) \( \left[ \frac{1}{2}, 2 \right] \)  (b) \( [-1, 2] \)
(c) \( \left[ -\frac{1}{2}, 1 \right] \)  (d) \( [-1, \frac{1}{2}] \)

14. If \( \log_{0.3}(x-1) < \log_{0.09}(x-1) \), then \( x \) lies in the interval \((1985 - 2 \text{ Marks})\)
(a) \( (2, \infty) \)  (b) \( (1, 2) \)
(c) \( (-2, -1) \)  (d) none of these

15*. If \( \alpha \) and \( \beta \) are the roots of \( x^2 + px + q = 0 \) and \( \alpha^4, \beta^4 \) are the roots of \( x^2 - px + s = 0 \), then \( x^2 - 4qx + 2q^2 - r = 0 \) has always
(a) two real roots  (b) two positive roots
(c) two negative roots  (d) one positive and one negative root

Question has more than one correct option.

16. Let \( a, b, c \) be real numbers, \( a \neq 0 \). If \( \alpha \) is a root of \( a^2x^2 + bx + c = 0 \), \( \beta \) is the root of \( a^2x^2 - bx - c = 0 \) and \( 0 < \alpha < \beta \), then the equation \( a^2x^2 + 2bx + 2c = 0 \) has a root \( \gamma \) that always satisfies \((1989 - 2 \text{ Marks})\)
(a) \( \frac{\alpha + \beta}{2} \)  (b) \( \frac{\alpha + \beta}{2} \)
(c) \( \alpha, \beta \)  (d) \( \alpha < \gamma < \beta \)

17. The number of solutions of the equation \( \sin(e^x) = 5^x + 5^{-x} \) is \((1990 - 2 \text{ Marks})\)
(a) 0  (b) 1  (c) 2  (d) Infinitely many

18. Let \( \alpha, \beta \) be the roots of the equation \( (x - \alpha)(x - \beta) = c, c \neq 0 \). Then the roots of the equation \( (x - \alpha)(x - \beta) + c = 0 \) are \((1992 - 2 \text{ Marks})\)
(a) \( a, c \)  (b) \( b, c \)
(c) \( a, b \)  (d) \( a + c, b + c \)

19. The number of points of intersection of two curves \( y = 2 \sin x \) and \( y = 5x^2 + 2x + 3 \) is \((1994)\)
(a) 0  (b) 1  (c) 2  (d) \( \infty \)

20. If \( p, q, r \) are +ve and are in A.P., the roots of quadratic equation \( px^2 + qx + r = 0 \) are all real for \((1994)\)
(a) \( \left| \frac{a - 7}{p} \right| \geq 4\sqrt{3} \)  (b) \( \left| \frac{P - 7}{p} \right| \geq 4\sqrt{3} \)
(c) all \( p \) and \( r \)  (d) no \( p \) and \( r \)

21. Let \( p, q \in \{1, 2, 3, 4\} \). The number of equations of the form \( px^2 + qx + 1 = 0 \) having real roots is \((1994)\)
(a) 15  (b) 9  (c) 7  (d) 8

22. If the roots of the equation \( x^2 - 2ax + a^2 + a - 3 = 0 \) are real and less than 3, then \((1999 - 2 \text{ Marks})\)
(a) \( a < 2 \)  (b) \( 2 \leq a \leq 3 \)
(c) \( 3 < a \leq 4 \)  (d) \( a > 4 \)

23. If \( \alpha \) and \( \beta \) are the roots of the equation \( x^2 + bx + c = 0 \), where \( c < 0 < b \), then \((2000S)\)
(a) \( 0 < \alpha < \beta \)  (b) \( \alpha < 0 < \beta < |\alpha| \)
(c) \( \alpha < \beta < 0 \)  (d) \( \alpha < 0 < |\alpha| < \beta \)

24. If \( a, b, c, d \) are positive real numbers such that \( a + b + c + d = 2 \), then \( M = (a + b)(c + d) \) satisfies the relation \((2000S)\)
(a) \( 0 \leq M \leq 1 \)  (b) \( 1 \leq M \leq 2 \)
(c) \( 2 \leq M \leq 3 \)  (d) \( 3 \leq M \leq 4 \)

25. If \( b > a \), then the equation \( (x - a)(x - b) - 1 = 0 \) has \((2000S)\)
(a) both roots in \((a, b) \)
(b) both roots in \((\infty, a) \)
(c) both roots in \((b, +\infty) \)
(d) one root in \((\infty, a) \) and the other in \((b, +\infty) \)

26. For the equation \( 3x^2 + px + q = 0 \), \( p > 0 \), if one of the root is square of the other, then \( p \) is equal to \((2002S)\)
(a) \( \frac{1}{3} \)  (b) 1  (c) 3  (d) \( \frac{2}{3} \)

27. If \( a_1, a_2, \ldots, a_n \) are positive real numbers whose product is a fixed number \( c \), then the minimum value of \( a_1 + a_2 + \ldots + a_{n-1} + 2a_n \) is \((2002S)\)
(a) \( \frac{n(2c)^{1/n}}{2} \)  (b) \( \frac{n+1}{2}c^{1/n} \)
(c) \( 2nc^{1/n} \)  (d) \( \frac{n+1}{2}c^{1/n} \)

28. The set of all real numbers \( x \) for which \( x^2 - |x + 2| + x > 0 \), is \((2002S)\)
(a) \( (-\infty, -2) \cup (2, \infty) \)  (b) \( (-\infty, -\sqrt{2}) \cup (\sqrt{2}, \infty) \)
(c) \( (-\infty, -1) \cup (1, \infty) \)  (d) \( (\sqrt{2}, \infty) \)

29. If \( \alpha \in \left(0, \frac{\pi}{2}\right) \) then \( \sqrt{x^2 + x + \tan^2 \alpha} \) is always greater than or equal to \((2003S)\)
(a) \( 2 \tan \alpha \)  (b) 1  (c) 2  (d) \( \sec^2 \alpha \)
30. For all \( x \), \( x^2 + 2ax + 10 - 3a > 0 \), then the interval in which \( a \) lies is \( 2004S \) 
(a) \( a < -5 \) (b) \( -5 < a < 2 \) (c) \( a > 5 \) (d) \( 2 < a < 5 \) 
31. If one root is square of the other root of the equation \( x^2 + px + q = 0 \), then the relation between \( p \) and \( q \) is \( 2004S \) 
(a) \( p^2 - q(3p - 1) + q^2 = 0 \) (b) \( p^2 - q(3p + 1) + q^2 = 0 \) (c) \( p^2 + q(3p + 1) + q^2 = 0 \) (d) \( p^2 + q(3p + 1) + q^2 = 0 \) 
32. Let \( a, b, c \) be the sides of a triangle where \( a \neq b \neq c \) and \( \lambda \in R \). If the roots of the equation 
\( x^2 + 2(a + b + c)x + 3\lambda (ab + bc + ca) = 0 \) are real, then 
(2006 - 3M, -1) 
(a) \( \lambda < \frac{4}{3} \) (b) \( \lambda > \frac{5}{3} \) 
(c) \( \lambda \in \left( \frac{1}{3}, \frac{5}{3} \right) \) (d) \( \lambda \in \left( \frac{4}{3}, \frac{5}{3} \right) \) 
33. Let \( \alpha, \beta \) be the roots of the equation \( x^2 - px + r = 0 \) and \( \frac{\alpha}{2}, 2\beta \) be the roots of the equation \( x^2 - qx + r = 0 \). Then the value of \( r \) is \( 2007 - 3 \) marks 
(a) \( \frac{2}{9}(p - q)(2q - p) \) (b) \( \frac{2}{9}(q - p)(2p - q) \) 
(c) \( \frac{2}{9}(q - 2p)(2q - p) \) (d) \( \frac{2}{9}(2p - q)(2q - p) \) 
34. Let \( p \) and \( q \) be real numbers such that \( p \neq 0, p^3 \neq q \) and \( p^3 \neq -q \). If \( \alpha \) and \( \beta \) are nonzero complex numbers satisfying \( \alpha + \beta = -p \) and \( \alpha^3 + \beta^3 = q \), then a quadratic equation having 
\( \frac{\alpha}{\beta} \) and \( \frac{\beta}{\alpha} \) as its roots is \( 2010 \) 
(a) \( (p^3 + q)x^2 - (p^3 + 2q)x + (p^3 + q) = 0 \) 
(b) \( (p^3 + q)x^2 - (p^3 - 2q)x + (p^3 + q) = 0 \) 
(c) \( (p^3 - q)x^2 - (5p^3 - 2q)x + (p^3 - q) = 0 \) 
(d) \( (p^3 - q)x^2 - (5p^3 + 2q)x + (p^3 - q) = 0 \) 
35. Let \( (x_0, y_0) \) be the solution of the following equations 
\( (2x)^n = 2^m y \) 
Then \( x_0 \) is \( 2011 \) 
(a) \( \frac{1}{6} \) (b) \( \frac{1}{3} \) (c) \( \frac{1}{2} \) (d) \( 6 \) 
36. Let \( \alpha \) and \( \beta \) be the roots of \( x^2 - 6x - 2 = 0 \), with \( \alpha > \beta \). If 
\( a_n = \alpha^n - \beta^n \) for \( n \geq 1 \), then the value of \( \frac{a_0 - 2a_2}{a_9} \) is \( 2011 \) 
(a) \( 1 \) (b) \( 2 \) (c) \( 3 \) (d) \( 4 \) 
37. A value of \( b \) for which the equations 
\( x^2 + bx - 1 = 0 \) 
\( x^2 + x + b = 0 \) 
have one root in common is \( 2011 \) 
(a) \( -\sqrt{2} \) (b) \( -i\sqrt{3} \) (c) \( i\sqrt{5} \) (d) \( \sqrt{2} \) 
38. The quadratic equation \( p(x) = 0 \) with real coefficients has purely imaginary roots. Then the equation \( p(p(x)) = 0 \) has \( JEE \ Adv. 2014 \) 
(a) one purely imaginary root (b) all real roots (c) two real and two purely imaginary roots (d) neither real nor purely imaginary roots 
39. Let \( -\frac{\pi}{6} < \theta < -\frac{\pi}{12} \). Suppose \( \alpha_1 \) and \( B_i \) are the roots of the equation \( x^2 - 2x \sec \alpha + 1 = 0 \) and \( \alpha_2 \) and \( \beta_2 \) are the roots of the equation \( x^2 + 2x \tan \theta - 1 = 0 \). If \( \alpha_1 > \beta_1 \) and \( \alpha_2 > \beta_2 \), then \( \alpha_1 + \beta_2 \) equals \( JEE \ Adv. 2016 \) 
(a) \( 2 \) (sec \( \theta - \tan \theta \)) (b) \( 2 \) sec \( \theta \) (c) \( -2 \tan \theta \) (d) \( 0 \) 

**MCQs with One or More than One Correct** 

1. For real \( x \), the function \( \frac{(x-a)(x-b)}{x-c} \) will assume all real values provided \( 2014 - 3 \) marks 
(a) \( a > b \) (b) \( a < b < c \) (c) \( a > c > b \) (d) \( a < c < b \) 
2. If \( S \) is the set of all real \( x \) such that \( \frac{2x-1}{2x^3 + 3x^2 + x} \) is positive, then \( 2016 - 2 \) marks 
(a) \( \left[ -\infty, -\frac{3}{2} \right] \) (b) \( \left( -\frac{3}{2}, -\frac{1}{4} \right) \) 
(c) \( \left( -\frac{1}{4}, \frac{1}{2} \right) \) (d) \( \left( \frac{1}{2}, \frac{3}{2} \right) \) (e) none of these 
3. If \( a, b \) and \( c \) are distinct positive numbers, then the expression \( (b + c - a)(c + a - b)(a + b - c) - abc \) is \( 2016 - 2 \) marks 
(a) positive (b) negative (c) non-positive (d) non-negative (e) none of these 
4. If \( a, b, c, d \) and \( p \) are distinct real numbers such that 
\( (a^2 + b^2 + c^2)p^2 - 2(ab + bc + cd)p + (b^2 + c^2 + d^2) \leq 0 \) 
then \( a, b, c, d \) \( 1987 - 2 \) Marks 
(a) are in A. P. (b) are in G. P. (c) are in H. P. (d) satisfy \( ab = cd \) (e) satisfy none of these 
5. The equation \( x^{3/4}(\log_2 x)^2 + \log_2 x - 5/4 = \sqrt{2} \) has \( 1990 - 2 \) Marks 
(a) at least one real solution (b) exactly three solutions (c) exactly one irrational solution (d) complex roots.
6. The product of \( n \) positive numbers is unity. Then their sum is \((1991 - 2\text{ Marks})\)
(a) a positive integer  
(b) divisible by \( n \)
(c) equal to \( n + \frac{1}{n} \)  
(d) never less than \( n \)

7. Number of divisors of the form \( 4n + 2 \) \((n \geq 0)\) of the integer 240 is \((1998 - 2\text{ Marks})\)
(a) 4  
(b) 8  
(c) 10  
(d) 3

8. If \( 3^x = 4^x \), then \( x = \) \((\text{JEE Adv. 2013})\)
(a) \( \frac{\log_3 2}{\log_3 2 - 1} \)  
(b) \( \frac{2}{2 - \log_2 3} \)  
(c) \( \frac{1}{\log_4 3} \)  
(d) \( \frac{2 \log_2 3}{2 \log_2 3 - 1} \)

9. Let \( S \) be the set of all non-zero real numbers such that the quadratic equation \( \alpha x^2 - x + \alpha = 0 \) has two distinct real roots \( x_1 \) and \( x_2 \) satisfying the inequality \( |x_1 - x_2| < 1 \). Which of the following intervals is (are) a subset(s) of \( S \)? \((\text{JEE Adv. 2015})\)
(a) \( \left( \frac{1}{2}, \frac{1}{\sqrt{5}} \right) \)  
(b) \( \left( -\frac{1}{\sqrt{5}}, 0 \right) \)  
(c) \( \left( 0, \frac{1}{\sqrt{5}} \right) \)  
(d) \( \left( \frac{1}{\sqrt{5}}, \frac{1}{2} \right) \)

### Subjective Problems

1. Solve for \( x \): \( 4^x - 3^{x - \frac{1}{2}} = 3^x + 1 \) \( \frac{1}{2} - 2^{x - 1} \) \((1978)\)

2. If \( (m, n) = \frac{(1-x^m)(1-x^{m-1}) \ldots (1-x^{n-1})}{(1-x)(1-x^2) \ldots (1-x^n)} \) \((1978)\)
where \( m \) and \( n \) are positive integers (\( n \leq m \)), show that \( (m, n+1) = (m-1, n+1) + x^{m-n-1} (m-1, n) \).

3. Solve for \( x \): \( \sqrt{x+1} - \sqrt{x-1} = 1 \) \((1978)\)

4. Solve the following equation for \( x \): \( 2 \log_a x^2 + \log_a x + 3 \log_a x^2 + a = 0, a > 0 \) \((1978)\)

5. Show that the square of \( \sqrt{26 - 15\sqrt{3}} \) is a rational number. \((1978)\)

6. Sketch the solution set of the following system of inequalities: \( x^2 + y^2 - 2x \geq 0; 3x - y - 12 \leq 0; y - x \leq 0; y \geq 0 \). \((1978)\)

7. Find all integers \( x \) for which \( (5x - 1)(x + 1)^2 < (7x - 3) \). \((1978)\)

8. If \( \alpha, \beta \) are the roots of \( x^2 + px + q = 0 \) and \( \gamma, \delta \) are the roots of \( x^2 + r x + s = 0 \), evaluate \( \alpha - \gamma \) \((\alpha - \delta)(\beta - \gamma) \) \((\beta - \delta) \) in terms of \( p, q, r \) and \( s \). Deduce the condition that the equations have a common root. \((1979)\)

9. Given \( n^4 < 10^n \) for a fixed positive integer \( n \geq 2 \), prove that \( (n + 1)^4 < 10^{n+1} \). \((1980)\)

10. Let \( y = \sqrt[3]{(x+1)(x-3)} \) \((x - 2) \) \((1980)\)
Find all the real values of \( x \) for which \( y \) takes real values.

11. For what values of \( m \), does the system of equations \( 3x + my = m \) \( 2x - 5y = 20 \) has solution satisfying the conditions \( x > 0, y > 0 \). \((1980)\)

12. Find the solution set of the system \( x + 2y + z = 1 \) \( 2x - 3y - w = 2 \) \( x \geq 0, y \geq 0, z \geq 0, w \geq 0 \). \((1980)\)

13. Show that the equation \( e^{\sin x} - e^{-\sin x} - 4 = 0 \) has no real solution. \((1982 - 2\text{ Marks})\)

14. \( mn \) squares of equal size are arranged to form a rectangle of dimension \( m \) by \( n \), where \( m \) and \( n \) are natural numbers. Two squares will be called ‘neighbours’ if they have exactly one common side. A natural number is written in each square such that the number written in any square is the arithmetic mean of the numbers written in its neighbouring squares. Show that this is possible only if all the numbers used are equal. \((1982 - 5\text{ Marks})\)

15. If one root of the quadratic equation \( ax^2 + bx + c = 0 \) is equal to the \( n \)-th power of the other, then show that \( \frac{1}{(ac^n)^{n+1}} + \frac{1}{(a^n c)^{n+1}} + b = 0 \). \((1983 - 2\text{ Marks})\)

16. Find all real values of \( x \) which satisfy \( x^2 - 3x + 2 > 0 \) and \( x^2 - 2x - 4 \leq 0 \). \((1983 - 2\text{ Marks})\)

17. Solve for \( x \): \((5 + 2\sqrt{6}) x^2 - 3 + (5 - 2\sqrt{6}) x^2 - 3 = 10 \) \((1985 - 5\text{ Marks})\)

18. For \( a \leq 0 \), determine all real roots of the equation \( x^2 - 2ax - a - 3a^2 = 0 \) \((1986 - 5\text{ Marks})\)

19. Find the set of all \( x \) for which \( \frac{2x}{(2x^2 + 5x + 2)} > \frac{1}{x+1} \). \((1987 - 3\text{ Marks})\)

20. Solve \( |x^2 + 4x + 3| - 2x + 5 = 0 \) \((1988 - 5\text{ Marks})\)

21. Let \( a, b, c \) be real. If \( ax^2 + bx + c = 0 \) has two real roots \( \alpha \) and \( \beta \), where \( \alpha < -1 \) and \( \beta > 1 \), then show that \( 1 + \frac{c}{a} \right| \frac{b}{a} < 0 \). \((1995 - 5\text{ Marks})\)

22. Let \( S \) be a square of unit area. Consider any quadrilateral which has one vertex on each side of \( S \). If \( a, b, c, \) and \( d \) denote the lengths of the sides of the quadrilateral, prove that \( 2 \leq a^2 + b^2 + c^2 + d^2 \leq 4 \). \((1997 - 5\text{ Marks})\)
23. If $\alpha$, $\beta$ are the roots of $ax^2 + bx + c = 0$, ($a \neq 0$) and $\alpha + \delta$, $\beta + \delta$ are the roots of $Ax^2 + Bx + C = 0$, ($A \neq 0$) for some constant $\delta$, then prove that $\frac{b^2 - 4ac}{a^2} = \frac{B^2 - 4AC}{A^2}$.

(2000 - 4 Marks)

24. Let $a$, $b$, $c$ be real numbers with $a \neq 0$ and let $\alpha$, $\beta$ be the roots of the equation $ax^2 + bx + c = 0$. Express the roots of $a^3x^2 + abx + c^3 = 0$ in terms of $\alpha$, $\beta$.

(2001 - 4 Marks)

25. If $x^2 + (a-b)x + (1-a-b) = 0$ where $a$, $b \in \mathbb{R}$ then find the values of $a$ for which equation has unequal real roots for all values of $b$.

(2003 - 4 Marks)

26. If $a$, $b$, $c$ are positive real numbers. Then prove that $(a+1)^7(b+1)^7(c+1)^7 > 7^7 a^4b^4c^4$.

(2004 - 4 Marks)

27. Let $a$ and $b$ be the roots of the equation $x^2 - 10cx - 11d = 0$ and those of $x^2 - 10ax - 11b = 0$ are $c$, $d$ then the value of $a + b + c + d$, when $a \neq b$ is not equal to $c \neq d$ is.

(2006 - 6M)

**Assertion & Reason Type Questions**

1. Let $a$, $b$, $c$, $p$, $q$ be real numbers. Suppose $\alpha$, $\beta$ are the roots of the equation $x^2 + 2px + q = 0$ and $\frac{1}{\beta}$ are the roots of the equation $ax^2 + 2bx + c = 0$, where $\beta^2 \notin \{-1, 0, 1\}$.

**Section-B**

1. If $\alpha \neq \beta$ but $\alpha^2 = 5\alpha - 3$ and $\beta^2 = 5\beta - 3$ then the equation having $\alpha$/$\beta$ as its roots is.

   (a) $3x^2 - 19x + 3 = 0$
   (b) $3x^2 + 19x - 3 = 0$
   (c) $3x^2 - 19x - 3 = 0$
   (d) $x^2 - 5x + 3 = 0$.

2. Difference between the corresponding roots of $x^2 + ax + b = 0$ and $x^2 + bx + a = 0$ is same and $a \neq b$, then

   (a) $a + b + 4 = 0$
   (b) $a + b - 4 = 0$
   (c) $a - b - 4 = 0$
   (d) $a - b + 4 = 0$.

3. Product of real roots of the equation $x^2 + |x| + 9 = 0$.

   (a) is always positive
   (b) is always negative
   (c) does not exist
   (d) none of these.

4. If $p$ and $q$ are the roots of the equation $x^2 + px + q = 0$, then

   (a) $p = 1$, $q = -2$
   (b) $p = 0$, $q = 1$
   (c) $p = -2$, $q = 0$
   (d) $p = -2$, $q = 1$.

5. If $a$, $b$, $c$ are distinct $+ve$ real numbers and $a^2 + b^2 + c^2 = 1$ then $ab + bc + ca$ is

   (a) less than 1
   (b) equal to 1
   (c) greater than 1
   (d) any real no.

6. If the sum of the roots of the quadratic equation $ax^2 + bx + c = 0$ is equal to the sum of the squares of their reciprocals, then $\frac{a}{c}$, $\frac{b}{a}$ and $\frac{c}{b}$ are in

   (a) Arithmetic - Geometric Progression
   (b) Arithmetic Progression

(c) Geometric Progression
(d) Harmonic Progression.

7. The value of 'a' for which one root of the quadratic equation $(a^2 - 5a + 3)x^2 + (3a - 1)x + 2 = 0$ is twice as large as the other is.

   (a) $-\frac{1}{3}$
   (b) $\frac{2}{3}$
   (c) $\frac{2}{3}$
   (d) $\frac{1}{3}$.

8. The number of real solutions of the equation $x^2 - 3|x| + 2 = 0$ is

   (a) 3
   (b) 2
   (c) 4
   (d) 1.

9. The real number $x$ when added to its inverse gives the minimum value of the sum at $x$ equal to

   (a) $-2$
   (b) 2
   (c) 1
   (d) 1.

10. Let two numbers have arithmetic mean 9 and geometric mean 4. Then these numbers are the roots of the quadratic equation.

    (a) $x^2 - 18x - 16 = 0$
    (b) $x^2 - 18x + 16 = 0$
    (c) $x^2 + 18x - 16 = 0$
    (d) $x^2 + 18x + 16 = 0$.

11. If $(1 - p)$ is a root of quadratic equation

    $x^2 + px + (1 - p) = 0$ then its root are

    (a) $-1, 2$
    (b) $-1, 1$
    (c) $0, -1$
    (d) $0, 1$.
12. If one root of the equation \( x^2 + px + 12 = 0 \) is 4, while the equation \( x^2 + px + q = 0 \) has equal roots, then the value of \( q \) is \[2004\]
(a) 4 (b) 12 (c) 3 (d) \( \frac{49}{4} \)

13. In a triangle \( PQR \), \( \angle R = \frac{\pi}{2} \). If \( \tan \left( \frac{P}{2} \right) \) and \( -\tan \left( \frac{Q}{2} \right) \) are the roots of \( ax^2 + bx + c = 0, a \neq 0 \) then \[2005\]
(a) \( a = b + c \) (b) \( c = a + b \) (c) \( b = c \) (d) \( b = a + c \)

14. If both the roots of the quadratic equation \( x^2 - 2kx + k^2 + 5 = 0 \) are less than 5, then \( k \) lies in the interval \[2005\]
(a) (5, 6) (b) (6, \( \infty \)) (c) (-\( \infty \), 4) (d) [4, 5]

15. If the roots of the quadratic equation \( x^2 + px + q = 0 \) are \( \tan 30^\circ \) and \( \tan 15^\circ \), respectively, then the value of \( 2 + q - p \) is \[2006\]
(a) 2 (b) 3 (c) 0 (d) 1

16. All the values of \( m \) for which both roots of the equation \( x^2 - 2mx + m^2 + 2 = 0 \) are greater than \( -2 \) but less than \( 4 \), lie in the interval \[2006\]
(a) \( -2 < m < 0 \) (b) \( m > 3 \) (c) \( -1 < m < 3 \) (d) \( 1 < m < 4 \)

17. If \( x \) is real, the maximum value of \( \frac{3x^2 + 9x + 17}{3x^2 + 9x + 7} \) is \[2006\]
(a) \( \frac{1}{4} \) (b) \( 41 \) (c) \( \frac{1}{7} \) (d) \( \frac{17}{7} \)

18. If the difference between the roots of the equation \( x^2 + ax + 1 = 0 \) is less than \( \sqrt{5} \), then the set of possible values of \( a \) is \[2007\]
(a) \( (3, \infty) \) (b) \( (-\infty, -3) \) (c) \( (-3, 3) \) (d) \( (-\infty, \infty) \).

19. **Statement-1**: For every natural number \( n \geq 2 \),
\[
\frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \ldots + \frac{1}{\sqrt{n}} > \sqrt{n}.
\]
**Statement-2**: For every natural number \( n \geq 2 \),
\[
\sqrt{n(n+1)} < n + 1.
\]
(a) Statement -1 is false, Statement-2 is true
(b) Statement -1 is true, Statement-2 is true; Statement -1 is a correct explanation for Statement -1
(c) Statement -1 is true, Statement-2 is true; Statement -2 is a correct explanation for Statement -1
(d) Statement -1 is true, Statement-2 is false

20. The quadratic equations \( x^2 - 6x + a = 0 \) and \( x^2 - cx + 6 = 0 \) have one root in common. The other roots of the first and second equations are integers in the ratio 4 : 3. Then the common root is \[2009\]
(a) 1 (b) 4 (c) 3 (d) 2

21. If the roots of the equation \( bx^2 + cx + a = 0 \) be imaginary, then for all real values of \( x \), the expression \[2009\]
\[
3b^2x^2 + 6bcx + 2c^2 = \]
(a) less than \( 4ab \) (b) greater than \( 4ab \) (c) less than \( -4ab \) (d) greater than \( 4ab \)

22. If \( \mid z - \frac{4}{z} \mid = 2 \), then the maximum value of \( \mid Z \) is equal to \[2009\]
(a) \( \sqrt{5} + 1 \) (b) 2 (c) \( 2 + \sqrt{2} \) (d) \( \sqrt{5} + 1 \)

23. If \( \alpha \) and \( \beta \) are the roots of the equation \( x^2 - x + 1 = 0 \), then \[2010\]
\[
\alpha^{2009} + \beta^{2009} =
\]
(a) -1 (b) 1 (c) 2 (d) -2

24. The equation \( e^{\sin x} - e^{-\sin x} = 4 \) has:
(a) infinite number of real roots
(b) no real roots
(c) exactly one real root
(d) exactly four real roots

25. The real number \( k \) for which the equation, \( 2x^3 + 3x + k = 0 \) has two distinct real roots in \([0, 1]\) \[JEE 2013\]
(a) lies between 1 and 2 (b) lies between 2 and 3 (c) lies between -1 and 0 (d) does not exist.

26. The number of values of \( k \), for which the system of equations:
\[
\begin{align*}
(k + 1)x + 8y &= 4k \\
kx + (k + 3)y &= 3k - 1
\end{align*}
\]
has no solution, is
(a) infinite (b) 1 (c) 2 (d) 3

27. If the equations \( x^2 + 2x + 3 = 0 \) and \( ax^2 + bx + c = 0 \) have a common root, then \( a:b:c \) is \[2013\]
(a) 1:2:3 (b) 3:2:1 (c) 1:3:2 (d) 3:1:2

28. If \( a \in R \) and the equation \( -3(x-[x])^2 + 2(x-[x]) + a^2 = 0 \) (where \([x]\) denotes the greatest integer \(\leq x\)) has no integral solution, then all possible values of \( a \) lie in the interval: \[2014\]
(a) \((-2, -1)\) (b) \((-\infty, -2) \cup (2, \infty)\)
(c) \((-1, 0) \cup (0, 1)\) (d) \((1, 2)\)

29. Let \( \alpha \) and \( \beta \) be the roots of equation \( px^2 + qx + r = 0 \), \( p \neq 0 \). If \( p, q, r \) are in A.P. and \( \frac{1}{\alpha} + \frac{1}{\beta} = 4 \), then the value of \( |\alpha - \beta| \) is: \[2014\]
(a) \( \frac{\sqrt{34}}{9} \) (b) \( \frac{2\sqrt{13}}{9} \) (c) \( \frac{\sqrt{61}}{9} \) (d) \( \frac{2\sqrt{17}}{9} \)

30. Let \( \alpha \) and \( \beta \) be the roots of equation \( x^2 - 6x - 2 = 0 \). If \( a_n = \alpha^n - \beta^n \), for \( n \geq 1 \), then the value of \( \frac{a_{10} - 2a_8}{2a_9} \) is equal to: \[2015\]
(a) 3 (b) -3 (c) 6 (d) -6

31. The sum of all real values of \( x \) satisfying the equation \( (x^2 - 5x + 5)x^2 + 4x - 60 = 1 \) is: \[2016\]
(a) 6 (b) 5 (c) 3 (d) -4
CHAPTER 4

Permutations and Combinations

Section-A

Fill in the Blanks

1. In a certain test, $a_i$ students gave wrong answers to atleast $i$ questions, where $i = 1, 2, \ldots, k$. No student gave more than $k$ wrong answers. The total number of wrong answers given is \ldots (1982 - 2 Marks)

2. The side $AB$, $BC$ and $CA$ of a triangle $ABC$ have 3, 4 and 5 interior points respectively on them. The number of triangles that can be constructed using these interior points as vertices is \ldots (1984 - 2 Marks)

3. Total number of ways in which six '+' and four '-' signs can be arranged in a line such that no two '-' signs occur together is \ldots (1988 - 2 Marks)

4. There are four balls of different colours and four boxes of colours, same as those of the balls. The number of ways in which the balls, one each in a box, could be placed such that a ball does not go to a box of its own colour is \ldots.

True / False

1. The product of any $r$ consecutive natural numbers is always divisible by $r!$. (1985 - 1 Mark)

MCQs with One Correct Answer

1. \( ^nC_{r-1} = 36, \ ^nC_r = 84 \) and \( ^nC_{r+1} = 126 \), then $r$ is: (1979)
   (a) 1 (b) 2 (c) 3 (d) None of these

2. Ten different letters of an alphabet are given. Words with five letters are formed from these given letters. Then the number of words which have at least one letter repeated are (1982 - 2 Marks)
   (a) 69760 (b) 30240 (c) 99748 (d) None of these

3. The value of the expression \( 47C_4 + \sum_{j=1}^{5} 52C_j \) is equal to (1982 - 2 Marks)
   (a) \( 47C_5 \) (b) \( 52C_5 \) (c) \( 52C_4 \) (d) None of these

4. Eight chairs are numbered 1 to 8. Two women and three men wish to occupy one chair each. First the women choose the chairs from amongst the chairs marked 1 to 4; and then the men select the chairs from amongst the remaining. The number of possible arrangements is (1982 - 2 Marks)
   (a) \( 6C_3 \times 4C_2 \) (b) \( 4P_2 \times 4P_3 \) (c) \( 4C_2 \times 4P_3 \) (d) None of these

5. A five-digit numbers divisible by 3 is to be formed using the numerals 0, 1, 2, 3, 4 and 5, without repetition. The total number of ways this can be done is (1989 - 2 Marks)
   (a) 216 (b) 240 (c) 600 (d) 3125

6. How many different nine digit numbers can be formed from the number 22355888 by rearranging its digits so that the odd digits occupy even positions? (2000S)
   (a) 16 (b) 36 (c) 60 (d) 180

7. Let $T_n$ denote the number of triangles which can be formed using the vertices of a regular polygon of $n$ sides. If $T_{n+1} - T_n = 21$, then $n$ equals (2001S)
   (a) 5 (b) 7 (c) 6 (d) 4

8. The number of arrangements of the letters of the word BANANA in which the two N's do not appear adjacent is (2002S)
   (a) 40 (b) 60 (c) 80 (d) 100

9. A rectangle with sides of length \( (2m - 1) \) and \( (2n - 1) \) units is divided into squares of unit length by drawing parallel lines as shown in the diagram, then the number of rectangles possible with odd side lengths is (2005S)

10. If the LCM of \( p, q \) is \( r^2s^3t^2 \), where \( r, s, t \) are prime numbers and \( p, q \) are the positive integers then the number of ordered pair \( (p, q) \) is (2006 - 3M, -1)
    (a) 252 (b) 254 (c) 225 (d) 224

11. The letters of the word COCHIN are permuted and all the permutations are arranged in an alphabetical order as in an English dictionary. The number of words that appear before the word COCHIN is (2007 - 3 marks)
    (a) 360 (b) 192 (c) 96 (d) 48

12. The number of seven digit integers, with sum of the digits equal to 10 and formed by using the digits 1, 2 and 3 only, is (2009)
    (a) 55 (b) 66 (c) 77 (d) 88
13. The total number of ways in which 5 balls of different colours can be distributed among 3 persons so that each person gets at least one ball is \(2012\) 
(a) 75  (b) 150  (c) 210  (d) 243

14. Six cards and six envelopes are numbered 1, 2, 3, 4, 5, 6 and cards are to be placed in envelopes so that each envelope contains exactly one card and no card is placed in the envelope bearing the same number and moreover the card numbered 1 is always placed in envelope numbered 2. Then the number of ways it can be done is \(JEE\ Adv.\ 2014\) 
(a) 264  (b) 265  (c) 53  (d) 67

15. A debate club consists of 6 girls and 4 boys. A team of 4 members is to be selected from this club including the selection of a captain (from among these 4 memos) for the team. If the team has to include at most one boy, then the number of ways of selecting the team is \(JEE\ Adv.\ 2016\) 
(a) 380  (b) 320  (c) 260  (d) 95

D  MCQs with One or More than One Correct

1. An n-digit number is a positive number with exactly n digits. Nine hundred distinct n-digit numbers are to be formed using only the three digits 2, 5 and 7. The smallest value of n for which this is possible is \(1998 - 2 Marks\) 
(a) 6  (b) 7  (c) 8  (d) 9

E  Subjective Problems

1. Six X's have to be placed in the squares of figure below in such a way that each row contains at least one X. In how many different ways can this be done. \(1978\)

F  Match the Following

Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. Consider all possible permutations of the letters of the word ENDEANOEL. Match the Statements / Expressions in Column I with the Statements / Expressions in Column II and indicate your answer by darkening the appropriate bubbles in the 4 x 4 matrix given in the ORS. \(2008\)

Column I

(A) The number of permutations containing the word ENDEA is

Column II

(p) 5!
Permutations and Combinations

- The number of permutations in which the letter E occurs in the first and the last positions is \((q) 2 \times 5!\)
- The number of permutations in which none of the letters D, L, N occurs in the last five positions is \((r) 7 \times 5!\)
- The number of permutations in which the letters A, E, O occur only in odd positions is \((s) 21 \times 5!\)

G Comprehension Based Questions

PASSAGE - 1

Let \(a_n\) denote the number of all \(n\)-digit positive integers formed by the digits 0, 1 or both such that no consecutive digits in them are 0. Let \(b_n\) be the number of such \(n\)-digit integers ending with digit 1 and \(c_n\) is the number of such \(n\)-digit integers ending with digit 0.

1. The value of \(b_6\) is
   (a) 7  (b) 8  (c) 9  (d) 11

2. Which of the following is correct?
   (a) \(a_7 = a_6 + a_5\)  (b) \(c_7 = c_6 + c_{16}\)
   (c) \(b_7 = b_6 + c_6\)  (d) \(a_7 = c_7 + b_6\)

I Integer Value Correct Type

1. Consider the set of eight vectors \(V = \{a \hat{i} + b \hat{j} + c \hat{k} : a, b, c \in \{-1, 1\}\}\). Three non-coplanar vectors can be chosen from \(V\) in \(2^p\) ways. Then \(p\) is \((JEE\ Adv. 2013)\)

2. Let \(n_1 < n_2 < n_3 < n_4 < n_5\) be positive integers such that \(n_1 + n_2 + n_3 + n_4 + n_5 = 20\). Then the number of such distinct arrangements \((n_1, n_2, n_3, n_4, n_5)\) is \((JEE\ Adv. 2014)\)

3. Let \(n \geq 2\) be an integer. Take \(n\) distinct points on a circle and join each pair of points by a line segment. Colour the line segment joining every pair of adjacent points by blue and the rest by red. If the number of red and blue line segments are equal, then the value of \(n\) is \((JEE\ Adv. 2014)\)

4. Let \(n\) be the number of ways in which 5 boys and 5 girls can stand in a queue in such a way that all the girls stand consecutively in the queue. Let \(m\) be the number of ways in which 5 boys and 5 girls can stand in a queue in such a way that exactly four girls stand consecutively in the queue.

Then the value of \(\frac{m}{n}\) is \((JEE\ Adv. 2015)\)

Section-B JEE Main/AIEEE

1. Total number of four digit odd numbers that can be formed using 0, 1, 2, 3, 5, 7 (using repetition allowed) are \([2002]\)
   (a) 216  (b) 375  (c) 400  (d) 720

2. Number greater than 1000 but less than 4000 is formed using the digits 0, 1, 2, 3, 4 (repetition allowed). Their number is \([2002]\)
   (a) 125  (b) 105  (c) 375  (d) 625

3. Five digit number divisible by 3 is formed using 0, 1, 2, 3, 4 and 5 without repetition. Total number of such numbers are \([2002]\)
   (a) 312  (b) 3125  (c) 120  (d) 216

4. The sum of integers from 1 to 100 that are divisible by 2 or 5 is \([2002]\)
   (a) 3000  (b) 3050  (c) 3600  (d) 3250

5. If \(^nC_r\) denotes the number of combination of \(n\) things taken \(r\) at a time, then the expression \(^{n+1}C_{r+1} + ^nC_{r-1} + 2^nC_r\) equals \([2003]\)
   (a) \(^{n+1}C_{r+1}\)  (b) \(^{n+2}C_r\)  (c) \(^nC_{r+1}\)  (d) \(^{n+1}C_r\)

6. A student is to answer 10 out of 13 questions in an examination such that he must choose at least 4 from the first five questions. The number of choices available to him is \([2003]\)
   (a) 346  (b) 140  (c) 196  (d) 280

7. The number of ways in which 6 men and 5 women can dine at a round table if no two women are to sit together is given by \([2003]\)
   (a) \(7! \times 5!\)  (b) \(6! \times 5!\)  (c) \(3! \times 5!\)  (d) \(5! \times 4!\)

8. How many ways are there to arrange the letters in the word GARDEN with vowels in alphabetical order \([2004]\)
   (a) 480  (b) 240  (c) 360  (d) 120

9. The number of ways of distributing 8 identical balls in 3 distinct boxes so that none of the boxes is empty is \([2004]\)
   (a) \(^8C_3\)  (b) 21  (c) \(3^8\)  (d) 5

10. If the letters of the word SACHIN are arranged in all possible ways and these words are written out as in dictionary, then the word SACHIN appears at serial number \([2005]\)
    (a) 601  (b) 600  (c) 603  (d) 602
11. At an election, a voter may vote for any number of candidates, not greater than the number to be elected. There are 10 candidates and 4 of be selected, if a voter votes for at least one candidate, then the number of ways in which he can vote is. 

\[ \frac{12!}{(4)!^3} \]  
(a) 5040  
(b) 6210  
(c) 385  
(d) 1110

12. The set \( S = \{1, 2, 3, \ldots, 12\} \) is to be partitioned into three sets \( A, B, C \) of equal size. Thus \( A \cup B \cup C = S \), \( A \cap B = B \cap C = A \cap C = \emptyset \). The number of ways to partition \( S \) is.

\[ \frac{12!}{3!(4!)^3} \]  
(a) \( \frac{12!}{(4!)^4} \)  
(b) \( \frac{12!}{3!(4!)^3} \)  
(c) \( \frac{12!}{(4!)^3} \)  
(d) \( \frac{12!}{3!(4!)^4} \)

13. In a shop there are five types of ice-creams available. A child buys six ice-creams.

**Statement-1**: The number of different ways the child can buy the six ice-creams is \( \sum_{5}^{5} \).

**Statement-2**: The number of different ways the child can buy the six ice-creams is equal to the number of different ways of arranging 6 A's and 4 B's in a row.

(a) Statement-1 is false, Statement-2 is true.
(b) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.
(c) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.
(d) Statement-1 is true, Statement-2 is false.

14. How many different words can be formed by jumbling the letters in the word \text{MISSISSIPI} in which no two S are adjacent?

(a) 8.6C4 \cdot 7C4  
(b) 6.7C4  
(c) 6.8C4  
(d) 7.6C4 \cdot 8C4

15. From 6 different novels and 3 different dictionaries, 4 novels and 1 dictionary are to be selected and arranged in a row on a shelf so that the dictionary is always in the middle. Then the number of such arrangement is.

(a) at least 500 but less than 750  
(b) at least 750 but less than 1000  
(c) at least 1000  
(d) less than 500

16. There are two urns. Urn A has 3 distinct red balls and urn B has 9 distinct blue balls. From each urn two balls are taken at random and then transferred to the other. The number of ways in which this can be done is.

(a) 36  
(b) 66  
(c) 108  
(d) 3

17. **Statement-1**: The number of ways of distributing 10 identical balls in 4 distinct boxes such that no box is empty is \( 9C_3 \).

**Statement-2**: The number of ways of choosing any 3 places from 9 different places is \( 9C_3 \).

(a) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.
(b) Statement-1 is true, Statement-2 is false.
(c) Statement-1 is false, Statement-2 is true.
(d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.

18. These are 10 points in a plane, out of these 6 are collinear, if N is the number of triangles formed by joining these points. then:

(a) \( n \leq 100 \)  
(b) \( 100 < n \leq 140 \)  
(c) \( 140 < n \leq 190 \)  
(d) \( n > 190 \)

19. Assuming the balls to be identical except for difference in colours, the number of ways in which one or more balls can be selected from 10 white, 9 green and 7 black balls is.

(a) 800  
(b) 629  
(c) 630  
(d) 879

20. Let \( T_n \) be the number of all possible triangles formed by joining vertices of an \( n \)-sided regular polygon. If \( T_{n+1} - T_n = 10 \), then the value of \( n \) is.

(a) 7  
(b) 5  
(c) 10  
(d) 8

21. The number of integers greater than 6,000 that can be formed, using the digits 3, 5, 6, 7 and 8, without repetition, is.

(a) 120  
(b) 72  
(c) 216  
(d) 192

22. If all the words (with or without meaning) having five letters, formed using the letters of the word SMALL and arranged as in a dictionary; then the position of the word SMALL is.

(a) 52nd  
(b) 58th  
(c) 46th  
(d) 59th
CHAPTER 5
Mathematical Induction and Binomial Theorem

Section-A

**JEE Advanced/ IIT-JEE**

**A** Fill in the Blanks

1. The larger of $99^{50} + 100^{50}$ and $101^{50}$ is ................. 
   (1982 - 2 Marks)

2. The sum of the coefficients of the polynomial $(1 + x - 3x^2)^{2163}$ is ................. 
   (1982 - 2 Marks)

3. If $(1 + ax)^n = 1 + 8x + 24x^2 + ....$ then $a = ......$ and $n = ............$ 
   (1983 - 2 Marks)

4. Let $n$ be positive integer. If the coefficients of 2nd, 3rd, and 4th terms in the expansion of $(1 + x)^n$ are in A.P., then the value of $n$ is ................. 
   (1994 - 2 Marks)

5. The sum of the rational terms in the expansion of 
   $(\sqrt{2} + 3^{1/5})^{10}$ is ................. 
   (1997 - 2 Marks)

**C** MCQs with One Correct Answer

1. Given positive integers $r > 1$, $n > 2$ and that the coefficient of 
   $(3r)\text{th}$ and $(r + 2)\text{th}$ terms in the binomial expansion of 
   $(1 + x)^n$ are equal. Then 
   (a) $n = 2r$ (b) $n = 3r$ (c) $n = 2r + 1$ (d) none of these 
   (1983 - 1 Mark)

2. The coefficient of $x^4$ in 
   $\left(\frac{x}{2} - \frac{3}{x^2}\right)^{10}$ is ................. 
   (1983 - 1 Mark)

   (a) 405 
   (b) 504 
   (c) 450 
   (d) none of these 
   (1983 - 1 Mark)

3. The expression 
   $\left(x + (x^3 - 1)^2\right)^5 + \left(x - (x^3 - 1)^2\right)^5$ is a 
   polynomial of degree ................. 
   (1992 - 2 Marks)

   (a) 5 
   (b) 6 
   (c) 7 
   (d) 8

4. If in the expansion of $(1 + x)^n (1 - x)^n$, the coefficients of $x$ and $x^2$ are 3 and -6 respectively, then $n$ is 
   (1999 - 2 Marks)

   (a) 6 
   (b) 9 
   (c) 12 
   (d) 24

5. For $2 \leq r \leq n$, 
   \[ \binom{n}{r} + \binom{n}{r-1} + \binom{n}{r-2} = \] 
   (2000S)

   (a) \[ \binom{n+1}{r-1} \] 
   (b) \[ \binom{n+1}{r+1} \] 
   (c) \[ \binom{n+2}{r} \] 
   (d) \[ \binom{n+2}{r} \]

6. In the binomial expansion of $(a - b)^n$, $n \geq 5$, the sum of the $5$th and $6$th terms is zero. Then \( a \div b \) equals 
   (2001S)

   (a) $\frac{n-5}{6}$ 
   (b) $\frac{n-4}{5}$ 
   (c) $\frac{5}{n-4}$ 
   (d) $\frac{6}{n-5}$

7. The sum 
   \[ \sum_{i=0}^{m} \binom{10}{i} \binom{20}{m-i} \] 
   (where \( p \div q \) = 0 if \( p < q \)) is maximum when \( m \) is 
   (2002S)

   (a) 5 
   (b) 10 
   (c) 15 
   (d) 20

8. Coefficient of $r^{24}$ in $(1 + x^{2})^{12}(1 + x^{2})(1 + x^{24})$ is 
   (2003S)

   (a) $12C_6 + 3$ 
   (b) $12C_6 + 1$ 
   (c) $12C_6$ 
   (d) $12C_6 + 2$

9. If \( nC_r = (k^2 - 3) \cdot nC_{r+1} \), then \( k \in \) 
   (2004S)

   (a) $(-\infty, -2)$ 
   (b) $[2, \infty)$ 
   (c) $[-\sqrt{3}, \sqrt{3}]$ 
   (d) $(\sqrt{3}, 2)$

10. The value of 
    \[ \left(\begin{array}{c} 30 \\ 0 \end{array}\right) \left(\begin{array}{c} 30 \\ 10 \end{array}\right) + \left(\begin{array}{c} 30 \\ 1 \end{array}\right) \left(\begin{array}{c} 30 \\ 11 \end{array}\right) + \left(\begin{array}{c} 30 \\ 2 \end{array}\right) \left(\begin{array}{c} 30 \\ 12 \end{array}\right) + ... = \left(\begin{array}{c} 30 \\ 20 \end{array}\right) \left(\begin{array}{c} 30 \\ 30 \end{array}\right) \] 
    is where 
    \[ \binom{n}{r} = nC_r \] 
    (2005S)

    (a) \[ \binom{30}{10} \] 
    (b) \[ \binom{30}{15} \] 
    (c) \[ \binom{60}{30} \] 
    (d) \[ \binom{31}{10} \]

11. For \( r = 0, 1, ..., 10 \), let \( A_r, B_r \) and \( C_r \) denote, respectively, 
    the coefficient of \( x^r \) in the expansions of 
    \( (1 + x)^{10}, (1 + x)^{20}, (1 + x)^{30} \). Then 
    \[ \sum_{r=1}^{10} A_r(B_r - C_r) \] is equal to 
    (2010)

    (a) \( B_{10} - C_{10} \) 
    (b) \( A_{10}(B_{10} - C_{10}) \) 
    (c) \( 0 \) 
    (d) \( C_{10} - B_{10} \)

12. Coefficient of \( x^{11} \) in the expansion of 
    \( (1 + x^3)(1 + x^3)(1 + x^4)^{1/2} \) is 
    (JEE Adv. 2014)

    (a) 1051 
    (b) 1106 
    (c) 1113 
    (d) 1120

**D** MCQs with One or More than One Correct

1. If \( C_r \) stands for \( ^nC_r \), then the sum of the series 
   \[ \frac{\binom{n}{2} \binom{n}{2} !}{n!} (nC_0 - 2C_1^2 + 3C_2^2 - ....... + (-1)^n (n+1)C_n^2) \]
   where \( n \) is an even positive integer, is equal to 
   (1986 - 2 Marks)

   (a) \[ \binom{n}{2} \binom{n}{2} ! \] 
   (b) \[ \frac{n!}{n!} \] 
   (c) \[ nC_0 - 2C_1^2 + 3C_2^2 - ....... + (-1)^n (n+1)C_n^2 \] 
   (d) \[ \frac{1}{n!} \]
Subjective Problems

1. Given that
   \[ C_1 + 2C_2 + 3C_3^2 + \ldots + 2n C_{2n-1} = 2n (1 + x)^{2n-1} \]
   where \( C_r = \frac{(2n)!}{r!(2n-r)!} \) for \( r = 0, 1, 2, \ldots, 2n \).

   Prove that
   \[ C_r^2 - 2C_r C_{2r} + 3C_{2r-2} - \ldots - 2n C_{2n-1} = (-1)^n n! C_r. \]

2. Prove that \( 7^{2n} + (2x^3 - 3)(3^{2n-1}) \) is divisible by 25 for any natural number \( n \).

3. If \((1 + x)^n = C_0 + C_1 x + C_2 x^2 + \ldots + C_n x^n\) then show that the sum of the products of the \( C_i \)'s taken two at a time, represented by \( \sum_{0 \leq i < j \leq n} C_i C_j \) is equal to \( 2^{2n-1} - \frac{(2n)!}{2(n!)} \).

4. Use mathematical induction to prove: If \( n \) is any odd positive integer, then \( n^2 - 1 \) is divisible by 24.

5. If \( p \) be a natural number then prove that \( p^{n+1} + (p + 1)^{2n-1} \) is divisible by \( p^2 + p + 1 \) for every positive integer \( n \).

6. Given \( s_n = 1 + q + q^2 + \ldots + q^n; \)
   \[ S_n = 1 + \frac{q + 1}{2} + \left( \frac{q + 1}{2} \right)^2 + \ldots + \left( \frac{q + 1}{2} \right)^n. \]
   \( q \neq 1 \) Prove that
   \[ n+1 C_1 + n+1 C_2 s_1 + n+1 C_3 s_2 + \ldots + n+1 C_n s_n = 2^n S_n. \]

7. Use method of mathematical induction 2.7^n + 3.5^n - 5 is divisible by 24 for all \( n > 0 \).

8. Prove by mathematical induction that \( \frac{(2n)!}{2^{2n}(n!^2)} \leq \frac{1}{(3n+1)^{1/2}} \) for all positive Integers \( n \).

9. Let \( R = (5\sqrt{5} + 1)^{2n+1} \) and \( f = R - [R] \), where \([ \_ \] denotes the greatest integer function. Prove that \( Rf = 4^{2n+4} \).

10. Using mathematical induction, prove that \( 2^{m-n} C_n + m C_1 n C_{k-1} + \ldots + m C_{k-n} C_0 = (m+n)C_k \), where \( m, n, k \) are positive integers, and \( p C_q = 0 \) for \( p < q \).

11. Prove that (1989 - 5 Marks)

   \[ C_0 - 2^2 C_1 + 3^2 C_2 - \ldots - (-1)^n (n + 1)^2 C_n = 0, \]
   where \( C_r = \frac{r}{n}C_r \).

12. Prove that \( \frac{n^2}{7} + \frac{n^5}{5} + \frac{2n^3}{3} - \frac{n}{105} \) is an integer for every positive integer \( n \).

13. Using induction or otherwise, prove that for any non-negative integers \( m, n \) and \( k \),

   \[ \sum_{m=0}^{k} (n-m)(r+m)! = \frac{(r+k+1)}{k!} \left( \frac{n-k}{r+1} - \frac{k}{r+2} \right) \]

14. If \( \sum_{r=0}^{2n} a_r (x-2)^r = \sum_{r=0}^{2n} b_r (x-3)^r \) and \( a_k = 1 \) for all \( k \geq n \), then show that \( b_n = 2^{n+1} C_{n+1} \).

15. Let \( p \geq 3 \) be an integer and \( \alpha, \beta \) be the roots of \( x^2 - (p+1)x + 1 = 0 \) using mathematical induction show that \( \alpha^n + \beta^n \).
   \( (i) \) is an integer and \( (ii) \) is not divisible by \( p \).

16. Using mathematical induction, prove that

   \[ \tan^{-1}(1/3) + \tan^{-1}(1/7) + \ldots + \tan^{-1}(1/(n^2 + n + 1)) = \tan^{-1}(n/(n+2)) \]

   (1993 - 5 Marks)

17. Prove that \( \sum_{r=1}^{k} (-3)^{r} - 3n C_{2r-1} = 0 \) where \( k = (3n)/2 \) and \( n \) is an even positive integer.

18. If \( x \) is not an integer multiple of 2\( \pi \) use mathematical induction to prove that:

   \[ \cos x + \cos 2x + \ldots + \cos nx = \cos \frac{n+1}{2} x \sin \frac{nx}{2} \cos \sec \frac{x}{2} \]

19. Let \( n \) be a positive integer and \( (1 + x + x^2)^n = a_0 + a_1 x + \ldots + a_{2n} x^{2n} \)

   Show that \( a_2 = a_4 + a_6 + \ldots \) and \( a_{2k} = a_k \).

20. Using mathematical induction prove that for every integer \( n \geq 1 \), \( (3^{2n-1}) \) is divisible by \( 2^{n+2} \) but not by \( 2^{n+3} \).

21. Let \( 0 < A_1 < \pi \) for \( i = 1, 2, \ldots, n \). Use mathematical induction to prove that

   \[ \sin A_1 + \sin A_2 + \ldots + \sin A_n \leq n \sin \left( \frac{A_1 + A_2 + \ldots + A_n}{n} \right) \]

   where \( n \) is a natural number.

   \{ You may use the fact that \( p \sin x + (1-p) \sin y \leq \sin [px + (1-p)y] \)

   where \( 0 < p < 1 \) and \( 0 < x, y < \pi \}. \]

22. Let \( p \) be a prime and \( m \) a positive integer. By mathematical induction on \( m \), or otherwise, prove that whenever \( r \) is an integer such that \( p \) does not divide \( r \), \( p \) divides \( mp C_r \).

   (1993 - 5 Marks)

   [Hint: You may use the fact that \((1 + x)^{mp} = (1 + x)^p (1 + x)^{p \cdot m} \) ]
23. Let \( n \) be any positive integer. Prove that
\[
\sum_{k=0}^{m} \binom{2n-k}{k} \binom{2n-2k}{2n-k} = \binom{n}{m}^{2n-2m}
\]
for each non-negative integer \( m \leq n \). (Here \( \binom{n}{m} \) = \( nC_m \).

24. For any positive integer \( m, n \) (with \( n \geq m \)), let \( \binom{n}{m} = nC_m \).

Prove that
\[
\binom{n}{m} + \binom{n}{m+1} + \binom{n}{m+2} + \ldots + \binom{n}{n-1} = \binom{n+1}{m+1}.
\]
Hence or otherwise, prove that
\[
\binom{n}{m} + 2\binom{n}{m+1} + 3\binom{n}{m+2} + \ldots + (n-m+1)\binom{n}{m} = \binom{n+2}{m+2}.
\] (2000 - 6 Marks)

25. For every positive integer \( n \), prove that
\[
\sqrt{4n+1} < \sqrt{n} + \sqrt{n+1} < \sqrt{4n+2}.
\]
Hence or otherwise, prove that \( \lceil \sqrt{n} + \sqrt{n+1} \rceil = \lceil \sqrt{4n+1} \rceil \), where \( \lceil x \rceil \) denotes the greatest integer not exceeding \( x \). (2000 - 6 Marks)

26. Let \( a, b, c \) be positive real numbers such that \( b^2 - 4ac > 0 \) and let \( \alpha_1 = c \). Prove by induction that
\[
\alpha_{n+1} = \frac{aa_n^2}{b^2 - 2a(\alpha_1 + \alpha_2 + \ldots + \alpha_n)} \text{ is well defined and}
\alpha_{n+1} < \frac{a_n}{2} \text{ for all } n = 1, 2, \ldots \text{ (Here, 'well-defined' means}
\] that the denominator in the expression for \( \alpha_{n+1} \) is not zero.) (2000 - 5 Marks)

I. Integer Value Correct Type

1. The coefficients of three consecutive terms of \((1 + x)^{n+3}\) are in the ratio \( 5 : 10 : 14 \). Then \( n = \) (JEE Adv. 2013) [2002]

2. Let \( m \) be the smallest positive integer such that the coefficient of \( x^2 \) in the expansion of \((1 + x)^3 + (1 + x)^3 + \ldots + (1 + x)^m \) is \((3n + 1) \cdot 51C_3\) for some positive integer \( n \). Then the value of \( m \) is (JEE Adv. 2016)

Section-B

1. The coefficients of \( x^0 \) and \( x^3 \) in the expansion of \((1 + x)^{n+q}\) are (a) equal (b) equal with opposite signs (c) reciprocals of each other (d) none of these [2002]

2. If the sum of the coefficients in the expansion of \((a + b)^{n}\) is 4096, then the greatest coefficient in the expansion is (a) 1594 (b) 792 (c) 924 (d) 2924 [2002]

3. The positive integer just greater than \((1 + 0.0001)^{10000} \) is (a) 4 (b) 5 (c) 2 (d) 3 [2002]

4. \( r \) and \( n \) are positive integers \( r > 1, n > 2 \) and coefficient of \((r+2)^{\text{th}}\) term and \( 3r^{\text{th}}\) term in the expansion of \((1 + x)^{2n}\) are equal, then \( n \) equals (a) 3 \( r \) (b) 3 \( r + 1 \) (c) 2 \( r \) (d) 2 \( r + 1 \) [2002]

5. If \( a_n = \sqrt[3]{7} + \sqrt[3]{7} + \ldots \) having \( n \) radical signs then by methods of mathematical induction which is true (a) \( a_n > 7 \forall n \geq 1 \) (b) \( a_n < 7 \forall n \geq 1 \) (c) \( a_n < 4 \forall n \geq 1 \) (d) \( a_n < 3 \forall n \geq 1 \) [2002]

6. If \( x \) is positive, the first negative term in the expansion of \((1 + x)^{27}/5\) is (a) 6th term (b) 7th term (c) 5th term (d) 8th term [2003]

7. The number of integral terms in the expansion of \((\sqrt{3} + \sqrt[3]{5})^{256}\) is (a) 35 (b) 32 (c) 33 (d) 34 [2003]

8. Let \( S(K) = 1 + 3 + 5 + \ldots + (2K - 1) = 3 + K^2 \). Then which of the following is true? (a) Principle of mathematical induction can be used to prove the formula (b) \( S(K) \Rightarrow S(K + 1) \) (c) \( S(K) \Rightarrow S(K) \) (d) \( S(1) \) is correct [2004]

9. The coefficient of the middle term in the binomial expansion in powers of \( x \) of \((1 + \alpha x)^4 \) and of \((1 - \alpha x)^6 \) is the same if \( \alpha \) equals (a) \( \frac{3}{5} \) (b) \( \frac{10}{3} \) (c) \( -\frac{3}{10} \) (d) \( -\frac{5}{3} \) [2004]
10. The coefficient of $x^n$ in the expansion of $(1 + x)(1 - x)^n$ is
(a) $(-1)^{n-1}n$  
(b) $(-1)^n(1 - n)$  
(c) $(-1)^{n-1}(n - 1)^2$  
(d) $(n - 1)$

11. The value of $^{50}C_4 + \sum_{r=1}^{6} \binom{56-r}{3}$ is
(a) $55C_4$  
(b) $55C_3$  
(c) $56C_3$  
(d) $56C_4$

12. If $A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$, then which one of the following holds for all $n \geq 1$, by the principle of mathematical induction
(a) $A^n = nA - (n-1)I$  
(b) $A^n = 2^{n-1}A - (n-1)I$  
(c) $A^n = nA + (n-1)I$  
(d) $A^n = 2^{n-1}A + (n-1)I$

13. If the coefficient of $x^7$ in $a x^3 + \left(\frac{1}{b x}\right)^{11}$ equals the coefficient of $x^7$ in $a x - \left(\frac{1}{b x}\right)^{11}$, then $a$ and $b$ satisfy
(a) $a - b = 1$  
(b) $a + b = 1$  
(c) $\frac{a}{b} = 1$  
(d) $ab = 1$

14. If $x$ is so small that $x^3$ and higher powers of $x$ may be neglected, then $\frac{3}{1 - x} \frac{1}{1 + x \frac{1}{2}^3}$ may be approximated as
(a) $1 - \frac{3}{8} x^2$  
(b) $3x + \frac{3}{8} x^2$  
(c) $\frac{3}{8} x^2$  
(d) $\frac{x}{2} - \frac{3}{8} x^2$

15. If the expansion in powers of $x$ of the function $\frac{1}{1 - ax(1 - bx)} = a_0 + a_1 x + a_2 x^2 + a_3 x^3$ is $a_0 \frac{b^n - a^n}{b - a}$  
(a) $\frac{b^n - a^n}{b - a}$  
(b) $\frac{a^n - b^n}{b - a}$  
(c) $\frac{a^{n+1} - b^{n+1}}{b - a}$  
(d) $\frac{b^{n+1} - a^{n+1}}{b - a}$

16. For natural numbers $m, n$ if $(1 - y)^m(1 + y)^n = 1 + ay + a_2 y^2 + \ldots$ and $a_1 = a_2 = 10$, then $(m, n)$ is
(a) $(20, 45)$  
(b) $(35, 20)$  
(c) $(45, 35)$  
(d) $(35, 45)$

17. In the binomial expansion of $(a - b)^n$, $n \geq 5$, the sum of the $5^{th}$ and $6^{th}$ terms is zero, then $a/b$ equals
(a) $\frac{n - 5}{6}$  
(b) $\frac{n - 4}{5}$  
(c) $\frac{5}{n - 4}$  
(d) $\frac{6}{n - 5}$

18. The sum of the series $\sum_{k=0}^{10} C_k + \sum_{k=2}^{10} C_k + \ldots + \sum_{k=10}^{20} C_k$ is
(a) 0  
(b) $20 C_{10}$  
(c) $-20 C_{10}$  
(d) $\frac{1}{2} 20 C_{10}$

19. Statement-1: $\sum_{r=0}^{n} (r + 1)^2 C_r = (n + 2)2^{n-1}$.  
Statement-2: $\sum_{r=0}^{n} (r + 1)^2 C_r x^r = (1 + x)^n + n x(1 + x)^{n-1}$.
(a) Statement-1 is false, Statement-2 is true  
(b) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1
(c) Statement-1 is true, Statement-2 is false; Statement-2 is not a correct explanation for Statement-1
(d) Statement-1 is true, Statement-2 is false

20. The remainder left out when $8^{2n} - (62)^{2n+1}$ is divided by 9 is
(a) 2  
(b) 7  
(c) 8  
(d) 0

21. Let $S_1 = \sum_{j=1}^{10} j(j - 1)^{10} C_j$, $S_2 = \sum_{j=1}^{10} j^{10} C_j$ and $S_3 = \sum_{j=1}^{10} j^2 10 C_j$.

Statement-1: $S_1 = 55 \times 2^9$.  
Statement-2: $S_2 = 90 \times 2^8$ and $S_3 = 10 \times 2^8$.
(a) Statement-1 is true, Statement-2 is false; Statement-2 is not a correct explanation for Statement-1
(b) Statement-1 is true, Statement-2 is false
(c) Statement-1 is false, Statement-2 is true
(d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1

22. The coefficient of $x^7$ in the expansion of $(1 + x - x^2 + x^3)^6$ is
(a) $-132$  
(b) $-144$  
(c) $132$  
(d) $144$

23. If $n$ is a positive integer, then $(\sqrt{3} + 1)^{2n} - (\sqrt{3} - 1)^{2n}$ is
(a) an irrational number  
(b) an odd positive integer  
(c) an even positive integer  
(d) a rational number other than positive integers

24. The term independent of $x$ in the expansion of $\left(\frac{x + 1}{x^{1/2} - x^{1/3} + 1} + \frac{x - 1}{x - x^{1/2}}\right)^{10}$ is
(a) $4$  
(b) $120$  
(c) $210$  
(d) $310$

25. If the coefficients of $x^3$ and $x^4$ in the expansion of $(1 + ax + bx^2)^2(1 - 2x)^8$ in powers of $x$ are both zero, then $(a, b)$ is equal to:
(a) $(4, 272/3)$  
(b) $(16, 272/3)$  
(c) $(16, 251/3)$  
(d) $(14, 251/3)$

26. The sum of coefficients of integral power of $x$ in the binomial expansion $(1 - 2x)^{20}$ is
(a) $\frac{1}{2}(3^{20} - 1)$  
(b) $\frac{1}{2}(2^{20} + 1)$  
(c) $\frac{1}{2}(3^{20} + 1)$  
(d) $\frac{1}{2}(3^{20})$

27. If the number of terms in the expansion of $(1 + \frac{2}{x} + \frac{4}{x^2})^n$, $x \neq 0$, is 28, then the sum of the coefficients of all the terms in this expansion is:
(a) 243  
(b) 729  
(c) 64  
(d) 2187
CHAPTER 6
Sequences and Series

Section-A

A Fill in the Blanks

1. The sum of integers from 1 to 100 that are divisible by 2 or 5 is.............
   \( \text{(1984 - 2 Marks)} \)

2. The solution of the equation \( \log_7 \log_5 (\sqrt{x} + 5 + \sqrt{x}) = 0 \) is.............
   \( \text{(1986 - 2 Marks)} \)

3. The sum of the first \( n \) terms of the series
   \[ 1^2 + 2^2 + 3^2 + 4^2 + ... + n^2 \]
   is \( n(n+1)/2 \), when \( n \) is even. When \( n \) is odd, the sum is.............
   \( \text{(1988 - 2 Marks)} \)

4. Let the harmonic mean and geometric mean of two positive numbers be the ratio 4 : 5. Then the two numbers are in the ratio.............
   \( \text{(1992 - 2 Marks)} \)

5. For any odd integer \( n \geq 1 \), \( n^3 - (n-1)^3 + ... + (-1)^{n+1} \) is.............
   \( \text{(1996 - 1 Mark)} \)

6. Let \( p \) and \( q \) be roots of the equations \( x^2 - 2x + A = 0 \) and \( r \) and \( s \) be the roots of the equation \( x^2 - 18x + B = 0 \). If \( p < q < r < s \) are in arithmetic progression, then \( A = \)............. and \( B = \).............
   \( \text{(1997 - 2 Marks)} \)

C MCQs with One Correct Answer

1. If \( x, y \) and \( z \) are \( p \)-th, \( q \)-th and \( r \)-th terms respectively of an A.P. and also of a G.P., then \( x^y - y^z - z^x \) is equal to:
   (a) \( xyz \) (b) 0 (c) 1 (d) None of these

2. The third term of a geometric progression is 4. The product of the first five terms is.............
   \( \text{(1982 - 2 Marks)} \)

   (a) \( 4 \) \( 3 \) (b) \( 4 \) \( 5 \) (c) \( 4 \) \( 4 \) (d) none of these

3. The rational number, which equals the number \( 2.357 \) with recurring decimal is.............
   \( \text{(1983 - 1 Mark)} \)

   (a) \( 2355 \) \( 1001 \) (b) \( 2379 \) \( 997 \) (c) \( 2355 \) \( 999 \) (d) none of these

4. If \( a, b, c \) are in G.P., then the equations \( ax^2 + 2bx + c = 0 \) and \( dx^2 + 2ex + f = 0 \) have a common root if \( \frac{d}{a}, \frac{e}{b}, \frac{f}{c} \) are in.............
   \( \text{(1985 - 2 Marks)} \)

   (a) A.P. (b) GP. (c) H.P. (d) none of these

5. Sum of the first \( n \) terms of the series
   \[ \frac{1}{2} + \frac{3}{4} + \frac{7}{8} + ... + \frac{15}{16} + ............ \]
   is equal to.............
   \( \text{(1888 - 2 Marks)} \)

   (a) \( 2^n - n - 1 \) (b) \( 1 - 2^n \) (c) \( n + 2^n - 1 \) (d) \( 2^n + 1 \).

6. The number \( \log_2 7 \) is.............
   \( \text{(1990 - 2 Marks)} \)

   (a) an integer (b) a rational number (c) an irrational number (d) a prime number

7. If \( \ln(a + c), \ln(a - c), \ln(a - 2b + c) \) are in A.P., then \( \text{(1994)} \)

   (a) \( a, b, c \) are in A.P. (b) \( a^2, b^2, c^2 \) are in A.P.
   (c) \( a, b, c \) are in G.P. (d) \( a, b, c \) are in H.P.

8. Let \( a_1, a_2, ..., a_{10} \) be in A.P., and \( h_1, h_2, ..., h_{10} \) be in H.P. If \( a_1 = h_1 = 2 \) and \( a_{10} = h_{10} = 3 \), then \( a_4 h_4 \) is.............
   \( \text{(1999 - 2 Marks)} \)

   (a) \( 2 \) (b) \( 3 \) (c) \( 5 \) (d) \( 6 \)

9. The harmonic mean of the roots of the equation
   \( \left(5 + \sqrt{2}\right)x^2 - \left(4 + \sqrt{5}\right)x + 8 + 2\sqrt{5} = 0 \) is.............
   \( \text{(1999 - 2 Marks)} \)

   (a) \( 2 \) (b) \( 4 \) (c) \( 6 \) (d) \( 8 \)

10. Consider an infinite geometric series with first term \( a \) and common ratio \( r \). If its sum is 4 and the second term is \( 3/4 \), then
    \( \text{(2000S)} \)

    (a) \( a = \frac{4}{7}, r = \frac{3}{7} \) (b) \( a = 2, r = \frac{3}{8} \)
    (c) \( a = \frac{3}{2}, r = \frac{1}{2} \) (d) \( a = 3, r = \frac{1}{4} \)

11. Let \( \alpha, \beta \) be the roots of \( x^2 - x + p = 0 \) and \( \gamma, \delta \) be the roots of \( x^2 - 4x + q = 0 \). If \( \alpha, \beta, \gamma, \delta \) are in G.P., then the integral values of \( p \) and \( q \) respectively, are.............
    \( \text{(2001S)} \)

    (a) \( -2, -3 \) (b) \( -2, 3 \) (c) \( -6, 3 \) (d) \( -6, -32 \)

12. Let the positive numbers \( a, b, c \) be in A.P. Then \( abc, abd, bcd \) are.............
    \( \text{(2001S)} \)

    (a) NOT in A.P./G.P./H.P. (b) in A.P.
    (c) in G.P. (d) in H.P.

13. If the sum of the first \( 2n \) terms of the A.P. \( 2, 5, 8, ..., \) is equal to the sum of the first \( n \) terms of the A.P. \( 57, 59, 61, ..., \) then \( n \) equals.............
    \( \text{(2001S)} \)

    (a) \( 10 \) (b) \( 12 \) (c) \( 11 \) (d) \( 13 \)

14. Suppose \( a, b, c \) are in A.P. and \( a^2, b^2, c^2 \) are in G.P. if \( a < b < c \) and \( a + b + c = \frac{3}{2} \), then the value of \( a \) is.............
    \( \text{(2002S)} \)

    (a) \( \frac{1}{2\sqrt{2}} \) (b) \( \frac{1}{2\sqrt{3}} \) (c) \( \frac{1}{2\sqrt{3}} \) (d) \( \frac{1}{2\sqrt{2}} \)

15. An infinite G.P. has first term \( x \) and sum \( 5 \), then \( x \) belongs to.............
    \( \text{(2004S)} \)

    (a) \( x < -10 \) (b) \( -10 < x < 0 \)
    (c) \( 0 < x < 10 \) (d) \( x > 10 \)

16. In the quadratic equation \( ax^2 + bx + c = 0 \), \( \Delta = b^2 - 4ac \) and \( \alpha + \beta, \alpha^2 + \beta^2, \alpha^3 + \beta^3 \) are in G.P. where \( \alpha, \beta \) are the root of \( ax^2 + bx + c = 0 \), then
    \( \text{(2005S)} \)

    (a) \( \Delta = 0 \) (b) \( b\Delta = 0 \) (c) \( c\Delta = 0 \) (d) \( \Delta = 0 \)
17. In the sum of first \( n \) terms of an A.P. is \( cn^2 \), then the sum of squares of these \( n \) terms is \( 2009 \)
(a) \( \frac{n(4n^2 - 1)c^2}{6} \)
(b) \( \frac{n(4n^2 + 1)c^2}{3} \)
(c) \( \frac{n(4n^2 - 1)c^2}{3} \)
(d) \( \frac{n(4n^2 + 1)c^2}{6} \)

18. Let \( a_1, a_2, a_3, \ldots \) be in harmonic progression with \( a_1 = 5 \)
and \( a_{20} = 25 \). The least positive integer \( n \) for which \( a_n < 0 \) is \( 2012 \)
(a) 22 (b) 23 (c) 24 (d) 25

19. Let \( b_i > 1 \) for \( i = 1, 2, \ldots, 101 \). Suppose \( a_1, b_1, a_2, b_2, \ldots, a_{101}, b_{101} \) are in arithmetic progression (A.P.) with the common difference \( d \). Suppose \( a_1, a_2, \ldots, a_{101} \) and \( b_1, b_2, \ldots, b_{101} \) are in A.P. such that \( a_i = b_i \) and \( a_{101} = b_{101} \). If \( t = b_1 + b_2 + \ldots + b_{101} \) and \( s = a_1 + a_2 + \ldots + a_{101} \), then \( JEE \text{ Adv. } 2016 \)
(a) \( s > t \) and \( a_{101} > b_{101} \)
(b) \( s > t \) and \( a_{101} < b_{101} \)
(c) \( s < t \) and \( a_{101} > b_{101} \)
(d) \( s < t \) and \( a_{101} < b_{101} \)

**MCQs with One or More Than One Correct**

1. If the first and the \( (2n - 1) \)st terms of an A.P., a G.P., and an H.P. are equal and their \( n \)-th terms are \( a, b \) and \( c \) respectively, then \( 1988 - 2 \text{ Marks} \)
(a) \( a = b = c \)
(b) \( a \geq b \geq c \)
(c) \( a + c = b \)
(d) \( ac - b^2 = 0 \)

2. For \( 0 < \phi < \pi/2 \), if

\[
x = \sum_{n=0}^{\infty} \cos^{2n} \phi, \quad y = \sum_{n=0}^{\infty} \sin^{2n} \phi, \quad z = \sum_{n=0}^{\infty} \cos^{2n} \phi \sin^{2n} \phi
\]

then \( 1993 - 2 \text{ Marks} \)
(a) \( xyz = xy + yz \)
(b) \( xyz = xy + z \)
(c) \( xyz = x + y + z \)
(d) \( xyz = yz + x \)

3. Let \( n \) be an odd integer. If \( \sin \theta = \frac{1}{n} \), then \( 1998 - 2 \text{ Marks} \)
(a) \( b_1 = 1, b_2 = 3 \)
(b) \( b_0 = 0, b_1 = n \)
(c) \( b_0 = -1, b_1 = n \)
(d) \( b_0 = 0, b_1 = n^2 - 3n + 3 \)

4. Let \( T_n \) be the \( n \)th term of an A.P., for \( r = 1, 2, 3, \ldots \). If for some positive integers \( m, n \), we have \( 1998 - 2 \text{ Marks} \)
\( T_m = \frac{1}{m} \) and \( T_n = \frac{1}{n} \), then \( T_mn \) equals

\[
\begin{align*}
(\text{a}) & \quad \frac{1}{mn} \\
(\text{b}) & \quad \frac{1}{m} + \frac{1}{n} \\
(\text{c}) & \quad 1 \\
(\text{d}) & \quad 0
\end{align*}
\]

5. If \( x > 1, y > 1, z > 1 \) are in G.P., then \( 1998 - 2 \text{ Marks} \)
\( \frac{1}{1 + \ln x} + \frac{1}{1 + \ln y} + \frac{1}{1 + \ln z} \)

(a) A.P. (b) H.P. (c) G.P. (d) None of these

6. For a positive integer \( n \), let
\( a(n) = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots + \frac{1}{2^n - 1} \).
Then \( 1999 - 3 \text{ Marks} \)
(a) \( a(100) \leq 100 \)
(b) \( a(100) > 100 \)
(c) \( a(200) \leq 100 \)
(d) \( a(200) > 100 \)

7. A straight line through the vertex \( P \) of a triangle \( PQR \) intersects the side \( QR \) at the point \( S \) and the circumcircle of the triangle \( PQR \) at the point \( T \). If \( S \) is not the centre of the circumcircle, then \( 2008 \)
\( \begin{align*}
(\text{a}) & \quad \frac{1}{PS} + \frac{1}{ST} < \frac{2}{\sqrt{QS \times SR}} \\
(\text{b}) & \quad \frac{1}{PS} + \frac{1}{ST} > \frac{2}{\sqrt{QS \times SR}} \\
(\text{c}) & \quad \frac{1}{PS} + \frac{1}{ST} < \frac{4}{QR} \\
(\text{d}) & \quad \frac{1}{PS} + \frac{1}{ST} > \frac{4}{QR}
\end{align*} \)

8. Let \( S_n = \sum_{k=1}^{n} \frac{n}{n^2 + kn + k^2} \) and \( T_n = \sum_{k=0}^{n-1} \frac{n}{n^2 + kn + k^2} \) for \( n = 1, 2, 3, \ldots \). Then \( 2008 \)
(a) \( S_n < \frac{\pi}{3\sqrt{3}} \)
(b) \( S_n > \frac{\pi}{3\sqrt{3}} \)
(c) \( T_n < \frac{\pi}{3\sqrt{3}} \)
(d) \( T_n > \frac{\pi}{3\sqrt{3}} \)

9. Let \( S_n = \sum_{k=1}^{n} \frac{k(k+1)}{2} \).
Then \( S_n \) can take value(s) \( 2013 \)
(a) 1056 (b) 1088 (c) 1120 (d) 1332

**Subjective Problems**

1. The harmonic mean of two numbers is 4. Their arithmetic mean \( A \) and the geometric mean \( G \) satisfy the relation \( 2A + G^2 = 27 \). Find the two numbers. \( 1979 \)

2. The interior angles of a polygon are in arithmetic progression. The smallest angle is 120°, and the common difference is 5°. Find the number of sides of the polygon. \( 1980 \)

3. Does there exist a geometric progression containing 27, 8 and 12 as three of its terms? If it exists, how many such progressions are possible? \( 1982 - 3 \text{ Marks} \)

4. Find three numbers \( a, b, c \), between 2 and 18 such that
(i) their sum is 25
(ii) the numbers 2, \( a, b \) are consecutive terms of an A.P.
(iii) the numbers \( b, c, 18 \) are consecutive terms of a G.P. \( 1983 - 2 \text{ Marks} \)

5. If \( a > 0, b > 0 \) and \( c > 0 \), prove that \( 1984 - 2 \text{ Marks} \)
\( (a + b + c) \left( \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) \geq 9 \)

6. If \( n \) is a natural number such that
\( n = p_1^{a_1} \cdot p_2^{a_2} \cdot p_3^{a_3} \cdot \ldots \cdot p_k^{a_k} \)
and \( p_1, p_2, \ldots, p_k \) are distinct primes, then show that \( \ln n \geq k \ln 2 \) \( 1984 - 2 \text{ Marks} \)

7. Find the sum of the series : \( 1985 - 5 \text{ Marks} \)
\( \sum_{r=0}^{m} (-1)^r \binom{n}{r} \frac{1}{2^r} + \frac{3^r}{2^{2r}} + \frac{7^r}{2^{3r}} + \frac{15^r}{2^{4r}} \ldots \) up to \( m \) terms
8. Solve for x the following equation: \[ \log_{(2x+3)}(6x^2 + 23x + 21) = 4 - \log_{(3x+7)}(4x^2 + 12x + 9) \]

9. If \( \log_{2} a \), \( \log_{3}(2^x - 5) \), and \( \log_{3}\left(\frac{2^x}{2}\right) \) are in arithmetic progression, determine the value of \( x \).

10. Let \( p \) be the first of the \( n \) arithmetic means between two numbers and \( q \) the first of \( n \) harmonic means between the same numbers. Show that \( q \) does not lie between \( p \) and \[ \left(\frac{n+1}{n-1}\right)^2 p. \]

11. If \( S_1, S_2, S_3, \ldots \ldots \) are the sums of infinite geometric series whose first terms are 1, 2, 3, \( 1 \) and whose common ratios are \( \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \ldots \frac{1}{n+1} \) respectively, then find the values of \( S_1^2 + S_2^2 + S_3^2 + \ldots + S_{n-1}^2 \)

12. The real numbers \( x_1, x_2, x_3 \) satisfying the equation \( x^3 - x^2 + \beta x + \gamma = 0 \) are in AP. Find the intervals in which \( \beta \) and \( \gamma \) lie.

13. Let \( a, b, c \) be real numbers in GP. If \( u, v, w \) satisfy the system of equations

\[ u + 2v + 3w = 6 \]
\[ 4u + 5v + 6w = 12 \]
\[ 6u + 9v = 4 \]

then show that the roots of the equation

\[ \frac{1}{u} + \frac{1}{v} + \frac{1}{w} \]
\[ + [(b-c)^2 + (c-a)^2 + (d-b)^2] x + u + v + w = 0 \]

and \( 20x^2 + 10(a-d)^2 x - 9 = 0 \) are reciprocals of each other.

14. The fourth power of the common difference of an arithmetic progression with integer entries is added to the product of any four consecutive terms of it. Prove that the resulting sum is the square of an integer.

15. Let \( a_1, a_2, \ldots, a_n \) be positive real numbers in geometric progression. For each \( n \), let \( A_n, G_n, H_n \) be respectively, the arithmetic mean, geometric mean, and harmonic mean of \( a_1, a_2, \ldots, a_n \). Find an expression for the geometric mean of \( G_1, G_2, \ldots, G_n \) in terms of \( A_1, A_2, \ldots, A_n, H_1, H_2, \ldots, H_n \).

16. Let \( a, b \) be positive real numbers. If \( a, A_1, A_2, b \) are in arithmetic progression, \( a, G_1, G_2, b \) are in geometric progression and \( a, H_1, H_2, b \) are in harmonic progression, show that

\[ \frac{G_1G_2}{H_1H_2} = \frac{A_1 + A_2}{H_1 + H_2} = \frac{(2a+b)(a+2b)}{9ab}. \]

17. If \( a, b, c \) are in A.P., \( a^2, b^2, c^2 \) are in H.P., then prove that either \( a = b = c \) or \( a, b, \frac{c}{2} \) form a G.P.

18. If \( a_n = \frac{3}{4} - \left(\frac{3}{4}\right)^2 + \left(\frac{3}{4}\right)^3 + \ldots - (-1)^{n-1}\left(\frac{3}{4}\right)^n \) and \( b_n = 1 - a_n \), then find the least natural number \( n_0 \) such that \( b_n > a_n \) \( \forall n \geq n_0 \).

### G Comprehension Based Questions

**PASSAGE-1**

Let \( V_r \) denote the sum of first \( r \) terms of an arithmetic progression (A.P.) whose first term is \( r \) and the common difference is \( 2r-1 \). Let \( T_r = V_{r+1} - V_r - 2 \) and \( Q_r = T_{r+1} - T_r \) for \( r = 1, 2, \ldots \).

1. The sum \( V_1 + V_2 + \ldots + V_n \) is \( 2007-4 \) marks

   \[ \frac{1}{12}n(n+1)(3n^2 - n + 1) \]

2. \( T_r \) is always 

   \[ \frac{1}{12}n(n+1)(3n^2 - n + 2) \]

3. Which one of the following is a correct statement?

   \[ \frac{1}{12}n(2n^2 - n + 1) \]

**PASSAGE-2**

Let \( A_1, G_1, H_1 \) denote the arithmetic, geometric and harmonic means, respectively, of two distinct positive numbers. For \( n \geq 2 \), let \( A_n, G_n, H_n \) have arithmetic, geometric and harmonic means as \( A_n, G_n, H_n \) respectively.

4. Which one of the following statements is correct?

   \[ A_1 > A_2 > A_3 \]

5. Which one of the following statements is correct?

   \[ A_1 < A_2 < A_3 \]

6. Which one of the following statements is correct?

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]

   \[ A_1 > A_2 > A_3 \]

   \[ A_1 < A_2 < A_3 \]
Assertion & Reason Type Questions

1. Suppose four distinct positive numbers $a_1, a_2, a_3, a_4$ are in G.P. Let $b_1 = a_1, b_2 = a_1 + a_2, b_3 = b_2 + a_3$ and $b_4 = b_3 + a_4$.

**STATEMENT - 1**: The numbers $b_1, b_2, b_3, b_4$ are neither in A.P. nor in G.P.

**STATEMENT - 2**: The numbers $b_1, b_2, b_3, b_4$ are in H.P.

(a) **STATEMENT - 1** is True, **STATEMENT - 2** is True;
(b) **STATEMENT - 1** is True, **STATEMENT - 2** is False;
(c) **STATEMENT - 1** is False, **STATEMENT - 2** is True;
(d) **STATEMENT - 1** is False, **STATEMENT - 2** is False.

Integer Value Correct Type

1. Let $S_k, k = 1, 2, \ldots, 100$, denote the sum of the infinite geometric series whose first term is $\frac{k-1}{k!}$ and the common ratio is $\frac{1}{k}$. Then the value of $\frac{100^2}{100!} + \sum_{k=1}^{100} (k^2 - 3k + 1)S_k$ is $\frac{100^2}{100!}$.

2. Let $a_1, a_2, a_3, \ldots, a_{11}$ be real numbers satisfying $a_1 = 15, 27 - 2a_2 > 0$ and $a_k = 2a_{k-1} - a_{k-2}$ for $k = 3, 4, \ldots, 11$. If $\frac{a_1^2 + a_2^2 + \ldots + a_{11}^2}{11} = 90$, then the value of $\frac{a_1 + a_2 + \ldots + a_{11}}{11}$ is equal to.

3. Let $a_1, a_2, a_3, \ldots, a_{100}$ be an arithmetic progression with $a_1 = 3$ and $S_p = \sum_{i=1}^{p} a_i, 1 \leq p \leq 100$. For any integer $n$ with $1 \leq n \leq 20$, let $m = 5n$. If $\frac{S_m}{S_n}$ does not depend on $n$, then $a_2$ is $2008$.

4. A pack contains $n$ cards numbered from $1$ to $n$. Two consecutive numbered cards are removed from the pack and the sum of the numbers on the remaining cards is $1224$. If the smaller of the numbers on the removed cards is $k$, then $k - 20 = 2011$.

5. Let $a, b, c$ be positive integers such that $\frac{b}{a}$ is an integer. If $a, b, c$ are in geometric progression and the arithmetic mean of $a, b, c$ is $b + 2$, then the value of $\frac{a^2 + a - 14}{a + 1}$ is $2014$.

6. Suppose that all the terms of an arithmetic progression (A.P.) are natural numbers. If the ratio of the sum of the first seven terms to the sum of the first eleven terms is $6 : 11$ and the seventh term lies in between 130 and 140, then the common difference of this A.P. is $2015$.

7. The coefficient of $x^9$ in the expansion of $\left(1 + x\right)\left(1 + x^2\right)\left(1 + x^3\right) \ldots (1 + x^{100})$ is $2015$. 

**JEE Adv. 2013**
Section-B

1. If \(1, \log_9 (3^{1-x} + 2), \log_3 (4.3^x - 1)\) are in A.P. then \(x\) equals \[2002\]
   \[
   (a) \ \log_3 4 \\
   (b) 1 - \log_3 4 \\
   (c) 1 - \log_9 3 \\
   (d) \ \log_3 3 \\
   \]

2. \(l, m, n\) are the \(p^{th}\), \(q^{th}\) and \(r^{th}\) term of a G.P. all positive, then
   \[
   \log l = p, \quad \log m = q, \quad \log n = r \]
   equals \[2002\]
   \[
   (a) -1 \\
   (b) 2 \\
   (c) 1 \\
   (d) 0 \\
   \]

3. The value of \(2^{1/4}, 4^{1/8}, 8^{1/16}, ... \) is \[2002\]
   \[
   (a) 1 \\
   (b) 2 \\
   (c) 3/2 \\
   (d) 4 \\
   \]

4. Fifth term of a GP is 2, then the product of its 9 terms is \[2002\]
   \[
   (a) 256 \\
   (b) 512 \\
   (c) 1024 \\
   (d) none of these \\
   \]

5. Sum of infinite number of terms of GP is 20 and sum of their square is 100. The common ratio of GP is \[2002\]
   \[
   (a) 5 \\
   (b) 3/5 \\
   (c) 8/5 \\
   (d) 1/5 \\
   \]

6. \(1^3 - 2^3 + 3^3 - 4^3 + ... + 9^3 = \) \[2002\]
   \[
   (a) 425 \\
   (b) -425 \\
   (c) 475 \\
   (d) -475 \\
   \]

7. The sum of the series \[2003\]
   \[
   \frac{1}{1.2} + \frac{1}{2.3} + \frac{1}{3.4} + .... up to \infty \]
   is equal to \(e\) \[2003\]
   \[
   (a) \ \log_e e \\
   (b) 2\log_e 2 \\
   (c) \ \log_e 2 - 1 \\
   (d) \ \log_e 2 \\
   \]

8. If \(S_n = \sum_{r=0}^{n} \frac{1}{nCr}\) and \(t_n = \sum_{r=0}^{n} \frac{r}{nCr}\), then \(t_n/S_n\) is equal to \[2004\]
   \[
   (a) \ \frac{2n-1}{2} \\
   (b) \ \frac{1}{2}n-1 \\
   (c) \ n-1 \\
   (d) \ \frac{1}{2}n \\
   \]

9. Let \(T_r\) be the \(r^{th}\) term of an A.P. whose first term is \(a\) and common difference is \(d\). If for some positive integers \(m, n, m \neq n\), \(T_m = \frac{1}{n}\) and \(T_n = \frac{1}{m}\), then \(a - d\) equals \[2004\]
   \[
   (a) \ \frac{1}{m + n} \\
   (b) 1 \\
   (c) \ \frac{1}{mn} \\
   (d) 0 \\
   \]

10. The sum of the first \(n\) terms of the series \(1^2 + 2^2 + 3^2 + 4^2 + 5^2 + 6^2 + ... \)
    is \(\frac{n(n+1)^2}{2}\) when \(n\) is even. When \(n\) is odd the sum is \[2004\]
    \[
    (a) \ \frac{n(n+1)^2}{2} \\
    (b) \ \frac{n^2(n+1)}{2} \\
    (c) \ \frac{n(n+1)^2}{4} \\
    (d) \ \frac{3n(n+1)}{2} \\
    \]

11. The sum of series \(\frac{1}{2!} + \frac{1}{4!} + \frac{1}{6!} + .... \) is \[2004\]
    \[
    (a) \ \frac{(e^2 - 2)}{e} \\
    (b) \ \frac{(e - 1)^2}{2e} \\
    (c) \ \frac{(e^2 - 1)}{2e} \\
    (d) \ \frac{(e^2 - 1)}{2} \\
    \]

12. If the coefficients of \(r^{th}, (r + 1)^{th}\), and \((r + 2)^{th}\) terms in the binomial expansion of \((1 + y)^m\) are in A.P., then \(m\) and \(r\) satisfy the equation \[2005\]
    \[
    (a) m^2 - m(4r - 1) + 4r^2 = 0 \\
    (b) m^2 - m(4r + 1) + 4r^2 = 0 \\
    (c) m^2 - m(4r + 1) + 4r^2 = 0 \\
    (d) m^2 - m(4r - 1) + 4r^2 + 2 = 0 \\
    \]

13. If \(x = \sum_{n=0}^{\infty} a^n\), \(y = \sum_{n=0}^{\infty} b^n\), \(z = \sum_{n=0}^{\infty} c^n\), where \(a, b, c\) are in A.P. and \(|a| < 1, |b| < 1, |c| < 1\) then \(x, y, z\) are in \[2005\]
    \[
    (a) \ \text{G.P.} \\
    (b) \ \text{A.P.} \\
    (c) \ \text{Arithmetic - Geometric Progression} \\
    (d) \ \text{H.P.} \\
    \]

14. The sum of the series \[2005\]
    \[
    1 + \frac{1}{4.2!} + \frac{1}{16.4!} + \frac{1}{64.6!} + \ldots \text{ad inf.} \\
    \]
    \[
    (a) \ \frac{e - 1}{\sqrt{e}} \\
    (b) \ \frac{e + 1}{\sqrt{e}} \\
    (c) \ \frac{e - 1}{2\sqrt{e}} \\
    (d) \ \frac{e + 1}{2\sqrt{e}} \\
    \]

15. Let \(a_1, a_2, a_3, \ldots\) be terms on A.P. If \[2006\]
    \[
    \frac{a_1 + a_2 + \ldots \ldots + a_p}{q^2} = \frac{p^2}{q^2}, \ p \neq q, \text{ then } \frac{a_6}{a_{21}} \text{ equals} \\
    \]
    \[
    (a) \ \frac{41}{11} \\
    (b) \ \frac{7}{2} \\
    (c) \ \frac{2}{7} \\
    (d) \ \frac{11}{41} \\
    \]
16. If \( a_1, a_2, \ldots, a_n \) are in H.P., then the expression \( a_1a_2 + a_2a_3 + \ldots + a_{n-1}a_n \) is equal to [2006]
   (a) \( n(a_1 - a_n) \)  
   (b) \( (n-1)(a_1 - a_n) \)
   (c) \( na_1a_n \)  
   (d) \( (n-1)a_1a_n \)

17. The sum of series \( \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \ldots \) upto infinity is [2007]
   (a) \( \frac{1}{2} \)  
   (b) \( \frac{1}{e^2} \)  
   (c) \( e^2 \)  
   (d) \( e^{-1} \)

18. In a geometric progression consisting of positive terms, each term equals the sum of the next two terms. Then the common ratio of its progression is equals [2007]
   (a) \( \sqrt{5} \)  
   (b) \( \frac{1}{2}(\sqrt{5} - 1) \)
   (c) \( \frac{1}{2}(1-\sqrt{5}) \)  
   (d) \( \frac{1}{2}\sqrt{5} \)

19. The first two terms of a geometric progression add up to 12. the sum of the third and the fourth terms is 48. If the terms of the geometric progression are alternately positive and negative, then the first term is [2008]
   (a) \(-4\)  
   (b) \(-12\)  
   (c) \(12\)  
   (d) \(4\)

20. The sum to infinite term of the series
   \[ \frac{2}{3} + \frac{6}{3^2} + \frac{10}{3^3} + \frac{14}{3^4} + \ldots \] is [2009]
   (a) \(3\)  
   (b) \(4\)  
   (c) \(6\)  
   (d) \(2\)

21. A man is to count 4500 currency notes. Let \( a_n \) denote the number of notes he counts in the \( n^{th} \) minute. If \( a_1 = a_2 = \ldots = a_{10} = a_{10}, a_{11}, \ldots \) are in an AP with common difference \(-2\), then the time taken by him to count all notes is [2010]
   (a) 34 minutes  
   (b) 125 minutes  
   (c) 135 minutes  
   (d) 24 minutes

22. A man saves \( \text{\textcurrency} 200 \) in each of the first three months of his service. In each of the subsequent months his saving increases by \( \text{\textcurrency} 40 \) more than the saving of immediately previous month. His total saving from the start of service will be \( \text{\textcurrency} 11040 \) after [2011]
   (a) 19 months  
   (b) 20 months  
   (c) 21 months  
   (d) 18 months

23. Statement-1: The sum of the series \( 1 + (1 + 2 + 4) + (4 + 6 + 9) + (9 + 12 + 16) + \ldots + (361 + 380 + 400) \) is 8000.

Statement-2: \[ \sum_{k=1}^{n} (k^3 - (k-1)^3) = n^3 \], for any natural number \( n \). [2012]

   (a) Statement-1 is false, Statement-2 is true.
   (b) Statement-1 is true, statement-2 is true; statement-2 is a correct explanation for Statement-1.
   (c) Statement-1 is true, statement-2 is true; statement-2 is not a correct explanation for Statement-1.
   (d) Statement-1 is true, statement-2 is false.

24. The sum of first 20 terms of the sequence 0.7, 0.77, 0.777, \ldots, is [JEE M 2013]
   (a) \( \frac{7}{81}(179 - 10^{-20}) \)  
   (b) \( \frac{7}{9}(99 - 10^{-20}) \)
   (c) \( \frac{7}{81}(179 + 10^{-20}) \)  
   (d) \( \frac{7}{9}(99 + 10^{-20}) \)

25. If \( (10)^9 + 2(11)^9 + (10)^9 + 3(11)^9 + (10)^9 + \ldots \)

\[ +10(11)^9 = k(10)^9 \], then \( k \) is equal to: [JEE M 2014]
   (a) 100  
   (b) 110  
   (c) 121  
   (d) 441

26. Three positive numbers form an increasing G.P. If the middle term in this G.P. is doubled, the new numbers are in A.P. then the common ratio of the G.P. is: [JEE M 2014]
   (a) \(-2\)  
   (b) \(2\)  
   (c) \(-\sqrt{3}\)  
   (d) \(\sqrt{3}\)

27. The sum of first 9 terms of the series.
   \[ \frac{1^3}{1} + \frac{1^3 + 2^3}{1+3} + \frac{1^3 + 2^3 + 3^3}{1+3+5} + \ldots \] [JEE M 2015]
   (a) \(142\)  
   (b) \(192\)  
   (c) \(71\)  
   (d) \(96\)

28. If \( m \) is the A.M. of two distinct real numbers \( l \) and \( n \), and \( G_1, G_2 \) and \( G_3 \) are three geometric means between \( l \) and \( n \), then \( G_1^4 + 2G_2^2 + G_3^2 \) equals: [JEE M 2015]
   (a) \(4lm^2\)  
   (b) \(4l^2mn^2\)  
   (c) \(4l^2m\)  
   (d) \(4lmn\)

29. If the 2\(^{nd}\), 5\(^{th}\) and 9\(^{th}\) terms of a non-constant A.P. are in G.P., then the common ratio of this G.P. is: [JEE M 2016]
   (a) \(1\)  
   (b) \(\frac{7}{4}\)  
   (c) \(\frac{8}{5}\)  
   (d) \(\frac{4}{3}\)

30. If the sum of the first ten terms of the series
   \[ \left( \frac{3}{5} \right)^2 + \left( \frac{2}{5} \right)^2 + \left( \frac{1}{5} \right)^2 + 4^2 + \left( \frac{4}{5} \right)^2 + \ldots \]

is \(\frac{16}{5}m\), then \( m \) is equal to: [JEE M 2016]
   (a) \(100\)  
   (b) \(99\)  
   (c) \(102\)  
   (d) \(101\)

CHAPTER 7

Straight Lines and Pair of Straight Lines

Section-A

JEE Advanced/ IIT-JEE

A Fill in the Blanks

1. The area enclosed within the curve |x| + |y| = 1 is .................
   \[ \text{(1981 - 2 Marks)} \]
2. \( y = 10^x \) is the reflection of \( y = \log_{10} x \) in the line whose equation is .................
   \[ \text{(1982 - 2 Marks)} \]
3. The set of lines \( ax + by + c = 0 \), where \( 3a + 2b + 4c = 0 \) is concurrent at the point .................
   \[ \text{(1982 - 2 Marks)} \]
4. Given the points \( A(0, 0) \) and \( B(0, -4) \), the equation of the locus of the point \( P(x, y) \) such that
   \[ |AP - BP| = 6 \] is .................
   \[ \text{(1983 - 1 Mark)} \]
5. If \( a, b \) and \( c \) are in A.P., then the straight line \( ax + by + c = 0 \) will always pass through a fixed point whose coordinates are .................
   \[ \text{(1984 - 2 Marks)} \]
6. The orthocentre of the triangle formed by the lines
   \[ x + y = 1, 2x + 3y = 6 \] and \( 4x - y + 4 = 0 \) lies in quadrant number .................
   \[ \text{(1985 - 2 Marks)} \]
7. Let the algebraic sum of the perpendicular distances from the points \((2, 0), (0, 2)\) and \((1, 1)\) to a variable straight line be zero; then the line passes through a fixed point whose coordinates are .................
   \[ \text{(1991 - 2 Marks)} \]
8. The vertices of a triangle are \( A(-1, -7), B(5, 1) \) and \( C(1, 4) \). The equation of the bisector of the angle \( \angle ABC \) is .................
   \[ \text{(1993 - 2 Marks)} \]

B True / False

1. The straight line \( 5x + 4y = 0 \) passes through the point of intersection of the straight lines \( x + 2y - 10 = 0 \) and \( 2x + 3y + 5 = 0 \).
   \[ \text{(1983 - 1 Mark)} \]
2. The lines \( 2x + 3y + 19 = 0 \) and \( 9x + 6y - 17 = 0 \) cut the coordinate axes in concyclic points.
   \[ \text{(1981 - 1 Mark)} \]

C MCQs with One Correct Answer

1. The points \((-a, -b), (0, 0), (a, b)\) and \((a^2, ab)\) are: \( (1979) \)
   (a) Collinear
   (b) Vertices of a parallelogram
   (c) Vertices of a rectangle
   (d) None of these
2. The point \((4, 1)\) undergoes the following three transformations successively.
   (i) Reflection about the line \( y = x \).
   (ii) Translation through a distance 2 units along the positive direction of \( x \)-axis.
   (iii) Rotation through an angle \( p/4 \) about the origin in the counter clockwise direction.
   \[ \text{(1980)} \]
3. Then the final position of the point is given by the coordinates.
   \( (a) \left( \frac{1}{\sqrt{2}}, \frac{7}{\sqrt{2}} \right) \)
   \( (b) \left( -\frac{\sqrt{2}}{2}, \frac{7\sqrt{2}}{2} \right) \)
   \( (c) \left( -\frac{1}{\sqrt{2}}, \frac{7}{\sqrt{2}} \right) \)
   \( (d) \left( \frac{\sqrt{2}}{2}, \frac{7\sqrt{2}}{2} \right) \)
4. The straight lines \( x + y = 0, 3x + y - 4 = 0, x + 3y - 4 = 0 \) form a triangle which is \( (1983 - 1 Mark) \)
   (a) isosceles
   (b) equilateral
   (c) right angled
   (d) none of these
5. If \( P = (1, 0), Q = (-1, 0) \) and \( R = (2, 0) \) are three given points, then locus of the point \( S \) satisfying the relation \( SQ^2 + SR^2 = 2SP^2 \), is \( (1988 - 2 Marks) \)
   (a) a straight line parallel to \( x \)-axis
   (b) a circle passing through the origin
   (c) a circle with the centre at the origin
   (d) a straight line parallel to \( y \)-axis.
6. Line \( L \) has intercepts \( a \) and \( b \) on the coordinate axes. When the axes are rotated through a given angle, keeping the origin fixed, the same line \( L \) has intercepts \( p \) and \( q \), then \( (1990 - 2 Marks) \)
   \( (a) \frac{a^2 + b^2}{p^2 + q^2} \)
   \( (b) \frac{1}{a^2} + \frac{1}{b^2} = \frac{1}{p^2} + \frac{1}{q^2} \)
   \( (c) \frac{a^2 + p^2}{b^2 + q^2} \)
   \( (d) \frac{1}{a^2} + \frac{1}{p^2} = \frac{1}{b^2} + \frac{1}{q^2} \)
7. If the sum of the distances of a point from two perpendicular lines in a plane is 1, then its locus is \( (1992 - 2 Marks) \)
   (a) square
   (b) circle
   (c) straight line
   (d) two intersecting lines
8. The locus of a variable point whose distance from \((-2, 0)\) is \(2/3\) times its distance from the line \( x = -\frac{9}{2} \) is \( (1994) \)
   (a) ellipse
   (b) parabola
   (c) hyperbola
   (d) none of these
9. The equations to a pair of opposite sides of parallelogram are \( x^2 - 5x + 6 = 0 \) and \( y^2 - 6y + 5 = 0 \), the equations to its diagonals are \( (1994) \)
   \( (a) x + 4y = 13, y = 4x - 7 \)
   \( (b) 4x + y = 13, 4y = x - 7 \)
   \( (c) 4x + y = 13, y = 4x - 7 \)
   \( (d) y - 4x = 13, y + 4x = 7 \)
10. The orthocentre of the triangle formed by the lines \( xy = 0 \) and \( x + y = 1 \) is \( (1995S) \)
    \( (a) \left( \frac{1}{2}, \frac{1}{2} \right) \)
    \( (b) \left( \frac{1}{3}, \frac{1}{3} \right) \)
    \( (c) (0, 0) \)
    \( (d) \left( \frac{1}{4}, \frac{1}{4} \right) \)
16. Let \( PQR \) be a right angled isosceles triangle, right angled at \( P(2, 1) \). If the equation of the line \( QR \) is \( 2x + y = 3 \), then the equation representing the pair of lines \( PQ \) and \( PR \) is \( (1999 - 2 \text{ Marks}) \)

(a) \( 3x^2 - 3y^2 + 8xy + 20x + 10y + 25 = 0 \)
(b) \( 3x^2 - 3y^2 + 8xy - 20x - 10y + 25 = 0 \)
(c) \( 3x^2 - 3y^2 + 8xy + 10x + 15y + 20 = 0 \)
(d) \( 3x^2 - 3y^2 - 8xy - 10x - 15y - 20 = 0 \)

11. If \( x_1, x_2, x_3 \) as well as \( y_1, y_2, y_3 \), are in G.P. with the same common ratio, then the points \( (x_1, y_1), (x_2, y_2), \) and \( (x_3, y_3) \) (1999 - 2 Marks)

(a) lie on a straight line (b) lie on an ellipse
(c) lie on a circle (d) are vertices of a triangle

12. Let \( PS \) be the median of the triangle with vertices \( P(2, 2), Q(6, -1) \) and \( R(7, 3) \). The equation of the line passing through \( (1, -1) \) and parallel to \( PS \) is \( (2000S) \)

(a) \( 2x - 9y - 7 = 0 \) (b) \( 2x - 9y - 11 = 0 \)
(c) \( 2x + 9y - 11 = 0 \) (d) \( 2x + 9y + 7 = 0 \)

13. The incenter of the triangle with vertices \( (1, \sqrt{3}), (0, 0) \) and \( (2, 0) \) is \( (2000S) \)

(a) \( \left( \frac{1}{2}, \frac{\sqrt{3}}{2} \right) \) (b) \( \left( \frac{2}{3}, \frac{1}{\sqrt{3}} \right) \)
(c) \( \left( \frac{2}{3}, -\frac{\sqrt{3}}{2} \right) \) (d) \( \left( 1, \frac{1}{\sqrt{3}} \right) \)

14. The number of integer values of \( m \), for which the x-coordinate of the point of intersection of the lines \( 3x + 4y = 9 \) and \( y = mx + 1 \) is also an integer, is \( (2001S) \)

(a) 2 (b) 0 (c) 4 (d) 1

15. Area of the parallelogram formed by the lines \( y = mx, y = mx + 1, y = nx \) and \( y = nx + 1 \) equals \( (2001S) \)

(a) \( \frac{|m+n|}{2} \) (b) \( \frac{2|m+n|}{|m-n|} \)
(c) \( \frac{1}{|m+n|} \) (d) \( \frac{1}{|m-n|} \)

16. Let \( 0 < \alpha < \frac{\pi}{2} \) be fixed angle. If

\[ P = (\cos \theta, \sin \theta) \text{ and } Q = (\cos(\alpha - \theta), \sin(\alpha - \theta)), \]

then \( Q \) is obtained from \( P \) by \( (2002S) \)

(a) clockwise rotation around origin through an angle \( \alpha \)
(b) anticycloidal rotation around origin through an angle \( \alpha \)
(c) reflection in the line through origin with slope \( \tan \alpha \)
(d) reflection in the line through origin with slope \( \alpha/2 \)

17. Let \( P = (-1, 0), Q = (0, 0) \) and \( R = (3, 3\sqrt{3}) \) be three points. Then the equation of the bisector of the angle \( PQR \) is \( (2002S) \)

(a) \( \frac{\sqrt{3}}{2} x + y = 0 \) (b) \( x + \sqrt{3} y = 0 \)
(c) \( \sqrt{3} x + y = 0 \) (d) \( x + \frac{\sqrt{3}}{2} y = 0 \)

18. A straight line through the origin \( O \) meets the parallel lines \( 4x + 2y = 9 \) and \( 2x + y + 6 = 0 \) at points \( P \) and \( Q \) respectively. Then the point \( O \) divides the segment \( PQ \) in the ratio \( (2002S) \)

(a) 1 : 2 (b) 3 : 4 (c) 2 : 1 (d) 4 : 3

19. The number of integral points (integral point means both the coordinates should be integer) in the interior of the triangle with vertices \((0, 0), (0, 21)\) and \((21, 0)\), is \( (2003S) \)

(a) 133 (b) 190 (c) 233 (d) 105

20. Orthocentre of triangle with vertices \((0, 0), (3, 4)\) and \((4, 0)\) is \( (2003S) \)

(a) \( \left( \frac{3}{4}, \frac{5}{4} \right) \) (b) \( (3, 12) \)
(c) \( \left( \frac{3}{4}, \frac{3}{4} \right) \) (d) \( (3, 9) \)

21. Area of the triangle formed by the line \( x + y = 3 \) and angle bisectors of the pair of straight lines \( x^2 - y^2 + 2y = 1 \) is \( (2004S) \)

(a) 2 sq. units (b) 4 sq. units
(c) 6 sq. units (d) 8 sq. units

22. Let \( O(0, 0), P(3, 4), Q(6, 0) \) be the vertices of the triangles \( OPQ \). The point \( R \) inside the triangle \( OPQ \) is such that the triangles \( OPQ, PQR, QOR \) are of equal area. The coordinates of \( R \) are \( (2007 - 3 \text{ marks}) \)

(a) \( \left( \frac{4}{3}, \frac{3}{4} \right) \) (b) \( \left( \frac{2}{3}, \frac{3}{2} \right) \)
(c) \( \left( \frac{4}{3}, \frac{2}{3} \right) \) (d) \( \left( \frac{2}{3}, \frac{4}{3} \right) \)

23. A straight line \( L \) through the point \((3, -2)\) is inclined at an angle \( 60^\circ \) to the line \( \sqrt{3}x + y = 1 \). If \( L \) also intersects the x-axis, then the equation of \( L \) is \( (2011) \)

(a) \( y + \sqrt{3}x + 2 - 3\sqrt{3} = 0 \) (b) \( y - \sqrt{3}x + 2 + 3\sqrt{3} = 0 \)
(c) \( \sqrt{3}y - x + 3 + 2\sqrt{3} = 0 \) (d) \( \sqrt{3}y + x - 3 - 2\sqrt{3} = 0 \)

D. MCQs with One or More than One Correct

1. Three lines \( px + qy + r = 0, qx + ry + p = 0 \) and \( rx + py + q = 0 \) are concurrent if \( (1985 - 2 \text{ Marks}) \)

(a) \( p + q + r = 0 \) (b) \( p^2 + q^2 + r^2 = qr + rp + pq \)
(c) \( p^3 + q^3 + r^3 = 3pqr \) (d) none of these.

2. The points \( \left( 0, \frac{8}{3} \right), (1, 3) \) and \( (82, 30) \) are vertices of \( (1986 - 2 \text{ Marks}) \)

(a) an obtuse angled triangle (b) an acute angled triangle
(c) a right angled triangle (d) an isosceles triangle
(e) none of these.

3. All points lying inside the triangle formed by the points \((1, 3), (5, 0), \) and \((-1, 2)\) satisfy \( (1986 - 2 \text{ Marks}) \)

(a) \( 3x + 2y \geq 0 \) (b) \( 2x + y - 13 \geq 0 \)
(c) \( 2x - 3y - 12 \leq 0 \) (d) \( -2x + y \geq 0 \)
(e) none of these.

4. The vector \( \vec{a} \) has components \( 2p \) and \( 1 \) with respect to a rectangular cartesian system. This system is rotated through a certain angle about the origin in the counterclockwise sense. If, with respect to the new system, \( \vec{a} \) has components \( p + 1 \) and 1, then \( (1986 - 2 \text{ Marks}) \)

(a) \( p = 0 \) (b) \( p = 1 \) or \( p = -\frac{1}{3} \)
5. If \( P(1, 2), Q(4, 6), R(5, 7) \) and \( S(a, b) \) are the vertices of a parallelogram \( PQRQ \), then \( (1988 - 2 \text{ Marks}) \)
   (a) \( a = 2, b = 4 \)     (b) \( a = 3, b = 4 \)
   (c) \( a = 2, b = 3 \)     (d) \( a = 3, b = 5 \)
6. The diagonals of a parallelogram \( PQRS \) are along the lines \( x + 3y = 4 \) and \( 6x - 2y = 7 \). Then \( PQRQ \) must be a: \( (1998 - 2 \text{ Marks}) \)
   (a) rectangle  (b) square
   (c) cyclic quadrilateral  (d) rhombus.
7. If the vertices \( P, Q, R \) of a triangle \( PQR \) are rational points, which of the following points of the triangle \( PQR \) is (are) always rational point(s)? \( (1998 - 2 \text{ Marks}) \)
   (a) centroid  (b) incentre
   (c) circumcentre  (d) orthocentre
   (A rational point is a point both of whose co-ordinates are rational numbers.)
8. Let \( L_1 \) be a straight line passing through the origin and \( L_2 \) be the straight line \( x + y = 1 \). If the intercepts made by the circle \( x^2 + y^2 - x + 3y = 0 \) on \( L_1 \) and \( L_2 \) are equal, then which of the following equations can represent \( L_2 \)? \( (1999 - 3 \text{ Marks}) \)
   (a) \( x + y = 0 \)     (b) \( x - y = 0 \)
   (c) \( x + 7y = 0 \)     (d) \( x - 7y = 0 \)
9. For \( a > b > c > 0 \), the distance between \( (1, 1) \) and the point of intersection of the lines \( ax + by + c = 0 \) and \( bx + ay + c = 0 \) is less than \( 2\sqrt{2} \). Then \( (JEE \text{ Adv. } 2013) \)
   (a) \( a + b - c > 0 \)     (b) \( a - b + c < 0 \)
   (c) \( a - b + c > 0 \)     (d) \( a + b - c < 0 \)

**E Subjective Problems**

1. A straight line segment of length \( \ell \) moves with its ends on two mutually perpendicular lines. Find the locus of the point which divides the line segment in the ratio \( 1:2 \). \( (1978) \)
2. The area of a triangle is 5. Two of its vertices are \( A(2, 1) \) and \( B(3, -2) \). The third vertex \( C \) lies on \( y = x + 3 \). Find \( C \). \( (1978) \)
3. One side of a rectangle lies along the line \( 4x + 7y + 5 = 0 \). Two of its vertices are \((-3, 1) \) and \((1, 1) \). Find the equations of the other three sides. \( (1978) \)
4. (a) Two vertices of a triangle are \((5, -1) \) and \((2, 3) \). If the orthocentre of the triangle is the origin, find the coordinates of the third point.
   (b) Find the equation of the line which bisects the obtuse angle between the lines \( x - 2y + 4 = 0 \) and \( 4x - 3y + 2 = 0 \). \( (1979) \)
5. A straight line \( L \) is perpendicular to the line \( 5x - y = 1 \). The area of the triangle formed by the line \( L \) and the coordinate axes is 5. Find the equation of the line \( L \). \( (1980) \)
6. The end \( A, B \) of a straight line segment of constant length \( c \) slide upon the fixed rectangular axes \( OX, OY \) respectively. If the rectangle \( OAQP \) be completed, then show that the locus of the foot of the perpendicular drawn from \( P \) to \( AB \) is \( x^2 + \frac{2}{3} y + \frac{2}{3} = c^3 \). \( (1983 - 2 \text{ Marks}) \)
7. The vertices of a triangle are \( [at_1t_2, a(t_1 + t_2)], [at_2t_3, a(t_2 + t_3)], [at_3t_1, a(t_3 + t_1)] \). Find the orthocentre of the triangle. \( (1983 - 3 \text{ Marks}) \)
8. The coordinates of \( A, B, C \) are \((6, 3), (-3, 5), (4, -2)\) respectively, and \( P \) is any point \((x, y)\). Show that the ratio of the area of the triangles \( \Delta PBC \) and \( \Delta ABC \) is \( \frac{x + y - 2}{7} \). \( (1983 - 2 \text{ Marks}) \)
9. Two equal sides of an isosceles triangle are given by the equations \( 7x - y + 3 = 0 \) and \( x + y - 3 = 0 \) and its third side passes through the point \((1, -10) \). Determine the equation of the third side. \( (1984 - 4 \text{ Marks}) \)
10. One of the diameters of the circle circumscribing the rectangle \( ABCD \) is \( 4y = x + 7 \). If \( A \) and \( B \) are the points \((-3, 4) \) and \((5, 4) \) respectively, then find the area of rectangle. \( (1985 - 3 \text{ Marks}) \)
11. Two sides of a rhombus \( ABCD \) are parallel to the lines \( y = x + 2 \) and \( y = 7x + 3 \). If the diagonals of the rhombus intersect at the point \((1, 2) \) and the vertex \( A \) is on the \( y \)-axis, find possible co-ordinates of \( A \). \( (1985 - 5 \text{ Marks}) \)
12. Lines \( L_1 = ax + by + c = 0 \) and \( L_2 = dx + my + n = 0 \) intersect at the point \( P \) and make an angle \( \theta \) with each other. Find the equation of a line \( L \) different from \( L_2 \) which passes through \( P \) and makes the same angle \( \theta \) with \( L_1 \). \( (1988 - 5 \text{ Marks}) \)
13. Let \( ABC \) be a triangle with \( AB = AC \). If \( D \) is the midpoint of \( BC \), \( E \) is the foot of the perpendicular drawn from \( D \) to \( AC \) and \( F \) is the mid-point of \( DE \), prove that \( AF \) is perpendicular to \( BE \). \( (1989 - 5 \text{ Marks}) \)
14. Straight lines \( 3x + 4y = 5 \) and \( 4x - 3y = 15 \) intersect at the point \( A \). Points \( B \) and \( C \) are chosen on these two lines such that \( AB = AC \). Determine the possible equations of the line \( BC \) passing through the point \((1, 2) \). \( (1990 - 4 \text{ Marks}) \)
15. A line cuts the \( x \)-axis at \( A(7, 0) \) and the \( y \)-axis at \( B(0, -5) \). A variable line \( PQ \) is drawn perpendicular to \( AB \) cutting the \( x \)-axis in \( P \) and the \( y \)-axis in \( Q \). If \( AQ \) and \( BP \) intersect at \( R \), find the locus of \( R \). \( (1990 - 4 \text{ Marks}) \)
16. Find the equation of the line passing through the point \((2, 3) \) and making intercept of length 2 units between the lines \( y + 2x = 3 \) and \( y + 2x = 5 \). \( (1991 - 4 \text{ Marks}) \)
17. Show that all chords of the curve \( 3x^2 - y^2 - 2x + 4y = 0 \), which subtend a right angle at the origin, pass through a fixed point. Find the coordinates of the point. \( (1991 - 4 \text{ Marks}) \)
18. Determine all values of \( \alpha \) for which the point \((\alpha, \alpha^2)\) lies inside the triangle formed by the lines
\[2x + 3y - 1 = 0\]
\[x + 2y - 3 = 0\]
\[5x - 6y - 1 = 0\]
(1992 - 6 Marks)

19. Tangent at a point \( P_1 \) (other than \((0,0)\)) on the curve \( y = x^3 \) meets the curve again at \( P_2 \). The tangent at \( P_2 \) meets the curve at \( P_3 \), and so on. Show that the abscissae of \( P_1, P_2, P_3 \ldots \ldots P_n \) form a G.P. Also find the ratio.

\[\text{[area } (\Delta P_1 P_2 P_3)]/[(\text{area } P_2 P_3 P_4)]\]
(1993 - 5 Marks)

20. A line through \( A (-5, -4) \) meets the line \( x + 3y + 2 = 0 \), \( 2x + y + 4 = 0 \) and \( x - y - 5 = 0 \) at the points \( B, C \) and \( D \) respectively. Find the values of \( 15/AB^2 + 10/AC^2 = (6/AD)^2 \), find the equation of the line.

(1993 - 5 Marks)

21. A rectangle \( PQRS \) has its side \( PQ \) parallel to the line \( y = mx \) and vertices \( P, Q \) and \( S \) on the lines \( y = a, x = b \) and \( x = -b \), respectively. Find the locus of the vertex \( R \).

(1996 - 2 Marks)

22. Using coordinate geometry, prove that the three altitudes of any triangle are concurrent.

(1998 - 8 Marks)

23. For points \( P = (x_1, y_1) \) and \( Q = (x_2, y_2) \) of the coordinate plane, a new distance \( d(P, Q) \) is defined by
\[d(P, Q) = |x_1 - x_2|^\frac{1}{2} + |y_1 - y_2|^\frac{1}{2}\]. Let \( O = (0, 0) \) and \( A = (3, 2) \). Prove that the set of points in the first quadrant which are equidistant (with respect to the new distance) from \( O \) and \( A \) consists of the union of a line segment of finite length and an infinite ray. Sketch this set in a labelled diagram.

(2000 - 10 Marks)

24. Let \( ABC \) and \( PQR \) be any two triangles in the same plane. Assume that the perpendiculars from the points \( A, B, C \) to the sides \( QR, RP, PQ \) respectively are concurrent. Using vector methods or otherwise, prove that the perpendiculars from \( P, Q, R \) to \( BC, CA, AB \) respectively are also concurrent.

(2000 - 10 Marks)

25. Let \( a, b, c \) be real numbers with \( a^2 + b^2 + c^2 = 1 \). Show that the equation
\[\begin{vmatrix}
ax - by - c & bx + ay & cx + a \\
px + ay & -ax + by - c & cy + b \\
px + a & cy + b & -ax - by + c
\end{vmatrix} = 0\]
represents a straight line.

(2001 - 6 Marks)

26. A straight line \( L \) through the origin meets the lines \( x + y = 1 \) and \( x + y = 3 \) at \( P \) and \( Q \) respectively. Through \( P \) and \( Q \) two straight lines \( L_1 \) and \( L_2 \) are drawn, parallel to \( 2x - y = 5 \) and \( 3x + y = 5 \) respectively. Lines \( L_1 \) and \( L_2 \) intersect at \( R \). Show that the locus of \( R \), as \( L \) varies, is a straight line.

(2002 - 5 Marks)

27. A straight line \( L \) with negative slope passes through the point \((8, 2)\) and cuts the positive coordinate axes at points \( P \) and \( Q \). Find the absolute minimum value of \( OP + OQ \) as \( L \) varies, where \( O \) is the origin.

(2002 - 5 Marks)

28. The area of the triangle formed by the intersection of a line parallel to \( x \)-axis and passing through \( P(h, k) \) with the lines \( y = x \) and \( x + y = 2 \) is \(4h^2 \). Find the locus of the point \( P \).

(2005 - 2 Marks)

**H** Assertion & Reason Type Questions

1. Lines \( L_1: y = x + 2 \) and \( L_2: 2x + y = 0 \) intersect the line \( L_3: y = x + 2 = 0 \) at \( P \) and \( Q \) respectively. The bisector of the acute angle between \( L_1 \) and \( L_2 \) intersects \( L_3 \) at \( R \).

**STATEMENT 1:** The ratio \( PR : RQ \) equals \( 2\sqrt{5} : 5 \).

**STATEMENT 2:** Because \( \tan 2 \theta = \frac{2 \tan \theta}{1 - \tan^2 \theta} \).

**STATEMENT 1** is True, **STATEMENT 2** is False

**STATEMENT 2** is Correct, **STATEMENT 1** is False

**STATEMENT 1** is False, **STATEMENT 2** is True

**STATEMENT 1** is False, **STATEMENT 2** is False

**I** Integer Value Correct Type

1. For a point \( P \) in the plane, let \( d_1(P) \) and \( d_2(P) \) be the distance of the point \( P \) from the lines \( x - y = 0 \) and \( x + y = 0 \) respectively. The area of the region \( R \) consisting of all points \( P \) lying in the first quadrant of the plane and satisfying \( 2 \leq d_1(P) + d_2(P) \leq 4 \), is __________. (JEE Adv. 2014)

- (a) \( \frac{1}{2} \)
- (b) \( \frac{1}{4} \)
- (c) \( \frac{1}{2} \)
- (d) \( \frac{1}{4} \)

3. If the pair of lines \( ax^2 + 2hxy + by^2 = 0 \) intersect on the \( y \)-axis then

- (a) \( h^2 = b^2 + c^2 \)
- (b) \( bh^2 = c^2 \)
- (c) \( abc = 2gfh \)
- (d) none of these

4. The pair of lines represented by \( 3ax^2 + 5xy + (a^2 - 2)y^2 = 0 \) are perpendicular to each other for

- (a) two values of \( a \) 
- (b) \( \forall a \)
- (c) for one value of \( a \) 
- (d) for no values of \( a \)
Straight Lines and Pair of Straight Lines

5. A square of side $a$ lies above the $x$-axis and has one vertex at the origin. The side passing through the origin makes an angle $\alpha \left(0 < \alpha < \frac{\pi}{4}\right)$ with the positive direction of $x$-axis. The equation of its diagonal not passing through the origin is
   (a) $y(\cos \alpha + \sin \alpha) = x(\cos \alpha - \sin \alpha) = a$ [2003]
   (b) $y(\cos \alpha - \sin \alpha) = x(\sin \alpha - \cos \alpha) = a$
   (c) $y(\cos \alpha + \sin \alpha) = x(\sin \alpha + \cos \alpha) = a$
   (d) $y(\cos \alpha + \sin \alpha) = x(\sin \alpha + \cos \alpha) = a$.

6. If the pair of straight lines $x^2 - 2pxy - y^2 = 0$ and $x^2 - 2qxy - y^2 = 0$ be such that each pair bisects the angle between the other pair, then
   (a) $pq = -1$ (b) $p = q$ (c) $p = -q$ (d) $pq = 1$.

7. Locus of centroid of the triangle whose vertices are $(a \cos t, a \sin t), (b \sin t, -b \cos t)$ and $(1, 0)$, where $t$ is a parameter, is
   (a) $(3x + 1)^2 + (3y)^2 = a^2 - b^2$ [2003]
   (b) $(3x - 1)^2 + (3y)^2 = a^2 - b^2$
   (c) $(3x - 1)^2 + (3y)^2 = a^2 + b^2$
   (d) $(3x + 1)^2 + (3y)^2 = a^2 + b^2$.

8. If $x_1, x_2, x_3$ and $y_1, y_2, y_3$ are both in G.P. with the same common ratio, then the points $(x_1, y_1), (x_2, y_2)$ and $(x_3, y_3)$ are vertices of a triangle
   (a) are vertices of a triangle
   (b) lie on a straight line
   (c) lie on an ellipse
   (d) lie on a circle.

9. If the equation of the locus of a point equidistant from the point $(a_1, b_1)$ and $(a_2, b_2)$ is
   $(a_1 - b_2)x + (a_1 - b_2)y + c = 0$, then the value of $c$ is
   (a) $\sqrt{a_1^2 + b_1^2 - a_2^2 - b_2^2}$ [2003]
   (b) $\frac{1}{2}(a_2^2 + b_2^2 - a_1^2 - b_1^2)$
   (c) $a_1^2 - a_2^2 + b_1^2 - b_2^2$
   (d) $\frac{1}{2}(a_1^2 + a_2^2 + b_1^2 + b_2^2)$.

10. Let $A(2, -3)$ and $B(-2, 3)$ be vertices of a triangle $ABC$. If the centroid of this triangle moves on the line $2x + 3y = 1$, then the locus of the vertex $C$ is the line
    (a) $3x - 2y = 3$ (b) $2x - 3y = 7$ [2004]
    (c) $3x + 2y = 5$ (d) $2x + 3y = 9$

11. The equation of the straight line passing through the point $(4, 3)$ and making intercepts on the co-ordinate axes whose sum is $-1$ is
    (a) $\frac{x}{2} - \frac{y}{3} = 1$ and $\frac{x}{-2} + \frac{y}{1} = 1$
    (b) $\frac{x}{2} - \frac{y}{3} = -1$ and $\frac{x}{-2} + \frac{y}{1} = -1$
    (c) $\frac{x}{2} + \frac{y}{3} = 1$ and $\frac{x}{-2} + \frac{y}{1} = 1$
    (d) $\frac{x}{2} + \frac{y}{3} = -1$ and $\frac{x}{-2} + \frac{y}{1} = -1$.

12. If the sum of the slopes of the lines given by $x^2 - 2cxy - 7y^2 = 0$ is four times their product $c$ has the value
    (a) $-2$ (b) $-1$ (c) $2$ (d) $1$.

13. If one of the lines given by $6x^2 - xy + 4cy^2 = 0$ is $3x + 4y = 0$, then $c$ equals
    (a) $-3$ (b) $-1$ (c) $3$ (d) $1$.

14. The line parallel to the $x$-axis and passing through the intersection of the lines $ax + 2by + 3b = 0$ and $bx - 2ay - 3a = 0$, where $(a, b) \neq (0, 0)$ is
    (a) below the $x$-axis at a distance of $\frac{3}{2}$ from it
    (b) below the $x$-axis at a distance of $\frac{2}{3}$ from it
    (c) above the $x$-axis at a distance of $\frac{3}{2}$ from it
    (d) above the $x$-axis at a distance of $\frac{2}{3}$ from it.

15. If a vertex of a triangle is $(1, 1)$ and the mid points of two sides through this vertex are $(-1, 2)$ and $(3, 2)$ then the centroid of the triangle is
    (a) $\left(-1, \frac{7}{3}\right)$ (b) $\left(-\frac{1}{3}, \frac{7}{3}\right)$
    (c) $\left(1, \frac{7}{3}\right)$ (d) $\left(\frac{1}{3}, \frac{7}{3}\right)$.

16. A straight line through the point $A(3, 4)$ is such that its intercept between the axes is bisected at $A$. Its equation is
    (a) $x + y = 7$ (b) $3x - 4y + 7 = 0$ [2006]
    (c) $4x + 3y = 24$ (d) $3x + 4y = 25$.

17. If $(a, a^2)$ falls inside the angle made by the lines $y = \frac{x}{2}$, $x > 0$ and $y = 3x$, $x > 0$, then $a$ belong to
    (a) [2006]
18. Let A (h, k), B(1, 1) and C (2, 1) be the vertices of a right angled triangle with AC as its hypotenuse. If the area of the triangle is 1 square unit, then the set of values which 'k' can take is given by [2007]
(a) {−1, 3} (b) {−3, −2} (c) {1, 3} (d) {0, 2}

19. Let P(−1, 0), Q(0, 0) and R(3, 3√3) be three points. The equation of the bisector of the angle PQR is [2007]
(a) \(\frac{\sqrt{3}}{2}x + y = 0\) (b) \(x + \sqrt{3}y = 0\)
(c) \(\sqrt{3}x + y = 0\) (d) \(x + \frac{\sqrt{3}}{2}y = 0\).

20. If one of the lines of \(my^2 + 1 - m^2 = 0\) is a bisector of the angle between the lines \(xy = 0\), then \(m\) is [2007]
(a) 1 (b) 2 (c) −1/2 (d) −2

21. The perpendicular bisector of the line segment joining P (1, 4) and Q(k, 3) has y-intercept −4. Then a possible value of k is [2008]
(a) 1 (b) 2 (c) −2 (d) −4

22. The shortest distance between the line \(y - x = 1\) and the curve \(x = y^2\) is: [2009]
(a) \(\frac{2\sqrt{3}}{8}\) (b) \(\frac{3\sqrt{2}}{5}\) (c) \(\frac{\sqrt{3}}{4}\) (d) \(\frac{3\sqrt{2}}{8}\)

23. The lines \((p^2 + 1)x - y + q = 0\) and \((p^2 + 1)^2x + (p^2 + 1)y + 2q = 0\) are perpendicular to a common line for : [2009]
(a) exactly one value of p
(b) exactly two values of p
(c) more than two values of p
(d) no value of p

24. Three distinct points A, B and C are given in the 2-dimensional coordinates plane such that the ratio of the distance of any one of them from the point (1, 0) to the distance from the point (−1, 0) is equal to \(\frac{1}{3}\). Then the circumcentre of the triangle ABC is at the point: [2009]
(a) \(\left(\frac{5}{4}, 0\right)\) (b) \(\left(\frac{5}{2}, 0\right)\) (c) \(\left(\frac{5}{3}, 0\right)\) (d) (0, 0)

25. The line \(L\) given by \(\frac{x}{5} + \frac{y}{b} = 1\) passes through the point (13, 32). The line \(K\) is parallel to \(L\) and has the equation \(\frac{x}{c} + \frac{y}{3} = 1\). Then the distance between \(L\) and \(K\) is [2010]
(a) \(\sqrt{17}\) (b) \(\frac{17}{\sqrt{15}}\) (c) \(\frac{23}{\sqrt{17}}\) (d) \(\frac{23}{\sqrt{15}}\)

26. The lines \(L_1 : y - x = 0\) and \(L_2 : 2x + y = 0\) intersect the line \(L_3 : y + 2 = 0\) at P and Q respectively. The bisector of the acute angle between \(L_1\) and \(L_2\) intersects \(L_3\) at R.

Statement-1: The ratio \(PR : RQ\) equals \(2\sqrt{2} : 2\sqrt{5}\)
Statement-2: In any triangle, bisector of an angle divides the triangle into two similar triangles. [2011]
(a) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.
(b) Statement-1 is true, Statement-2 is false.
(c) Statement-1 is false, Statement-2 is true.
(d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.

27. If the line \(2x + y = k\) passes through the point which divides the line segment joining the points (1, 1) and (2, 4) in the ratio 3 : 2, then \(k\) equals : [2012]
(a) \(\frac{29}{5}\) (b) 5 (c) 6 (d) \(\frac{11}{5}\)

28. A ray of light along \(x + \sqrt{3}y = \sqrt{3}\) gets reflected upon reaching x-axis, the equation of the reflected ray is [JEE M 2013]
(a) \(y = x + \sqrt{3}\) (b) \(\sqrt{3}y = x - \sqrt{3}\)
(c) \(\sqrt{3}x = y - \sqrt{3}\) (d) \(\sqrt{3}y = x - 1\)

29. The x-coordinate of the incentre of the triangle that has the coordinates of mid points of its sides as (0, 1), (1, 1) and (1, 0) is : [JEE M 2013]
(a) \(2 + \sqrt{2}\) (b) \(2 - \sqrt{2}\) (c) \(1 + \sqrt{2}\) (d) \(1 - \sqrt{2}\)

30. Let PS be the median of the triangle with vertices P(2, 2), Q(6, −1) and R(7, 3). The equation of the line passing through (1, −1) and parallel to PS is: [JEE M 2014]
(a) \(4x + 7y + 3 = 0\) (b) \(2x - 9y - 11 = 0\)
(c) \(4x - 7y - 11 = 0\) (d) \(2x + 9y + 7 = 0\)

31. Let \(a\), \(b\), \(c\) and \(d\) be non-zero numbers. If the point of intersection of the lines \(4ax + 2ay + c = 0\) and \(5bx + 2by + d = 0\) lies in the fourth quadrant and is equidistant from the two axes then [JEE M 2014]
(a) \(3bc - 2ad = 0\) (b) \(3bc + 2ad = 0\)
(c) \(2bc - 3ad = 0\) (d) \(2bc + 3ad = 0\)

32. The number of points, having both co-ordinates as integers, that lie in the interior of the triangle with vertices (0, 0), (0, 41) and (41, 0) is: [JEE M 2015]
(a) 820 (b) 780 (c) 901 (d) 861

33. Two sides of a rhombus are along the lines, \(x - y + 1 = 0\) and \(7x - y - 5 = 0\). If its diagonals intersect at \((-1, -2)\), then which one of the following is a vertex of this rhombus? [JEE M 2016]
(a) \(\left(\frac{1}{3}, 3\right)\) (b) \(\left(\frac{10}{3}, -\frac{7}{3}\right)\)
(c) \((-3, -9)\) (d) \((-3, -8)\)
CHAPTER 8

SECTION -A

JEE Advanced/ IIT-JEE

A. Fill in the Blanks

1. If A and B are points in the plane such that PA/PB = k (constant) for all P on a given circle, then the value of k cannot be equal to ................. (1982 - 2 Marks)

2. The points of intersection of the line $4x - 3y - 10 = 0$ and the circle $x^2 + y^2 - 2x + 4y - 20 = 0$ are .............. and .............. (1983 - 2 Marks)

3. The lines $3x - 4y + 4 = 0$ and $6x - 8y - 7 = 0$ are tangents to the same circle. The radius of this circle is ................. (1984 - 2 Marks)

4. Let $x^2 + y^2 - 4x - 2y - 11 = 0$ be a circle. A pair of tangents from the point $(4, 5)$ with a pair of radii form a quadrilateral of area ................. (1985 - 2 Marks)

5. From the origin chords are drawn to the circle $(x - 1)^2 + y^2 = 1$. The equation of the locus of the mid-points of these chords is ................. (1985 - 2 Marks)

6. The equation of the line passing through the points of intersection of the circles $3x^2 + y^2 = 2x + 12y - 9 = 0$ and $x^2 + 2y^2 + 6x + 2y - 15 = 0$ is ................. (1986 - 2 Marks)

7. From the point A(0, 3) on the circle $x^2 + 4x + (y - 3)^2 = 0$, a chord AB is drawn and extended to a point M such that $AM = 2AB$. The equation of the locus of M is ................. (1986 - 2 Marks)

8. The area of the triangle formed by the tangents from the point (4, 3) to the circle $x^2 + 2 = 9$ and the line joining their points of contact is ................. (1987 - 2 Marks)

9. If the circle $C_1 : x^2 + y^2 = 16$ intersects another circle $C_2$ of radius 5 in such a manner that common chord is of maximum length and has a slope equal to 3/4, then the coordinates of the centre of $C_2$ are ................. (1988 - 2 Marks)

10. The area of the triangle formed by the positive x-axis and the normal and the tangent to the circle $x^2 + y^2 = 4$ at (1, $\sqrt{3}$) is, ................. (1989 - 2 Marks)

11. If a circle passes through the points of intersection of the coordinate axes with the lines $\lambda x - y + 1 = 0$ and $x - 2y + 3 = 0$, then the value of $\lambda$ = ................. (1991 - 2 Marks)

12. The equation of the locus of the mid-points of the circle $4x^2 + 4y^2 - 12x + 4y + 1 = 0$ that subtend an angle of $2\pi/3$ at its centre is ................. (1993 - 2 Marks)

13. The intercept on the line $y = x$ by the circle $x^2 + y^2 - 2x = 0$ is $AB$. Equation of the circle with $AB$ as a diameter is ................. (1996 - 1 Mark)

14. For each natural number $k$, let $C_k$ denote the circle with radius $k$ centimetres and centre at the origin. On the circle $C_k$, $\alpha$-particle moves $k$ centimetres in the counter-clockwise direction. After completing its motion on $C_k$, the particle moves to $C_{k+1}$ in the radial direction. The motion of the particle continues in this manner. The particle starts at $(1, 0)$. If the particle crosses the positive direction of the x-axis for the first time on the circle $C_n$ then $n =$ ................. (1997 - 2 Marks)

15. The chords of contact of the pair of tangents drawn from each point on the line $2x + y = 4$ to circle $x^2 + y^2 = 1$ pass through the point ................. (1997 - 2 Marks)

B. True / False

1. No tangent can be drawn from the point $(5/2, 1)$ to the circumcircle of the triangle with vertices $(1, \sqrt{3})$, $(1, -\sqrt{3})$, $(3, \sqrt{3})$. (1985 - 1 Mark)

2. The line $x + 3y = 0$ is a diameter of the circle $x^2 + y^2 - 6x + 2y = 0$. (1989 - 1 Mark)

C. MCQs with One Correct Answer

1. A square is inscribed in the circle $x^2 + y^2 - 2x + 4y + 3 = 0$. Its sides are parallel to the coordinate axes. The one vertex of the square is (1980)
   (a) $(1 + \sqrt{2}, -2)$  (b) $(1 - \sqrt{2}, -2)$
   (c) $(1, -2 + \sqrt{2})$  (d) none of these

2. Two circles $x^2 + y^2 = 6$ and $x^2 + y^2 - 6x + 8 = 0$ are given. Then the equation of the circle through their points of intersection and the point $(1, 1)$ is (1980)
   (a) $x^2 + y^2 - 6x + 4 = 0$  (b) $x^2 + y^2 - 3x + 1 = 0$
   (c) $x^2 + y^2 - 4y + 2 = 0$  (d) none of these
3. The centre of the circle passing through the point (0, 1) and touching the curve \( y = x^2 \) at (2, 4) is \((1983 - 1 \text{ Mark})\)
(a) \( \left( \frac{-16}{5}, 10 \right) \) (b) \( \left( \frac{-16}{7}, 10 \right) \) (c) \( \left( \frac{-16}{5}, 10 \right) \) (d) none of these

4. The equation of the circle passing through (1, 1) and the points of intersection of \( x^2 + y^2 + 13x - 3y = 0 \) and \( 2x^2 + 2y^2 + 4x - 7y - 25 = 0 \) is \((1983 - 1 \text{ Mark})\)
(a) \( 4x^2 + 4y^2 - 30x - 10y - 25 = 0 \) (b) \( 4x^2 + 4y^2 + 30x - 13y - 25 = 0 \) (c) \( 4x^2 + 4y^2 - 17x - 10y + 25 = 0 \) (d) none of these

5. The locus of the mid-point of a chord of the circle \( x^2 + y^2 = 4 \) which subtends a right angle at the origin is \((1984 - 2 \text{ Marks})\)
(a) \( x + y = 2 \) (b) \( x^2 + y^2 = 1 \) (c) \( x^2 + y^2 = 2 \) (d) \( x + y = 1 \)

6. If a circle passes through the point \((a, b)\) and cuts the circle \( x^2 + y^2 = k^2 \) orthogonally, then the equation of the locus of its centre is \((1988 - 2 \text{ Marks})\)
(a) \( 2ax + 2by - (a^2 + b^2 + k^2) = 0 \) (b) \( 2ax + 2by - (a^2 - b^2 + k^2) = 0 \) (c) \( x^2 + y^2 - 3ax - 4by + (a^2 + b^2 - k^2) = 0 \) (d) \( x^2 + y^2 - 2ax - 3by + (a^2 - b^2 - k^2) = 0 \)

7. If the two circles \( (x - 1)^2 + (y - 3)^2 = r^2 \) and \( x^2 + y^2 - 8x + 2y + 8 = 0 \) intersect in two distinct points, then \(1989 - 2 \text{ Marks}\)
(a) \( 2 < r < 8 \) (b) \( r < 2 \) (c) \( r = 2 \) (d) \( r > 2 \)

8. The lines \( 2x - 3y = 5 \) and \( 3x - 4y = 7 \) are diameters of a circle of area 154 sq. units. Then the equation of this circle is \((1989 - 2 \text{ Marks})\)
(a) \( x^2 + y^2 + 2x - 2y = 62 \) (b) \( x^2 + y^2 + 2x - 2y = 47 \) (c) \( x^2 + y^2 - 2x + 2y = 47 \) (d) \( x^2 + y^2 - 2x + 2y = 62 \)

9. The centre of a circle passing through the points (0, 0), (1, 0) and touching the circle \( x^2 + y^2 = 9 \) is \((1992 - 2 \text{ Marks})\)
(a) \( \left( \frac{3}{2}, \frac{1}{2} \right) \) (b) \( \left( \frac{1}{2}, \frac{3}{2} \right) \) (c) \( \left( \frac{1}{2}, \frac{1}{2} \right) \) (d) \( \left( \frac{1}{2}, -\frac{1}{2} \right) \)

10. The locus of the centre of a circle, which touches externally the circle \( x^2 + y^2 - 6x - 6y + 14 = 0 \) and also touches the y-axis, is given by the equation: \((1993 - 1 \text{ Mark})\)
(a) \( x^2 - 6x - 10y + 14 = 0 \) (b) \( x^2 - 10x - 6y + 14 = 0 \) (c) \( y^2 - 6x + 14 = 0 \) (d) \( y^2 - 10x - 6y + 14 = 0 \)

11. The circles \( x^2 + y^2 - 10x + 16 = 0 \) and \( x^2 + y^2 = r^2 \) intersect each other in two distinct points \((1994)\)
(a) \( r < 2 \) (b) \( r > 8 \) (c) \( 2 < r < 8 \) (d) \( 2 \leq r \leq 8 \)

12. The angle between a pair of tangents drawn from a point \( P \) to the circle \( x^2 + y^2 + 4x - 6y + 9 = 0 \) and \( \alpha + 13 \cos^2 \alpha = 0 \) is \(2 \alpha \).
(a) \( x^2 + y^2 + 4x - 6y + 4 = 0 \) (b) \( x^2 + y^2 + 4x - 6y - 9 = 0 \) (c) \( x^2 + y^2 + 4x - 6y - 4 = 0 \) (d) \( x^2 + y^2 - 4x - 6y + 9 = 0 \)

13. If two distinct chords, drawn from the point \((p, q)\) on the circle \( x^2 + y^2 = px + qy \) (where \( pq \neq 0 \)) are bisected by the x-axis, then \((1999 - 2 \text{ Marks})\)
(a) \( p^2 = q^2 \) (b) \( p^2 = 8q^2 \) (c) \( p^2 < 8q^2 \) (d) \( p^2 > 8q^2 \)

14. The triangle \( PQR \) is inscribed in the circle \( x^2 + y^2 = 25 \). If \( Q \) and \( R \) have co-ordinates \((3, 4)\) and \((-4, 3)\) respectively, then \( \angle QPR \) is equal to \((2000)\)
(a) \( \frac{\pi}{2} \) (b) \( \frac{\pi}{3} \) (c) \( \frac{\pi}{4} \) (d) \( \frac{\pi}{6} \)

15. If the circles \( x^2 + y^2 + 2x + 2ky + 6 = 0 \) and \( x^2 + y^2 + 2ky + k = 0 \) intersect orthogonally, then \( k \) is \((2000)\)
(a) \( 2 - \frac{3}{2} \) (b) \( -2 - \frac{3}{2} \) (c) \( 2 + \frac{3}{2} \) (d) \( -2 + \frac{3}{2} \)

16. Let \( AB \) be a chord of the circle \( x^2 + y^2 = r^2 \) subtending a right angle at the centre. Then the locus of the centroid of the triangle \( PAB \) as \( P \) moves on the circle is \((2001)\)
(a) a parabola (b) a circle (c) an ellipse (d) a pair of straight lines

17. Let \( PQ \) and \( RS \) be tangents at the extremities of the diameter \( PR \) of a circle of radius \( r \). If \( PS \) and \( RQ \) intersect at a point \( X \) on the circumference of the circle, then \( 2r \) equals \((2001)\)
(a) \( \sqrt{PQ \cdot RS} \) (b) \( (PQ + RS)/2 \) (c) \( 2PQ \cdot RS/(PQ + RS) \) (d) \( \sqrt{(PQ^2 + RS^2)/2} \)

18. If the tangent at the point \( P \) on the circle \( x^2 + y^2 + 6x + 6y = 2 \) meets a straight line \( 5x - 2y + 6 = 0 \) at a point \( Q \) on the y-axis, then the length of \( PQ \) is \((2002S)\)
(a) \( 4 \) (b) \( 2\sqrt{5} \) (c) \( 5 \) (d) \( 3\sqrt{5} \)

19. The centre of circle inscribed in square formed by the lines \( x^2 - 8x + 12 = 0 \) and \( y^2 - 14y + 45 = 0 \), is \((2003S)\)
(a) \((4, 7)\) (b) \((7, 4)\) (c) \((9, 4)\) (d) \((4, 9)\)

20. If one of the diameters of the circle \( x^2 + y^2 - 2x - 6y + 6 = 0 \) is a chord to the circle with centre \((2, 1)\), then the radius of the circle is \((2004)\)
(a) \( \sqrt{3} \) (b) \( \sqrt{2} \) (c) \( 3 \) (d) \( 2 \)

21. A circle is given by \( x^2 + (y-1)^2 = 1 \), another circle \( C \) touches it externally and also the x-axis, then the locus of its centre is \((2005)\)
(a) \( \{(x, y) : x^2 = 4y \} \cup \{(x, y) : y \leq 0\} \) (b) \( \{(x, y) : x^2 + (y-1)^2 = 4 \} \cup \{(x, y) : y \leq 0\} \) (c) \( \{(x, y) : x^2 = y \} \cup \{(0, y) : y \leq 0\} \) (d) \( \{(x, y) : x^2 = 4y \} \cup \{(0, y) : y \leq 0\} \)
22. Tangents drawn from the point \(P(1, 8)\) to the circle \(x^2 + y^2 - 6x - 4y - 11 = 0\) touch the circle at the points \(A\) and \(B\). The equation of the circumcircle of the triangle \(PAB\) is
   \[ (a) \quad x^2 + y^2 - 4x - 6y + 19 = 0 \]
   \[ (b) \quad x^2 + y^2 - 4x - 10y + 19 = 0 \]
   \[ (c) \quad x^2 + y^2 - 2x + 6y - 29 = 0 \]
   \[ (d) \quad x^2 + y^2 - 6x - 4y + 19 = 0 \]

23. The circle passing through the point \((-1, 0)\) and touching the \(y\)-axis at \((0, 2)\) also passes through the point. \(2011\)
   \[ (a) \quad \left(\frac{3}{2}, 0\right) \quad (b) \quad \left(-\frac{5}{2}, 2\right) \quad (c) \quad \left(-\frac{3}{2}, \frac{5}{2}\right) \quad (d) \quad (-4, 0) \]

24. The locus of the mid-point of the chord of contact of tangents drawn from points lying on the straight line \(4x - 5y = 20\) to the circle \(x^2 + y^2 = 9\) is \(2012\)
   \[ (a) \quad 20(x^2 + y^2) - 36x + 45y = 0 \]
   \[ (b) \quad 20(x^2 + y^2) + 36x - 45y = 0 \]
   \[ (c) \quad 36(x^2 + y^2) - 20x + 45y = 0 \]
   \[ (d) \quad 36(x^2 + y^2) + 20x - 45y = 0 \]

D MCQs with One or More than One Correct

1. The equations of the tangents drawn from the origin to the circle \(x^2 + y^2 - 2ax - 2by + a^2 = 0\), are \(1988 - 2\) Marks
   \[ (a) \quad x = 0 \quad (b) \quad y = 0 \]
   \[ (c) \quad (h^2 - r^2)x - 2rh = 0 \quad (d) \quad (h^2 - r^2)x + 2rh = 0 \]

2. The number of common tangents to the circles \(x^2 + y^2 = 4\) and \(x^2 + y^2 - 6x - 8y = 24\) is \(1998 - 2\) Marks
   \[ (a) \quad 0 \quad (b) \quad 1 \quad (c) \quad 3 \quad (d) \quad 4 \]

3. If the circle \(x^2 + y^2 = a^2\) intersects the hyperbola \(xy = c^2\) in four points \(P(x_1, y_1), Q(x_2, y_2), R(x_3, y_3), S(x_4, y_4)\), then \(1998 - 2\) Marks
   \[ (a) \quad x_1 + x_2 + x_3 + x_4 = 0 \quad (b) \quad y_1 + y_2 + y_3 + y_4 = 0 \]
   \[ (c) \quad x_1x_2x_3x_4 = c^4 \quad (d) \quad y_1y_2y_3y_4 = c^4 \]

4. Circle(s) touching x-axis at a distance 3 from the origin and having an intercept of length \(2\sqrt{7}\) on y-axis is (are) \(2013\)
   \[ (a) \quad x^2 + y^2 - 6x + 8y + 9 = 0 \quad (b) \quad x^2 + y^2 - 6x + 7y + 9 = 0 \]
   \[ (c) \quad x^2 + y^2 - 6x - 8y + 9 = 0 \quad (d) \quad x^2 + y^2 - 6x - 7y + 9 = 0 \]

5. A circle \(S\) passes through the point \((0, 1)\) and is orthogonal to the circles \((x - 1)^2 + y^2 = 16\) and \(x^2 + y^2 = 1\). Then \(2014\)
   \[ (a) \quad \text{radius of } S = 8 \quad (b) \quad \text{radius of } S = 7 \]
   \[ (c) \quad \text{centre of } S = (7, 1) \quad (d) \quad \text{centre of } S = (-8, 1) \]

6. Let \(RS\) be the diameter of the circle \(x^2 + y^2 = 1\), where \(S\) is the point \((1, 0)\). Let \(P\) be a variable point (other than \(R\) and \(S\)) on the circle and tangents to the circle at \(S\) and \(P\) meet at the point \(Q\). The normal to the circle at \(P\) intersects a line drawn through \(Q\) parallel to \(RS\) at point \(E\). Then the locus of \(E\) passes through the point(s) \(2016\)
   \[ (a) \quad \left(\frac{1}{3}, \frac{1}{\sqrt{3}}\right) \quad (b) \quad \left(\frac{1}{4}, \frac{1}{2}\right) \]
   \[ (c) \quad \left(\frac{1}{3}, -\frac{1}{\sqrt{3}}\right) \quad (d) \quad \left(\frac{1}{4}, -\frac{1}{2}\right) \]

E Subjective Problems

1. Find the equation of the circle whose radius is 5 and which touches the circle \(x^2 + y^2 - 2x - 4y - 20 = 0\) at the point \((5, 5)\). \(1978\)

2. Let \(A\) be the centre of the circle \(x^2 + y^2 - 2x - 4y - 20 = 0\). Suppose that the tangents at the points \(B(1, 7)\) and \(D(-4, -2)\) on the circle meet at the point \(C\). Find the area of the quadrilateral \(ABCD\). \(1981 - 4\) Marks

3. Find the equations of the circle passing through \((-4, 3)\) and touching the lines \(x + y = 2\) and \(x - y = 2\). \(1982 - 3\) Marks

4. Through a fixed point \((h, k)\), secants are drawn to the circle \(x^2 + y^2 = r^2\). Show that the locus of the mid-points of the secants intercepted by the circle is \(x^2 + y^2 = hx + ky\). \(1983 - 5\) Marks

5. The abscissa of the two points \(A\) and \(B\) are the roots of the equation \(x^2 + 2ax - b^2 = 0\) and their ordinates are the roots of the equation \(x^2 + 2px - q^2 = 0\). Find the equation and the radius of the circle with \(AB\) as diameter. \(1984 - 4\) Marks

6. Lines \(5x + 12y - 10 = 0\) and \(5x - 12y - 40 = 0\) touch a circle \(C\) of diameter 6. If the centre of \(C\) lies in the first quadrant, find the equation of the circle \(C\), which is concentric with \(C\) and cuts intercepts of length 8 on these lines. \(1986 - 5\) Marks

7. Let a given line \(L_1\) intersects the \(x\) and \(y\) axes at \(P\) and \(Q\), respectively. Let another line \(L_2\), perpendicular to \(L_1\), cut the \(x\) and \(y\) axes at \(R\) and \(S\), respectively. Show that the locus of the point of intersection of the lines \(PS\) and \(QR\) is a circle passing through the origin. \(1987 - 3\) Marks

8. The circle \(x^2 + y^2 - 4x - 4y + 4 = 0\) is inscribed in a triangle which has two of its sides along the co-ordinate axes. The locus of the circumcentre of the triangle is \(x + y - xy + k(x^2 + y^2)^{1/2} = 0\). Find \(k\). \(1987 - 4\) Marks

9. If \(\left(\frac{m_i}{m_j}, \frac{1}{m_i}\right), m_i > 0, i = 1, 2, 3, 4\) are four distinct points on a circle, then show that \(m_1m_2m_3m_4 = 1\). \(1989 - 2\) Marks

10. A circle touches the line \(y = x\) at a point \(P\) such that \(OP = 4\sqrt{2}\), where \(O\) is the origin. The circle contains the point \((-10, 2)\) in its interior and the length of its chord on the line \(x + y = 0\) is \(6\sqrt{2}\). Determine the equation of the circle. \(1990 - 5\) Marks

11. Two circles, each of radius 5 units, touch each other at \((1, 2)\). If the equation of their common tangent is \(4x + 3y = 10\), find the equation of the circles. \(1991 - 4\) Marks

12. Let a circle be given by \(2x(x - a) + y(2y - b) = 0\), \((a \neq 0, b \neq 0)\). Find the condition on \(a\) and \(b\) if two chords, each bisected by the \(x\)-axis, can be drawn to the circle from \(\left(\frac{a}{2}, \frac{b}{2}\right)\). \(1992 - 6\) Marks
13. Consider a family of circles passing through two fixed points $A(3,7)$ and $B(6,5)$. Show that the chords in which the circle $x^2 + y^2 - 4x - 6y - 3 = 0$ cuts the members of the family are concurrent at a point. Find the coordinate of this point. 

(1993 - 5 Marks)

14. Find the coordinates of the point at which the circles $x^2 + y^2 - 4x - 2y = -4$ and $x^2 + y^2 - 12x - 8y = -36$ touch each other. Also find equations common tangents touching the circles in the distinct points. 

(1993 - 5 Marks)

15. Find the intervals of values of $a$ for which the line $y + x = 0$ bisects two chords drawn from a point \( \frac{1 + \sqrt{2}a}{2}, \frac{1 - \sqrt{2}a}{2} \) to the circle $2x^2 + 2y^2 - (1 + \sqrt{2}a)x - (1 - \sqrt{2}a)y = 0$. 

(1996 - 5 Marks)

16. A circle passes through three points $A, B$ and $C$ with the line segment $AC$ as its diameter. A line passing through $A$ intersects the chord $BC$ at a point $D$ inside the circle. If angles $DAB$ and $CAB$ are $\alpha$ and $\beta$ respectively and the distance between the point $A$ and the mid point of the line segment $DC$ is $d$, prove that the area of the circle is \[ \frac{\pi d^2 \cos^2 \alpha}{\cos^2 \alpha + \cos^2 \beta + 2 \cos \alpha \cos \beta \cos (\beta - \alpha)} \] 

(1996 - 5 Marks)

17. Let $C$ be any circle with centre $(0, \sqrt{2})$. Prove that at the most two rational points can be there on $C$. (A rational point is a point both of whose coordinates are rational numbers.) 

(1997 - 5 Marks)

18. $C_1$ and $C_2$ are two concentric circles, the radius of $C_2$ being twice that of $C_1$. From a point $P$ on $C_2$, tangents $PM$ and $PB$ are drawn to $C_1$. Prove that the centroid of the triangle $PAB$ lies on $C_1$. 

(1998 - 8 Marks)

19. Let $T_1', T_2'$ be two tangents drawn from $(-2, 0)$ onto the circle $C': x^2 + y^2 = 1$. Determine the circles touching $C$ and having $T_1', T_2'$ as their pair of tangents. Further, find the equations of all possible common tangents to these circles, when taken two at a time. 

(1999 - 10 Marks)

20. Let $2x^2 + y^2 - 3xy = 0$ be the equation of a pair of tangents drawn from the origin $O$ to a circle of radius $3$ with centre in the first quadrant. If $A$ is one of the points of contact, find the length of $OA$. 

(2001 - 5 Marks)

21. Let $C_1$ and $C_2$ be two circles with $C_2$ lying inside $C_1$. A circle $C$ lying inside $C_1$ touches $C_1$ internally and $C_2$ externally. Identify the locus of the centre of $C$. 

(2001 - 5 Marks)

22. For the circle $x^2 + y^2 = r^2$, find the value of $r$ for which the area enclosed by the tangents drawn from the point $P(6, 8)$ to the circle and the chord of contact is maximum. 

(2003 - 2 Marks)

23. Find the equation of circle touching the line $2x + 3y + 1 = 0$ at $(1, -1)$ and cutting orthogonally the circle having line segment joining $(0, 3)$ and $(-2, -1)$ as diameter. 

(2004 - 4 Marks)

24. Circles with radii $3, 4$ and $5$ touch each other externally. If $P$ is the point of intersection of tangents to these circles at their points of contact, find the distance of $P$ from the points of contact. 

(2005 - 2 Marks)

G Comprehension Based Questions

PASSAGE-1

$ABCD$ is a square of side length $2$ units. $C_1$ is the circle touching all the sides of the square $ABCD$ and $C_2$ is the circumcircle of square $ABCD$. $L$ is a fixed line in the same plane and $R$ is a fixed point.

1. If $P$ is any point of $C_1$ and $Q$ is another point on $C_2$, then \[ \frac{PA^2 + PB^2 + PC^2 + PD^2}{QA^2 + QB^2 + QC^2 + QD^2} \] is equal to (2006 - 5M, -2)

(a) $0.5$  (b) $1.5$  (c) $1$  (d) $0.5$

2. If a circle is such that it touches the line $L$ and the circle $C_1$ externally, such that both the circles are on the same side of the line, then the locus of centre of the circle is (2006 - 5M, -2)

(a) ellipse (b) hyperbola (c) parabola (d) pair of straight line

3. A line $L'$ through $A$ is drawn parallel to $BD$. Point $S$ moves such that its distances from the line $BD$ and the vertex $A$ are equal. If locus of $S$ cuts $L'$ at $T_2$ and $T_3$ and $AC$ at $T_1$, then area of $\Delta T_1T_2T_3$ is (2006 - 5M, -2)

(a) $\frac{1}{2}$ sq. units (b) $\frac{2}{3}$ sq. units (c) 1 sq. units (d) $2$ sq. units

PASSAGE-2

A circle $C$ of radius $1$ is inscribed in an equilateral triangle $PQR$. The points of contact of $C$ with the sides $PQ, QR, RP$ are $D, E, F$, respectively. The line $PQ$ is given by the equation $\sqrt{3}x + y - 6 = 0$ and the point $D$ is \( \left(\frac{3\sqrt{3}}{2}, \frac{3}{2}\right) \). Further, it is given that the origin and the centre of $C$ are on the same side of the line $PQ$.

4. The equation of circle $C$ is (2008)

(a) $(x - 2\sqrt{3})^2 + (y - 1)^2 = 1$

(b) $(x - 2\sqrt{3})^2 + \left(y + \frac{1}{2}\right)^2 = 1$

(c) $(x - \sqrt{3})^2 + (y + 1)^2 = 1$

(d) $(x - \sqrt{3})^2 + (y - 1)^2 = 1$
5. Points $E$ and $F$ are given by

(a) \( \left( \frac{\sqrt{3}}{2}, \frac{3}{2} \right), (\sqrt{3}, 0) \)
(b) \( \left( \frac{\sqrt{3}}{2}, \frac{1}{2} \right), (\sqrt{3}, 0) \)
(c) \( \left( \frac{\sqrt{3}}{2}, \frac{3}{2} \right), \left( \frac{\sqrt{3}}{2}, \frac{1}{2} \right) \)
(d) \( \left( \frac{3}{2}, \frac{\sqrt{3}}{2} \right), \left( \frac{1}{2}, \frac{\sqrt{3}}{2} \right) \)

6. Equations of the sides QR, RP are

(a) \( y = \frac{2}{\sqrt{3}}x + 1, y = -\frac{2}{\sqrt{3}}x - 1 \)
(b) \( y = \frac{1}{\sqrt{3}}x, y = 0 \)
(c) \( y = \frac{\sqrt{3}}{2}x + 1, y = -\frac{\sqrt{3}}{2}x - 1 \)
(d) \( y = \sqrt{3}x, y = 0 \)

**PASSAGE-3**

A tangent $PT$ is drawn to the circle $x^2 + y^2 = 4$ at the point $P(\sqrt{3}, 1)$. A straight line $L$, perpendicular to $PT$, is a tangent to the circle $(x - 3)^2 + y^2 = 1$.

7. A possible equation of $L$ is

(a) \( x - \sqrt{3}y = 1 \)
(b) \( x + \sqrt{3}y = 1 \)
(c) \( x - \sqrt{3}y = -1 \)
(d) \( x + \sqrt{3}y = 5 \)

8. A common tangent of the two circles is

(a) \( x = 4 \)
(b) \( y = 2 \)
(c) \( x + \sqrt{3}y = 4 \)
(d) \( x + 2\sqrt{2}y = 6 \)

**H Assertion & Reason Type Questions**

1. Tangents are drawn from the point $(17, 7)$ to the circle $x^2 + y^2 = 169$.

   **STATEMENT-1**: The tangents are mutually perpendicular.

   **STATEMENT-2**: The locus of the points from which mutually perpendicular tangents can be drawn to the given circle is $x^2 + y^2 = 338$.

   (2007 - 3 marks)

   (a) Statement-1 is True, statement-2 is True; Statement-2 is a correct explanation for Statement-1.
   (b) Statement-1 is True, Statement-2 is True; Statement-2 is NOT a correct explanation for Statement-1.
   (c) Statement-1 is True, Statement-2 is False.
   (d) Statement-1 is False, Statement-2 is True.

2. Consider $L_1 : 2x + 3y + p - 3 = 0$
   $L_2 : 2x + 3y + p + 3 = 0$
   where $p$ is a real number, and $C : x^2 + y^2 + 6x - 10y + 30 = 0$

   **STATEMENT-1**: If line $L_1$ is a chord of circle $C$, then line $L_2$ is not always a diameter of circle $C$.

   **STATEMENT-2**: If line $L_1$ is a diameter of circle $C$, then line $L_2$ is not a chord of circle $C$.

   (2008)

   (a) Statement - 1 is True, Statement - 2 is True; Statement - 2 is a correct explanation for Statement - 1.
   (b) Statement - 1 is True, Statement - 2 is True; Statement - 2 is NOT a correct explanation for Statement - 1.
   (c) Statement - 1 is True, Statement - 2 is False.
   (d) Statement - 1 is False, Statement - 2 is True.

**I Integer Value Correct Type**

1. The centres of two circles $C_1$ and $C_2$ each of unit radius are at a distance of 6 units from each other. Let $P$ be the midpoint of the line segment joining the centres of $C_1$ and $C_2$ and $C$ be a circle touching circles $C_1$ and $C_2$ externally. If a common tangent to $C_1$ and $C$ passing through $P$ is also a common tangent to $C_2$ and $C$, then the radius of the circle $C$ is.

   (2009)

2. The straight line $2x - 3y = 1$ divides the circular region $x^2 + y^2 \leq 6$ into two parts.

   If $S = \left\{ \left( \frac{3}{4}, \frac{3}{4} \right), \left( \frac{1}{4}, \frac{1}{4} \right), \left( \frac{1}{8}, \frac{1}{4} \right) \right\}$ then the number of points (s) in $S$ lying inside the smaller part is

   (2011)
Section-B

1. If the chord \( y = mx + 1 \) of the circle \( x^2+y^2=1 \) subtends an angle of measure \( 45^\circ \) at the major segment of the circle then value of \( m \) is [2002]
   (a) \( 2\pm\sqrt{2} \) (b) \( -2\pm\sqrt{2} \)
   (c) \( 1\pm\sqrt{2} \) (d) none of these

2. The centres of a set of circles, each of radius 3, lie on the circle \( x^2+y^2=25 \). The locus of any point in the set is [2002]
   (a) \( 4 \leq x^2+y^2 \leq 64 \) (b) \( x^2+y^2 \leq 25 \)
   (c) \( x^2+y^2 \geq 25 \) (d) \( 3 \leq x^2+y^2 \leq 9 \)

3. The centre of the circle passing through (0, 0) and (1, 0) and touching the circle \( x^2+y^2=9 \) is [2002]
   (a) \( \left( \frac{1}{2}, \frac{1}{2} \right) \) (b) \( \left( \frac{1}{2}, -\sqrt{2} \right) \)
   (c) \( \left( \frac{3}{2}, \frac{1}{2} \right) \) (d) \( \left( \frac{1}{2}, \frac{3}{2} \right) \)

4. The equation of a circle with origin as a centre and passing through equilateral triangle whose median is of length 3\( a \) is [2002]
   (a) \( x^2+y^2=9a^2 \) (b) \( x^2+y^2=16a^2 \)
   (c) \( x^2+y^2=4a^2 \) (d) \( x^2+y^2=a^2 \)

5. If the two circles \( (x-1)^2+(y-3)^2=r^2 \) and \( x^2+y^2-8x+2y+8=0 \) intersect in two distinct point, then [2003]
   (a) \( r > 2 \) (b) \( 2 < r < 8 \) (c) \( r < 2 \) (d) \( r = 2 \).

6. The lines \( 2x-3y=5 \) and \( 3x-4y=7 \) are diameters of a circle having area as 154 sq. units. Then the equation of the circle is [2003]
   (a) \( x^2+y^2-2x+2y=62 \) (b) \( x^2+y^2+2x-2y=62 \)
   (c) \( x^2+y^2+2x-2y=47 \) (d) \( x^2+y^2-2x+2y=47 \)

7. If a circle passes through the point \((a, b)\) and cuts the circle \( x^2+y^2=4 \) orthogonally, then the locus of its centre is [2004]
   (a) \( 2ax-2by-(a^2+b^2+4)=0 \)
   (b) \( 2ax+2by-(a^2+b^2+4)=0 \)
   (c) \( 2ax-2by+(a^2+b^2+4)=0 \)
   (d) \( 2ax+2by+(a^2+b^2+4)=0 \)

8. A variable circle passes through the fixed point \( A(p, q) \) and touches x-axis. The locus of the other end of the diameter through \( A \) is [2004]
   (a) \( (y-q)^2 = 4px \) (b) \( (x-q)^2 = 4py \)
   (c) \( (y-p)^2 = 4qx \) (d) \( (x-p)^2 = 4qy \)

9. If the lines \( 2x+3y+1=0 \) and \( 3x-y-4=0 \) lie along diameter of a circle of circumference 10\( \pi \), then the equation of the circle is [2004]
   (a) \( x^2+y^2+2x-2y=23 \) (b) \( x^2+y^2-2x-2y=23 \)
   (c) \( x^2+y^2+2x+2y=23 \) (d) \( x^2+y^2-2x+2y=23 \)

10. Intercept on the line \( y=x \) by the circle \( x^2+y^2-2x=0 \) is \( AB \). Equation of the circle on \( AB \) as a diameter is [2004]
    (a) \( x^2+y^2+x+y=0 \) (b) \( x^2+y^2-x+y=0 \)
    (c) \( x^2+y^2+x-y=0 \) (d) \( x^2+y^2-x-y=0 \)

11. If the circles \( x^2+y^2+2ax+cy+a=0 \) and \( x^2+y^2-3ax+dy-1=0 \) intersect in two distinct points \( P \) and \( Q \) then the line \( 5x+by-a=0 \) passes through \( P \) and \( Q \) for [2005]
    (a) exactly one value of \( a \)
    (b) no value of \( a \)
    (c) infinitely many values of \( a \)
    (d) exactly two values of \( a \)

12. A circle touches the x-axis and also touches the circle with centre at \((0, 3)\) and radius 2. The locus of the centre of the circle is [2005]
    (a) an ellipse (b) a circle
    (c) a hyperbola (d) a parabola

13. If a circle passes through the point \((a, b)\) and cuts the circle \( x^2+y^2=p^2 \) orthogonally, then the equation of the locus of its centre is [2005]
    (a) \( x^2+y^2-3ax-4by+(a^2+b^2-p^2)=0 \)
    (b) \( 2ax+2by-(a^2-b^2+p^2)=0 \)
14. If the pair of lines \( ax^2 + 2(a + b)xy + by^2 = 0 \) lie along diameters of a circle and divide the circle into four sectors such that the area of one of the sectors is thrice the area of another sector then \([2005]\)

(a) \( 3a^2 - 10ab + 3b^2 = 0 \)  
(b) \( 3a^2 - 2ab + 3b^2 = 0 \)

(c) \( 3a^2 + 10ab + 3b^2 = 0 \)  
(d) \( 3a^2 + 2ab + 3b^2 = 0 \)

15. If the lines \( 3x - 4y - 7 = 0 \) and \( 2x - 3y - 5 = 0 \) are two diameters of a circle of area \( 49\pi \) square units, the equation of the circle is \([2006]\)

(a) \( x^2 + y^2 + 2x - 2y - 47 = 0 \)  
(b) \( x^2 + y^2 + 2x - 2y - 62 = 0 \)

(c) \( x^2 + y^2 - 2x + 2y - 62 = 0 \)  
(d) \( x^2 + y^2 - 2x + 2y - 47 = 0 \)

16. Let \( C \) be the circle with centre \((0, 0)\) and radius 3 units. The equation of the locus of the mid points of the chords of the circle \( C \) that subtend an angle of \( \frac{2\pi}{3} \) at its center is \([2006]\)

(a) \( x^2 + y^2 = \frac{3}{2} \)  
(b) \( x^2 + y^2 = 1 \)

(c) \( x^2 + y^2 = \frac{27}{4} \)  
(d) \( x^2 + y^2 = \frac{9}{4} \)

17. Consider a family of circles which are passing through the point \((-1, 1)\) and are tangent to \( x \)-axis. If \((h, k)\) are the coordinates of the center of the circles, then the set of values of \( k \) is given by the interval \([2007]\)

(a) \( -\frac{1}{2} \leq k \leq \frac{1}{2} \)  
(b) \( k \leq \frac{1}{2} \)

(c) \( 0 \leq k \leq \frac{1}{2} \)  
(d) \( k \geq \frac{1}{2} \)

18. The point diametrically opposite to the point \( P(1, 0) \) on the circle \( x^2 + y^2 + 2x + 4y - 3 = 0 \) is \([2008]\)

(a) \((-3, 4)\)  
(b) \((-3, -4)\)  
(c) \((-3, -4)\)  
(d) \((3, 4)\)

19. The differential equation of the family of circles with fixed radius 5 units and centre on the line \( y = 2 \) is

(a) \( x^2 + y^2 - 2ax - 3by + (a^2 - b^2 - p^2) = 0 \)  
(b) \( 2ax + 2by - (a^2 + b^2 + p^2) = 0 \)

20. If \( P \) and \( Q \) are the points of intersection of the circles \( x^2 + y^2 + 3x + 7y + 2p - 5 = 0 \) and \( x^2 + y^2 + 2x + 2y - p^2 = 0 \) then there is a circle passing through \( P, Q \) and \((1, 1)\) for: \([2009]\)

(a) all except one value of \( p \)  
(b) all except two values of \( p \)

(c) exactly one value of \( p \)  
(d) all values of \( p \)

21. The circle \( x^2 + y^2 = 4x + 8y + 5 \) intersects the line \( 3x - 4y = m \) at two distinct points if \([2010]\)

(a) \(-35 < m < 15\)  
(b) \(15 < m < 65\)

(c) \(35 < m < 85\)  
(d) \(-85 < m < -35\)

22. The two circles \( x^2 + y^2 = ax \) and \( x^2 + y^2 = c^2 \) \((c > 0)\) touch each other if \([2011]\)

(a) \( |a| = c \)  
(b) \( a = 2c \)

(c) \( |a| = 2c \)  
(d) \( 2 |a| = c \)

23. The length of the diameter of the circle which touches the \( x \)-axis at the point \((1,0)\) and passes through the point \((2,3)\) is: \([2012]\)

(a) \( \frac{10}{3} \)  
(b) \( \frac{3}{5} \)  
(c) \( \frac{6}{5} \)  
(d) \( \frac{5}{3} \)

24. The circle passing through \((1, -2)\) and touching the axis of \( x \) at \((3, 0)\) also passes through the point \([2013]\)

(a) \((-5, 2)\)  
(b) \((2, -5)\)  
(c) \((5, -2)\)  
(d) \((-2, 5)\)

25. Let \( C \) be the circle with centre at \((1, 1)\) and radius 1. If \( T \) is the circle centred at \((0, y)\), passing through origin and touching the circle \( C \) externally, then the radius of \( T \) is equal to \([2014]\)

(a) \( \frac{1}{2} \)  
(b) \( \frac{1}{4} \)  
(c) \( \frac{\sqrt{2}}{\sqrt{2}} \)  
(d) \( \frac{\sqrt{3}}{2} \)

26. Locus of the image of the point \((2, 3)\) in the line \(2x - 3y + 4 + k(x - 2y + 3) = 0, k \in R\), is a: \([2015]\)

(a) circle of radius \( \sqrt{2} \).  
(b) circle of radius \( \sqrt{3} \).  
(c) straight line parallel to x-axis  
(d) straight line parallel to y-axis

27. The number of common tangents to the circles \( x^2 + y^2 = 4x - 6x - 12 = 0 \) and \( x^2 + y^2 + 6x + 18y + 26 = 0 \), is \( [2015]\)

(a) 3  
(b) 4  
(c) 1  
(d) 2
28. The centres of those circles which touch the circle, \( x^2 + y^2 - 8x - 8y - 4 = 0 \), externally and also touch the x-axis, lie on: [JEE M 2016]

(a) a hyperbola  
(b) a parabola  
(c) a circle  
(d) an ellipse which is not a circle

29. If one of the diameters of the circle, given by the equation, \( x^2 + y^2 - 4x + 6y - 12 = 0 \), is a chord of a circle S, whose centre is at \((-3, 2)\), then the radius of S is: [JEE M 2016]

(a) 5  
(b) 10  
(c) \(5\sqrt{2}\)  
(d) \(5\sqrt{3}\)
CHAPTER 9

Conic Sections

Section-A

A Fill in the Blanks

1. The point of intersection of the tangents at the ends of the latus rectum of the parabola \( y^2 = 4x \) is........
   \[(1994 - 2 \text{ Marks})\]

2. An ellipse has eccentricity \( \frac{1}{2} \) and one focus at the point
   \( P\left(\frac{1}{2}, 1\right) \). Its one directrix is the common tangent, nearer to
   the point \( P \), to the circle \( x^2 + y^2 = 1 \) and the hyperbola
   \( x^2 - y^2 = 1 \). The equation of the ellipse, in the standard form, is...........
   \[(1996 - 2 \text{ Marks})\]

B MCQs with One Correct Answer

1. The equation \( \frac{x^2}{1-r} - \frac{y^2}{1+r} = 1 \), \( r > 1 \) represents
   \[(1891 - 2 \text{ Marks})\]
   (a) an ellipse   (b) a hyperbola   (c) a circle   (d) none of these

2. Each of the four inequalities given below defines a region in the \( xy \) plane. One of these four regions does not have the following property. For any two points \((x_1, y_1)\) and \((x_2, y_2)\) in
   the region, the point \( \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right) \) is also in the
   region. The inequality defining this region is
   \[(1891 - 2 \text{ Marks})\]
   (a) \( x^2 + 2y^2 \leq 1 \)   (b) Max \( \{\ | x | , \ | y | \} \leq 1 \)
   (c) \( x^2 - y^2 \leq 1 \)   (d) \( y^2 - x \leq 0 \)

3. The equation \( 2x^2 + 3y^2 - 8x - 18y + 35 = k \) represents
   \[(1994)\]
   (a) no locus if \( k > 0 \)   (b) an ellipse if \( k < 0 \)
   (c) a point if \( k = 0 \)   (d) a hyperbola if \( k > 0 \)

4. Let \( E \) be the ellipse \( \frac{x^2}{9} + \frac{y^2}{4} = 1 \) and \( C \) be the circle
   \( x^2 + y^2 = 9 \). Let \( P \) and \( Q \) be the points \((1, 2)\) and \((2, 1)\)
   respectively. Then
   \[(1994)\]

5. Consider a circle with its centre lying on the focus of the parabola \( y^2 = 2px \) such that it touches the directrix of the parabola. Then a point of intersection of the circle and parabola is
   \[(1995)\]
   (a) \( \left(\frac{P}{2}, \frac{P}{2}\right) \) or \( \left(\frac{P}{2}, -\frac{P}{2}\right) \)
   (b) \( \left(\frac{P}{2}, \frac{P}{2}\right) \)
   (c) \( \left(-\frac{P}{2}, \frac{P}{2}\right) \)
   (d) \( \left(-\frac{P}{2}, -\frac{P}{2}\right) \)

6. The radius of the circle passing through the foci of the ellipse \( \frac{x^2}{16} + \frac{y^2}{9} = 1 \), and having its centre at \((0, 3)\) is
   \[(1995)\]
   (a) 4   (b) 3   (c) \( \frac{1}{2} \)   (d) \( \frac{7}{2} \)

7. Let \( P \) (a sec \( \theta \), \( b \) tan \( \theta \)) and \( Q \) (a sec \( \phi \), \( b \) tan \( \phi \)), where
   \( \theta + \phi = \pi / 2 \), be two points on the hyperbola \( \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \).
   If \((b, k)\) is the point of intersection of the normals at \( P \) and \( Q \), then \( k \) is equal to
   \[(1999 - 2 \text{ Marks})\]
   (a) \( \frac{a^2 + b^2}{a} \)   (b) \( -\left(\frac{a^2 + b^2}{a}\right) \)
   (c) \( \frac{a^2 + b^2}{b} \)   (d) \( -\left(\frac{a^2 + b^2}{b}\right) \)

8. If \( x = 9 \) is the chord of contact of the hyperbola \( x^2 - y^2 = 9 \),
   then the equation of the corresponding pair of tangents is
   \[(1999 - 2 \text{ Marks})\]
   (a) \( 9x^2 - 8y^2 + 18x - 9 = 0 \)   (b) \( 9y^2 - 8y^2 - 18x + 9 = 0 \)
   (c) \( 9x^2 - 8y^2 - 18x - 9 = 0 \)   (d) \( 9x^2 - 8y^2 + 18x + 9 = 0 \)

9. The curve described parametrically by \( x = t^2 + t + 1 \),
   \( y = t^2 - t + 1 \) represents
   \[(1999 - 2 \text{ Marks})\]
   (a) a pair of straight lines   (b) an ellipse
   (c) a parabola   (d) a hyperbola
16. If \( x + y = k \) is normal to \( y^2 = 12x \), then \( k \) is \( (2000S) \)
(a) 3 (b) 9 (c) \(-9\) (d) \(-3\)

11. If the line \( x - 1 = 0 \) is the directrix of the parabola \( y^2 - kx + 8 = 0 \), then one of the values of \( k \) is \( (2000S) \)
(a) 1/8 (b) 8 (c) 4 (d) \(1/4\)

12. The equation of the common tangent touching the circle \((x - 3)^2 + y^2 = 9\) and the parabola \(y^2 = 4x\) above the \(x\)-axis is \( (2001S) \)
(a) \(\sqrt{3}y = 3x + 1\) (b) \(\sqrt{3}y = -(x + 3)\) 
(c) \(\sqrt{3}y = x + 3\) (d) \(\sqrt{3}y = -(3x + 1)\)

13. The equation of the directrix of the parabola \(y^2 + 4y + 4x + 2 = 0\) is \( (2001S) \)
(a) \(x = -1\) (b) \(x = 1\) (c) \(x = -3/2\) (d) \(x = 3/2\)

14. If \( a > 2b > 0 \) then the positive value of \( m \) for which \(\frac{2b}{\sqrt{a^2 - 4b^2}}\) is a common tangent to \(x^2 + y^2 = b^2\) and \((x-a)^2 + y^2 = b^2\) is \( (2002S) \)
(a) \(\frac{2b}{\sqrt{a^2 - 4b^2}}\) (b) \(\frac{\sqrt{a^2 - 4b^2}}{2b}\)
(c) \(\frac{2b}{a - 2b}\) (d) \(\frac{b}{a - 2b}\)

15. The locus of the mid-point of the line segment joining the focus to a moving point on the parabola \(y^2 = 4ax\) is another parabola with directrix \( (2002S) \)
(a) \(x = -a\) (b) \(x = -a/2\) (c) \(x = 0\) (d) \(x = a/2\)

16. The equation of the common tangent to the curves \(y^2 = 8x\) and \(xy = -1\) is \( (2002S) \)
(a) \(3y = 9x + 2\) (b) \(y = 2x + 1\) 
(c) \(2y = x + 8\) (d) \(y = x + 2\)

17. The area of the quadrilateral formed by the tangents at the end points of latus rectum to the ellipse \(\frac{x^2}{9} + \frac{y^2}{5} = 1\), is \( (2003S) \)
(a) \(27/4\) sq. units (b) \(9\) sq. units 
(c) \(27/2\) sq. units (d) \(27\) sq. units

18. The focal chord to \(y^2 = 16x\) is tangent to \((x - 6)^2 + y^2 = 2\), then the possible values of the slope of this chord, are \( (2003S) \)
(a) \(-1, 1\) (b) \(-2, 2\) 
(c) \(-2, -1/2\) (d) \([2, -1/2]\)

19. For hyperbola \(\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1\) which of the following \( (2003S) \)
(a) abscissae of vertices (b) abscissae of foci 
(c) eccentricity (d) directrix

20. If tangents are drawn to the ellipse \(x^2 + 2y^2 = 2\), then the locus of the mid-point of the intercept made by the tangents between the coordinate axes is \( (2004S) \)
(a) \(\frac{1}{2x^2} + \frac{1}{4y^2} = 1\) (b) \(\frac{1}{4x^2} + \frac{1}{2y^2} = 1\)
(c) \(\frac{x^2}{2} + \frac{y^2}{4} = 1\) (d) \(\frac{x^2}{4} + \frac{y^2}{2} = 1\)

21. The angle between the tangents drawn from the point \((1, 4)\) to the parabola \(y^2 = 4x\) is \( (2004S) \)
(a) \(\pi/6\) (b) \(\pi/4\) (c) \(\pi/3\) (d) \(\pi/2\)

22. If the line \(2x + \sqrt{6}y = 2\) touches the hyperbola \(x^2 - 2y^2 = 4\), then the point of contact is \( (2004S) \)
(a) \((-2, \sqrt{6})\) (b) \((-5/2, \sqrt{6})\)
(c) \(\left(\frac{1}{2}, \frac{1}{\sqrt{6}}\right)\) (d) \((4, -\sqrt{6})\)

23. The minimum area of triangle formed by the tangent to the hyperbola \(\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1\) & coordinate axes is \( (2005S) \)
(a) \(ab\) sq. units (b) \(\frac{a^2 + b^2}{2}\) sq. units 
(c) \(\frac{(a + b)^2}{2}\) sq. units (d) \(\frac{a^2 + ab + b^2}{3}\) sq. units

24. Tangent to the curve \(y = x^2 + 6\) at a point \((1, 7)\) touches the circle \(x^2 + y^2 + 16x + 12y + c = 0\) at a point \(Q\). Then the coordinates of \(Q\) are \( (2005S) \)
(a) \((-6, -11)\) (b) \((-9, -13)\) 
(c) \((-10, -15)\) (d) \((-6, -7)\)

25. The axis of a parabola is along the line \(y = x\) and the distances of its vertex and focus from origin are \(\sqrt{2}\) and \(2\sqrt{2}\) respectively. If vertex and focus both lie in the first quadrant, then the equation of the parabola is \( (2006 - 3M, -1) \)
(a) \((x + y)^2 = (x - y - 2)\) (b) \((x - y)^2 = (x + y - 2)\)
(c) \((x - y)^2 = 4(x + y - 2)\) (d) \((x - y)^2 = 8(x + y - 2)\)

26. A hyperbola, having the transverse axis of length 2\(\sin\theta\), is confocal with the ellipse \(3x^2 + 4y^2 = 12\). Then its equation is \( (2007 - 3 marks) \)
(a) \(x^2\csc^2\theta - y^2\sec^2\theta = 1\) (b) \(x^2\csc^2\theta - y^2\csc^2\theta = 1\)
(c) \(x^2\sin^2\theta - y^2\cos^2\theta = 1\) (d) \(x^2\cos^2\theta - y^2\sin^2\theta = 1\)

27. Let \(a\) and \(b\) be non-zero real numbers. Then, the equation \((ax^2 + by^2 + c)(x^2 - 5xy + 6y^2) = 0\) represents \( (2008) \)
(a) four straight lines, when \(c = 0\) and \(a, b\) are of the same sign. 
(b) two straight lines and a circle, when \(a = b\), and \(c\) is of sign opposite to that of \(a\)
(c) two straight lines and a hyperbola, when \(a\) and \(b\) are of the same sign and \(c\) is of sign opposite to that of \(a\)
(d) a circle and an ellipse, when \(a\) and \(b\) are of the same sign and \(c\) is of sign opposite to that of \(a\)

28. Consider a branch of the hyperbola \(x^2 - 2y^2 - 2\sqrt{2}x - 4\sqrt{2}y - 6 = 0\) with vertex at the point \(A\). Let \(B\) be one of the end points of its latus rectum. If \(C\) is the focus of the hyperbola nearest to the point \(A\), then the area of the triangle \(ABC\) is \( (2008) \)
(a) \(1 - \frac{2}{3}\sqrt{3}\) (b) \(\sqrt{3} - 1\) 
(c) \(1 + \frac{2}{3}\sqrt{3}\) (d) \(\sqrt{3} + 1\)
29. The line passing through the extremity A of the major axis and extremity B of the minor axis of the ellipse
\[ x^2 + 9y^2 = 9 \]
meets its auxiliary circle at the point M. Then the area of the triangle with vertices at A, M and the origin O is \( 2009 \) 
(a) \( \frac{31}{10} \) (b) \( \frac{29}{10} \) (c) \( \frac{21}{10} \) (d) \( \frac{27}{10} \)

30. The normal at a point P on the ellipse \( x^2 + 4y^2 = 16 \) meets the x-axis at Q. If M is the mid point of the line segment PQ, then the locus of M intersects the latus rectums of the given ellipse at the points \( 2009 \)
(a) \( \left( \pm \frac{3 \sqrt{5}}{2}, \pm \frac{9}{4} \right) \) (b) \( \left( \pm \frac{3 \sqrt{5}}{2}, \pm \frac{19}{4} \right) \) (c) \( \left( \pm \sqrt{3}, \pm \frac{1}{7} \right) \) (d) \( \left( \pm 2 \sqrt{3}, \pm \frac{4 \sqrt{3}}{7} \right) \)

31. The locus of the orthocentre of the triangle formed by the lines 
\( (1+p)x - py + p(1+p) = 0, \quad (1+q)x - cq + q(1+q) = 0, \) and \( y = 0 \), where \( p \neq q \) is \( 2009 \) 
(a) a hyperbola (b) a parabola (c) an ellipse (d) a straight line

32. Let \( P(6, 3) \) be a point on the hyperbola \( \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \). If the normal at the point \( P \) intersects the x-axis at \( (9, 0) \), then the eccentricity of the hyperbola is \( 2011 \) 
(a) \( \sqrt{2} \) (b) \( \sqrt{3} \) (c) \( \sqrt{2} \) (d) \( \sqrt{3} \)

33. Let \( (x, y) \) be any point on the parabola \( y^2 = 4x \). Let \( P \) be the point that divides the line segment from \( (0, 0) \) to \( (x, y) \) in the ratio 1 : 3. Then the locus of \( P \) is \( 2011 \) 
(a) \( x^2 = y \) (b) \( y^2 = 2x \) (c) \( y^2 = x \) (d) \( x^2 = 2y \)

34. The ellipse \( \frac{x^2}{9} + \frac{y^2}{4} = 1 \) is inscribed in a rectangle \( R \) whose sides are parallel to the coordinate axes. Another ellipse \( E_2 \) passing through the point \( (0, 4) \) circumscribes the rectangle \( R \). The eccentricity of the ellipse \( E_2 \) is \( 2012 \) 
(a) \( \frac{\sqrt{2}}{2} \) (b) \( \frac{\sqrt{2}}{2} \) (c) \( \frac{1}{2} \) (d) \( \frac{3}{4} \)

35. The common tangents to the circle \( x^2 + y^2 = 2 \) and the parabola \( y^2 = 8x \) touch the circle at the points \( P, Q \) and the parabola at the points \( R, S \). Then the area of the quadrilateral \( PQRS \) is \( JEE \text{ Adv. 2014} \) 
(a) 3 (b) 6 (c) 9 (d) 15

D. MCQs with One or More than One Correct

1. The number of values of \( c \) such that the straight line \( y = 4x + c \) touches the curve \( (x^2/4) + y^2 = 1 \) is \( 1998 - 2 \text{ Marks} \)
   (a) 0 (b) 1 (c) 2 (d) infinite.

2. If \( P(x, y), F_1 = (3, 0), F_2 = (-3, 0) \) and \( 16x^2 + 25y^2 = 400 \), then \( PF_1 + PF_2 \) equals \( 1998 - 2 \text{ Marks} \)
   (a) 8 (b) 6 (c) 10 (d) 12

3. On the ellipse \( 4x^2 + 9y^2 = 1 \), the points at which the tangents are parallel to the line \( 8x = 9y \) are \( 1999 - 3 \text{ Marks} \)
   (a) \( \left( \frac{2}{5}, \frac{1}{5} \right) \) (b) \( \left( \frac{2}{5}, \frac{1}{5} \right) \) (c) \( \left( -\frac{2}{5}, -\frac{1}{5} \right) \) (d) \( \left( \frac{2}{5}, -\frac{1}{5} \right) \)

4. The equations of the common tangents to the parabola \( y = x^2 \) and \( y = -(x - 2)^2 \) are \( 2006 - 5 \text{ M, -1} \)
   (a) \( y = 4(x - 1) \) (b) \( y = 0 \) (c) \( y = -4(x - 1) \) (d) \( y = -30x - 50 \)

5. Let a hyperbola passes through the focus of the ellipse \( \frac{x^2}{25} + \frac{y^2}{16} = 1 \). The transverse and conjugate axes of this hyperbola coincide with the major and minor axes of the given ellipse, also the product of eccentricities of given ellipse and hyperbola is 1, then \( 2006 - 5 \text{ M, -1} \)
   (a) the equation of hyperbola is \( \frac{x^2}{9} - \frac{y^2}{16} = 1 \) (b) the equation of hyperbola is \( \frac{x^2}{9} - \frac{y^2}{25} = 1 \)
   (c) focus of hyperbola is \( (5, 0) \) (d) vertex of hyperbola is \( (5\sqrt{3}, 0) \)

6. Let \( P(x_1, y_1) \) and \( Q(x_2, y_2) \), \( y_1 < 0, y_2 < 0 \), be the end points of the latus rectum of the ellipse \( x^2 + 4y^2 = 4 \). The equations of parabolas with latus rectum \( PQ \) are \( 2008 \)
(a) \( x^2 + 2\sqrt{3}y = 3 + \sqrt{3} \) (b) \( x^2 - 2\sqrt{3}y = 3 + \sqrt{3} \)
(c) \( x^2 + 2\sqrt{3}y = 3 - \sqrt{3} \) (d) \( x^2 - 2\sqrt{3}y = 3 - \sqrt{3} \)

7. In a triangle \( ABC \) with fixed base \( BC \), the vertex \( A \) moves such that \( \cos B + \cos C = 4 \sin^2 \frac{A}{2} \).
If \( a, b \) and \( c \) denote the lengths of the sides of the triangle opposite to the angles \( A, B \) and \( C \), respectively, then
   (a) \( b + c = 4a \) \( 2009 \)
   (b) \( b + c = 2a \)
   (c) locus of point \( A \) is an ellipse
   (d) locus of point \( A \) is a pair of straight lines
8. The tangent $PT$ and the normal $PN$ to the parabola $y^2 = 4ax$ at a point $P$ on it meet its axis at points $T$ and $N$, respectively. The locus of the centroid of the triangle $PTN$ is a parabola whose vertex is \( \left( \frac{2a}{3}, 0 \right) \) and directrix is $x = 0$.

(a) \( \text{vertex is } \left( \frac{2a}{3}, 0 \right) \) (b) directrix is $x = 0$

(c) latus rectum is $\frac{2a}{3}$ (d) focus is $(a, 0)$

9. An ellipse intersects the hyperbola \( 2x^2 - 2y^2 = 1 \) orthogonally. The eccentricity of the ellipse is reciprocal of that of the hyperbola. If the axes of the ellipse are along the coordinate axes, then \( \text{(2009)} \)

(a) equation of ellipse is $x^2 + 2y^2 = 2$
(b) the foci of ellipse are $(\pm 1, 0)$
(c) equation of ellipse is $x^2 + 2y^2 = 4$
(d) the foci of ellipse are $(\pm \sqrt{2}, 0)$

10. Let $A$ and $B$ be two distinct points on the parabola $y^2 = 4x$. If the axis of the parabola touches a circle of radius $r$ having $AB$ as its diameter, then the slope of the line joining $A$ and $B$ can be $\frac{1}{r}$.

(a) $-\frac{1}{r}$ (b) $\frac{1}{r}$ (c) $\frac{2}{r}$ (d) $-\frac{2}{r}$

11. Let the eccentricity of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ be reciprocal to that of the ellipse $x^2 + 4y^2 = 4$. If the hyperbola passes through a focus of the ellipse, then \( \text{(2011)} \)

(a) the equation of the hyperbola is $\frac{x^2}{3} - \frac{y^2}{2} = 1$
(b) a focus of the hyperbola is $(2, 0)$
(c) the eccentricity of the hyperbola is $\frac{\sqrt{5}}{3}$
(d) the equation of the hyperbola is $x^2 - 3y^2 = 3$

12. Let $L$ be a normal to the parabola $y^2 = 4x$. If $L$ passes through the point $(9, 6)$, then $L$ is given by \( \text{(2011)} \)

(a) $y - x + 3 = 0$ (b) $y + 3x - 33 = 0$
(c) $y + x - 15 = 0$ (d) $y - 2x + 12 = 0$

13. Tangents are drawn to the hyperbola $\frac{x^2}{9} - \frac{y^2}{4} = 1$, parallel to the straight line $2x - y = 1$. The points of contact of the tangents on the hyperbola are \( \text{(2012)} \)

(a) $\left( \frac{9}{2\sqrt{2}}, \frac{1}{\sqrt{2}} \right)$ (b) $\left( \frac{9}{2\sqrt{2}}, -\frac{1}{\sqrt{2}} \right)$
(c) $\left( 3\sqrt{3}, -2\sqrt{2} \right)$ (d) $\left( -3\sqrt{3}, 2\sqrt{2} \right)$

14. Let $P$ and $Q$ be distinct points on the parabola $y^2 = 2x$ such that a circle with $PQ$ as diameter passes through the vertex $O$ of the parabola. If $P$ lies in the first quadrant and the area of the triangle $\triangle OPQ$ is $3\sqrt{2}$, then which of the following is (are) the coordinates of $P$? \( \text{(JEE Adv. 2015)} \)

(a) $(4, 2\sqrt{2})$ (b) $(9, 3\sqrt{2})$
(c) $\left( \frac{1}{4}, \frac{1}{2\sqrt{2}} \right)$ (d) $(1, \sqrt{2})$

15. Let $E_1$ and $E_2$ be two ellipses whose centers are at the origin. The major axes of $E_1$ and $E_2$ lie along the $x$-axis and the $y$-axis, respectively. Let $S$ be the circle $x^2 + (y - 1)^2 = 2$. The straight line $x + y = 3$ touches the curves $S$, $E_1$ and $E_2$ at $P$, $Q$ and $R$ respectively. Suppose that $PQ = PR = 2\sqrt{2}$. If $e_1$ and $e_2$ are the eccentricities of $E_1$ and $E_2$, respectively, then the correct expression(s) is (are) \( \text{(JEE Adv. 2015)} \)

(a) $e_1^2 + e_2^2 = \frac{43}{40}$ (b) $e_1e_2 = \frac{\sqrt{7}}{2\sqrt{10}}$
(c) $\left| e_1^2 - e_2^2 \right| = \frac{5}{8}$ (d) $e_1e_2 = \frac{\sqrt{3}}{4}$

16. Consider the hyperbola $H : x^2 - y^2 = 1$ and a circle $S$ with center $N(x_2, 0)$. Suppose that $H$ and $S$ touch each other at a point $P(x_1, y_1)$ with $x_1 > 1$ and $y_1 > 0$. The common tangent to $H$ and $S$ at $P$ intersects the $x$-axis at point $M$. If $(l, m)$ is the centroid of the triangle $PMN$, then the correct expression(s) is(are) \( \text{(JEE Adv. 2015)} \)

(a) $\frac{dl}{dx_1} = 1 - \frac{1}{3x_1^2}$ for $x_1 > 1$
(b) $\frac{dm}{dx_1} = \frac{x_1}{3\sqrt{x_1^2 - 1}}$ for $x_1 > 1$
(c) $\frac{dl}{dx_1} = 1 + \frac{1}{3x_1^2}$ for $x_1 > 1$
(d) $\frac{dm}{dx_1} = \frac{1}{3}$ for $y_1 > 0$

17. The circle $C_1 : x^2 + y^2 = 3$, with centre at $O$, intersects the parabola $x^2 = 2y$ at the point $P$ in the first quadrant. Let the tangent to the circle $C_1$, at $P$ touches other two circles $C_2$ and $C_3$ at $R_2$ and $R_3$, respectively. Suppose $C_2$ and $C_3$ have equal radii $2\sqrt{3}$ and centres $Q_2$ and $Q_3$, respectively. If $Q_2$ and $Q_3$ lie on the $y$-axis, then \( \text{(JEE Adv. 2016)} \)

(a) $Q_2Q_3 = 12$
(b) $R_2R_3 = 4\sqrt{6}$
(c) area of the triangle $\triangle OR_2R_3$ is $6\sqrt{2}$
(d) area of the triangle $\triangle PQ_2Q_3$ is $4\sqrt{2}$
18. Let $P$ be the point on the parabola $y^2 = 4x$ which is at the shortest distance from the center $S$ of the circle $x^2 + y^2 - 4x - 16y + 64 = 0$. Let $Q$ be the point on the circle dividing the line segment $SP$ internally. Then \( \text{(JEE Adv. 2016)} \)

(a) $SP = 2\sqrt{5}$

(b) $SP: SQ = (\sqrt{5} + 1): 2$

(c) The $x$-intercept of the normal to the parabola at $P$ is 6

(d) The slope of the tangent to the circle at $Q$ is $\frac{1}{2}$

11. Consider the family of circles $x^2 + y^2 = r^2$, $2 < r < 5$. If in the first quadrant, the common tangent to a circle of this family and the ellipse $4x^2 + 25y^2 = 100$ meets the co-ordinate axes at $A$ and $B$, then find the equation of the locus of the mid-point of $AB$. \( \text{(1999 - 10 Marks)} \)

12. Find the co-ordinates of all the points $P$ on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, for which the area of the triangle $PON$ is maximum, where $O$ denotes the origin and $N$, the foot of the perpendicular from $O$ to the tangent at $P$ \( \text{(1999 - 10 Marks)} \)

13. Let $ABC$ be an equilateral triangle inscribed in the circle $x^2 + y^2 = a^2$. Suppose perpendiculums from $A$, $B$, $C$ to the major axis of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, (a > b)$ meets the ellipse respectively, at $P, Q, R$. So that $P, Q, R$ lie on the same side of the major axis as $A, B, C$ respectively. Prove that the normals to the ellipse drawn at the points $P, Q$ and $R$ are concurrent. \( \text{(2000 - 7 Marks)} \)

14. Let $C_1$ and $C_2$ be respectively, the parabolas $x^2 = y + 1$ and $y^2 = x - 1$. Let $P$ be any point on $C_1$ and $Q$ be any point on $C_2$. Let $P_1$ and $Q_1$ be the reflections of $P$ and $Q$, respectively, with respect to the line $y = x$. Prove that $P_1$ lies on $C_2$, $Q_1$ lies on $C_1$ and $PQ \geq \min \{PP_1, QQ_1\}$ Hence or otherwise determine points $P_0$ and $Q_0$ on the parabolas $C_1$ and $C_2$ respectively such that $P_0Q_0 \leq PQ$ for all pairs of points $(P, Q)$ with $P$ on $C_1$ and $Q$ on $C_2$. \( \text{(2000 - 10 Marks)} \)

15. Let $P$ be a point on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, $0 < b < a$. Let the line parallel to $y$-axis passing through $P$ meet the circle $x^2 + y^2 = a^2$ at point $Q$ such that $P$ and $Q$ are on the same side of $x$-axis. For two positive real numbers $r$ and $s$, find the locus of the point $R$ on $PQ$ such that $PR : RQ = r : s$ as $P$ varies over the ellipse. \( \text{(2001 - 4 Marks)} \)

16. Prove that, in an ellipse, the perpendicular from a focus upon any tangent and the line joining the centre of the ellipse to the point of contact meet on the corresponding directrix. \( \text{(2002 - 5 Marks)} \)

17.Normals are drawn from the point $P$ with slopes $m_1, m_2, m_3$ to the parabola $y^2 = 4ax$. If the locus of $P$ with $m_1, m_2 = \alpha$ is a part of the parabola itself then find $\alpha$. \( \text{(2003 - 4 Marks)} \)

18. Tangent is drawn to parabola $y^2 = 2x - 4x^2 + 5 = 0$ at a point $P$ which cuts the directrix at the point $Q$. A point $R$ is such that it divides $OP$ externally in the ratio $1:2$. Find the locus of point $R$. \( \text{(2004 - 4 Marks)} \)

19. Tangents are drawn from any point on the hyperbola $\frac{x^2}{9} - \frac{y^2}{4} = 1$ to the circle $x^2 + y^2 = 9$. Find the locus of mid-point of the chord of contact. \( \text{(2005 - 4 Marks)} \)

20. Find the equation of the common tangent in $1^{st}$ quadrant to the circle $x^2 + y^2 = 16$ and the ellipse $\frac{x^2}{25} + \frac{y^2}{4} = 1$. Also find the length of the intercept of the tangent between the coordinate axes. \( \text{(2005 - 4 Marks)} \)
**Match the Following**

**DIRECTIONS (Q. 1-3):** Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. Match the following: (3, 0) is the pt. from which three normals are drawn to the parabola $y^2 = 4x$ which meet the parabola in the points $P$, $Q$ and $R$. Then

<table>
<thead>
<tr>
<th>Column I</th>
<th>Column II</th>
</tr>
</thead>
<tbody>
<tr>
<td>(A) Area of $\Delta PQR$</td>
<td>(p) 2</td>
</tr>
<tr>
<td>(B) Radius of circumcircle of $\Delta PQR$</td>
<td>(q) $5/2$</td>
</tr>
<tr>
<td>(C) Centroid of $\Delta PQR$</td>
<td>(r) $(5/2, 0)$</td>
</tr>
<tr>
<td>(D) Circumcentre of $\Delta PQR$</td>
<td>(s) $(2/3, 0)$</td>
</tr>
</tbody>
</table>

(2006 - 6M)

2. Match the statements in Column I with the properties in Column II and indicate your answer by darkening the appropriate bubbles in the $4 \times 4$ matrix given in the ORS.

(2007 - 6 marks)

<table>
<thead>
<tr>
<th>Column I</th>
<th>Column II</th>
</tr>
</thead>
<tbody>
<tr>
<td>(A) Two intersecting circles</td>
<td>(p) have a common tangent</td>
</tr>
<tr>
<td>(B) Two mutually external circles</td>
<td>(q) have a common normal</td>

(2009)

**DIRECTIONS (Q. 4):** Following question has matching lists. The codes for the list have choices (a), (b), (c) and (d) out of which ONLY ONE is correct.

4. A line $L: y = mx + 3$ meets $y$–axis at $E(0, 3)$ and the arc of the parabola $y^2 = 16x$, $0 \leq y \leq 6$ at the point $F(x_0, y_0)$. The tangent to the parabola at $F(x_0, y_0)$ intersects the $y$–axis at $G(0, y_1)$. The slope $m$ of the line $L$ is chosen such that the area of the triangle $EFG$ has a local maximum.

(JEE Adv. 2013)

Match List I with List II and select the correct answer using the code given below the lists:

<table>
<thead>
<tr>
<th>List I</th>
<th>List II</th>
</tr>
</thead>
<tbody>
<tr>
<td>$m=$</td>
<td>1. $\frac{1}{2}$</td>
</tr>
<tr>
<td>Q. Maximum area of $\Delta EFG$</td>
<td>2. $4$</td>
</tr>
<tr>
<td>R. $y_0 =$</td>
<td>3. $2$</td>
</tr>
<tr>
<td>S. $y_1 =$</td>
<td>4. $1$</td>
</tr>
</tbody>
</table>

**Codes:**

(a) 4 1 2 3                     (b) 3 4 1 2
(c) 1 3 2 4                     (d) 1 3 4 2
Comprehension Based Questions

**PASSAGE 1**
Consider the circle $x^2 + y^2 = 9$ and the parabola $y^2 = 8x$. They intersect at $P$ and $Q$ in the first and the fourth quadrants, respectively. Tangents to the circle at $P$ and $Q$ intersect the x-axis at $R$ and tangents to the parabola at $P$ and $Q$ intersect the x-axis at $S$.

(2007-4 marks)
1. The ratio of the areas of the triangles $PQS$ and $PQR$ is
   (a) $1 : \sqrt{2}$  
   (b) $1 : 2$  
   (c) $1 : 4$  
   (d) $1 : 8$
2. The radius of the circumcircle of the triangle $PQS$ is
   (2007-4 marks)
   (a) $5$  
   (b) $3\sqrt{3}$  
   (c) $3\sqrt{2}$  
   (d) $2\sqrt{3}$
3. The radius of the incircle of the triangle $PQR$ is
   (2007-4 marks)
   (a) $4$  
   (b) $3$  
   (c) $\frac{8}{3}$  
   (d) $2$

**PASSAGE 2**
The circle $x^2 + y^2 - 8x = 0$ and hyperbola $\frac{x^2}{9} - \frac{y^2}{4} = 1$ intersect at the points $A$ and $B$.

(2010)
4. Equation of a common tangent with positive slope to the circle as well as to the hyperbola is
   (a) $2x - \sqrt{5}y - 20 = 0$  
   (b) $2x - \sqrt{5}y + 4 = 0$
   (c) $3x - 4y + 8 = 0$  
   (d) $4x - 3y + 4 = 0$
5. Equation of the circle with $AB$ as its diameter is
   (a) $x^2 + y^2 - 12x + 24 = 0$  
   (b) $x^2 + y^2 + 12x + 24 = 0$
   (c) $x^2 + y^2 + 24x - 12 = 0$  
   (d) $x^2 + y^2 - 24x - 12 = 0$

**PASSAGE 3**
Tangents are drawn from the point $P(3, 4)$ to the ellipse $\frac{x^2}{9} + \frac{y^2}{4} = 1$ touching the ellipse at points $A$ and $B$.

(2010)
6. The coordinates of $A$ and $B$ are
   (a) $(3, 0)$ and $(0, 2)$
   (b) $\left(8, 2\sqrt{161}\right)$ and $\left(-9, \frac{8}{5}\right)$
   (c) $\left(8, 2\sqrt{161}\right)$ and $(0, 2)$
   (d) $(3, 0)$ and $\left(\frac{9}{5}, \frac{8}{5}\right)$
7. The orthocenter of the triangle $PAB$ is
   (a) $\left(5, \frac{8}{7}\right)$  
   (b) $\left(\frac{7}{5}, \frac{25}{8}\right)$  
   (c) $\left(11, \frac{8}{5}\right)$  
   (d) $\left(\frac{8}{25}, \frac{7}{5}\right)$
8. The equation of the locus of the point whose distances from the point $P$ and the line $AB$ are equal, is
   (a) $9x^2 + y^2 - 6xy - 54x - 62y + 241 = 0$
   (b) $9x^2 + 9y^2 + 6xy - 54x + 62y - 241 = 0$
   (c) $9x^2 + y^2 - 6xy - 54x - 62y - 241 = 0$
   (d) $x^2 + y^2 - 2xy + 27x + 3y - 120 = 0$

**PASSAGE 4**
Let $PQ$ be a focal chord of the parabola $y^2 = 4ax$. The tangents to the parabola at $P$ and $Q$ meet at a point lying on the line $y = 2x + a$, $a > 0$.

9. Length of chord $PQ$ is
   (JEE Adv. 2013)
   (a) $7a$  
   (b) $5a$  
   (c) $2a$  
   (d) $3a$
10. If chord $PQ$ subtends an angle $\theta$ at the vertex of $y^2 = 4ax$, then $\tan \theta =$
   (JEE Adv. 2013)
   (a) $\frac{2}{3}\sqrt{7}$  
   (b) $\frac{-2}{3}\sqrt{7}$  
   (c) $\frac{2}{3}\sqrt{5}$  
   (d) $\frac{-2}{3}\sqrt{5}$

**PASSAGE 5**
Let $a, r, s, t$ be nonzero real numbers. Let $P(\alpha t^2, 2\alpha t)$, $Q(\alpha r^2, 2\alpha r)$ and $S(\alpha s^2, 2\alpha s)$ be distinct points on the parabola $y^2 = 4ax$. Suppose that $PQ$ is the focal chord and lines $QR$ and $PK$ are parallel, where $K$ is the point $(2a, 0)$.

(2014)
11. The value of $r$ is
   (a) $-\frac{1}{t}$  
   (b) $\frac{t^2 + 1}{t}$  
   (c) $\frac{1}{t}$  
   (d) $\frac{t^2 - 1}{t}$
12. If $st = 1$, then the tangent at $P$ and the normal at $S$ to the parabola meet at a point whose ordinates
   (a) $\frac{(t^2 + 1)^2}{2t^3}$  
   (b) $\frac{(t^2 + 1)^2}{2t^3}$
   (c) $\frac{a(t^2 + 1)^2}{t^3}$  
   (d) $\frac{a(t^2 + 2)^2}{t^3}$

**PASSAGE 6**
Let $F_1(x_1, 0)$ and $F_2(x_2, 0)$ for $x_1 < 0$ and $x_2 > 0$, be the foci of the ellipse $\frac{x^2}{9} + \frac{y^2}{8} = 1$. Suppose a parabola having vertex at the origin and focus at $F_2$ intersects the ellipse at point $M$ in the first quadrant and at point $N$ in the fourth quadrant.

(2016)
13. The orthocentre of the triangle $P, MN$ is
   (JEE Adv. 2016)
   (a) $\left(-\frac{9}{10}, 0\right)$  
   (b) $\left(\frac{2}{3}, 0\right)$
   (c) $\left(\frac{9}{10}, 0\right)$  
   (d) $\left(\frac{2}{3}, \sqrt{6}\right)$
14. If the tangents to the ellipse at $M$ and $N$ meet at $R$ and the normal to the parabola at $M$ meets the x-axis at $Q$, then the ratio of area of the triangle $MQR$ to area of the quadrilateral $MF_1NF_2$, is
   (JEE Adv. 2016)
   (a) $3 : 4$  
   (b) $4 : 5$
   (c) $5 : 8$  
   (d) $2 : 3$
Assertion & Reason Type Questions

1. **STATEMENT-1**: The curve \( y = \frac{-x^2}{2} + x + 1 \) is symmetric with respect to the line \( x = 1 \). Because

**STATEMENT-2**: A parabola is symmetric about its axis. (2007-3 marks)

(a) Statement-1 is True, Statement-2 is True; Statement-2 is a correct explanation for Statement-1
(b) Statement-1 is True, Statement-2 is True; Statement-2 is NOT a correct explanation for Statement-1
(c) Statement-1 is True, Statement-2 is False
(d) Statement-1 is False, Statement-2 is True.

Integer Value Correct Type

1. The line \( 2x + y = 1 \) is tangent to the hyperbola \( \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \). If this line passes through the point of intersection of the nearest directrix and the x-axis, then the eccentricity of the hyperbola is (2010)

2. Consider the parabola \( y^2 = 8x \). Let \( \Delta_1 \) be the area of the triangle formed by the end points of its latus rectum and the point \( P\left(\frac{1}{2}, 2\right) \) on the parabola and \( \Delta_2 \) be the area of the triangle formed by drawing tangents at \( P \) and at the end points of the latus rectum. Then \( \frac{\Delta_1}{\Delta_2} \) is (2011)

3. Let \( S \) be the focus of the parabola \( y^2 = 8x \) and let \( PQ \) be the common chord of the circle \( x^2 + y^2 - 2x - 4y = 0 \) and the given parabola. The area of the triangle \( PQS \) is (2012)

4. A vertical line passing through the point \( (h, 0) \) intersects the ellipse \( \frac{x^2}{4} + \frac{y^2}{3} = 1 \) at the points P and Q. Let the tangents to the ellipse at P and Q meet at the point R. If \( \Delta(h) = \text{area of the triangle } PQR \), \( \Delta_1 = \max_{1/2 \leq h \leq 1} \Delta(h) \) and \( \Delta_2 = \min_{1/2 \leq h \leq 1} \Delta(h) \), then \( \frac{8}{\sqrt{5}} \Delta_1 - 8\Delta_2 = \) (JEE Adv. 2013)

(a) \( g(x) \) is continuous but not differentiable at \( a \)
(b) \( g(x) \) is differentiable on \( R \)
(c) \( g(x) \) is continuous but not differentiable at \( b \)
(d) \( g(x) \) is continuous and differentiable at either (a) or (b) but not both

5. If the normals of the parabola \( y^2 = 4x \) drawn at the end points of its latus rectum are tangents to the circle \( (x - 3)^2 + (y + 4)^2 = r^2 \), then the value of \( r^2 \) is (JEE Adv. 2015)

6. Let the curve \( C \) be the mirror image of the parabola \( y^2 = 4x \) with respect to the line \( x + y + 4 = 0 \). If \( A \) and \( B \) are the points of intersection of \( C \) with the line \( y = -5 \), then the distance between \( A \) and \( B \) is (JEE Adv. 2015)

7. Suppose that the foci of the ellipse \( \frac{x^2}{9} + \frac{y^2}{5} = 1 \) are \( (f_1, 0) \) and \( (f_2, 0) \) where \( f_1 > 0 \) and \( f_2 < 0 \). Let \( P_1 \) and \( P_2 \) be two parabolas with a common vertex at \( (0, 0) \) and with foci at \( (f_1, 0) \) and \( (2f_2, 0) \), respectively. Let \( T_1 \) be a tangent to \( P_1 \) which passes through \( (2f_2, 0) \) and \( T_2 \) be a tangent to \( P_2 \) which passes through \( (f_1, 0) \). If \( m_1 \) is the slope of \( T_1 \) and \( m_2 \) is the slope of \( T_2 \), then the value of \( \frac{1}{m_1^2 + m_2^2} \) is (JEE Adv. 2015)
1. Two common tangents to the circle \( x^2 + y^2 = 2a^2 \) and parabola \( y^2 = 8ax \) are [2002]

(a) \( x = \pm (y + 2a) \)  
(b) \( y = \pm (x + 2a) \)  
(c) \( x = \pm (y + a) \)  
(d) \( y = \pm (x + a) \)  

2. The normal at the point \((bt_1^2, 2bt_1)\) on a parabola meets the parabola again in the point \((bt_2^2, 2bt_2)\), then [2003]

(a) \( t_2 = t_1 + \frac{2}{t_1} \)  
(b) \( t_2 = -t_1 - \frac{2}{t_1} \)

(c) \( t_2 = -t_1 + \frac{2}{t_1} \)  
(d) \( t_2 = t_1 - \frac{2}{t_1} \)  

3. The foci of the ellipse \( \frac{x^2}{16} + \frac{y^2}{b^2} = 1 \) and the hyperbola \( \frac{x^2}{144} - \frac{y^2}{81} = \frac{1}{25} \) coincide. Then the value of \( b^2 \) is [2003]

(a) 9  
(b) 1  
(c) 5  
(d) 7

4. If \( a \neq 0 \) and the line \( 2bx + 3cy + 4d = 0 \) passes through the points of intersection of the parabolas \( y^2 = 4ax \) and \( x^2 = 4ay \), then [2004]

(a) \( d^2 + (3b - 2c)^2 = 0 \)  
(b) \( d^2 + (3b + 2c)^2 = 0 \)  
(c) \( d^2 + (2b - 3c)^2 = 0 \)  
(d) \( d^2 + (2b + 3c)^2 = 0 \)

5. The eccentricity of an ellipse, with its centre at the origin, is \( \frac{1}{2} \). If one of the directrices is \( x = 4 \), then the equation of the ellipse is: [2004]

(a) \( 4x^2 + 3y^2 = 1 \)  
(b) \( 3x^2 + 4y^2 = 12 \)  
(c) \( 4x^2 + 3y^2 = 12 \)  
(d) \( 3x^2 + 4y^2 = 1 \)

6. Let \( P \) be the point \((1,0)\) and \( Q \) a point on the locus \( y^2 = 8x \). The locus of mid point of \( PQ \) is [2005]

(a) \( y^2 - 4x + 2 = 0 \)  
(b) \( y^2 + 4x + 2 = 0 \)  
(c) \( x^2 + 4y + 2 = 0 \)  
(d) \( x^2 - 4y + 2 = 0 \)

7. The locus of a point \( P(\alpha, \beta) \) moving under the condition that the line \( y = \alpha x + \beta \) is a tangent to the hyperbola \( \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \) is [2005]

(a) an ellipse  
(b) a circle  
(c) a parabola  
(d) a hyperbola  

8. An ellipse has \( OB \) as semi minor axis, \( F \) and \( F' \) its foci and the angle \( FBF' \) is a right angle. Then the eccentricity of the ellipse is [2005]

(a) \( \frac{1}{\sqrt{2}} \)  
(b) \( \frac{1}{2} \)  
(c) \( \frac{1}{4} \)  
(d) \( \frac{1}{\sqrt{3}} \)

9. The locus of the vertices of the family of parabolas \( y = \frac{ax^2}{3} + \frac{a^2}{2}x - 2a \) is [2006]

(a) \( xy = \frac{105}{64} \)  
(b) \( xy = \frac{3}{4} \)  
(c) \( xy = \frac{35}{16} \)  
(d) \( xy = \frac{64}{105} \)

10. In an ellipse, the distance between its foci is \( 6 \) and minor axis is \( 8 \). Then its eccentricity is [2006]

(a) \( \frac{3}{5} \)  
(b) \( \frac{1}{2} \)  
(c) \( \frac{4}{5} \)  
(d) \( \frac{1}{\sqrt{5}} \)

11. Angle between the tangents to the curve \( y = x^2 - 5x + 6 \) at the points \((2,0)\) and \((3,0)\) is [2006]

(a) \( \pi \)  
(b) \( \frac{\pi}{2} \)  
(c) \( \frac{\pi}{6} \)  
(d) \( \frac{\pi}{4} \)

12. For the Hyperbola \( \frac{x^2}{\cos^2 \alpha} - \frac{y^2}{\sin^2 \alpha} = 1 \), which of the following remains constant when \( \alpha \) varies? [2007]

(a) abscissae of vertices  
(b) abscissa of foci  
(c) eccentricity  
(d) directrix.

13. The equation of a tangent to the parabola \( y^2 = 8x \) is \( y = x + 2 \). The point on this line from which the other tangent to the parabola is perpendicular to the given tangent is [2007]

(a) \((2,4)\)  
(b) \((-2,0)\)  
(c) \((-1,1)\)  
(d) \((0,2)\)

14. The normal to a curve at \( P(x, y) \) meets the x-axis at \( G \). If the distance of \( G \) from the origin is twice the abscissa of \( P \), then the curve is a [2007]

(a) circle  
(b) hyperbola  
(c) ellipse  
(d) parabola.

15. A focus of an ellipse is at the origin. The directrix is the line \( x = 4 \) and the eccentricity is \( \frac{1}{2} \). Then the length of the semi-major axis is [2008]

(a) \( \frac{8}{3} \)  
(b) \( \frac{2}{3} \)  
(c) \( \frac{4}{3} \)  
(d) \( \frac{5}{3} \)

16. A parabola has the origin as its focus and the line \( x = 2 \) as the directrix. Then the vertex of the parabola is at [2008]

(a) \((0,2)\)  
(b) \((1,0)\)  
(c) \((0,1)\)  
(d) \((2,0)\)
17. The ellipse $x^2 + 4y^2 = 4$ is inscribed in a rectangle aligned with the coordinate axes, which in turn is inscribed in another ellipse that passes through the point (4, 0). Then the equation of the ellipse is: [2009]
   (a) $x^2 + 12y^2 = 16$  
   (b) $4x^2 + 48y^2 = 48$  
   (c) $4x^2 + 64y^2 = 48$  
   (d) $x^2 + 16y^2 = 16$

18. If two tangents drawn from a point P to the parabola $y^2 = 4x$ are at right angles, then the locus of P is [2010]
   (a) $2x + 1 = 0$  
   (b) $x = -1$  
   (c) $2x - 1 = 0$  
   (d) $x = 1$

19. Equation of the ellipse whose axes are the axes of coordinates and which passes through the point (−3, 1) and has eccentricity $\sqrt{2}/5$ is [2011]
   (a) $5x^2 + 3y^2 - 48 = 0$  
   (b) $3x^2 + 5y^2 - 15 = 0$  
   (c) $5x^2 + 3y^2 - 32 = 0$  
   (d) $3x^2 + 5y^2 - 32 = 0$

20. Statement-1: An equation of a common tangent to the parabola $y^2 = 16\sqrt{3}x$ and the ellipse $2x^2 + y^2 = 4$ is $y = 2x + 2\sqrt{3}$. Statement-2: If the line $y = mx + \frac{4\sqrt{3}}{m}$ ($m \neq 0$) is a common tangent to the parabola $y^2 = 16\sqrt{3}x$ and the ellipse $2x^2 + y^2 = 4$, then $m$ satisfies $m^4 + 2m^2 = 24$ [2012]
   (a) Statement-1 is false, Statement-2 is true.  
   (b) Statement-1 is true, Statement-2 is false.  
   (c) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.  
   (d) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.

21. An ellipse is drawn by taking a diameter of the circle $(x - 1)^2 + y^2 = 1$ as its semi-minor axis and a diameter of the circle $x^2 + (y - 2)^2 = 4$ as semi-major axis. If the centre of the ellipse is at the origin and its axes are the coordinate axes, then the equation of the ellipse is: [2012]
   (a) $4x^2 + y^2 = 4$  
   (b) $2x^2 + 4y^2 = 8$  
   (c) $4x^2 + y^2 = 8$  
   (d) $x^2 + 4y^2 = 16$

22. The equation of the circle passing through the foci of the ellipse $\frac{x^2}{16} + \frac{y^2}{9} = 1$, and having centre at (0, 3) is [2013]
   (a) $x^2 + y^2 - 6y - 7 = 0$  
   (b) $x^2 + y^2 - 6y + 7 = 0$  
   (c) $x^2 + y^2 - 6y - 5 = 0$  
   (d) $x^2 + y^2 - 6y + 5 = 0$

23. Given: A circle, $2x^2 + 2y^2 = 5$ and a parabola, $y^2 = 4\sqrt{3}x$.
   Statement-1: An equation of a common tangent to these curves is $y = x + 2\sqrt{3}$.
   Statement-2: If the line, $y = mx + \frac{\sqrt{3}}{m}$ ($m \neq 0$) is their common tangent, then $m$ satisfies $m^4 - 3m^2 + 2 = 0$. [JEE M 2013]

24. The locus of the foot of perpendicular drawn from the centre of the ellipse $x^2 + 3y^2 = 6$ on any tangent to it is [JEE M 2014]
   (a) $(x^2 + y^2)^2 = 6x^2 + 2y^2$  
   (b) $(x^2 + y^2)^2 = 6x^2 - 2y^2$  
   (c) $(x^2 - y^2)^2 = 6x^2 + 2y^2$  
   (d) $(x^2 - y^2)^2 = 6x^2 - 2y^2$

25. The slope of the line touching both the parabolas $y^2 = 4x$ and $x^2 = -32y$ is [JEE M 2014]
   (a) $\frac{1}{8}$  
   (b) $\frac{2}{3}$  
   (c) $\frac{1}{2}$  
   (d) $\frac{3}{2}$

26. Let O be the vertex and Q be any point on the parabola, $x^2 = 8y$. If the point P divides the line segment OQ internally in the ratio 1 : 3, then locus of P is: [JEE M 2015]
   (a) $y^2 = 2x$  
   (b) $x^2 = 2y$  
   (c) $x^2 = y$  
   (d) $y^2 = x$

27. The normal to the curve, $x^2 + 2xy - 3y^2 = 0$, at (1, 1) [JEE M 2015]
   (a) meets the curve again in the third quadrant.  
   (b) meets the curve again in the fourth quadrant.  
   (c) does not meet the curve again.  
   (d) meets the curve again in the second quadrant.

28. The area (in sq. units) of the quadrilateral formed by the tangents at the end points of the latera recta to the ellipse $\frac{x^2}{9} + \frac{y^2}{5} = 1$, is: [JEE M 2015]
   (a) $\frac{27}{2}$  
   (b) $27$  
   (c) $\frac{27}{4}$  
   (d) 18

29. Let P be the point on the parabola, $y^2 = 8x$ which is at a minimum distance from the centre C of the circle, $x^2 + (y + 6)^2 = 1$. Then the equation of the circle, passing through C and having its centre at P is: [JEE M 2016]
   (a) $x^2 + y^2 - x - 2y - 24 = 0$  
   (b) $x^2 + y^2 - 4x + 9y + 18 = 0$  
   (c) $x^2 + y^2 - 4x + 8y + 12 = 0$  
   (d) $x^2 + y^2 - x + 4y - 12 = 0$

30. The eccentricity of the hyperbola whose length of the latus rectum is equal to 8 and the length of its conjugate axis is equal to half of the distance between its foci, is: [JEE M 2016]
   (a) $\frac{2}{\sqrt{3}}$  
   (b) $\sqrt{3}$  
   (c) $\frac{4}{3}$  
   (d) $\frac{4}{\sqrt{3}}$
CHAPTER 10

Functions

Section-A

A Fill in the Blanks

1. The values of \( f(x) = 3 \sin \left( \frac{\pi^2}{16} x^2 \right) \) lie in the interval ............... \( (1983 \text{ - 1 Mark}) \)

2. For the function \( f(x) = \frac{x}{1 + e^{1/x}}, \ x \neq 0 \) \[ = 0, \ x = 0 \] the derivative from the right, \( f'(0^+) = \) ................., and the derivative from the left, \( f'(0^-) = \) ................. \( (1983 \text{ - 2 Marks}) \)

3. The domain of the function \( f(x) = \sin^{-1} \left( \log_2 \frac{x^2}{2} \right) \) is given by ................. \( (1984 \text{ - 2 Marks}) \)

4. Let \( A \) be a set of \( n \) distinct elements. Then the total number of distinct functions from \( A \) to \( A \) is ................. and out of these ................. are onto functions. \( (1985 \text{ - 2 Marks}) \)

5. If \( f(x) = \sin \left( \sqrt{4-x^2} \right) \), then domain of \( f(x) \) is .... and its range is ................. \( (1985 \text{ - 2 Marks}) \)

6. There are exactly two distinct linear functions, ................., and ................. which map \([-1, 1]\) onto \([0, 2]\). \( (1989 \text{ - 2 Marks}) \)

7. If \( f \) is an even function defined on the interval \((-5, 5)\), then four real values of \( x \) satisfying the equation \( f(x) = f\left( \frac{x + 1}{x + 2} \right) \) are ................., ................., ................., and ................. \( (1996 \text{ - 1 Mark}) \)

8. If \( f(x) = \sin^2 x + \sin^2 \left( x + \frac{\pi}{3} \right) + \cos x \cos \left( x + \frac{\pi}{3} \right) \) and \( g \left( \frac{5}{4} \right) = 1 \), then \( (gof)(x) = \) ................. \( (1996 \text{ - 2 Marks}) \)

B True / False

1. If \( f(x) = (a-x^n)^{1/n} \) where \( a > 0 \) and \( n \) is a positive integer, then \( f(f(x)) = x \). \( (1983 \text{ - 1 Mark}) \)

2. The function \( f(x) = \frac{x^2 + 4x + 30}{x^2 - 8x + 18} \) is not one-to-one. \( (1983 \text{ - 1 Mark}) \)

3. If \( f_1(x) \) and \( f_2(x) \) are defined on domains \( D_1 \) and \( D_2 \) respectively, then \( f_1(x) + f_2(x) \) is defined on \( D_1 \cup D_2 \). \( (1988 \text{ - 1 Mark}) \)

C MCQs with One Correct Answer

1. Let \( R \) be the set of real numbers. If \( f: R \to R \) is a function defined by \( f(x) = x^2 \), then \( f \) is:
   (a) Injective but not surjective
   (b) Surjective but not injective
   (c) Bijective
   (d) None of these. \( (1979) \)

2. The entire graphs of the equation \( y = x^2 + kx - x + 9 \) is strictly above the x-axis if and only if
   (a) \( k < 7 \)
   (b) \( 5 < k < 7 \)
   (c) \( k > -5 \)
   (d) None of these. \( (1979) \)

3. Let \( f(x) = |x-1| \). Then
   (a) \( f(x^2) = (f(x))^2 \)
   (b) \( f(x+y) = f(x) + f(y) \)
   (c) \( f(|x|) = |f(x)| \)
   (d) None of these \( (1983 \text{ - 1 Mark}) \)

4. If \( x \) satisfies \( |x-1| + |x-2| + |x-3| \geq 6 \), then
   (a) \( 0 \leq x \leq 4 \)
   (b) \( x \leq -2 \) or \( x \geq 4 \)
   (c) \( x \leq 0 \) or \( x \geq 4 \)
   (d) None of these. \( (1983 \text{ - 1 Mark}) \)

5. If \( f(x) = \cos(\ln x) \), then \( f(x)f(y) - \frac{1}{2} \left[ f \left( \frac{x}{y} \right) + f(xy) \right] \) has the value
   (a) \( -1 \)
   (b) \( 1/2 \)
   (c) \( -2 \)
   (d) None of these \( (1983 \text{ - 1 Mark}) \)
6. The domain of definition of the function
\[ y = \frac{1}{\log_{10}(1-x)} + \sqrt{x+2} \] is \( (1983 - 1\text{ Mark}) \)
(a) \((-3,-2)\) excluding \(-2.5\)  (b) \([0,1]\) excluding \(0.5\)
(c) \([-2,1]\) excluding \(0\)  (d) none of these

7. Which of the following functions is periodic?
\( (1983 - 1\text{ Mark}) \)
(a) \(f(x) = x - [x]\) where \([x]\) denotes the largest integer less than or equal to the real number \(x\)
(b) \(f(x) = \sin \frac{1}{x}\) for \(x \neq 0\), \(f(0) = 0\)
(c) \(f(x) = x \cos x\)
(d) none of these

8. Let \(f(x) = \sin x\) and \(g(x) = \ln |x|\). If the ranges of the composition functions \(fog\) and \(gof\) are \(R_1\) and \(R_2\) respectively, then
\( (1994 - 2\text{ Marks}) \)
(a) \(R_1 = \{u : -1 \leq u < 1\}, R_2 = \{v : -\infty < v < 0\}\)
(b) \(R_1 = \{u : -\infty < u < 0\}, R_2 = \{v : -1 \leq v \leq 0\}\)
(c) \(R_1 = \{u : -1 < u < 1\}, R_2 = \{v : -\infty < v < 0\}\)
(d) \(R_1 = \{u : 0 \leq u \leq 1\}, R_2 = \{v : -\infty < v \leq 0\}\)

9. Let \(f(x) = (x+1)^2 - 1\), \(x \geq -1\). Then the set
\( \{x : f(x) = f^{-1}(x)\} \) is \( (1995) \)
(a) \(\{0, -1, -\frac{3+i\sqrt{3}}{2}, -\frac{3-i\sqrt{3}}{2}\}\)
(b) \(\{0, 1, -1\}\)
(c) \(\{0, -1\}\)
(d) empty

10. The function \(f(x) = |px - q| + r| x |\), \(x \in (-\infty, \infty)\) where \(p > 0, q > 0, r > 0\) assumes its minimum value only on one point if
\( (1995) \)
(a) \(p \neq q\)  (b) \(r \neq q\)
(c) \(r \neq p\)  (d) \(p = q = r\)

11. Let \(f(x)\) be defined for all \(x > 0\) and be continuous. Let \(f(x)\)
\[ \text{satisfy} \ y = f(x) - f(y) \text{ for all } x, y \text{ and } f(e) = 1. \] Then \( (1995S) \)
(a) \(f(x)\) is bounded  (b) \(f\left(\frac{1}{x}\right) \to 0 \text{ as } x \to 0\)
(c) \(xf(x) \to 1 \text{ as } x \to 0\)  (d) \(f(x) = \ln x\)

12. If the function \(f [1, \infty) \to [1, \infty)\) is defined by \(f(x) = 2^{(x-1)}\), then \(f^{2}(x)\) is \( (1999 - 2\text{ Marks}) \)
(a) \(\left(\frac{1}{2}\right)\)  (b) \(\frac{1}{2} (1 + \sqrt{1 + 4 \log_{2} x})\)
(c) \(\frac{1}{2} (1 - \sqrt{1 + 4 \log_{2} x})\)  (d) not defined

13. Let \(f : R \to R\) be any function. Define \(g : R \to R\) by \(g(x) = f(x)\) for all \(x\). Then \(g\) is \( (2000S) \)
(a) onto if \(f\) is onto  (b) one-one if \(f\) is one-one
(c) continuous if \(f\) is continuous  (d) differentiable if \(f\) is differentiable

14. The domain of definition of the function \(f(x)\) given by the equation \(2x^2 + 2x = 2\) is \( (2000S) \)
(a) \(0 < x \leq 1\)  (b) \(0 \leq x < 1\)
(c) \(-\infty < x \leq 0\)  (d) \(-\infty < x < 1\)

15. Let \(g(x) = 1 + x - [x]\) and \(f(x) = \begin{cases} 1, & x = 0 \\ -1, & x < 0 \end{cases}\) Then for all \(x, f(g(x))\) is equal to \( (2001S) \)
(a) \(x\)  (b) \(1\)  (c) \(f(x)\)  (d) \(g(x)\)

16. If \(f(1, \infty) \to [2, \infty)\) is given by \(f(x) = \frac{1}{x}\) then \(f^{-1}(x)\) equals \( (2001S) \)
(a) \((x + \sqrt{x^2 - 4})/2\)  (b) \(x/(1 + x^2)\)
(c) \((x + \sqrt{x^2 - 4})/2\)  (d) \(1 + \sqrt{x^2 - 4}\)

17. The domain of definition of \(f(x) = \frac{\log_2 (x + 3)}{x^2 + 3x + 2}\) is \( (2001S) \)
(a) \(R \setminus \{-1, -2\}\)  (b) \((-\infty, \infty)\)
(c) \(R \setminus \{-1, -2, -3\}\)  (d) \((-\infty, \infty) \setminus \{-1, -2\}\)

18. Let \(E = \{1, 2, 3, 4\}\) and \(F = \{1, 2\}\). Then the number of onto functions from \(E\) to \(F\) is \( (2001S) \)
(a) \(14\)  (b) \(16\)  (c) \(12\)  (d) \(8\)

19. Let \(f(x) = \frac{ax}{x + 1}, x \neq -1\). Then, for what value of \(a\) is \(f(f(x)) = x\)? \( (2001S) \)
(a) \(\sqrt{2}\)  (b) \(-\sqrt{2}\)  (c) \(1\)  (d) \(-1\)

20. Suppose \(f(x) = (x + 1)^2\) for \(x \geq -1\). If \(g(x)\) is the function whose graph is the reflection of the graph of \(f(x)\) with respect to the line \(y = x\), then \(g(x)\) equals \( (2002S) \)
(a) \(-\sqrt{x - 1}, x \geq 0\)  (b) \(\frac{1}{(x+1)^2}, x > -1\)
(c) \(\sqrt{x+1}, x \geq -1\)  (d) \(\sqrt{x - 1}, x \geq 0\)

21. Let function \(f : R \to R\) be defined by \(f(x) = 2x + \sin x\) for \(x \in R\), then \(f\) is \( (2002S) \)
(a) one-to-one and onto  (b) one-to-one but NOT onto
(c) onto but NOT one-to-one  (d) neither one-to-one nor onto

22. If \(f : [0, \infty) \to (0, \infty), f(x) = \frac{x}{1 + x}\) then \(f\) is \( (2003S) \)
(a) one-to-one and onto  (b) one-to-one but not onto
(c) onto but not one-to-one  (d) neither one-to-one nor onto
23. Domain of definition of the function
\[ f(x) = \sqrt{\sin^{-1}(2x)} + \frac{\pi}{6} \] for real valued \( x \), is \( \text{(2003S)} \)
(a) \[ \left[ \frac{1}{4}, \frac{1}{2} \right] \] (b) \[ \left( \frac{1}{2}, 1 \right] \] (c) \[ \left( \frac{1}{2}, \frac{3}{2} \right) \] (d) \[ \left( -\frac{1}{2}, \frac{1}{4} \right] \]

24. Range of the function \( f(x) = \frac{x^2 + x + 2}{x^2 + x + 1} \); \( x \in \mathbb{R} \) is \( \text{(2003S)} \)
(a) \( (1, \infty) \) (b) \( \left( 1, \frac{11}{7} \right] \) (c) \( \left( 1, \frac{7}{3} \right] \) (d) \( \left( 1, \frac{7}{5} \right] \)

25. If \( f(x) = x^2 + 2bx + 2c^2 \) and \( g(x) = -x^2 - 2cx + b^2 \) such that \( \min f(x) > \max g(x) \), then the relation between \( b \) and \( c \) is

(a) no real value of \( b \) & \( c \) (b) \( 0 < c < b \sqrt{2} \)
(c) \( |c| < |b| \sqrt{2} \) (d) \( |c| > |b| \sqrt{2} \) \( \text{(2003S)} \)

26. If \( f(x) = \sin x \cos x \), \( g(x) = x^2 - 1 \), then \( g(f(x)) \) is invertible in the domain \( \text{(2004S)} \)
(a) \( \left( 0, \frac{\pi}{2} \right] \) (b) \( \left[ -\frac{\pi}{4}, \frac{\pi}{4} \right] \) (c) \( \left[ -\frac{\pi}{2}, \frac{\pi}{2} \right] \) (d) \( [0, \pi] \)

27. If the functions \( f(x) \) and \( g(x) \) are defined on \( \mathbb{R} \rightarrow \mathbb{R} \) such that
\[ f(x) = \begin{cases} 0, & x \in \mathbb{R} \text{ rational} \\ x, & x \in \mathbb{R} \text{ irrational} \end{cases} \]
and \( g(x) = \begin{cases} 0, & x \in \mathbb{R} \text{ rational} \\ x, & x \in \mathbb{R} \text{ irrational} \end{cases} \)
then \( (f - g)(x) \) is \( \text{(2005S)} \)
(a) one-one & onto (b) neither one-one nor onto (c) one-one but not onto (d) onto but not one-one

28. \( X \) and \( Y \) are two sets and \( f: X \rightarrow Y \). If \( \{f(c) = y; c \in X, y \in Y\} \) and \( \{f^{-1}(y) = x; d \in Y, x \in X\} \), then the true statement is \( \text{(2005S)} \)
(a) \( f(f^{-1}(b)) = b \) (b) \( f^{-1}(f(a)) = a \) (c) \( f(f^{-1}(b)) = b, b \in y \) (d) \( f^{-1}(f(a)) = a, a \in x \)

29. If \( F(x) = \left( f \left( \frac{x}{2} \right) \right)^2 + \left( g \left( \frac{x}{2} \right) \right)^2 \) where \( f(x) = -f(x) \) and \( g(x) = f'(x) \) and given that \( F(5) = 5 \), then \( F(10) \) is equal to \( \text{(2006 - 3M, -1)} \)
(a) 5 (b) 10 (c) 0 (d) 15

30. Let \( f(x) = \frac{x}{(1 + x^n)^{1/n}} \) for \( n \geq 2 \)
\[ g(x) = \frac{f \circ f \circ \ldots \circ f}{f \text{ occurs } n \text{ times}}(x) \]. Then \( \int x^n - 2 g(x) \) equals. \( \text{(2007 - 3 marks)} \)
(a) \( \frac{1}{n(n-1)} \right( 1 + nx^n \right)^{1-n} + K \) (b) \( \frac{1}{n-1} \right( 1 + nx^n \right)^{1-n} + K \)
(c) \( \frac{1}{n(n+1)} \right( 1 + nx^n \right)^{1-n} + K \) (d) \( \frac{1}{n-1} \right( 1 + nx^n \right)^{1-n} + K \)

31. Let \( f, g \) and \( h \) be real-valued functions defined on the interval \( [0, 1] \) by
\[ f(x) = e^{x^2} + e^{-x^2} \]
\[ g(x) = xe^{x^2} + e^{-x^2} \]
and \( h(x) = x^2 e^{x^2} + e^{-x^2} \). If \( a, b \) and \( c \) denote, respectively, the absolute maximum of \( f, g \) and \( h \) on \( [0, 1] \), then \( \text{(2010)} \)
(a) \( a = b \) and \( c \neq b \) (b) \( a = c \) and \( a \neq b \)
(c) \( a \neq b \) and \( c = b \) (d) \( a = b = c \)

32. Let \( f(x) = x^2 \) and \( g(x) = \sin x \) for all \( x \in \mathbb{R} \). Then the set of all \( x \) satisfying \( (f \circ g \circ o f)(x) = (g \circ g \circ o f)(x) \), where \( (f \circ g)(x) = f(g(x)) \), is \( \text{(2011)} \)
(a) \( \pm \sqrt{n \pi}, n \in \{0, 1, 2, \ldots\} \)
(b) \( \pm \sqrt{n \pi}, n \in \{1, 2, \ldots\} \)
(c) \( \pm \frac{\pi}{2} + 2n \pi, n \in \{\ldots -2, -1, 0, 1, 2, \ldots\} \)
(d) \( 2n \pi, n \in \{\ldots -2, -1, 0, 1, 2, \ldots\} \)

33. The function \( f: [0, 3] \rightarrow [1, 29] \), defined by \( f(x) = 2x^2 - 15x^2 + 36x + 1 \), is \( \text{(2012)} \)
(a) one-one and onto (b) onto but not one-one (c) one-one but not onto (d) neither one-one nor onto

D MCQs with One or More than One Correct

1. If \( y = f(x) = \frac{x + 2}{x - 1} \) then \( \text{(1984 - 3 Marks)} \)
   (a) \( x = f(y) \) (b) \( f(1) = 3 \) (c) \( y \) increases with \( x \) for \( x < 1 \) (d) \( f \) is a rational function of \( x \)

2. Let \( g(x) \) be a function defined on \([-1, 1]\). If the area of the equilateral triangle with two of its vertices at \((0, 0)\) and \([x, g(x)] = \frac{\sqrt{3}}{4} \), then the function \( g(x) \) is \( \text{(1989 - 2 Marks)} \)
   (a) \( g(x) = \pm \sqrt{1 - x^2} \) (b) \( g(x) = \sqrt{1 - x^2} \) (c) \( g(x) = -\sqrt{1 - x^2} \) (d) \( g(x) = \sqrt{1 + x^2} \)

3. If \( f(x) = \cos(\pi^2) x + \cos(-\pi^2) x \), where \([x] \) stands for the greatest integer function, then \( \text{(1991 - 2 Marks)} \)
   (a) \( f\left( \frac{\pi}{2} \right) = -1 \) (b) \( f(\pi) = 1 \)
   (c) \( f(-\pi) = 0 \) (d) \( f\left( \frac{\pi}{4} \right) = 1 \)

4. If \( f(x) = 3x - 5 \), then \( f^{-1}(x) \) \( \text{(1998 - 2 Marks)} \)
   (a) is given by \( \frac{1}{3}x - 5 \) (b) is given by \( \frac{x + 5}{3} \)
   (c) does not exist because \( f \) is not one-one (d) does not exist because \( f \) is not onto.
5. If \( g(f(x)) = |\sin x| \) and \( f(g(x)) = (\sin \sqrt{x})^2 \), then
(a) \( f(x) = \sin^2 x, g(x) = \sqrt{x} \)  \( (1998 - 2 \text{ Marks}) \)
(b) \( f(x) = \sin x, g(x) = |x| \)
(c) \( f(x) = x^2, g(x) = \sin \sqrt{x} \)
(d) \( f \) and \( g \) cannot be determined.

6. Let \( f : (0, 1) \to \mathbb{R} \) be defined by \( f(x) = \frac{b-x}{1-bx} \), where \( b \) is a constant such that \( 0 < b < 1 \). Then
(a) \( f \) is not invertible on \( (0, 1) \)
(b) \( f \neq f^{-1} \) on \( (0, 1) \) and \( f'(b) = \frac{1}{f'(0)} \)
(c) \( f = f^{-1} \) on \( (0, 1) \) and \( f'(b) = \frac{1}{f'(0)} \)
(d) \( f^{-1} \) is differentiable \( (0, 1) \)

7. Let \( f : (-1, 1) \to \mathbb{R} \) be such that \( f(\cos 40) = \frac{1}{2 - \sec^2 0} \) for \( \theta \in \left(0, \frac{\pi}{4}\right) \cup \left(\frac{\pi}{4}, \frac{\pi}{2}\right) \). Then the value(s) of \( f \left( \frac{1}{3} \right) \) is (are)
(a) \( 1 - \frac{3}{\sqrt{2}} \)
(b) \( 1 + \frac{3}{\sqrt{2}} \)
(c) \( 1 - \frac{\sqrt{2}}{3} \)
(d) \( 1 + \frac{\sqrt{2}}{3} \)

8. The function \( f(x) = 2|x| + |x + 2| - |x + 2| - 2|\ x| \) has a local minimum or a local maximum at \( x = \) \( \left( JEE \text{ Adv. 2015} \right) \)
(a) \(-2\)
(b) \(-\frac{2}{3}\)
(c) \(2\)
(d) \(\frac{2}{3}\)

9. Let \( f : \left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \to \mathbb{R} \) be given by \( f(x) = (\log(\sec x + \tan x))^3 \).
Then \( \left( JEE \text{ Adv. 2014} \right) \)
(a) \( f(x) \) is an odd function
(b) \( f(x) \) is one-one function
(c) \( f(x) \) is an onto function
(d) \( f(x) \) is an even function

10. Let \( a \in \mathbb{R} \) and let \( f : \mathbb{R} \to \mathbb{R} \) be given by \( f(x) = x^5 - 5x + a \). Then \( \left( JEE \text{ Adv. 2014} \right) \)
(a) \( f(x) \) has three real roots if \( a > 4 \)
(b) \( f(x) \) has only real root if \( a > 4 \)
(c) \( f(x) \) has three real roots if \( -4 < a < 4 \)
(d) \( f(x) \) has three real roots if \( -4 < a < 4 \)

11. Let \( f(x) = \sin \left( \frac{\pi}{6} \sin \left( \frac{\pi}{2} \sin x \right) \right) \) for all \( x \in \mathbb{R} \) and \( g(x) = \frac{\pi}{2} \sin x \) for all \( x \in \mathbb{R} \). Let \( (f \circ g)(x) \) denote \( f(g(x)) \) and \( (g \circ f)(x) \) denote \( g(f(x)) \). Then which of the following is (are) true? \( \left( JEE \text{ Adv. 2015} \right) \)
(a) Range of \( f \) is \( \left[ -\frac{1}{2}, \frac{1}{2} \right] \)
(b) Range of \( g \circ f \) is \( \left[ -\frac{1}{2}, \frac{1}{2} \right] \)

12. \( \lim_{x \to 0} \frac{f(x)}{g(x)} = \frac{\pi}{6} \)
(d) \( f(x) \) is an integer whenever \( x \) is an integer.

E Subjective Problems

1. Find the domain and range of the function \( f(x) = \frac{x^2}{1+x^2} \). Is the function one-to-one? \( \left( 1978 \right) \)
2. Draw the graph of \( y = |x|^2 \) for \(-1 \leq x \leq 1 \). \( \left( 1978 \right) \)
3. If \( f(x) = x^3 - 6x^2 - 2x^2 + 12x^3 + x^4 - 7x^3 + 3x^2 + x - 3 \), find \( f(6) \). \( \left( 1979 \right) \)
4. Consider the following relations in the set of real numbers \( R \) is \( R = \{(x, y) : x, y \in \mathbb{R}, x^2 + y^2 \leq 25 \} \)
\( R' = \{(x, y) : x, y \in \mathbb{R}, y \geq \frac{4}{9} x^2 \} \)
Find the domain and range of \( R \cap R' \). Is the relation \( R \cap R' \) a function? \( \left( 1979 \right) \)
5. Let \( A \) and \( B \) be two sets each with a finite number of elements. Assume that there is an injective mapping from \( A \) to \( B \) and that there is an injective mapping from \( B \) to \( A \). Prove that there is a bijective mapping from \( A \) to \( B \). \( \left( 1981 - 2 \text{ Marks} \right) \)
6. Let \( f \) be a one-one function with domain \( \{x, y, z\} \) and range \( \{1, 2, 3\} \). It is given that exactly one of the following statements is true and the remaining two are false \( f(x) = 1, f(y) \neq 1, f(z) \neq 2 \) determine \( f'(1) \). \( \left( 1982 - 3 \text{ Marks} \right) \)
7. Let \( R \) be the set of real numbers and \( f : R \to R \) be such that for all \( x \) and \( y \) in \( R \), \( |f(x) - f(y)| \leq |x-y|^2 \). Prove that \( f(x) \) is a constant. \( \left( 1988 - 2 \text{ Marks} \right) \)
8. Find the natural number \( a \) for which \( \sum_{k=1}^{n} f(a+k) = 16(2^n - 1) \), where the function \( f \) satisfies the relation \( f(x+y) = f(x)f(y) \) for all natural numbers \( x, y \) and further \( f(1) = 2 \). \( \left( 1992 - 6 \text{ Marks} \right) \)
9. Let \( \{x\} \) and \( [x] \) denote the fractional and integral part of a real number \( x \) respectively. Solve \( 4[x] = x + [x] \). \( \left( 1994 - 4 \text{ Marks} \right) \)
10. A function \( f: \mathbb{R} \to \mathbb{R} \), where \( \mathbb{R} \) is the set of real numbers, is defined by \( f(x) = \frac{ax^2 + bx - 8}{a + 6x - 8x^2} \). Find the interval of values of \( a \) for which \( f \) is onto. Is the function one-to-one for \( a = 37 \)? Justify your answer. \( \left( 1996 - 5 \text{ Marks} \right) \)
11. Let \( f(x) = Ax^2 + Bx + C \) where \( A, B, C \) are real numbers. Prove that if \( f(x) \) is an integer whenever \( x \) is an integer, then the numbers \( 2A, A + B \) and \( C \) are all integers. Conversely, prove that if the numbers \( 2A, A + B \) and \( C \) are all integers then \( f(x) \) is an integer whenever \( x \) is an integer. \( \left( 1998 - 8 \text{ Marks} \right) \)
Functions

**Match the Following**

Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. Let the function defined in column I have domain \( \left( -\frac{\pi}{2}, \frac{\pi}{2} \right) \) and range \((-\infty, \infty)\) \hspace{1cm} (1992 - 2 Marks)

<table>
<thead>

I Integer Value Correct Type

1. Let \( f : [0, 4\pi] \rightarrow [0, \pi] \) be defined by \( f(x) = \cos^{-1}(\cos x) \). The number of points \( x \in [0, 4\pi] \) satisfying the equation

\[
f(x) = \frac{10 - x}{10}
\]

is \hspace{1cm} (JEE Adv. 2014)

Section-B JEE Main / AIEEE

1. The domain of \( \sin^{-1} \left( \log_3 (x/3) \right) \) is \hspace{1cm} [2002]
   (a) \([1, 9]\) \hspace{1cm} (b) \([-1, 9]\) \hspace{1cm} (c) \([-9, 1]\) \hspace{1cm} (d) \([-9, -1]\)

2. The function \( f(x) = \log \left( x + \sqrt{x^2 + 1} \right) \), is \hspace{1cm} [2003]
   (a) neither an even nor an odd function \hspace{1cm} (b) an even function \hspace{1cm} (c) an odd function \hspace{1cm} (d) a periodic function.

3. Domain of definition of the function \( f(x) = \frac{3}{4 - x^2} + \log_{10}(x^3 - x) \), is \hspace{1cm} [2003]
   (a) \((-1,0) \cup (1,2) \cup (2,\infty)\) \hspace{1cm} (b) \((a,2)\) \hspace{1cm} (c) \((-1,0) \cup (a,2)\) \hspace{1cm} (d) \((1,2) \cup (2,\infty)\).

4. If \( f : R \rightarrow R \) satisfies \( f(x + y) = f(x) + f(y) \), for all \( x, y \in R \) and \( f(1) = 7 \), then \( \sum_{r=1}^{n} f(r) \) is \hspace{1cm} [2003]
   (a) \( \frac{7n(n+1)}{2} \) \hspace{1cm} (b) \( \frac{7n}{2} \) \hspace{1cm} (c) \( \frac{7(n+1)}{2} \) \hspace{1cm} (d) \( 7n + (n+1) \).

5. A function \( f \) from the set of natural numbers to integers defined by
   \[
f(n) = \begin{cases} 
\frac{n-1}{2}, & \text{when } n \text{ is odd} \\
\frac{n}{2}, & \text{when } n \text{ is even}
\end{cases}
\]
6. The range of the function \( f(x) = \frac{2^x}{x^3 - 3} \) is \([0, 1] \) \( \cup \) \( (1, \infty) \). \[2004\]
(a) \( \{1, 2, 3, 4, 5\} \)  (b) \( \{1, 2, 3, 4, 5, 6\} \)  (c) \( \{1, 2, 3, 4\} \)  (d) \( \{1, 2, 3\} \)

7. If \( f: R \rightarrow S \), defined by \( f(x) = \sin x - \sqrt{3} \cos x + 1 \), is onto, then the interval of \( S \) is \([0, 2]\) \[2004\]
(a) \( [-1, 3] \)  (b) \([-1, 1]\)  (c) \([0, 1]\)  (d) \([0, 3]\)

8. The graph of the function \( y = f(x) \) is symmetrical about the line \( x = 2 \), then
   (a) \( f(x) = -f(-x) \)  (b) \( f(2 + x) = f(2 - x) \)  (c) \( f(x) = f(-x) \)  (d) \( f(x + 2) = f(x - 2) \)

9. The domain of the function \( f(x) = \frac{\sin^{-1}(x - 3)}{\sqrt{9 - x^2}} \) is \([-3, 3]\) \[2004\]
(a) \([1, 2]\)  (b) \([2, 3]\)  (c) \([1, 2]\)  (d) \([2, 3]\)

10. Let \( f: (-1, 1) \rightarrow B \), be a function defined by
    \( f(x) = \tan^{-1} \frac{2x}{1 - x^2} \), then \( f \) is both one-one and onto when \( B \) is the interval \([0, \pi]\) \[2005\]
(a) \( \left(0, \frac{\pi}{2}\right]\)  (b) \( \left[0, \frac{\pi}{2}\right] \)  (c) \( \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \)  (d) \( \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \)

11. A function is matched below against an interval where it is supposed to be increasing. Which of the following pairs is incorrectly matched? \[2005\]

<table>
<thead>
<tr>
<th>Interval</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a) ((-\infty, \infty))</td>
<td>(x^3 - 3x^2 + 3x + 3)</td>
</tr>
<tr>
<td>(b) ([2, \infty))</td>
<td>(2x^3 - 3x^2 - 12x + 6)</td>
</tr>
<tr>
<td>(c) ((-\infty, -3))</td>
<td>(3x^2 - 2x + 1)</td>
</tr>
<tr>
<td>(d) ((-\infty, -4))</td>
<td>(x^3 + 6x^2 + 6)</td>
</tr>
</tbody>
</table>

12. A real valued function \( f(x) \) satisfies the functional equation
    \( f(x - y) = f(x)f(y) - f(ax - x)f(a + y) \)
    where \( a \) is a given constant and \( f(0) = 1 \), \( f(2a - x) \) is equal to \[2005\]
    (a) \(-f(x)\)  (b) \(f(x)\)  (c) \(f(a) + f(a - x)\)  (d) \(f(-x)\)

13. The largest interval lying in \( \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \) for which the function,
    \( f(x) = 4^{-x^2} + \cos^{-1}\left(\frac{x}{2} - 1\right) + \log(\cos x) \), is defined, is \[2007\]
    (a) \(\left[-\frac{\pi}{4}, \frac{\pi}{4}\right]\)  (b) \(\left[0, \frac{\pi}{2}\right]\)  (c) \([0, \pi]\)  (d) \(\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]\)

14. Let \( f: N \rightarrow Y \) be a function defined as \( f(x) = 4x + 3 \) where \( Y = \{y \in N: y = 4x + 3 \text{ for some } x \in N\} \).
    Show that \( f \) is invertible and its inverse is \[2008\]
    (a) \(g(y) = \frac{3y + 4}{3}\)  (b) \(g(y) = 4 + \frac{y + 3}{4}\)  (c) \(g(y) = \frac{y + 3}{4}\)  (d) \(g(y) = -\frac{y - 3}{4}\)

15. Let \( f(x) = (x + 1)^2 - 1, x \geq -1 \)
    Statement-1 : The set \( \{x : f(x) = f^{-1}(x)\} = \{0, -1\} \)
    Statement-2 : \( f \) is a bijection. \[2009\]
    (a) Statement-1 is true, Statement-2 is true.
    (b) Statement-1 is true, Statement-2 is false.
    (c) Statement-1 is false, Statement-2 is true.
    (d) Statement-1 is true, Statement-2 is true.
    Statement-2 is not a correct explanation for Statement-1.

16. For real \( x \), let \( f(x) = x^3 + 5x + 1 \), then \[2009\]
    (a) \( f \) is onto \( R \) but not one-one
    (b) \( f \) is one-one and onto \( R \)
    (c) \( f \) is neither one-one nor onto \( R \)
    (d) \( f \) is one-one but not onto \( R \)

17. The domain of the function \( f(x) = \frac{1}{\sqrt{|x| - x}} \) is \[2011\]
    (a) \( (0, \infty) \)  (b) \((-\infty, 0)\)  (c) \((-\infty, \infty) - \{0\}\)  (d) \((-\infty, \infty)\)
CHAPTER 11
Limits, Continuity and Differentiability

Section-A
JEE Advanced/ IIT-JEE

A Fill in the Blanks

1. Let \( f(x) = \begin{cases} \frac{(x-1)^2 \sin \frac{1}{x-1}}{x-1} & \text{if } x \neq 1 \\ 1, & \text{if } x = 1 \end{cases} \)
be a real-valued function. Then the set of points where \( f(x) \)
is not differentiable is \( \ldots \ldots \ldots \ldots \) \( (1981 - 2 \text{ Marks}) \)

2. Let \( f(x) = \begin{cases} x^3 + x^2 - 16x + 20 & \text{if } x \neq 2 \\ k, & \text{if } x = 2 \end{cases} \)
If \( f(x) \) is continuous for all \( x \), then \( k = \ldots \ldots \ldots \ldots \) \( (1981 - 2 \text{ Marks}) \)

3. A discontinuous function \( y = f(x) \) satisfying \( x^2 + y^2 = 4 \)
is given by \( f(x) = \ldots \ldots \ldots \ldots \) \( (1982 - 2 \text{ Marks}) \)

4. \( \lim_{x \to 1} \left( 1 - x \right) \tan \frac{\pi x}{2} = \ldots \ldots \ldots \ldots \) \( (1984 - 2 \text{ Marks}) \)

5. If \( f(x) = \sin x, \ x \neq n\pi, n = 0, \pm 1, \pm 2, \pm 3, \ldots \ldots \) \( = 2, \) otherwise
and \( g(x) = x^2 + 1, \ x \neq 0, 2 \)
\( = 4, x = 0 \)
\( = 5, x = 2, \)
then \( \lim_{x \to g(x)} f(g(x)) \) is \( \ldots \ldots \ldots \ldots \) \( (1986 - 2 \text{ Marks}) \)

6. \( \lim_{x \to \infty} \frac{x^4 \sin \frac{1}{x} + x^2}{(1 + |x|^2)} = \ldots \ldots \ldots \ldots \) \( (1987 - 2 \text{ Marks}) \)

7. If \( f(9) = 9, \ f'(9) = 4, \) then \( \lim_{x \to 9} \frac{\sqrt{f(x)} - 3}{\sqrt{x} - 3} \) equals \( \ldots \ldots \ldots \ldots \) \( (1988 - 2 \text{ Marks}) \)

8. \( ABC \) is an isosceles triangle inscribed in a circle of radius \( r. \) If \( AB = AC \) and \( h \) is the altitude from \( A \) to \( BC \) then the
triangle \( ABC \) has perimeter \( P = 2 \left( \sqrt{2hr - h^2} + \sqrt{2hr} \right) \) and
area \( A = \ldots \ldots \ldots \ldots \) also \( \lim_{h \to 0} \frac{A}{P^3} = \ldots \ldots \ldots \ldots \) \( (1989 - 2 \text{ Marks}) \)

9. \( \lim_{x \to \infty} \left( \frac{x + 6}{x + 1} \right) = \ldots \ldots \ldots \ldots \) \( (1990 - 2 \text{ Marks}) \)

10. Let \( f(x) = x | x |. \) The set of points where \( f(x) \) is twice
differentiable is \( \ldots \ldots \ldots \ldots \) \( (1992 - 2 \text{ Marks}) \)

11. Let \( f(x) = [x] \sin \left( \frac{\pi}{[x] + 1} \right), \) where \([x]\) denotes the greatest
integer function. The domain of \( f \) is \( \ldots \ldots \ldots \ldots \) and the points of
discontinuity of \( f \) in the domain are \( \ldots \ldots \ldots \ldots \) \( (1996 - 2 \text{ Marks}) \)

12. \( \lim_{x \to 0} \left( \frac{1 + 5x^2}{1 + 3x^2} \right)^{1/2} = \ldots \ldots \ldots \ldots \) \( (1996 - 1 \text{ Mark}) \)

13. Let \( f(x) \) be a continuous function defined for \( 1 \leq x \leq 3. \)
If \( f(x) \) takes rational values for all \( x \) and \( f(2) = 10, \) then
\( f(1.5) = \ldots \ldots \ldots \ldots \) \( (1997 - 2 \text{ Marks}) \)

B True / False

1. If \( \lim_{x \to a} [f(x)g(x)] \) exists then both \( \lim_{x \to a} f(x) \) and
\( \lim_{x \to a} g(x) \) exist. \( (1981 - 2 \text{ Marks}) \)

C MCQs with One Correct Answer

1. If \( f(x) = \frac{x - \sin x}{\sqrt{x + \cos^2 x}} \), then \( \lim_{x \to \infty} f(x) \) is \( \ldots \ldots \ldots \ldots \) \( (1979) \)
   (a) 0 \quad (b) \infty \quad (c) 1 \quad (d) none of these

2. For a real number \( y \), let \([y]\) denotes the greatest integer less
then or equal to \( y \): Then the function \( f(x) = \frac{\tan(\pi x - \pi)}{1 + [x]^2} \)
is \( \ldots \ldots \ldots \ldots \) \( (1981 - 2 \text{ Marks}) \)
   (a) discontinuous at some \( x \)
   (b) continuous at all \( x \), but the derivative \( f'(x) \) does not
   exist for some \( x \)
   (c) \( f'(x) \) exists for all \( x \), but the second derivative \( f''(x) \)
   does not exist for some \( x \)
   (d) \( f'(x) \) exists for all \( x \)
3. There exist a function \( f(x) \), satisfying \( f(0) = 1, f'(0) = -1, \)
\( f(x) > 0 \) for all \( x \), and
\( (1982 - 2 \text{ Marks}) \)
(a) \( f''(x) > 0 \) for all \( x \)  
(b) \( -1 < f''(x) < 0 \) for all \( x \)  
(c) \( -2 \leq f''(x) \leq -1 \) for all \( x \)  
(d) \( f''(x) < -2 \) for all \( x \)  

4. If \( G(x) = -\sqrt{25 - x^2} \) then \( \lim_{x \to 1} \frac{G(x) - G(1)}{x - 1} \) has the value \( (1983 - 1 \text{ Mark}) \)
(a) \( \frac{1}{24} \)  
(b) \( \frac{1}{5} \)  
(c) \( -\sqrt{24} \)  
(d) none of these  

5. If \( f(a) = 2, f'(a) = 1, g(a) = -1, g'(a) = 2 \), then the value of \( \lim_{x \to a} \frac{g(x)f(a) - g(a)f(x)}{x - a} \) is \( (1983 - 1 \text{ Mark}) \)
(a) \(-5\)  
(b) \(\frac{1}{5}\)  
(c) \(5\)  
(d) none of these  

6. The function \( f(x) = \frac{\ln(1+ax) - \ln(1-bx)}{x} \) is not defined \( (1983 - 1 \text{ Mark}) \)
at \( x = 0 \). The value which should be assigned to \( f \) at \( x = 0 \) so that it is continuous at \( x = 0 \), is
(a) \( a - b \)  
(b) \( a + b \)  
(c) \( \ln a - \ln b \)  
(d) none of these  

7. \( \lim_{n \to \infty} \left( \frac{1}{1-n^2} + \frac{2}{1-n^2} + \ldots + \frac{n}{1-n^2} \right) \) is equal to \( (1984 - 2 \text{ Marks}) \)
(a) \(0\)  
(b) \(\frac{-1}{2}\)  
(c) \(\frac{1}{2}\)  
(d) none of these  

8. If \( f(x) = \frac{\sin[x]}{x} \), \( x \neq 0 \) \( (1985 - 2 \text{ Marks}) \)
\[ = 0, \quad [x] = 0 \]
Where \( [x] \) denotes the greatest integer less than or equal to \( x \). Then \( \lim_{x \to 0} f(x) \) equals –
(a) \(1\)  
(b) \(0\)  
(c) \(-1\)  
(d) none of these  

9. Let \( f: R \to R \) be a differentiable function and \( f(1) = 4 \). Then the value of \( \lim_{x \to 1} \int_{0}^{f(x)} \frac{2t}{x-1} \, dt \) is \( (1990 - 2 \text{ Marks}) \)
(a) \(8f'(1)\)  
(b) \(4f'(1)\)  
(c) \(2f'(1)\)  
(d) \(f'(1)\)  

10. Let \( [.] \) denote the greatest integer function and \( f(x) = [\tan^2 x] \), then: \( (1993 - 1 \text{ Mark}) \)
(a) \( \lim_{x \to 0} f(x) \) does not exist  
(b) \( f(x) \) is continuous at \( x = 0 \)  
(c) \( f(x) \) is not differentiable at \( x = 0 \)  
(d) \( f'(0) = 1 \)  

11. The function \( f(x) = [x] \cos \left( \frac{2x-1}{2} \right) \) denotes the greatest integer function, is discontinuous at \( (1995 \text{S}) \)
(a) All \( x \)  
(b) All integer points  
(c) No \( x \)  
(d) \( x \) which is not an integer  

12. \( \lim_{n \to \infty} \frac{\sum_{r=1}^{2n} r}{\sqrt{n^2 + r^2}} \) equals \( (1997 - 2 \text{ Marks}) \)
(a) \( 1 + \sqrt{3} \)  
(b) \(-1 + \sqrt{3} \)  
(c) \(-1 + \sqrt{2} \)  
(d) \(1 + \sqrt{2} \)  

13. The function \( f(x) = [x^2 - [x^2]] \) (where \([y]\) is the greatest integer less than or equal to \( y \)), is discontinuous at \( (1999 - 2 \text{ Marks}) \)
(a) all integers  
(b) all integers except 0 and 1  
(c) all integers except 0  
(d) all integers except 1  

14. The function \( f(x) = (x^2 - 1) |x^2 - 3x + 2| + \cos(|x|) \) is NOT differentiable at \( (1999 - 2 \text{ Marks}) \)
(a) \(-1\)  
(b) \(0\)  
(c) \(1\)  
(d) \(2\)  

15. \( \lim_{x \to 0} \frac{x \tan 2x - 2x \tan x}{(1 - \cos 2x)^2} \) is \( (1999 - 2 \text{ Marks}) \)
(a) \(2\)  
(b) \(-2\)  
(c) \(1/2\)  
(d) \(-1/2\)  

16. For \( x \in R \), \( \lim_{x \to \infty} \left( \frac{x - 3}{x + 2} \right)^x = \) \( (2000 \text{S}) \)
(a) \(e\)  
(b) \(e^{-1}\)  
(c) \(e^5\)  
(d) \(e^5\)  

17. \( \lim_{x \to 0} \frac{\sin(\pi \cos^2 x)}{x^2} \) equals \( (2001 \text{S}) \)
(a) \(-\pi\)  
(b) \(\pi\)  
(c) \(\pi/2\)  
(d) \(1\)  

18. The left-hand derivative of \( f(x) = [x] \sin(\pi x) \) at \( x = k, k \) an integer, is \( (2001 \text{S}) \)
(a) \((-1)^k (k-1)\pi\)  
(b) \((-1)^k (k-1)\pi\)  
(c) \((-1)^k \pi\)  
(d) \((-1)^k \pi\)  

19. Let \( f: R \to R \) be a function defined by \( f(x) = \max \{x, x^3\} \). The set of all points where \( f(x) \) is NOT differentiable is \( (2001 \text{S}) \)
(a) \(-1, 1\)  
(b) \(-1, 0\)  
(c) \(0, 1\)  
(d) \(-1, 0, 1\)  

20. Which of the following functions is differentiable at \( x = 0 \)? \( (2001 \text{S}) \)
(a) \(\cos(3x) + |x|\)  
(b) \(\cos(3x) - |x|\)  
(c) \(\sin(3x) + |x|\)  
(d) \(\sin(3x) - |x|\)  

21. The domain of the derivative of the function \( f(x) = \)
\[ \begin{cases} \frac{\tan^{-1} x}{x} & \text{if } |x| \leq 1 \\ \frac{1}{2} (|x|-1) & \text{if } |x| > 1 \end{cases} \]
is \( (2002 \text{S}) \)
(a) \(R \setminus \{0\}\)  
(b) \(R \setminus \{1\}\)  
(c) \(R \setminus \{-1\}\)  
(d) \(R \setminus \{-1, 1\}\)
22. The integer $n$ for which $\lim_{x \to 0} \frac{(\cos x - 1)(\cos x - e^x)}{x^n}$ is a finite non-zero number is $2002S$

(a) $1$  (b) $2$  (c) $3$  (d) $4$

23. Let $f : R \to R$ be such that $f(1) = 3$ and $f'(1) = 6$. Then

\[ \lim_{x \to 0} \left( \frac{f(1+x)}{f(1)} \right)^{1/x} \] equals $2002S$

(a) $1$  (b) $e^{1/2}$  (c) $e^2$  (d) $e^3$

24. If $\lim_{x \to 0} \frac{(a-n)x - \tan x) \sin x}{x^2}$ = $0$, where $n$ is nonzero real number, then $a$ is equal to $2003S$

(a) $0$  (b) $\frac{n+1}{n}$  (c) $n$  (d) $\frac{n+1}{n}$

25. $\frac{f(2h+2 + h^2) - f(2)}{h}$, given that $f'(2) = 6$ and $f'(1) = 4$ $2004S$

(a) does not exist  (b) is equal to $-3/2$  (c) is equal to $3/2$  (d) is equal to $3$

26. If $(x)$ is differentiable and strictly increasing function, then

the value of $\lim_{x \to 0} \frac{f(x^2) - f(x)}{f'(x)}$ is $2005S$

(a) $1$  (b) $0$  (c) $-1$  (d) $2$

27. The function given by $y = |x| - 1$ is differentiable for all real numbers except the points $2005S$

(a) $\{0, 1, -1\}$  (b) $\{1\}$  (c) $1$  (d) $-1$

28. If $f(3x)$ is continuous and differentiable function and $f(1/n) = 0 \forall \ n \geq 1$ and $n \in I$, then $2005S$

(a) $f(0) = 0, x \in (0, 1]$  (b) $f(0) = 0, f'(0) = 0$  (c) $f(0) = 0, x \in (0, 1]$  (d) $f(0) = 0$ and $f'(0)$ need not to be zero

29. The value of $\lim_{x \to 0} (\sin x)^{1/x} + (1 + x)^{\sin x}$, where $x > 0$ is $2006 - 3M, -1$

(a) $0$  (b) $-1$  (c) $1$  (d) $2$

30. Let $f(x)$ is differentiable on the interval $0, \infty$ such that

$f(1) = 1$, and $\lim_{t \to x} \frac{f(t) - f(x) - x^2 f(t)}{t - x} = 1$ for each $x > 0$. Then $2007 - 3M$

$f(x)$ is

(a) $\frac{1}{3x} + \frac{2x^2}{3}$  (b) $-\frac{4x^2}{3x} + \frac{2}{3x}$  (c) $\frac{-1}{x^2} + \frac{2}{x^2}$  (d) $\frac{1}{x}$

31. $\lim_{x \to \pi/4} \frac{2}{x^2 - \pi^2} = 2007 - 3M$

(a) $\frac{8}{\pi} f(2)$  (b) $\frac{2}{\pi} f(2)$  (c) $\frac{2}{\pi} f(\frac{1}{2})$  (d) $4f(2)$

32. Let $g(x) = \frac{(x-1)^n}{\log \cos^m(x-1)}$; $0 < x < 2$, $m$ and $n$ are integers, $m \ne 0$, $n > 0$, and let $p$ be the left hand derivative of $|x - 1|$ at $x = 1$. If $\lim_{x \to 1^+} g(x) = p$, then $2008$

(a) $n = 1, m = 1$  (b) $n = 1, m = -1$  (c) $n = 2, m = 2$  (d) $n > 2, m = n$

33. If $\lim_{x \to 0} \left[ 1 + x + (n(1 + b^2))^{-1} \right]^{1/x} = 2b \sin^2 \theta, b > 0$ and $\theta \in (\pi, \pi)$, then the value of $\theta$ is $2011$

(a) $\frac{\pi}{4}$  (b) $\frac{\pi}{3}$  (c) $\frac{\pi}{6}$  (d) $\frac{\pi}{2}$

34. If $\lim_{x \to 0} \left( \frac{x^2 + x + 1}{x+1} - ax - b \right) = 4$, then $2012$

(a) $a = 1, b = 4$  (b) $a = 1, b = -4$  (c) $a = 2, b = 3$  (d) $a = 2, b = 3$

35. Let $f(x) = \begin{cases} x^2 \cos \frac{x}{x}, & x \ne 0, \ x \in R \text{ then } f \text{ is } (2012) \\ 0, & x = 0 \end{cases}$

(a) differentiable both at $x = 0$ and at $x = 2$  (b) differentiable at $x = 0$ but not differentiable at $x = 2$  (c) not differentiable at $x = 0$ but differentiable at $x = 2$  (d) differentiable neither at $x = 0$ nor at $x = 2$

36. Let $\alpha(a)$ and $\beta(a)$ be the roots of the equation $(\sqrt{1+a} - 1)x^2 + (\sqrt{1+a} - 1)x + (\sqrt{1+a} - 1) = 0$ where $a > -1$. Then $\lim_{a \to 0^+} \alpha(a)$ and $\lim_{a \to 0^+} \beta(a)$ are $2012$

(a) $-\frac{5}{2}$ and $1$  (b) $-\frac{1}{2}$ and $-1$  (c) $-\frac{7}{2}$ and $2$  (d) $-\frac{9}{2}$ and $3$

**MCQs with One or More than One Correct**

1. If $x + |y| = 2y$, then $y$ as a function of $x$ is $1984 - 3 \text{ Marks}$

(a) defined for all real $x$  (b) continuous at $x = 0$  (c) differentiable for all $x$  (d) such that $\frac{dy}{dx} = \frac{1}{3}$ for $x < 0$

2. If $f(x) = x(\sqrt{x} - \sqrt{x+1})$, then $1985 - 2 \text{ Marks}$

(a) $f(x)$ is continuous but not differentiable at $x = 0$  (b) $f(x)$ is differentiable at $x = 0$  (c) $f(x)$ is not differentiable at $x = 0$  (d) none of these
3. The function \( f(x) = 1 + \sin x \) is continuous everywhere. (1986 - 2 Marks)
   (a) continuous nowhere (b) continuous everywhere (c) differentiable nowhere
   (d) not differentiable at \( x = 0 \) (e) not differentiable at infinite number of points.
4. Let \( [x] \) denote the greatest integer less than or equal to \( x \). If \( f(x) = [x \sin x] \), then \( f(x) \) is continuous at \( x = 0 \) (b) continuous in \( (-1, 0) \) (c) differentiable at \( x = 1 \) (d) differentiable in \( (-1, 1) \)
   (e) none of these
5. The set of all points where the function \( f(x) = \frac{x}{(1 + |x|)} \) is differentiable, is \( (-\infty, \infty) \) (b) \( [0, \infty) \)
   (c) \( (-\infty, 0) \cup (0, \infty) \) (d) \( (0, \infty) \)
   (e) None
6. The function \( f(x) = \begin{cases} |x - 3|, & x \geq 1 \\ \frac{x^2}{2} - \frac{3x}{4} + \frac{13}{4}, & x < 1 \end{cases} \) is continuous at \( x = 1 \) (b) differentiable at \( x = 1 \)
   (c) continuous at \( x = 3 \) (d) differentiable at \( x = 3 \).
7. If \( f(x) = \frac{1}{2} x - 1 \), then on the interval \([0, \pi]\) (1989 - 2 Marks)
   (a) \( \tan [f(x)] \) and \( 1/f(x) \) are both continuous
   (b) \( \tan [f(x)] \) and \( 1/f(x) \) are both discontinuous
   (c) \( \tan [f(x)] \) and \( f^{-1}(x) \) are both continuous
   (d) \( \tan [f(x)] \) is continuous but \( 1/f(x) \) is not.
8. The value of \( \lim_{x \to 0} \frac{\sqrt{1 - \cos 2x}}{x} \) is \( 1 \) (b) \(-1\)
   (c) \( 0\) (d) none of these
9. The following functions are continuous on \((0, \pi)\). (1991 - 2 Marks)
   (a) \( \tan x \)
   (b) \( \int_{0}^{\pi} \sin x \, dt \)
   (c) \( \left\{ \begin{array}{ll} 1, & 0 < x \leq \frac{3\pi}{4} \\ \frac{2}{9} \sin \frac{2}{9} x, & \frac{3\pi}{4} < x < \pi \end{array} \right. \)
   (d) \( \left\{ \begin{array}{ll} x \sin x, & 0 < x \leq \frac{\pi}{2} \\ \frac{\pi}{2} \sin(\pi + x), & \frac{\pi}{2} < x < \pi \end{array} \right. \)
10. Let \( f(x) = \begin{cases} 0, & x < 0 \\ \frac{1}{x^2}, & x \geq 0 \end{cases} \) then for all \( x \) (1994)
    (a) \( f' \) is differentiable (b) \( f \) is differentiable
    (c) \( f' \) is continuous (d) \( f \) is continuous
11. Let \( g(x) = x f(x) \), where \( f(x) = \begin{cases} x \sin \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases} \). At \( x = 0 \)
    (a) \( g \) is differentiable but \( g' \) is not continuous (b) \( g \) is differentiable while \( f \) is not
    (c) both \( f \) and \( g \) are differentiable (d) \( g \) is differentiable and \( g' \) is continuous
12. The function \( f(x) = \max \{ (1 - x), (1 + x), 2 \} \), \( x \in (-\infty, \infty) \) is continuous at all points (1995)
    (b) differentiable at all points
    (c) differentiable at all points except at \( x = 1 \) and \( x = -1 \)
    (d) continuous at all points except at \( x = 1 \) and \( x = -1 \), where it is discontinuous
13. Let \( h(x) = \min \{ x, x^2 \} \), for every real number of \( x \). Then (1998 - 2 Marks)
    (a) \( h \) is continuous for all \( x \)
    (b) \( h \) is differentiable for all \( x \)
    (c) \( h'(x) = 1 \), for all \( x > 1 \)
    (d) \( h \) is not differentiable at two values of \( x \).
14. \( \lim_{x \to 1} \frac{\sqrt{1 - \cos 2(x-1)}}{x - 1} \) (1998 - 2 Marks)
    (a) exists and it equals \( \sqrt{2} \)
    (b) exists and it equals \( -\frac{\sqrt{2}}{2} \)
    (c) does not exist because \( x \to 0 \)
    (d) does not exist because the left hand limit is not equal to the right hand limit.
15. If \( f(x) = \min \{ 1, x^2, x^3 \} \), then (2006 - 5M, -1)
    (a) \( f(x) \) is continuous \( \forall x \in R \)
    (b) \( f(x) \) is continuous and differentiable everywhere.
    (c) \( f(x) \) is not differentiable at two points
    (d) \( f(x) \) is not differentiable at one point
16. Let \( L = \lim_{x \to 0} \frac{ax - \sqrt{a^2 - x^2} - x^2}{x^4} \), \( a > 0 \). (2009)
    If \( L \) is finite, then (a) \( a = 2 \) (b) \( a = 1 \) (c) \( L = \frac{1}{64} \) (d) \( L = \frac{1}{32} \)
17. Let \( f : R \to R \) be a function such that \( f(x + y) = f(x) + f(y) \), \( \forall x, y \in R \). If \( f(x) \) is differentiable at \( x = 0 \), then (2011)
    (a) \( f(x) \) is differentiable only in a finite interval containing zero
    (b) \( f(x) \) is continuous \( \forall x \in R \)
    (c) \( f'(x) \) is constant \( \forall x \in R \)
    (d) \( f(x) \) is differentiable except at finitely many points.
18. If \( f(x) = \begin{cases} 
-x - \frac{\pi}{2}, & x \leq \frac{\pi}{2} \\
-\cos x, & \frac{\pi}{2} < x \leq 0 \\
x - 1, & 0 < x \leq 1 \\
\ln x, & x > 1
\end{cases} \) (2011)

(a) \( f(x) \) is continuous at \( x = -\frac{\pi}{2} \)

(b) \( f(x) \) is not differentiable at \( x = 0 \)

(c) \( f(x) \) is differentiable at \( x = 1 \)

(d) \( f(x) \) is differentiable at \( x = -\frac{3}{2} \)

19. For every integer \( n \), let \( a_n \) and \( b_n \) be real numbers. Let function \( f: \mathbb{R} \to \mathbb{R} \) be given by (2012)

\[
f(x) = \begin{cases} 
 a_n + \sin \pi x, & x \in [2n, 2n+1] \\
b_n + \cos \pi x, & x \in (2n-1, 2n)
\end{cases}
\]

for all integers \( n \). If \( f \) is continuous, then which of the following hold(s) for all \( n \)?

(a) \( a_{n-1} - b_{n-1} = 0 \)

(b) \( a_n - b_n = 1 \)

(c) \( a_n - b_{n+1} = 1 \)

(d) \( a_{n-1} - b_n = -1 \)

20. For \( a \in \mathbb{R} \) (the set of all real numbers), \( a \neq -1 \), (JEE Adv. 2013)

\[
\lim_{n \to \infty} \frac{(1^a + 2^a + \ldots + n^a)}{(n+1)^a - [(na+1) + (na+2) + \ldots + (na+n)]]} = \frac{1}{60}
\]

Then \( a = \)

(a) 5  (b) 7  (c) \( -\frac{15}{2} \)  (d) \( -\frac{17}{2} \)

21. Let \( f: [a, b] \to [1, \infty) \) be a continuous function and let \( g: \mathbb{R} \to \mathbb{R} \) be defined as (JEE Adv. 2014)

\[
g(x) = \begin{cases} 
 0, & \text{if } x < a, \\
\int_a^x f(t) \, dt, & \text{if } a \leq x \leq b; \text{ then} \\
\int_a^b f(t) \, dt, & \text{if } x > b.
\end{cases}
\]

(a) \( g(x) \) is continuous but not differentiable at \( a \)

(b) \( g(x) \) is differentiable on \( R \)

(c) \( g(x) \) is continuous but not differentiable at \( b \)

(d) \( g(x) \) is continuous and differentiable at either \( a \) or \( b \) but not both

22. For every pair of continuous functions \( f, g: [0, 1] \to \mathbb{R} \) such that \( \max \{ f(x) : x \in [0, 1] \} = \max \{ g(x) : x \in [0, 1] \} \), the correct statement(s) is (are):

(JEE Adv. 2014)

(a) \( (f(c))^2 + 3f(c) = (g(c))^2 + 3g(c) \) for some \( c \in [0, 1] \)

(b) \( (f(c))^2 + f(c) = (g(c))^2 + 3g(c) \) for some \( c \in [0, 1] \)

(c) \( (f(c))^2 + 3f(c) = (g(c))^2 + g(c) \) for some \( c \in [0, 1] \)

(d) \( (f(c))^2 = (g(c))^2 \) for some \( c \in [0, 1] \)

23. Let \( g: \mathbb{R} \to \mathbb{R} \) be a differentiable function with \( g(0) = 0 \), \( g'(0) = 0 \) and \( g'(1) \neq 0 \). Let \( f(x) = \begin{cases} 
 x, & x \neq 0 \\
 0, & x = 0
\end{cases} \)

and \( h(x) = e^{|x|} \) for all \( x \in \mathbb{R} \). Let \( (foh)(x) \) denote \( f(h(x)) \) and \( (hof)(x) \) denote \( h(f(x)) \). Then which of the following is (are) true?

(JEE Adv. 2015)

(a) \( f \) is differentiable at \( x = 0 \)

(b) \( h \) is differentiable at \( x = 0 \)

(c) \( foh \) is differentiable at \( x = 0 \)

(d) \( hof \) is differentiable at \( x = 0 \)

24. Let \( a, b \in \mathbb{R} \) and \( f: \mathbb{R} \to \mathbb{R} \) be defined by \( f(x) = \cos (|x^2 - x|) + b |x| \sin (|x^2 + x|) \).

Then \( f \) is (JEE Adv. 2016)

(a) differentiable at \( x=0 \) if \( a=0 \) and \( b=1 \)

(b) differentiable at \( x=1 \) if \( a=1 \) and \( b=0 \)

(c) NOT differentiable at \( x=0 \) if \( a=1 \) and \( b=0 \)

(d) NOT differentiable at \( x=1 \) if \( a=1 \) and \( b=1 \)

25. Let \( f: \left[ -\frac{1}{2}, 2 \right] \to \mathbb{R} \) and \( g: \left[ -\frac{1}{2}, 2 \right] \to \mathbb{R} \) be functions defined by \( f(x) = |x^2 - 3| \) and \( g(x) = |x|f(x) + |4x - 7| f(x) \), where \( [y] \) denotes the greatest integer less than or equal to \( y \) for \( y \in \mathbb{R} \). Then (JEE Adv. 2016)

(a) \( f \) is discontinuous exactly at three points in \( \left[ -\frac{1}{2}, 2 \right] \)

(b) \( f \) is discontinuous exactly at four points in \( \left[ -\frac{1}{2}, 2 \right] \)

(c) \( g \) is NOT differentiable exactly at four points in \( \left( -\frac{1}{2}, 2 \right) \)

(d) \( g \) is NOT differentiable exactly at five points in \( \left( -\frac{1}{2}, 2 \right) \)

**E Subjective Problems**

1. Evaluate \( \lim_{x \to a} \frac{\sqrt{a + 2x} - \sqrt{3x}}{\sqrt{3a + x} - 2\sqrt{x}} \), \( a \neq 0 \) (1978)

2. \( f(x) \) is the integral of \( \frac{2\sin x - \sin 2x}{x^3} \), \( x \neq 0 \), find \( \lim_{x \to 0} f'(x) \) (1979)
3. Evaluate: \[ \lim_{h \to 0} \frac{(a+h)^2 \sin(a+h) - a^2 \sin a}{h} \quad (1980) \]

4. Let \( f(x+y) = f(x) + f(y) \) for all \( x \) and \( y \). If the function \( f(x) \) is continuous at \( x = 0 \), then show that \( f(x) \) is continuous at all \( x \). \( (1981 - 2 \text{ Marks}) \)

5. Use the formula \( \lim_{x \to 0} \frac{2^x - 1}{x} = \ln 2 \) to find \( \lim_{x \to 0} \frac{2^x - 1}{(1 + x)^{1/2} - 1} \). \( (1982 - 2 \text{ Marks}) \)

6. Let \( f(x) = \begin{cases} 1 + x, & 0 \leq x \leq 2 \\ 3 - x, & 2 < x \leq 3 \end{cases} \) \( (1983 - 2 \text{ Marks}) \)

Determine the form of \( g(x) = f(f(x)) \) and hence find the points of discontinuity of \( g \), if any.

7. Let \( f(x) = \begin{cases} x^2 & 0 \leq x < 1 \\ 2x^2 - 3x + 1 & 1 \leq x \leq 2 \end{cases} \) \( (1983 - 2 \text{ Marks}) \)

Discuss the continuity of \( f \), \( f' \) and \( f'' \) on \([0, 2]\).

8. Let \( f(x) = x^3 - x^2 + x + 1 \) and \( g(x) = \max \{ f(t), 0 \leq t \leq x, 0 \leq x \leq 1 \} \).

\[ \begin{align*} g(x) &= 3 - x, & 0 \leq x \leq 1 \\ &= 3 - x, & 0 \leq x \leq 2 \end{align*} \] \( (1985 - 5 \text{ Marks}) \)

Discuss the continuity and differentiability of the function \( g(x) \) in the interval \((0, 2)\).

9. Let \( f(x) \) be defined in the interval \([-2, 2]\) such that \( f(x) = \begin{cases} -1, & -2 \leq x < 0 \\ 0, & 0 < x \leq 2 \end{cases} \)

and \( g(x) = f( \lfloor x \rfloor ) + |f(x)| \).

Test the differentiability of \( g(x) \) in \((-2, 2)\). \( (1986 - 5 \text{ Marks}) \)

10. Let \( f(x) \) be a continuous and \( g(x) \) be a discontinuous function, prove that \( f(x) + g(x) \) is a discontinuous function. \( (1987 - 2 \text{ Marks}) \)

11. Let \( f(x) \) be a function satisfying the condition \( f(-x) = f(x) \) for all real \( x \). If \( f'(0) \) exists, find its value. \( (1987 - 2 \text{ Marks}) \)

12. Find the values of \( a \) and \( b \) so that the function

\[ f(x) = \begin{cases} x + a \sqrt{2} \sin x, & 0 \leq x < \pi/4 \\ 2x \cos x + b, & \pi/4 \leq x \leq \pi/2 \\ a \cos 2x - b \sin x, & \pi/2 < x \leq \pi \end{cases} \]

is continuous for \( 0 \leq x \leq \pi \). \( (1989 - 2 \text{ Marks}) \)

13. Draw a graph of the function \( y = \lfloor x \rfloor + |1 - x|, \) \( -1 \leq x \leq 3 \).

Determine the points, if any, where this function is not differentiable. \( (1989 - 4 \text{ Marks}) \)

14. Let \( f(x) = \begin{cases} a, & x = 0 \\ \sqrt{x}, & x > 0 \end{cases} \) \( (1990 - 4 \text{ Marks}) \)

Determine the value of \( a \), if possible, so that the function is continuous at \( x = 0 \).

15. A function \( f : R \to R \) satisfies the equation \( f(x + y) = f(x)f(y) \) for all \( x, y \) in \( R \) and \( f(x) \neq 0 \) for any \( x \) in \( R \). Let the function be differentiable at \( x = 0 \) and \( f'(0) = 2 \). Show that \( f'(x) = 2f(x) \) for all \( x \) in \( R \). Hence, determine \( f(x) \). \( (1990 - 4 \text{ Marks}) \)

16. Find \( \lim_{x \to 0} \{ \tan(\pi + 4x)\}^{1/x} \) \( (1993 - 2 \text{ Marks}) \)

17. Let \( f(x) = \begin{cases} 1 + |\sin x|, & 0 < x < \pi/6 \\ b, & x = 0 \\ e^{\tan 2x / \tan 3x}, & 0 < x < \pi/6 \end{cases} \) \( (1994 - 4 \text{ Marks}) \)

Determine \( a \) and \( b \) such that \( f(x) \) is continuous at \( x = 0 \).

18. Let \( f(x) = f(x) \) exists and equals \(-1 \) and \( f(0) = 1 \), find \( f(2) \). \( (1995 - 5 \text{ Marks}) \)

19. Determine the values of \( x \) for which the following function fails to be continuous or differentiable: \( (1997 - 5 \text{ Marks}) \)

\[ f(x) = \begin{cases} 1 - x, & x < 1 \\ (1 - x)(2 - x), & 1 \leq x \leq 2 \end{cases} \]

Justify your answer.

19. \[ 3 - x, \quad x > 2 \]

20. Let \( f(x), x \geq 0, \) be a non-negative continuous function, and

let \( F(x) = \int_0^x f(t) \, dt, x \geq 0 \).

If for some \( c > 0, f(x) \leq cf(x) \) for all \( x \geq 0 \), then show that \( f(x) = 0 \) for all \( x \geq 0 \). \( (2001 - 5 \text{ Marks}) \)

21. Let \( \alpha \in R \). Prove that a function \( f : R \to R \) is differentiable at \( \alpha \) if and only if there is a function \( g : R \to R \) which is continuous at \( \alpha \) and satisfies \( f(x) - f(\alpha) = g(x)(x - \alpha) \) for all \( x \in R \). \( (2001 - 5 \text{ Marks}) \)

22. Let \( f(x) = \begin{cases} x + a & \text{if} \quad x < 0 \\ |x - 1| & \text{if} \quad x \geq 0 \end{cases} \) and \( g(x) = \begin{cases} \frac{x + 1}{(x - 1)^2 + b} & \text{if} \quad x < 0 \\ \frac{1}{x - a} & \text{if} \quad x \geq 0 \end{cases} \)

where \( a \) and \( b \) are non-negative real numbers. Determine the composite function \( g \circ f \). If \( g \circ f \) is continuous for all \( x \), determine the values of \( a \) and \( b \). Further, for these values of \( a \) and \( b \), is \( g \circ f \) differentiable at \( x = 0 \)? Justify your answer.
23. If a function $f : [-2a, 2a] \to \mathbb{R}$ is an odd function such that $f(x) = f(2a - x)$ for $x \in [a, 2a]$ and the left hand derivative at $x = a$ is 0 then find the left hand derivative at $x = -a$. 

(2003 - 2 Marks)

24. $f'(0) = \lim_{n \to \infty} n! \left( \frac{1}{n} \right)$ and $f(0) = 0$. Using this find

$$\lim_{n \to \infty} \left( (n + 1) \frac{2}{\pi} \cos^{-1} \left( \frac{1}{n} \right) - n \right) \cos^{-1} \frac{1}{n} < \frac{\pi}{2}$$

(2004 - 2 Marks)

25. If $|c| \leq \frac{1}{2}$ and $f(x)$ is a differentiable function at $x = 0$ given

$$f(x) = \begin{cases} b \sin^{-1} \left( \frac{c + x}{2} \right), & -\frac{1}{2} < x < 0 \\ \frac{1}{2}, & x = 0 \\ e^{\frac{\pi x}{2}} - 1, & 0 < x < \frac{1}{2} \end{cases}$$

Find the value of $a$ and prove that $64 b^2 = 4 - c^2$.

(2004 - 4 Marks)

26. If $f(x - y) = f(x) \cdot g(y) - f(y) \cdot g(x)$ and $g(x - y) = g(x) \cdot g(y) - f(x) \cdot f(y)$ for all $x, y \in \mathbb{R}$.

If right hand derivative at $x = 0$ exists for $f(x)$. Find derivative of $g(x)$ at $x = 0$.

(2005 - 4 Marks)

### F Integer Value Correct Type

**DIRECTIONS (Q. 1 and 2) :** Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. In this question there are entries in columns I and II. Each entry in column I is related to exactly one entry in column II. Write the correct letter from column II against the entry number in column I in your answer book.

   (1992 - 2 Marks)

   **Column I**
   - (A) $\sin(\pi \lfloor x \rfloor)$
   - (B) $\sin(\pi (x - \lfloor x \rfloor))$

   **Column II**
   - (p) differentiable everywhere
   - (q) nowhere differentiable
   - (r) not differentiable at 1 and $-1$

2. In the following $[x]$ denotes the greatest integer less than or equal to $x$.

   Match the functions in **Column I** with the properties in **Column II** and indicate your answer by darkening the appropriate bubbles in the $4 \times 4$ matrix given in the ORS.

   (2007 - 6 marks)

   **Column I**
   - (A) $x \lfloor x \rfloor$
   - (B) $\sqrt{|x|}$
   - (C) $x + [x]$
   - (D) $|x - 1| + |x + 1|$

   **Column II**
   - (p) continuous in $(-1, 1)$
   - (q) differentiable in $(-1, 1)$
   - (r) strictly increasing in $(-1, 1)$
   - (s) not differentiable at least at one point in $(-1, 1)$

**DIRECTIONS (Q. 3) :** Following question has matching lists. The codes for the list have choices (a), (b), (c) and (d) out of which ONLY ONE is correct.

3. Let $f_1 : \mathbb{R} \to \mathbb{R}$, $f_2 : [0, \infty) \to \mathbb{R}$, $f_3 : \mathbb{R} \to \mathbb{R}$ and $f_4 : \mathbb{R} \to [0, \infty)$ be defined by $f_1(x) = \begin{cases} |x| & \text{if } x < 0, \\
e^x & \text{if } x \geq 0; \end{cases}$

   $f_2(x) = x^2$; $f_3(x) =\begin{cases} \sin x & \text{if } x < 0, \\
x & \text{if } x \geq 0; \end{cases}$ and $f_4(x) = \begin{cases} f_2(f_1(x)) & \text{if } x < 0, \\
\left[f_2(f_1(x))\right] - 1 & \text{if } x \geq 0. \end{cases}$

   (JEE Adv. 2014)
I

Integer Value Correct Type

1. Let \( f : [1, \infty) \rightarrow [2, \infty) \) be a differentiable function such that 
\[ f'(x) = 2. \] 
If \( \int_1^x f(t)dt = 3xf(x) - x^3 \) for all \( x \geq 1 \), then the value of \( f(2) \) is \( \text{[2011]} \).

2. The largest value of non-negative integer \( a \) for which 
\[ \lim_{x \to 1} \left( \frac{-ax + \sin(x - 1) + a}{x + \sin(x - 1) - 1} \right) = 1 \] 
is \( \text{[JEE Adv. 2014]} \).

3. Let \( f : R \rightarrow R \) and \( g : R \rightarrow R \) be respectively given by 
\[ f(x) = |x| + 1 \] 
and \( g(x) = x^2 + 1 \). Define \( h : R \rightarrow R \) by 
\[ h(x) = \begin{cases} 
\max & \{ f(x), g(x) \} & \text{if } x \leq 0, \\
\min & \{ f(x), g(x) \} & \text{if } x > 0.
\end{cases} \]
The number of points at which \( h(x) \) is not differentiable is \( \text{(JEE Adv. 2014)} \).

4. Let \( m \) and \( n \) be two positive integers greater than 1. If 
\[ \lim_{\alpha \to 0} \left( \frac{e^{\cos(\alpha^n)} - e}{\alpha^m} \right) = -\left( \frac{e}{2} \right) \] 
then the value of \( \frac{m}{n} \) is \( \text{(JEE Adv. 2015)} \).

5. Let \( \alpha, \beta \in \mathbb{R} \) be such that 
\[ \lim_{x \to 0} \frac{x^2 \sin(\beta x)}{\alpha x - \sin x} = 1. \]
Then \( 6 (\alpha + \beta) \) equals. \( \text{(JEE Adv. 2016)} \).

Section-B

JEE Main / AIEEE

1. \( \lim_{x \to 0} \frac{\sqrt{1 - \cos 2x}}{\sqrt{2x}} \) is: \( \text{[2002]} \)
(a) 1 (b) -1 (c) zero (d) does not exist

2. \( \lim_{x \to \infty} \left( \frac{x^2 + 5x + 3}{x^2 + x + 3} \right)^x \) is \( \text{[2002]} \)
(a) \( e \) (b) \( e^2 \) (c) \( e^3 \) (d) 1

3. Let \( f(x) = 4 \) and \( f'(x) = 4 \). Then \( \lim_{x \to 2} \frac{x^2 f'(2) - 2f(x)}{x - 2} \) is
given by 
(a) 2 (b) -2 (c) -4 (d) 3

4. \( \lim_{n \to \infty} \frac{1 + 2p + 3p + \ldots + np^p}{n^{p+1}} \) is \( \text{[2002]} \)
(a) \( \frac{1}{p+1} \) (b) \( \frac{1}{1-p} \) (c) \( \frac{1}{p} - \frac{1}{p-1} \) (d) \( \frac{1}{p+2} \)

5. \( \lim_{x \to 0} \frac{\log x^n - [x]}{[x]} \), \( n \in N \) , \([x]\) denotes greatest integer less than or equal to \( x \)
(a) has value -1 (b) has value 0 (c) has value 1 (d) does not exist

6. If \( f(1) = 1, f'(1) = 2, \) then \( \lim_{x \to 1} \frac{\sqrt{f(x)} - 1}{\sqrt{x} - 1} \) is \( \text{[2002]} \)
(a) 2 (b) 4 (c) 1 (d) 1/2

7. \( f \) is defined in [-5, 5] as 
\[ f(x) = x \text{ if } x \text{ is rational} \]
\[ = -x \text{ if } x \text{ is irrational}. \]
Then 
(a) \( f(x) \) is continuous at every \( x \), except \( x = 0 \)
(b) \( f(x) \) is discontinuous at every \( x \), except \( x = 0 \)
(c) \( f(x) \) is continuous everywhere 
(d) \( f(x) \) is discontinuous everywhere

8. \( f(x) \) and \( g(x) \) are two differentiable functions on [0, 2] such that 
\( f''(x) - g''(x) = 0, \) \( f'(1) = 2g'(1) = 4f(2) = 3g(2) = 9 \)
then \( f(x) - g(x) \) at \( x = 3/2 \) is \( \text{[2002]} \)
(a) 0 (b) 2 (c) 10 (d) 5
9. If \( f(x + y) = f(x)f(y) \) for all \( x, y \) and \( f(5) = 2, f'(0) = 3 \), then \( f'(5) \) is
   (a) 0 (b) 1 (c) 6 (d) 2

10. \( \lim_{n \to \infty} \frac{1 + 2^4 + 3^4 + \ldots n^4}{n^5} = \lim_{n \to \infty} \frac{1 + 2^3 + 3^3 + \ldots n^3}{n^5} \)
    (a) \( \frac{1}{5} \) (b) \( \frac{1}{30} \) (c) 0 (d) \( \frac{1}{4} \)

11. If \( \lim_{x \to 0} \frac{\log(3 + x) - \log(3 - x)}{x} = k \), the value of \( k \) is
    (a) \( \frac{2}{3} \) (b) 0 (c) \( \frac{1}{3} \) (d) \( \frac{2}{3} \)

12. The value of \( \lim_{x \to 0} \frac{\int_0^x \sec^2 t \, dt}{x \sin x} \) is
    (a) 0 (b) 3 (c) 2 (d) 1

13. Let \( f(a) = g(a) = k \) and their \( n \)th derivatives exist and are not equal for some \( n \). Further if
    \( \lim_{x \to a} \frac{f(a)g(x) - f(x)g(a) + g(a)f(x) - f(a)g(x)}{g(x) - f(x)} = 4 \)
    then the value of \( k \) is
    (a) 0 (b) 4 (c) 2 (d) 1

14. \( \lim_{x \to \frac{\pi}{2}} \frac{1 - \tan \left( \frac{x}{2} \right)\left[ 1 - \sin x \right]}{1 + \tan \left( \frac{x}{2} \right)\left[ 1 - \cos 2x \right]^3} \)
    (a) \( \infty \) (b) \( \frac{1}{8} \) (c) 0 (d) \( \frac{1}{32} \)

15. If \( f(x) = \begin{cases} \frac{1}{x} & x \neq 0 \\ 0 & x = 0 \end{cases} \), then \( f(x) \) is
    (a) discontinuous everywhere
    (b) continuous as well as differentiable for all \( x \)
    (c) continuous for all \( x \) but not differentiable at \( x = 0 \)
    (d) neither differentiable nor continuous at \( x = 0 \)

16. If \( \lim_{x \to \infty} (1 + \frac{a}{x} + \frac{b}{x^2})^{2x} = e^2 \), then the values of \( a \) and \( b \), are
    (a) \( a = 1 \) and \( b = 2 \) (b) \( a = 1, b \in R \)
    (c) \( a \in R, b = 2 \) (d) \( a \in R, b \in R \)

17. Let \( f(x) = \frac{1 - \tan x}{4x - \pi}, x \neq \frac{\pi}{4}, x \in \left[ 0, \frac{\pi}{2} \right] \). If \( f(x) \) is continuous in \( \left[ 0, \frac{\pi}{2} \right] \), then \( f \left( \frac{\pi}{4} \right) \) is
    (a) \( -1 \) (b) \( \frac{1}{2} \) (c) \( -\frac{1}{2} \) (d) 1

18. \( \lim_{n \to \infty} \left( \frac{1}{n^2} + \frac{1}{n^2} \frac{1}{n^2} \frac{1}{n^2} \ldots \frac{1}{n^2} \right) \)
    (a) \( \frac{1}{2} \) (b) \( \frac{1}{2} \) sec \( 1 \) (c) \( \frac{1}{2} \) sec \( 1 \) (d) \( \frac{1}{2} \) tan \( 1 \)

19. Let \( \alpha \) and \( \beta \) be the distinct roots of \( ax^2 + bx + c = 0 \), then
    \( \lim_{x \to a} \frac{1 - \cos(ax^2 + bx + c)}{(x - \alpha)^2} \)
    (a) \( \frac{a^2}{2} (\alpha - \beta)^2 \) (b) 0
    (c) \( -\frac{a^2}{2} (\alpha - \beta)^2 \) (d) \( \frac{1}{2} (\alpha - \beta)^2 \)

20. Suppose \( f(x) \) is differentiable at \( x = 1 \) and
    \( \lim_{h \to 0} f(1 + h) = 5 \), then \( f'(1) \) equals
    (a) 3 (b) 4 (c) 5 (d) 6

21. Let \( f \) be differentiable for all \( x \). If \( f(6) = 2 \) and \( f'(x) \geq 2 \) for \( x \in [1, 6] \), then
    (a) \( f(6) \geq 8 \) (b) \( f(6) < 8 \) (c) \( f(6) < 5 \) (d) \( f(6) = 5 \)

22. If \( f \) is a real valued differentiable function satisfying
    \( |f(x) - f(y)| \leq (x - y)^2, x, y \in R \) and \( f(0) = 0 \), then \( f(1) \) equals
    (a) \( -1 \) (b) 0 (c) 2 (d) 1

23. Let \( f : R \to R \) be a function defined by
    \( f(x) = \min \{ x + 1, |x| + 1 \} \), then which of the following is true?
    (a) \( f(x) \) is differentiable everywhere
    (b) \( f(x) \) is not differentiable at \( x = 0 \)
    (c) \( f(x) \geq 1 \) for all \( x \in R \)
    (d) \( f(x) \) is not differentiable at \( x = 1 \)

24. The function \( f : R \to \{0 \} \to R \) given by
    \( f(x) = \frac{1}{x} - \frac{2}{e^{2x} - 1} \)
    can be made continuous at \( x = 0 \) by defining \( f(0) \) as
    (a) 0 (b) 1 (c) 2 (d) -1
25. Let \( f(x) = \begin{cases} (x-1) \sin \frac{1}{x-1} & \text{if } x \neq 1 \\ 0 & \text{if } x = 1 \end{cases} \) \[2008\]

Then which one of the following is true?
(a) \( f \) is neither differentiable at \( x = 0 \) nor at \( x = 1 \)
(b) \( f \) is differentiable at \( x = 0 \) and at \( x = 1 \)
(c) \( f \) is differentiable at \( x = 0 \) but not at \( x = 1 \)
(d) \( f \) is differentiable at \( x = 1 \) but not at \( x = 0 \)

26. Let \( f : \mathbb{R} \rightarrow \mathbb{R} \) be a positive increasing function with
\[
\lim_{x \to \infty} \frac{f(3x)}{f(x)} = 1. \text{ Then } \lim_{x \to \infty} \frac{f(2x)}{f(x)} = \frac{3}{2} \text{ (b) } \frac{3}{2} \text{ (c) } 3 \text{ (d) } 1
\]\[2010\]

27. \( \lim_{x \to 2} \frac{\sqrt{1 - \cos(2\pi(x-2))}}{x-2} \) is equal to:
(a) equals \( \sqrt{2} \) (b) equals \( -\sqrt{2} \) (c) equals \( \frac{1}{\sqrt{2}} \) (d) does not exist
\[2011\]

28. The values of \( p \) and \( q \) for which the function \( f(x) = \begin{cases} \frac{\sin(p+1)x + \sin x}{x}, & x < 0 \\ \sqrt{x + x^2 - \sqrt{x}}, & x > 0 \end{cases} \) is continuous for all \( x \) in \( \mathbb{R} \), are
(a) \( p = \frac{5}{2}, q = \frac{1}{2} \) (b) \( p = -\frac{3}{2}, q = \frac{1}{2} \)
(c) \( p = \frac{1}{2}, q = \frac{3}{2} \) (d) \( p = \frac{1}{2}, q = -\frac{3}{2} \)
\[2011\]

29. Let \( f : \mathbb{R} \rightarrow [0, \infty) \) be such that \( \lim_{x \to 5} f(x) \) exists and
\( \lim_{x \to 5} \left( \frac{f(x)}{x-5} \right)^2 - 9 = 0 \). Then \( \lim_{x \to 5} f(x) \) equals:
(a) 0 (b) 1 (c) 2 (d) 3
\[2011\]

30. If \( f : \mathbb{R} \rightarrow \mathbb{R} \) is a function defined by \( f(x) = [x] \cos \left( \frac{2x-1}{2} \right) \pi \), where \([x]\) denotes the greatest integer function, then \( f \) is:
(a) continuous for every real \( x \).
(b) discontinuous only at \( x = 0 \)
(c) discontinuous only at non-zero integral values of \( x \).
(d) continuous only at \( x = 0 \).
\[2012\]

31. Consider the function \( f(x) = |x - 2| + |x - 5|, x \in \mathbb{R} \).
Statement-1: \( f'(4) = 0 \)
Statement-2: \( f \) is continuous in \([2,5]\), differentiable in \((2,5)\) and \( f(2) = f(5) \).
\[2012\]

(a) Statement-1 is false, Statement-2 is true.
(b) Statement-1 is true, Statement-2 is true; statement-2 is a correct explanation for Statement-1.
(c) Statement-1 is true, Statement-2 is true; statement-2 is not a correct explanation for Statement-1.
(d) Statement-1 is true, Statement-2 is false.

32. \( \lim_{x \to 0} \frac{(1 - \cos 2x)(3 + \cos x)}{x \tan 4x} \) is equal to:
(a) \( \frac{1}{4} \) (b) \( \frac{1}{2} \) (c) 1 (d) 2
\[2013\]

33. \( \lim_{x \to 0} \frac{\sin(\pi x^2)}{x^2} \) is equal to:
(a) \( -\pi \) (b) \( \pi \) (c) \( \frac{\pi}{2} \) (d) 1
\[2014\]

34. \( \lim_{x \to 0} \frac{(1 - \cos 2x)(3 + \cos x)}{x \tan 4x} \) is equal to:
(a) 2 (b) \( \frac{1}{2} \) (c) 4 (d) 3
\[2015\]

35. If the function \( g(x) = \begin{cases} k \sqrt{x + 1}, & 0 \leq x \leq 3 \\ m x + 2, & 3 < x \leq 5 \end{cases} \) is differentiable, then the value of \( k + m \) is:
\[2015\]

(a) \( \frac{10}{3} \) (b) 4 (c) 2 (d) \( \frac{16}{5} \)

36. For \( x \in \mathbb{R} \), \( f(x) = [\log 2 - \sin x] \) and \( g(x) = f(f(x)) \), then:
\[2016\]

(a) \( g'(0) = -\cos \log 2 \)
(b) \( g \) is differentiable at \( x = 0 \) and \( g'(0) = -\sin \log 2 \)
(c) \( g \) is not differentiable at \( x = 0 \)
(d) \( g'(0) = \cos \log 2 \)

37. \( \lim_{n \to \infty} \left( \frac{(n+1)(n+2)\ldots2n}{n^{2n}} \right)^{\frac{1}{n}} \) is equal to:
\[2016\]

(a) \( \frac{9}{e^2} \) (b) \( 3 \log 3 - 2 \)
(c) \( \frac{18}{e^4} \) (d) \( \frac{27}{e^2} \)

38. Let \( p = \lim_{x \to 0^+} \left( 1 + \tan^2 2\sqrt{x} \right)^{\frac{1}{2x}} \). Then \( \log p \) is equal to:
\[2016\]

(a) \( \frac{1}{2} \) (b) \( \frac{1}{4} \)
(c) 2 (d) 1
CHAPTER 12

Differentiation

Section-A

A Fill in the Blanks

1. If \( y = f \left( \frac{2x-1}{x^2+1} \right) \) and \( f'(x) = \sin x^2 \), then \( \frac{dy}{dx} = \) ................. (1982 - 2 Marks)

2. If \( f_r(x), g_r(x), h_r(x), r = 1, 2, 3 \) are polynomials in \( x \) such that \( f_1(a) = g_1(a) = h_1(a), r = 1, 2, 3 \)
   and \( F(x) = \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ g_1(x) & g_2(x) & g_3(x) \\ h_1(x) & h_2(x) & h_3(x) \end{vmatrix} \) then \( F'(x) \) at \( x = a \) is ................. (1985 - 2 Marks)

3. If \( f(x) = \log_x \ln x \), then \( f'(x) \) at \( x = e \) is ................. (1985 - 2 Marks)

4. The derivative of \( \sec^{-1} \left( \frac{1}{2x^2 - 1} \right) \) with respect to \( \sqrt{1 - x^2} \) at \( x = \frac{1}{2} \) is ................. (1986 - 2 Marks)

5. If \( f(x) = |x - 2| \) and \( g(x) = f[f(x)] \), then \( g'(x) = \) ................. for \( x > 20 \) (1990 - 2 Marks)

6. If \( xe^{xy} = y + \sin^2 x \), then at \( x = 0 \), \( \frac{dy}{dx} = \) ................. (1996 - 1 Mark)

B True/ False

1. The derivative of an even function is always an odd function. (1983 - 1 Mark)

C MCQs with One Correct Answer

1. If \( y^2 = P(x) \), a polynomial of degree 3, then
   \[ 2 \frac{d}{dx} \left( y^3 \frac{d^2 y}{dx^2} \right) \] equals \( \) ................. (1988 - 2 Marks)

2. Let \( f(x) \) be a quadratic expression which is positive for all the real values of \( x \). If \( g(x) = f(x) + f'(x) + f''(x) \), then for any real \( x \),
   \( \) ................. (1990 - 2 Marks)
   \[ \begin{array}{ll}
   (a) & g(x) < 0 \\
   (b) & g(x) > 0 \\
   (c) & g(x) = 0 \\
   (d) & g(x) \geq 0
   \end{array} \]

3. If \( y = (\sin x)\tan x \), then \( \frac{dy}{dx} \) is equal to \( \) ................. (1994)
   \[ \begin{array}{ll}
   (a) & (\sin x)^n \tan x (1 + \sec^2 x \log \sin x) \\
   (b) & \tan x (\sin x)^n \tan x^{-1} \cos x \\
   (c) & (\sin x)^n \tan x \sec^2 x \log \sin x \\
   (d) & (\tan x (\sin x)^n \tan x^{-1} \\
   \end{array} \]

4. If \( x^2 + y^2 = 1 \) then
   \( \) ................. (2000)
   \[ \begin{array}{ll}
   (a) & yy'' - 2(\gamma^2 + 1) = 0 \\
   (b) & yy'' + (\gamma^2 + 1) = 0 \\
   (c) & \gamma'' + (\gamma^2 + 1) = 0 \\
   (d) & \gamma'' + 2(\gamma^2 + 1) = 0
   \end{array} \]

5. Let \( f: (0, \infty) \to R \) and \( F(x) = \int_0^x f(t) \, dt \). If \( F(x^2) = x^2(1 + x) \),
   then \( f(4) \) equals \( \) ................. (2001S)
   \[ \begin{array}{ll}
   (a) & 5/4 \\
   (b) & 7 \\
   (c) & 4 \\
   (d) & 2
   \end{array} \]

6. If \( y \) is a function of \( x \) and \( \log (x + y) - 2xy = 0 \), then the value of \( y'(0) \) is equal to \( \) ................. (2004S)
   \[ \begin{array}{ll}
   (a) & 1 \\
   (b) & -1 \\
   (c) & 2 \\
   (d) & 0
   \end{array} \]

7. If \( f(x) \) is a twice differentiable function and given that \( f(1) = 1, f(2) = 4, f(3) = 9 \), then \( \) ................. (2005S)
   \[ \begin{array}{ll}
   (a) & f''(x) = 2 \quad \forall \quad x \in (1, 3) \\
   (b) & f''(x) = f'(x) = 5 \quad \text{for some } x \in (2, 3) \\
   (c) & f''(x) = 3 \quad \forall \quad x \in (2, 3) \\
   (d) & f''(x) = 2 \quad \text{for some } x \in (1, 3)
   \end{array} \]

8. \( \frac{d^2 x}{dy^2} \) equals \( \) ................. (2007 - 3 marks)
   \[ \begin{array}{ll}
   (a) & \left( \frac{d^2 y}{dx^2} \right)^{-1} \\
   (b) & -\left( \frac{d^2 y}{dx^2} \right)^{-1} \left( \frac{dy}{dx} \right)^{-3} \\
   (c) & \left( \frac{d^2 y}{dx^2} \right)^{-2} \left( \frac{dy}{dx} \right)^{-2} \\
   (d) & -\left( \frac{d^2 y}{dx^2} \right)^{-1} \left( \frac{dy}{dx} \right)^{-3}
   \end{array} \]
9. Let $g(x) = \log f(x)$ where $f(x)$ is twice differentiable positive function on $(0, \infty)$ such that $f(x + 1) = xf(x)$. Then, for $N=1, 2, 3, \ldots$ 
\begin{align*}
g''\left(N+\frac{1}{2}\right) - g''\left(\frac{1}{2}\right) &= \\
(a) \quad & -4\left\{1+\frac{1}{9}+\frac{1}{25}+\ldots+\frac{1}{(2N-1)^2}\right\} \\
(b) \quad & 4\left\{1+\frac{1}{9}+\frac{1}{25}+\ldots+\frac{1}{(2N-1)^2}\right\} \\
(c) \quad & -4\left\{1+\frac{1}{9}+\frac{1}{25}+\ldots+\frac{1}{(2N+1)^2}\right\} \\
(d) \quad & 4\left\{1+\frac{1}{9}+\frac{1}{25}+\ldots+\frac{1}{(2N+1)^2}\right\} \tag{2008}
\end{align*}

3. Given $y = \frac{5x}{3\sqrt{(1-x)^2}} + \cos^2 (2x + 1)$; Find $\frac{dy}{dx}$ \hspace{1cm} (1980)

4. Let $y = e^x \sin x^3 + (\tan x)^2$. Find $\frac{dy}{dx}$ \hspace{1cm} (1981 - 2 Marks)

5. Let $f$ be a twice differentiable function such that $f''(x) = -f(x)$ and $f'(x) = g(x)$, $h(x) = [f(x)]^2 + [g(x)]^2$ 

Find $h(10)$ if $h(5) = 11$ \hspace{1cm} (1982 - 3 Marks)

6. If $\alpha$ is a repeated root of a quadratic equation $f(x) = 0$ and $A(x)$, $B(x)$ and $C(x)$ be polynomials of degree 3, 4 and 5 respectively, then show that

\begin{align*}
\begin{bmatrix}
A(x) & B(x) & C(x) \\
A(\alpha) & B(\alpha) & C(\alpha) \\
A'(\alpha) & B'(\alpha) & C'(\alpha)
\end{bmatrix}
\end{align*}

is divisible by $f(x)$, where prime denotes the derivatives. \hspace{1cm} (1984 - 4 Marks)

7. If $x = \sec \theta - \cos \theta$ and $y = \sec^2 \theta - \cos^2 \theta$, then show that $(x^2 + 4) \left(\frac{dy}{dx}\right)^2 = n^2 (y^2 + 4)$ \hspace{1cm} (1989 - 2 Marks)

8. Find $\frac{dy}{dx}$ at $x = -1$, when 

\begin{align*}
\sin (y) \sqrt{\frac{\pi}{2}} + \frac{\sqrt{3}}{2} \sec^{-1} (2x) + 2^5 \tan (\ln(x + 2)) = 0
\end{align*}

\hspace{1cm} (1991 - 4 Marks)

9. If $y = \frac{ax^2}{(x-a)(x-b)(x-c)} + \frac{bx}{(x-b)(x-c)} - \frac{c}{x-c}$, prove that \hspace{1cm} (1998 - 8 Marks)

\begin{align*}
\frac{y'}{y} = \frac{1}{x} \left(\frac{a}{a-x} + \frac{b}{b-x} + \frac{c}{c-x}\right)
\end{align*}

\section*{D \hspace{1cm} MCQs with One or More than One Correct}

1. Let $f : \mathbb{R} \to \mathbb{R}$, $g : \mathbb{R} \to \mathbb{R}$ and $h : \mathbb{R} \to \mathbb{R}$ be differentiable functions such that $f(x) = x^3 + 3x + 2$, $g(f(x)) = x$ and $h(2g(x)) = x$ for all $x \in \mathbb{R}$. Then \hspace{1cm} (JEE Adv. 2016)

\begin{align*}
(a) \quad & g'(2) = \frac{1}{15} \\
(b) \quad & h'(1) = 666 \\
(c) \quad & h(0) = 16 \\
(d) \quad & h(2) = 36
\end{align*}

\section*{E \hspace{1cm} Subjective Problems}

1. Find the derivative of $\sin (x^2 + 1)$ with respect to $x$ from first principle. \hspace{1cm} (1978)

2. Find the derivative of

\begin{align*}
f(x) &= \begin{cases} 
\frac{x-1}{2x^2 - 7x + 5} & \text{when } x \neq 1 \\
\frac{1}{3} & \text{when } x = 1
\end{cases}
\end{align*}

at $x = 1$ \hspace{1cm} (1979)

\section*{H \hspace{1cm} Assertion & Reason Type Questions}

1. Let $f(x) = 2 + \cos x$ for all real $x$.

\textbf{STATEMENT - 1}: For each real $t$, there exists a point $c$ in $[t, t + \pi]$ such that $f'(c) = 0$ because

\textbf{STATEMENT - 2}: $f(t) = f(t + 2\pi)$ for each real $t$. \hspace{1cm} (2007 - 3 marks)

\begin{itemize}
\item[(a)] Statement - 1 is True, Statement - 2 is True; Statement - 2 is a correct explanation for Statement - 1
\item[(b)] Statement - 1 is True, Statement - 2 is True; Statement - 2 is NOT a correct explanation for Statement - 1
\item[(c)] Statement - 1 is True, Statement - 2 is False
\item[(d)] Statement - 1 is False, Statement - 2 is True.
\end{itemize}
2. Let \( f \) and \( g \) be real valued functions defined on interval \((-1, 1)\) such that \( g''(x) \) is continuous, \( g(0) \neq 0, \ g'(0) = 0, \ g''(0) \neq 0 \), and \( f(x) = g(x) \sin x \)

**STATEMENT - 1 :** \( \lim_{x \to 0} [g(x) \cot x - g(0) \cosec x] = f'(0) \)
and
**STATEMENT - 2 :** \( f'(0) = g(0) \)

(a) Statement - 1 is True, Statement - 2 is True; Statement - 2 is a correct explanation for Statement - 1
(b) Statement - 1 is True, Statement - 2 is True; Statement - 2 is NOT a correct explanation for Statement - 1
(c) Statement - 1 is True, Statement - 2 is False
(d) Statement - 1 is False, Statement - 2 is True

---

**Section-B**

**Integer Value Correct Type**

1. If the function \( f(x) = x^3 + x^2 \) and \( g(x) = f^{-1}(x) \), then the value of \( g'(1) \) is \( 2009 \)

2. Let \( f(\theta) = \sin \left( \tan^{-1} \left( \frac{\sin \theta}{\sqrt{\cos 2\theta}} \right) \right) \), where \( -\frac{\pi}{4} < \theta < \frac{\pi}{4} \).

Then the value of \( \frac{d}{d(\tan \theta)} (f(\theta)) \) is \( 2011 \)

---

1. If \( y = (x + \sqrt{1 + x^2})^2 \), then \( (1 + x^2) \frac{d^2 y}{dx^2} + \frac{dy}{dx} \) is \( 2002 \)

(a) \( n^2 y \) (b) \( -n^2 y \) (c) \( -y \) (d) \( 2x^2 y \)

2. If \( f(y) = e^y \), \( g(y) = y \), \( y > 0 \) and

\[ F(t) = \int_0^t f(t - y)g(y)dy, \]  then \( 2003 \)

(a) \( F(t) = te^{-t} \) (b) \( F(t) = 1 - te^{-t} (1 + t) \)
(c) \( F(t) = e^{-t} (1 + t) \) (d) \( F(t) = te^t \)

3. If \( f(x) = x^n \), then the value of \( 2003 \)

\[ f^{(n)}(1) = f^{(1)}(1) + f^{(2)}(1) - f^{(3)}(1) + \ldots + (-1)^n f^{(n)}(1) \]

(a) \( 1 \) (b) \( 2^n \) (c) \( 2^n - 1 \) (d) \( 0 \)

4. Let \( f(x) \) be a polynomial function of second degree. If \( f(1) = f(-1) \) and \( a, b, c \) are in A.P., then \( f'(a), f''(b), f'(c) \) are in

(a) Arithmetic - Geometric Progression (b) A.P (c) G.P (d) H.P.

5. If \( x = e^{y+e^y+e^{y+\ldots}} \), \( x > 0 \), then \( \frac{dy}{dx} \) is \( 2004 \)

(a) \( \frac{1 + x}{x} \) (b) \( \frac{1}{x} \) (c) \( \frac{1 - x}{x} \) (d) \( \frac{x}{1 + x} \)

6. The value of \( a \) for which the sum of the squares of the roots of the equation \( x^2 - (a - 2)x - a - 1 = 0 \) assume the least value is \( 2005 \)

(a) \( 1 \) (b) \( 0 \) (c) \( 3 \) (d) \( 2 \)

7. If the roots of the equation \( x^2 - bx + c = 0 \) be two consecutive integers, then \( b^2 - 4c \) equals \( 2005 \)

(a) \( -2 \) (b) \( 3 \) (c) \( 2 \) (d) \( 1 \)

8. Let \( f: \mathbb{R} \to \mathbb{R} \) be a differentiable function having \( f(2) = 6 \),

\( f'(2) = \frac{1}{48} \). Then \( \lim_{x \to 2} \int_2^{f(x)} \frac{4t^3}{x - 2} dt \) equals \( 2005 \)

(a) \( 24 \) (b) \( 36 \) (c) \( 12 \) (d) \( 18 \)

9. The set of points where \( f(x) = \frac{x}{1 + |x|} \) is differentiable is \( 2006 \)

(a) \( (-\infty, 0) \cup (0, \infty) \) (b) \( (-\infty, -1) \cup (-1, \infty) \)
(c) \( (-\infty, \infty) \) (d) \( (0, \infty) \)

10. If \( x^m y^n = (x + y)^{m+n} \), then \( \frac{dy}{dx} \) is \( 2006 \)

(a) \( \frac{y}{x} \) (b) \( \frac{x + y}{xy} \) (c) \( xy \) (d) \( \frac{x}{y} \)

11. Let \( y \) be an implicit function of \( x \) defined by \( x^2 - 2x \cot y - 1 = 0 \). Then \( y'(1) \) equals \( 2009 \)

(a) \( 1 \) (b) \( \log 2 \) (c) \( -\log 2 \) (d) \( -1 \)

12. Let \( f: (-1, 1) \to \mathbb{R} \) be a differentiable function with \( f(0) = -1 \) and \( f'(0) = 1 \). Let \( g(x) = [f(2f(x) + 2)]^2 \). Then \( g'(0) = \) \( 2010 \)

(a) \( -4 \) (b) \( 0 \) (c) \( -2 \) (d) \( 4 \)
13. \( \frac{d^2x}{dy^2} \) equals:

(a) \( -\left(\frac{d^2y}{dx^2}\right)^3 \left(\frac{dy}{dx}\right) \)
(b) \( \left(\frac{d^2y}{dx^2}\right)^3 \left(\frac{dy}{dx}\right)^2 \)
(c) \( -\left(\frac{d^2y}{dx^2}\right)^3 \left(\frac{dy}{dx}\right) \)
(d) \( \left(\frac{d^2y}{dx^2}\right)^3 \left(\frac{dy}{dx}\right)^{-1} \)

14. If \( y = \sec(\tan^{-1}x) \), then \( \frac{dy}{dx} \) at \( x = 1 \) is equal to:

(a) \( \frac{1}{\sqrt{2}} \)
(b) \( \frac{1}{2} \)
(c) \( 1 \)
(d) \( \sqrt{2} \)

15. If \( g \) is the inverse of a function \( f \) and \( f'(x) = \frac{1}{1+x^5} \), then \( g'(x) \) is equal to:

(a) \( \frac{1}{1+\{g(x)\}^5} \)
(b) \( 1+\{g(x)\}^5 \)
(c) \( 1+x^5 \)
(d) \( 5x^4 \)

16. If \( x = -1 \) and \( x = 2 \) are extreme points of \( f(x) = \alpha \log|x| + \beta x^2 + x \) then

(a) \( \alpha = 2, \beta = \frac{1}{2} \)
(b) \( \alpha = 2, \beta = \frac{1}{2} \)
(c) \( \alpha = -6, \beta = \frac{1}{2} \)
(d) \( \alpha = -6, \beta = -\frac{1}{2} \)
CHAPTER 13

Properties of Triangle

Section-A

JEE Advanced/ IIT-JEE

A. Fill in the Blanks

1. In a \( \triangle ABC \), \( \angle A = 90^\circ \) and \( AD \) is an altitude. Complete the relation

\[
\frac{BD}{BA} = \frac{AB}{(...)}
\]

(1980)

2. \( \triangle ABC \) is a triangle, \( P \) is a point on \( AB \), and \( Q \) is point on \( AC \) such that \( \angle AQP = \angle ABC \). Complete the relation

\[
\text{area of } \triangle AQP = \text{area of } \triangle ABC \times \frac{(...)}{AC^2}
\]

(1980)

3. \( \triangle ABC \) is a triangle with \( \angle B \) greater than \( \angle C \). \( D \) and \( E \) are points on \( BC \) such that \( AD \) is perpendicular to \( BC \) and \( AE \) is the bisector of angle \( A \). Complete the relation

\[
\angle DAE = \frac{1}{2} [ (\ldots) - \angle C ]
\]

(1980)

4. The set of all real numbers \( a \) such that \( a^2 + 2a, 2a + 3 \) and \( a^2 + 3a + 8 \) are the sides of a triangle is

(1985 - 2 Marks)

5. In a triangle \( \triangle ABC \), if \( \cot A, \cot B, \cot C \) are in A.P., then \( a^2, b^2, c^2 \), are in ................. progression. (1985 - 2 Marks)

6. A polygon of nine sides, each of length 2, is inscribed in a circle. The radius of the circle is

(1987 - 2 Marks)

7. If the angles of a triangle are 30\(^\circ\) and 45\(^\circ\) and the included side is \((\sqrt{3} + 1) \) cm, then the area of the triangle is

(1988 - 2 Marks)

8. If in a triangle \( \triangle ABC \),

\[
\frac{2\cos A}{a} + \frac{\cos B}{b} + \frac{2\cos C}{c} = \frac{a + b}{bc} + \frac{b}{ca},
\]

then the value of the angle \( A \) is ................. degrees. (1993 - 2 Marks)

9. In a triangle \( \triangle ABC \), \( AD \) is the altitude from \( A \). Given \( b > c \),

\[
\angle C = 23^\circ \text{ and } AD = \frac{abc}{b^2 - c^2}, \text{ then } \angle B = ..............
\]

(1994 - 2 Marks)

10. A circle is inscribed in an equilateral triangle of side \( a \). The area of any square inscribed in this circle is

(1994 - 2 Marks)

11. In a triangle \( \triangle ABC \), \( a : b : c = 4 : 5 : 6 \). The ratio of the radius of the circumcircle to that of the incircle is

(1996 - 1 Mark)

C. MCQs with One Correct Answer

1. If the bisector of the angle \( P \) of a triangle \( \triangle PQR \) meets \( QR \) in \( S \), then

(a) \( QS = SR \)  (b) \( QS : SR = PR : PQ \)  (c) \( QS : SR = PQ : PR \)  (d) None of these

(1979)

2. From the top of a light-house 60 metres high with its base at the sea-level, the angle of depression of a boat is 15\(^\circ\). The distance of the boat from the foot of the light house is

(1983 - 1 Mark)

(a) \( \frac{\sqrt{3} - 1}{\sqrt{3} + 1} \) 60 metres  (b) \( \frac{\sqrt{3} + 1}{\sqrt{3} - 1} \) 60 metres  (c) \( \frac{\sqrt{3} + 1}{\sqrt{3} - 1} \) 2 metres  (d) None of these

3. In a triangle \( \triangle ABC \), angle \( A \) is greater than angle \( B \). If the measures of angles \( A \) and \( B \) satisfy the equation \( 3 \sin x - 4 \sin^3 x - k = 0 \), then the measure of angle \( C \) is

(1990 - 2 Marks)

(a) \( \frac{\pi}{3} \)  (b) \( \frac{\pi}{2} \)  (c) \( \frac{2\pi}{3} \)  (d) \( \frac{5\pi}{6} \)

4. If the lengths of the sides of triangle are 3, 5, 7 then the largest angle of the triangle is

(1994)

(a) \( \frac{\pi}{2} \)  (b) \( \frac{5\pi}{6} \)  (c) \( \frac{2\pi}{3} \)  (d) \( \frac{3\pi}{4} \)

5. In a triangle \( \triangle ABC \), \( \angle B = \frac{\pi}{3} \) and \( \angle C = \frac{\pi}{4} \). Let \( D \) divide \( BC \) internally in the ratio 1 : 3 then \( \frac{\sin \angle BAD}{\sin \angle CAD} \) is equal to

(1995 - S)

(a) \( \frac{1}{\sqrt{6}} \)  (b) \( \frac{1}{3} \)  (c) \( \frac{1}{\sqrt{3}} \)  (d) \( \frac{2}{\sqrt{3}} \)

6. In a triangle \( \triangle ABC \), \( 2ac \sin \frac{1}{2}(A - B + C) =

(2000 - S)

(a) \( a^2 + b^2 - c^2 \)  (b) \( c^2 + a^2 - b^2 \)  (c) \( b^2 - c^2 - a^2 \)  (d) \( c^2 - a^2 - b^2 \)
7. In a triangle \(ABC\), let \(\angle C = \frac{\pi}{2}\). If \(r\) is the inradius and \(R\) is the circumradius of the triangle, then \(2(r + R)\) is equal to \(2000S\)
(a) \(a + b\)  
(b) \(b + c\)  
(c) \(c + a\)  
(d) \(a + b + c\)
8. A pole stands vertically inside a triangular park \(\triangle ABC\). If the angle of elevation of the top of the pole from each corner of the park is same, then in \(\triangle ABC\) the foot of the pole is at \(2000S\)
(a) centroid  
(b) circumcentre  
(c) incentre  
(d) orthocentre
9. A man from the top of a 100 metres high tower sees a car moving towards the tower at an angle of depression of 30\(^\circ\). After some time, the angle of depression becomes 60\(^\circ\). The distance (in metres) travelled by the car during this time is \(2001S\)
(a) \(100\sqrt{3}\)  
(b) \(200\sqrt{3}\)  
(c) \(100\sqrt{3}/3\)  
(d) \(200\sqrt{3}/3\)
10. Which of the following pieces of data does NOT uniquely determine an acute-angled triangle \(ABC\) (\(R\) being the radius of the circumcircle)? \(2002S\)
(a) \(a, \sin A, \sin B\)  
(b) \(a, b, c\)  
(c) \(a, \sin B, R\)  
(d) \(a, \sin A, R\)
11. If the angles of a triangle are in the ratio \(4:1:1\), then the ratio of the longest side to the perimeter is \(2003S\)
(a) \(\sqrt{3}: (2 + \sqrt{3})\)  
(b) \(1:6\)  
(c) \(1:2 + \sqrt{3}\)  
(d) \(2:3\)
12. The sides of a triangle are in the ratio \(\sqrt{3}:2\), then the angles of the triangle are in the ratio \(2004S\)
(a) \(1:3:5\)  
(b) \(2:3:4\)  
(c) \(3:2:1\)  
(d) \(1:2:3\)
13. In an equilateral triangle, 3 coins of radii 1 unit each are kept so that they touch each other and also the sides of the triangle. Area of the triangle is \(2005S\)
(a) \(4 + 2\sqrt{3}\)  
(b) \(6 + 4\sqrt{3}\)  
(c) \(12 + 7\sqrt{3}/4\)  
(d) \(3 + 7\sqrt{3}/4\)
14. In a triangle \(ABC\), \(a, b, c\) are the lengths of its sides and \(A, B, C\) are the angles of triangle \(ABC\). The correct relation is given by \(2005S\)
(a) \((b-c)\sin\left(\frac{B-C}{2}\right) = a\cos\frac{A}{2}\)  
(b) \((b-c)\cos\left(\frac{A}{2}\right) = a\sin\frac{B-C}{2}\)  
(c) \((b+c)\sin\left(\frac{B+C}{2}\right) = a\cos\frac{A}{2}\)  
(d) \((b-c)\cos\frac{A}{2} = 2a\sin\frac{B+C}{2}\)
15. One angle of an isosceles \(\triangle\) is 120\(^\circ\) and radius of its incircle \(= \sqrt{3}\). Then the area of the triangle in sq. units is \(2006 - 3M, -1\)
(a) \(7 + 12\sqrt{3}\)  
(b) \(12 - 7\sqrt{3}\)  
(c) \(12 + 7\sqrt{3}\)  
(d) \(4\pi\)
16. Let \(ABCD\) be a quadrilateral with area 18, with side \(AB\) parallel to the side \(CD\) and \(2AB = CD\). Let \(AD\) be perpendicular to \(AB\) and \(CD\). If a circle is drawn inside the quadrilateral \(ABCD\) touching all the sides, then its radius is \(2007 - 3\) marks
(a) \(3\)  
(b) \(2\)  
(c) \(\frac{3}{2}\)  
(d) \(1\)
17. If the angles A, B and C of a triangle are in an arithmetic progression and if \(a, b\) and \(c\) denote the lengths of the sides opposite to A, B and C respectively, then the value of the expression \(\frac{a\sin 2C + c\sin 2A}{a\sin C}\) is \(2010\)
(a) \(\frac{1}{2}\)  
(b) \(\frac{\sqrt{3}}{2}\)  
(c) \(1\)  
(d) \(\sqrt{3}\)
18. Let \(PQR\) be a triangle of area \(A\) with \(a = 2\), \(b = \frac{7}{2}\) and \(c = \frac{5}{2}\); where \(a, b,\) and \(c\) are the lengths of the sides of the triangle opposite to the angles at \(P, Q\) and \(R\) respectively. Then equals. \(2012\)
\(\frac{2\sin P - \sin 2P}{2\sin P + \sin 2P}\)
(a) \(\frac{3}{4A}\)  
(b) \(\frac{45}{4A}\)  
(c) \(\left(\frac{3}{4A}\right)^2\)  
(d) \(\left(\frac{45}{4A}\right)^2\)
19. In a triangle the sum of two sides is \(x\) and the product of the same sides is \(y\). If \(x^2 - c^2 = y\), where \(c\) is the third side of the triangle, then the ratio of the in radius to the circum-radius of the triangle is \(JEE\) Adv. 2014
(a) \(\frac{3y}{2x(x+c)}\)  
(b) \(\frac{3y}{2c(x+c)}\)  
(c) \(\frac{3y}{4x(x+c)}\)  
(d) \(\frac{3y}{4c(x+c)}\)

**MCQs with One or More than One Correct**

1. There exists a triangle \(ABC\) satisfying the conditions
(a) \(b\sin A = a, A < \pi/2\) \(1986 - 2\) Marks
(b) \(b\sin A > a, A > \pi/2\)
(c) \(b\sin A > a, A < \pi/2\)
(d) \(b\sin A < a, A < \pi/2, b > a\)
(e) \(b\sin A < a, A > \pi/2, b = a\)
2. In a triangle, the lengths of the two larger sides are 10 and 9, respectively. If the angles are in A.P. Then the length of the third side can be

\[ \text{(1987 - 2 Marks)} \]

(a) \( 5 - \sqrt{6} \) \hspace{1cm} (b) \( 3\sqrt{3} \)

(c) 5 \hspace{1cm} (d) \( 5 + \sqrt{6} \) \hspace{1cm} (e) none

3. If in a triangle \( PQR \), \( \sin P, \sin Q, \sin R \) are in A.P., then the altitudes are in A.P. \( \text{(1998 - 2 Marks)} \)

(a) \( \text{the altitudes are in A.P.} \) \hspace{1cm} (b) \( \text{the altitudes are in H.P.} \)

(c) \( \text{the medians are in G.P.} \) \hspace{1cm} (d) \( \text{the medians are in A.P.} \)

4. Let \( A_0A_1A_2A_3A_4A_5 \) be a regular hexagon inscribed in a circle of unit radius. Then the product of the lengths of the line segments \( A_0A_1, A_0A_2, A_0A_3 \) is \( \text{(1998 - 2 Marks)} \)

(a) \( \frac{3}{4} \) \hspace{1cm} (b) \( 3\sqrt{3} \) \hspace{1cm} (c) 3 \hspace{1cm} (d) \( \frac{3\sqrt{3}}{2} \)

5. In \( \triangle ABC \), internal angle bisector of \( \angle A \) meets side \( BC \) in \( D \). \( DE \perp AD \) meets \( AC \) in \( E \) and \( AB \) in \( F \). Then \( \text{(2006 - 5M, -I)} \)

(a) \( AE \) is HM of \( b \) and \( c \) \hspace{1cm} (b) \( AD = \frac{2bc}{b+c} \cos \frac{A}{2} \)

(c) \( EF = \frac{4bc}{b+c} \sin \frac{A}{2} \) \hspace{1cm} (d) \( \triangle AEF \) is isosceles

6. Let \( ABC \) be a triangle such that \( \angle ACB = \frac{\pi}{6} \) and let \( a, b \) and \( c \) denote the lengths of the sides opposite to \( A, B \) and \( C \) respectively. The value(s) of \( x \) for which \( a = x^2 + x + 1 \), \( b = x^2 - 1 \) and \( c = 2x + 1 \) is (are) \( \text{(2010)} \)

(a) \( -2 + \sqrt{3} \) \hspace{1cm} (b) \( 1 + \sqrt{3} \)

(c) \( 2 + \sqrt{3} \) \hspace{1cm} (d) \( 4\sqrt{3} \)

7. In a triangle \( PQR \), \( P \) is the largest angle and \( \cos P = \frac{1}{3} \). Further the incircle of the triangle touches the sides \( PQ, QR \) and \( RP \) at \( N, L \) and \( M \) respectively, such that the lengths of \( PN, QL \) and \( RM \) are consecutive even integers. Then possible length(s) of the side(s) of the triangle is (are) \( \text{(JEE Adv. 2013)} \)

(a) 16 \hspace{1cm} (b) 18 \hspace{1cm} (c) 24 \hspace{1cm} (d) 22

8. In a triangle \( XYZ \), let \( x, y, z \) be the lengths of sides opposite to the angles \( X, Y, Z \), respectively, and \( 2s = x + y + z \). If \( \frac{s-x}{4} = \frac{s-y}{3} = \frac{s-z}{2} \) and area of incircle of the triangle \( XYZ \) is \( \frac{8\pi}{3} \), then \( \text{(JEE Adv. 2016)} \)

(a) area of the triangle \( XYZ \) is \( 6\sqrt{6} \)

(b) the radius of circumcircle of the triangle \( XYZ \) is \( \frac{35}{6} \sqrt{6} \)

(c) \( \frac{X}{2} \sin \frac{Y}{2} \sin \frac{Z}{2} = \frac{4}{35} \)

(d) \( \sin^2 \left( \frac{X+Y}{2} \right) = \frac{3}{5} \)

\[ \text{(E)} \]

**Subjective Problems**

1. A triangle \( ABC \) has sides \( AB = AC = 5 \text{ cm} \) and \( BC = 6 \text{ cm} \). Triangle \( A'B'C' \) is the reflection of the triangle \( ABC \) in a line parallel to \( AB \) placed at a distance 2 cm from \( AB \), outside the triangle \( ABC \). Triangle \( A''B''C'' \) is the reflection of the triangle \( A'B'C' \) in a line parallel to \( B'C' \) placed at a distance of 2 cm from \( B'C' \) outside the triangle \( A'B'C' \). Find the distance between \( A \) and \( A'' \). \( \text{(1978)} \)

2. (a) If a circle is inscribed in a right angled triangle \( ABC \) with the right angle at \( B \), show that the diameter of the circle is equal to \( AB + BC - AC \).

(b) If a triangle is inscribed in a circle, then the product of any two sides of the triangle is equal to the product of the diameter and the perpendicular distance of the third side from the opposite vertex. Prove the above statement. \( \text{(1979)} \)

3. (a) A balloon is observed simultaneously from three points \( A, B \) and \( C \) on a straight road directly beneath it. The angular elevation at \( B \) is twice that at \( A \) and the angular elevation at \( C \) is thrice that at \( A \). If the distance between \( A \) and \( B \) is \( a \) and the distance between \( B \) and \( C \) is \( b \), find the height of the balloon in terms of \( a \) and \( b \).

(b) Find the area of the smaller part of a disc of radius 10 cm, cut off by a chord \( AB \) which subtends an angle of \( 22 \frac{1}{2}^\circ \) at the circumference. \( \text{(1979)} \)

4. \( ABC \) is a triangle. \( D \) is the middle point of \( BC \). If \( AD \) is perpendicular to \( AC \), then prove that \( \text{(1980)} \)

\[ \cos A \cos C = \frac{2(c^2 - a^2)}{3ac} \]

5. \( ABC \) is a triangle with \( AB = AC \). \( D \) is any point on the side \( BC \). \( E \) and \( F \) are points on the side \( AB \) and \( AC \), respectively, such that \( DE \) is parallel to \( AC \), and \( DF \) is parallel to \( AB \). Prove that \( \text{(1980)} \)

\[ DF + FA + AE + ED = AB + AC \]

6. (i) \( PQ \) is a vertical tower. \( P \) is the foot and \( Q \) is the top of the tower. \( A, B, C \) are three points in the horizontal plane through \( P \). The angles of elevation of \( Q \) from \( A, B, C \) are equal, and each is equal to \( \theta \). The sides of the triangle \( ABC \) are \( a, b, c \); and the area of the triangle \( ABC \) is \( \Delta \). Show that the height of the tower is \( \text{(1980)} \)

\[ \frac{abc \tan \theta}{4\Delta} \]

(ii) \( AB \) is a vertical pole. The end \( A \) is on the level ground. \( C \) is the middle point of \( AB \). \( P \) is a point on the level ground. The portion \( CB \) subtends an angle \( \beta \) at \( P \). If \( \text{(1980)} \)

\[ AP = n \, AB, \text{ then show that } \tan \beta = \frac{n}{2n^2 + 1} \]

7. Let the angles \( A, B, C \) of a triangle \( ABC \) be in A.P. and let \( b: c = \sqrt{3} : \sqrt{2} \). Find the angle \( A \). \( \text{(1981 - 2 Marks)} \)
8. A vertical pole stands at a point \( Q \) on a horizontal ground. \( A \) and \( B \) are points on the ground, \( d \) meters apart. The pole subtends angles \( \alpha \) and \( \beta \) at \( A \) and \( B \) respectively. \( AB \) subtends an angle \( \gamma \) at \( Q \). Find the height of the pole.  
\((1982 - 3 \text{ Marks})\)

9. Four ships \( A, B, C \) and \( D \) are at sea in the following relative positions: \( B \) is on the straight line segment \( AC \). \( B \) is due North of \( D \) and \( D \) is due west of \( C \). The distance between \( B \) and \( D \) is 2 km. \( \angle BDA = 40^\circ, \angle BCD = 25^\circ \). What is the distance between \( A \) and \( D \)? (Take \( \sin 25^\circ = 0.423 \))  
\((1983 - 3 \text{ Marks})\)

10. The ex-radii \( r_1, r_2, r_3 \) of \( \Delta ABC \) are in H.P. Show that its sides \( a, b, c \) are in A.P.  
\((1983 - 3 \text{ Marks})\)

11. For a triangle \( ABC \) it is given that \( \cos A + \cos B + \cos C = \frac{3}{2} \).  
Prove that the triangle is equilateral.  
\((1984 - 4 \text{ Marks})\)

12. With usual notation, if in a triangle \( ABC \), \( \frac{b + c}{11} = \frac{c + a}{12} = \frac{a + b}{13} \) then prove that \( \frac{\cos A}{7} = \frac{\cos B}{19} = \frac{\cos C}{25} \).  
\((1984 - 4 \text{ Marks})\)

13. A ladder rests against a wall at an angle \( \alpha \) to the horizontal. Its foot is pulled away from the wall through a distance \( a \), so that it slides \( a \) distance \( b \) down the wall making an angle \( \beta \) with the horizontal. Show that \( a = b \tan \frac{1}{2} (\alpha + \beta) \).  
\((1985 - 5 \text{ Marks})\)

14. In a triangle \( ABC \), the median to the side \( BC \) is of length \( \frac{1}{\sqrt{11 - 6\sqrt{3}}} \).  
and it divides the angle \( A \) into angles \( 30^\circ \) and \( 45^\circ \). Find the length of the side \( BC \).  
\((1985 - 5 \text{ Marks})\)

15. If in a triangle \( ABC \), \( \cos A \cos B + \sin A \sin B \sin C = 1 \), Show that \( a : b : c = 1 : 1 : \sqrt{2} \).  
\((1986 - 5 \text{ Marks})\)

16. A sign-post in the form of an isosceles triangle \( ABC \) is mounted on a pole of height \( h \) fixed to the ground. The base \( BC \) of the triangle is parallel to the ground. A man standing on the ground at a distance \( d \) from the sign-post finds that the top vertex \( A \) of the triangle subtends an angle \( \beta \) and either of the other two vertices subtends the same angle \( \alpha \) at his feet. Find the area of the triangle.  
\((1988 - 5 \text{ Marks})\)

17. \( ABC \) is a triangular park with \( AB = AC = 100 \) m. A television tower stands at the midpoint of \( BC \). The angles of elevation of the top of the tower at \( A, B, C \) are \( 45^\circ, 60^\circ, 60^\circ \) respectively. Find the height of the tower.  
\((1989 - 5 \text{ Marks})\)

18. A vertical tower \( PQ \) stands at a point \( P \). Points \( A \) and \( B \) are located to the South and East of \( P \) respectively. \( M \) is the mid point of \( AB \). \( PAM \) is an equilateral triangle; and \( N \) is the foot of the perpendicular from \( P \) on \( AB \). Let \( AN = 20 \) metres and the angle of elevation of the top of the tower at \( N \) is \( \tan^{-1}(2) \). Determine the height of the tower and the angles of elevation of the top of the tower at \( A \) and \( B \).  
\((1990 - 4 \text{ Marks})\)

19. The sides of a triangle are three consecutive natural numbers and its largest angle is twice the smallest one. Determine the sides of the triangle.  
\((1991 - 4 \text{ Marks})\)

20. In a triangle of base \( a \) the ratio of the other two sides is \( r < 1 \). Show that the altitude of the triangle is less than \( \frac{ar}{1 - r^2} \).  
\((1991 - 4 \text{ Marks})\)

21. A man notices two objects in a straight line due west. After walking a distance \( c \) due north he observes that the objects subtend an angle \( \alpha \) at his eye; and, after walking a further distance \( 2c \) due north, an angle \( \beta \). Show that the distance between the objects is \( \frac{8c}{3 \cot \beta - \cot \alpha} \); the height of the man is being ignored.  
\((1991 - 4 \text{ Marks})\)

22. Three circles touch the one another externally. The tangent at their point of contact meet at a point whose distance from a point of contact is 4. Find the ratio of the product of the radii to the sum of the radii of the circles.  
\((1992 - 4 \text{ Marks})\)

23. An observer at \( O \) notices that the angle of elevation of the top of \( A \) is \( 30^\circ \). The line joining \( O \) to the base of the tower makes an angle of \( \tan^{-1}(1/\sqrt{2}) \) with the North and is inclined Eastwards. The observer travels a distance of 300 meters towards the North to a point \( A \) and finds the tower to his East. The angle of elevation of the top of the tower at \( A \) is \( \phi \). Find \( \phi \) and the height of the tower.  
\((1993 - 5 \text{ Marks})\)

24. A tower \( AB \) leans towards west making an angle \( \alpha \) with the vertical. The angular elevation of \( B \), the topmost point of the tower is \( \beta \) as observed from a point \( C \) due west of \( A \) at a distance \( d \) from \( A \). If the angular elevation of \( B \) from a point \( D \) due east of \( C \) at a distance \( 2d \) from \( C \) is \( \gamma \), then prove that \( 2 \tan \alpha = -\cot \beta + \cot \gamma \).  
\((1994 - 4 \text{ Marks})\)

25. Let \( A_1, A_2, \ldots, A_n \) be the vertices of an \( n \)-sided regular polygon such that \( \frac{1}{A_1A_2} = \frac{1}{A_1A_3} + \frac{1}{A_1A_4} \). Find the value of \( n \).  
\((1994 - 4 \text{ Marks})\)

26. Consider the following statements concerning a triangle \( ABC \)  
\((1994 - 5 \text{ Marks})\)

(i) The sides \( a, b, c \) and area \( \Delta \) are rational.

(ii) \( a, \tan \frac{B}{2}, \tan \frac{C}{2} \) are rational.

(iii) \( a, \sin A, \sin B, \sin C \) are rational.  
Prove that (i) \( \iff \) (ii) \( \iff \) (iii) \( \iff \) (i)

27. A bird flies in a circle on a horizontal plane. An observer stands at a point on the ground. Suppose \( 60^\circ \) and \( 30^\circ \) are the maximum and the minimum angles of elevation of the bird and that they occur when the bird is at the points \( P \) and \( Q \) respectively on its path. Let \( \theta \) be the angle of elevation of the bird when it is at a point on the arc of the circle exactly midway between \( P \) and \( Q \). Find the numerical value of \( \tan^2 \theta \). (Assume that the observer is not inside the vertical projection of the path of the bird.)  
\((1998 - 8 \text{ Marks})\)
28. Prove that a triangle $ABC$ is equilateral if and only if $\tan A + \tan B + \tan C = 3 \sqrt{3}$. (1998 - 8 Marks)

29. Let $ABC$ be a triangle having $O$ and $I$ as its circumcenter and in centre respectively. If $R$ and $r$ are the circumradius and the inradius, respectively, then prove that $(IO)^2 = R^2 - 2Rr$. Further show that the triangle $BIO$ is a right-angled triangle if and only if $b$ is arithmetic mean of $a$ and $c$. (1999 - 10 Marks)

30. Let $ABC$ be a triangle with incentre $I$ and inradius $r$. Let $D, E, F$ be the feet of the perpendiculars from $I$ to the sides $BC, CA$ and $AB$ respectively. If $r_1, r_2$ and $r_3$ are the radii of circles inscribed in the quadrilaterals $AFIE$, $BDIF$ and $CIEA$ respectively, prove that

$$\frac{r_1}{r-r_1} + \frac{r_2}{r-r_2} + \frac{r_3}{r-r_3} = \frac{r_1r_2r_3}{(r-r_1)(r-r_2)(r-r_3)},$$

(2000 - 7 Marks)

31. If $\Delta$ is the area of a triangle with side lengths $a, b, c$, then show that $\Delta \leq \frac{1}{4} \sqrt{(a+b+c)(a-b)(b-c)(c-a)}$. Also show that the equality occurs in the above inequality if and only if $a = b = c$. (2001 - 6 Marks)

---

**Section-B**

1. The sides of a triangle are $3x+4y$, $4x+3y$ and $5x+5y$ where $x, y > 0$ then the triangle is
   (a) right angled  (b) obtuse angled  (c) equilateral  (d) none of these
   [2002]

2. In a triangle with sides $a, b, c, r_1 > r_2 > r_3$ (which are the ex-radii) then
   (a) $a > b > c$  (b) $a > b > c$  (c) $a > b$ and $b < c$  (d) $a < b$ and $b > c$
   [2002]

3. The sum of the radii of inscribed and circumscribed circles for an $n$ sided regular polygon of side $a$, is
   (a) $\frac{a}{4} \cot \left(\frac{\pi}{2n}\right)$  (b) $a \cot \left(\frac{\pi}{n}\right)$  (c) $\frac{a}{2} \cot \left(\frac{\pi}{2n}\right)$  (d) $a \cot \left(\frac{\pi}{2n}\right)$
   [2003]

4. In a triangle $ABC$, medians $AD$ and $BE$ are drawn. If $AD = 4$,
   \[ \angle DAB = \frac{\pi}{6} \text{ and } \angle ABE = \frac{\pi}{3}, \]
   then the area of the $\Delta ABC$ is
   (a) $64 \frac{3}{3}$  (b) $32 \frac{8}{3}$  (c) $32 \frac{16}{3}$  (d) $32 \frac{32}{3\sqrt{3}}$
   [2003]

5. If in a $\Delta ABC$, $\cos^2 \left(\frac{C}{2}\right) + \cos^2 \left(\frac{A}{2}\right) = \frac{3b^2}{2}$, then the sides $a, b, c$
   (a) satisfy $a + b = c$  (b) are in A.P  (c) are in G.P  (d) are in H.P.
   [2003]

6. The sides of a triangle are $\sin \alpha, \cos \alpha$ and $\sqrt{1+\sin \alpha \cos \alpha}$ for some $0 < \alpha < \frac{\pi}{2}$. Then the greatest angle of the triangle is
   (a) $150^\circ$  (b) $90^\circ$  (c) $120^\circ$  (d) $60^\circ$
   [2004]

7. A person standing on the bank of a river observes that the angle of elevation of the top of a tree on the opposite bank of the river is $60^\circ$ and when he retires 40 meters away from the tree the angle of elevation becomes $30^\circ$. The breadth of the river is
   (a) 60 $m$  (b) 30 $m$  (c) 40 $m$  (d) 20 $m$
   [2004]

8. In a triangle $ABC$, let $\angle C = \frac{\pi}{2}$. If $r$ is the inradius and $R$ is the circumradius of the triangle $ABC$, then $2(r + R)$ equals
   (a) $b + c$  (b) $a + b$  (c) $a + b + c$  (d) $c + a$
   [2005]

9. If in a $\Delta ABC$, the altitudes from the vertices $A, B, C$ on opposite sides are in H.P, then sin $A, \sin B, \sin C$ are in
   (a) G.P  (b) A.P  (c) A.P-G.P  (d) H.P
   [2005]

10. A tower stands at the centre of a circular park. $A$ and $B$ are two points on the boundary of the park such that $AB (=a)$ subtends an angle of $60^\circ$ at the foot of the tower, and the angle of elevation of the top of the tower from $A$ or $B$ is $30^\circ$. The height of the tower is
    (a) $a/\sqrt{3}$  (b) $a\sqrt{3}$  (c) $2a/\sqrt{3}$  (d) $2a\sqrt{3}$
    [2007]
11. \( AB \) is a vertical pole with \( B \) at the ground level and \( A \) at the top. A man finds that the angle of elevation of the point \( A \) from a certain point \( C \) on the ground is 60°. He moves away from the pole along the line \( BC \) to a point \( D \) such that \( CD = 7 \) m. From \( D \) the angle of elevation of the point \( A \) is 45°. Then the height of the pole is \( \frac{\sqrt{3}}{2} \left( \frac{1}{\sqrt{3} - 1} \right) m \) \( \frac{7\sqrt{3}}{2} \) \( \frac{1}{\sqrt{3} + 1} m \) \( \frac{7\sqrt{3}}{2} \) \( \frac{(\sqrt{3} + 1)m}{2} \) \( \frac{7\sqrt{3}}{2} \) \( \frac{1}{\sqrt{3} + 1} m \) \[2008\]

12. For a regular polygon, let \( r \) and \( R \) be the radii of the inscribed and the circumscribed circles. A false statement among the following is \[2010\]

(a) There is a regular polygon with \( \frac{r}{R} = \frac{1}{\sqrt{2}} \)
(b) There is a regular polygon with \( \frac{r}{R} = \frac{2}{3} \)
(c) There is a regular polygon with \( \frac{r}{R} = \frac{\sqrt{3}}{2} \)
(d) There is a regular polygon with \( \frac{r}{R} = \frac{1}{2} \)

13. A bird is sitting on the top of a vertical pole 20 m high and its elevation from a point \( O \) on the ground is 45°. It flies off horizontally straight away from the point \( O \). After one second, the elevation of the bird from \( O \) is reduced to 30°. Then the speed (in m/s) of the bird is

(a) \( 20\sqrt{2} \)
(b) \( 20(\sqrt{3} - 1) \)
(c) \( 40(\sqrt{2} - 1) \)
(d) \( 40(\sqrt{3} - \sqrt{2}) \) \[JEE M 2014\]

14. If the angles of elevation of the top of a tower from three collinear points \( A, B \) and \( C \), on a line leading to the foot of the tower, are 30°, 45° and 60° respectively, then the ratio, \( AB : BC \), is:

(a) \( 1 : \sqrt{3} \)
(b) \( 2 : 3 \)
(c) \( \sqrt{3} : 1 \)
(d) \( \sqrt{3} : \sqrt{2} \) \[JEE M 2015\]
CHAPTER 14

Inverse Trigonometric Functions

Section-A

A Fill in the Blanks

1. Let a, b, c be positive real numbers. Let
\[ \theta = \tan^{-1} \sqrt{\frac{a(a+b+c)}{bc}} + \tan^{-1} \sqrt{\frac{b(a+b+c)}{ca}} + \tan^{-1} \sqrt{\frac{c(a+b+c)}{ab}}. \]

Then \( \tan \theta = \ldots \) \( (1981 - 2 \text{ Marks}) \)

2. The numerical value of \( \tan \left[ 2 \tan^{-1} \left( \frac{1}{3} \right) - \frac{\pi}{4} \right] \) is equal to \ldots \( (1984 - 2 \text{ Marks}) \)

3. The greater of the two angles \( A = 2 \tan^{-1} (2 \sqrt{2} - 1) \) and \( B = 3 \sin^{-1} (1/3) + \sin^{-1} (3/5) \) is \ldots \( (1989 - 2 \text{ Marks}) \)

B MCQs with One Correct Answer

1. The value of \( \tan \left[ \cos^{-1} \left( \frac{4}{5} \right) + \tan^{-1} \left( \frac{2}{3} \right) \right] \) is \( (1983 - 1 \text{ Mark}) \)
   (a) \( \frac{6}{17} \) (b) \( \frac{7}{16} \) (c) \( \frac{16}{7} \) (d) none

2. If we consider only the principle values of the inverse trigonometric functions then the value of \( \tan \left( \cos^{-1} \frac{1}{2} - \sin^{-1} \frac{4}{17} \right) \) is \( (1994) \)
   (a) \( \frac{\sqrt{29}}{3} \) (b) \( \frac{29}{3} \) (c) \( \frac{\sqrt{3}}{29} \) (d) \( \frac{3}{29} \)

3. The number of real solutions of \( \tan^{-1} \sqrt{x(x+1)} + \sin^{-1} \sqrt{x^2 + x + 1} = \pi / 2 \) is \( (1999 - 2 \text{ Marks}) \)
   (a) zero (b) one (c) two (d) infinite

C MCQs with One or More than One Correct

1. The principal value of \( \sin^{-1} \left( \sin \frac{2\pi}{3} \right) \) is \( (1986 - 2 \text{ Marks}) \)
   (a) \( -\frac{2\pi}{3} \) (b) \( \frac{2\pi}{3} \) (c) \( \frac{4\pi}{3} \) (d) none

2. If \( \alpha = 3 \sin^{-1} \left( \frac{6}{11} \right) \) and \( \beta = 3 \cos^{-1} \left( \frac{4}{9} \right) \), where the inverse trigonometric functions take only the principal values, then the correct option(s) is (are) \( (JEE \text{ Adv. 2015}) \)
   (a) \( \cos \beta > 0 \) (b) \( \sin \beta < 0 \) (c) \( \cos(\alpha + \beta) > 0 \) (d) \( \cos \alpha < 0 \)
### E Subjective Problems

1. Find the value of: \[ \cos(2\cos^{-1}x + \sin^{-1}x) \] at \[ x = \frac{1}{5} \], where \[ 0 \leq \cos^{-1}x \leq \pi \] and \[ -\pi/2 \leq \sin^{-1}x \leq \pi/2 \].

(1981 - 2 Marks)

2. Find all the solution of \[ 4\cos^2x \sin x - 2\sin^2x = 3\sin x \] \( (1983 - 2 \text{ Marks}) \)

3. Prove that \[ \cos^{-1}\sin x \cot^{-1}x = \frac{\sqrt{x^2 + 1}}{\sqrt{x^2 + 2}} \]. \( (2002 - 5 \text{ Marks}) \)

### F Match the Following

**DIRECTIONS (Q. 1 & 2):** Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

#### Column II

<table>
<thead>
<tr>
<th></th>
<th>p</th>
<th>q</th>
<th>r</th>
<th>s</th>
<th>t</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>( p )</td>
<td>( q )</td>
<td>( r )</td>
<td>( s )</td>
<td>( t )</td>
</tr>
<tr>
<td>B</td>
<td>( p )</td>
<td>( q )</td>
<td>( r )</td>
<td>( s )</td>
<td>( t )</td>
</tr>
<tr>
<td>C</td>
<td>( p )</td>
<td>( q )</td>
<td>( r )</td>

<tr>
<td>D</td>
<td>( p )</td>
<td>( q )</td>
<td>( r )</td>
<td>( s )</td>
<td>( t )</td>
</tr>
</tbody>
</table>

#### Question 1

1. Match the following \( (2006 - 6M) \)

**Column I**

- \( \sum_{i=1}^{\infty} \tan^{-1} \left( \frac{1}{2i^2} \right) = t \), then \( t = \)

**Column II**

- (A) \( \sum_{i=1}^{\infty} \tan^{-1} \left( \frac{1}{2i^2} \right) = t \), then \( t = \)

- (B) Sides \( a, b, c \) of a triangle \( ABC \) are in AP and \( \cos \theta_1 = \frac{a}{b+c} \), \( \cos \theta_2 = \frac{b}{a+c} \), \( \cos \theta_3 = \frac{c}{a+b} \).

- then \( \tan^2 \left( \frac{\theta_1}{2} \right) + \tan^2 \left( \frac{\theta_3}{2} \right) = \)

- (C) A line is perpendicular to \( x + 2y + 2z = 0 \) and passes through \((0, 1, 0)\). The perpendicular distance of this line from the origin is \( \frac{2}{3} \).

#### Question 2

2. Let \( (x, y) \) be such that \( \sin^{-1}(ax) + \cos^{-1}(y) + \cos^{-1}(bx^y) = \frac{\pi}{2} \) \( (2007) \)

Match the statements in Column I with statements in Column II and indicate your answer by darkening the appropriate bubbles in the \( 4 \times 4 \) matrix given in the ORS.

**Column I**

- (A) If \( a = 1 \) and \( b = 0 \), then \((x, y)\)

- (B) If \( a = 1 \) and \( b = 1 \), then \((x, y)\)

- (C) If \( a = 1 \) and \( b = 2 \), then \((x, y)\)

- (D) If \( a = 2 \) and \( b = 2 \), then \((x, y)\)

**Column II**

- (p) lies on the circle \( x^2 + y^2 = 1 \)

- (q) lies on \( (x^2 - 1)(y^2 - 1) = 0 \)

- (r) lies on \( y = x \)

- (s) lies on \((4x^2 - 1)(y^2 - 1) = 0 \)
3. Match List I with List II and select the correct answer using the code given below the lists:  

**List I**

- \( P \), \( \left( \frac{1}{y^2} \left( \frac{\cos(\tan^{-1}y) + y\sin(\tan^{-1}y)}{\cot(\sin^{-1}y) + \tan(\sin^{-1}y)} \right)^2 + y^4 \right)^{1/2} \) takes value
- \( Q \), If \( \cos x + \cos y + \cos z = 0 = \sin x + \sin y + \sin z \) then possible value of \( \cos \frac{x-y}{2} \) is
- \( R \), If \( \cos \left( \frac{\pi}{4} - x \right) \cos 2x + \sin x \sin 2 \sec x = \cos x \sin 2x \sec x + \)
  \( \cos \left( \frac{\pi}{4} + x \right) \cos 2x \) then possible value of \( \sec x \) is
- \( S \), If \( \cot \left( \sin^{-1} \sqrt{1-x^2} \right) = \sin \left( \tan^{-1} \left( x \sqrt{6} \right) \right) \), \( x \neq 0 \), then possible value of \( x \) is

**List II**

- 1. \( \frac{1}{2} \sqrt[2]{3} \)
- 2. \( \sqrt{2} \)
- 3. \( \frac{1}{2} \)
- 4. \( 1 \)

**Codes:**

1. \( \cot^{-1}(\sqrt{\cos \alpha}) - \tan^{-1}(\sqrt{\cos \alpha}) = x \), then \( \sin x = \)
   (a) \( \tan \left( \frac{\alpha}{2} \right) \)
   (b) \( \cot \left( \frac{\alpha}{2} \right) \)
   (c) \( \tan \alpha \)
   (d) \( \cot \left( \frac{\alpha}{2} \right) \) [2002]

2. The trigonometric equation \( \sin^{-1} x = 2 \sin^{-1} a \) has a solution for
   (a) \( |a| \geq \frac{1}{\sqrt{2}} \)
   (b) \( \frac{1}{2} < |a| < \frac{1}{\sqrt{2}} \)
   (c) all real values of \( a \)
   (d) \( |a| < \frac{1}{2} \) [2003]

3. If \( \cos^{-1} x - \cos^{-1} \frac{y}{2} = \alpha \), then \( 4x^2 - 4xy \cos \alpha + y^2 \) is equal to
   (a) \( 2 \sin 2\alpha \)
   (b) \( 4 \)
   (c) \( 4 \sin^2 \alpha \)
   (d) \( -4 \sin^2 \alpha \) [2005]

4. If \( \sin^{-1} \left( \frac{x}{5} \right) + \cosec^{-1} \left( \frac{5}{4} \right) = \frac{\pi}{2} \), then the values of \( x \) is
   (a) \( 4 \)
   (b) \( 5 \)
   (c) \( 1 \)
   (d) \( 3 \) [2007]

5. The value of \( \cot \left( \sec^{-1} \frac{5}{3} + \tan^{-1} \frac{2}{3} \right) \) is
   (a) \( \frac{6}{17} \)
   (b) \( \frac{3}{17} \)
   (c) \( \frac{4}{17} \)
   (d) \( \frac{5}{17} \)

6. If \( x, y, z \) are in A.P. and \( \tan^{-1} x, \tan^{-1} y \) and \( \tan^{-1} z \) are also in A.P., then
   (a) \( x = y = z \)
   (b) \( 2x = 3y = 6z \)
   (c) \( 6x = 3y = 2z \)
   (d) \( 6x = 4y = 3z \) [JEE M 2013]

7. Let \( \tan^{-1} y = \tan^{-1} \frac{2x}{1-x^2} \), where \( |x| < \frac{1}{\sqrt{3}} \). Then a value of \( y \) is:
   (a) \( \frac{3x - x^3}{1 + 3x^2} \)
   (b) \( \frac{3x + x^3}{1 + 3x^2} \)
   (c) \( \frac{3x - x^3}{1 - 3x^2} \)
   (d) \( \frac{3x + x^3}{1 - 3x^2} \) [JEE M 2015]
CHAPTER 15
Matrices and Determinants

Section-A

A. Fill in the Blanks

1. Let \( p\lambda^4 + q\lambda^3 + r\lambda^2 + s\lambda + t = \lambda^2 + 3\lambda - 1 \lambda + 3 \)
   \( \lambda - 3 \lambda + 4 \lambda - 4 \)
   be an identity in \( \lambda \), where \( p, q, r, s \) and \( t \) are constants.
   Then, the value of \( t \) is ..................  
   \( (1981 - 2 \text{ Marks}) \)

2. The solution set of the equation
   \[
   \begin{vmatrix}
   1 & 4 & 20 \\
   1 & -2 & 5 \\
   1 & 2x & 5x^2 \\
   \end{vmatrix} = 0
   \]
   is ..................  
   \( (1981 - 2 \text{ Marks}) \)

3. A determinant is chosen at random from the set of all determinants of order 2 with elements 0 or 1 only. The probability that the value of determinant chosen is positive is .......... 
   \( (1982 - 2 \text{ Marks}) \)

4. Given that \( x = -9 \) is a root of
   \[
   \begin{vmatrix}
   x & 3 & 7 \\
   2 & x & 2 \\
   7 & 6 & x \\
   \end{vmatrix} = 0 \text{ the other}
   \]
   two roots are .......... and ..........  
   \( (1983 - 2 \text{ Marks}) \)

5. The system of equations
   \[
   \begin{align*}
   \lambda x + y + z &= 0 \\
   -x + \lambda y + z &= 0 \\
   -x - y + \lambda z &= 0 \\
   \end{align*}
   \]
   will have a non-zero solution if real values of \( \lambda \) are given by .......... 
   \( (1984 - 2 \text{ Marks}) \)

6. The value of the determinant
   \[
   \begin{vmatrix}
   1 & a & a^2 - bc \\
   1 & b & b^2 - ca \\
   1 & c & c^2 - ab \\
   \end{vmatrix}
   \]
   is ..................  
   \( (1988 - 2 \text{ Marks}) \)

7. For positive numbers \( x, y \) and \( z \), the numerical value of the determinant
   \[
   \begin{vmatrix}
   \log_x y & \log_x z \\
   \log_y x & 1 \\
   \log_z x & \log_y z \\
   \end{vmatrix}
   \]
   is ..................  
   \( (1993 - 2 \text{ Marks}) \)

B. True/False

1. The determinants
   \[
   \begin{vmatrix}
   1 & a & a^2 \\
   1 & b & b^2 \\
   1 & c & c^2 \\
   \end{vmatrix}
   \]
   are not identically equal.  
   \( (1988 - 2 \text{ Marks}) \)

2. If
   \[
   \begin{vmatrix}
   x_1 & y_1 & 1 \\
   x_2 & y_2 & 1 \\
   x_3 & y_3 & 1 \\
   \end{vmatrix} = \begin{vmatrix}
   a_1 & b_1 & 1 \\
   a_2 & b_2 & 1 \\
   a_3 & b_3 & 1 \\
   \end{vmatrix}
   \]
   then the two triangles with vertices
   \( (x_1,y_1), (x_2,y_2), (x_3,y_3) \), and \( (a_1,b_1), (a_2,b_2), (a_3,b_3) \)
   must be congruent.  
   \( (1985 - 1 \text{ Mark}) \)

C. MCQs with One Correct Answer

1. Consider the set \( A \) of all determinants of order 3 with entries 0 or 1 only. Let \( B \) be the subset of \( A \) consisting of all determinants with value 1. Let \( C \) be the subset of \( A \) consisting of all determinants with value -1. Then
   (a) \( C \) is empty 
   (b) \( B \) has as many elements as \( C \) 
   (c) \( A = B \cup C \) 
   (d) \( B \) has twice as many elements as elements as \( C \) 

2. If \( \omega (\neq 1) \) is a cube root of unity, then
   \[
   \begin{vmatrix}
   1 & 1+i+\omega^2 & \omega^2 \\
   1-i & -1 & \omega^2-1 \\
   -i & -i+\omega-1 & -1 \\
   \end{vmatrix}
   \]
   \( (1995S) \)
   (a) 0 
   (b) 1 
   (c) i 
   (d) \( \omega \)

3. Let \( a, b, c \) be the real numbers. Then following system of equations in \( x, y \) and \( z \)
   \( (1995S) \)
   \[
   \begin{align*}
   \frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} &= 1, \\
   \frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} &= 1, \\
   -\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} &= 1
   \end{align*}
   \]
   has
   (a) no solution 
   (b) unique solution 
   (c) infinitely many solutions 
   (d) finitely many solutions
4. If $A$ and $B$ are square matrices of equal degree, then which one is correct among the followings? (1995S)
(a) $A + B = B + A$
(b) $A + B = A - B$
(c) $A - B = B - A$
(d) $AB = BA$

5. The parameter, on which the value of the determinant
$$\begin{vmatrix}
1 & a & a^2 \\
\cos(p-d)x & \cos px & \cos(p+d)x \\
\sin(p-d)x & \sin px & \sin(p+d)x \\
\end{vmatrix}$$
does not depend upon is (1997 - 2 Marks)
(a) $a$  (b) $p$  (c) $d$  (d) $x$

6. If $f(x) = \begin{vmatrix}
1 & x & x+1 \\
2x & x(x-1) & (x+1)x \\
3x(x-1) & x(x-1)(x-2) & (x+1)(x)(x-1) \\
\end{vmatrix}$
f(100) is equal to (1999 - 2 Marks)
(a) 0  (b) 1  (c) 100  (d) -100

7. If the system of equations
$x - ky - z = 0, \quad kx - y - z = 0, \quad x + y - z = 0$ has a non-zero solution, then the possible values of $k$ are (2000S)
(a) $-1, 2$  (b) $1, 2$  (c) $0, 1$  (d) $-1, 1$

8. Let $\omega = \frac{1}{2} + i \frac{\sqrt{3}}{2}$. Then the value of the determinant
$$\begin{vmatrix}
1 & 1 & 1 \\
1 & -1 - \omega & \omega^2 \\
1 & \omega & \omega^4 \\
\end{vmatrix}$$
is (2002S)
(a) $3\omega$  (b) $3\omega(\omega - 1)$  (c) $3\omega^2$  (d) $3\omega(1 - \omega)$

9. The number of values of $k$ for which the system of equations
$(k+1)x + 8y = 4k, \quad kx + (k+3)y = 3k - 1$ has infinitely many solutions is (2002S)
(a) 0  (b) 1  (c) 2  (d) infinite

10. If $A = \begin{bmatrix} \alpha & 0 \\ 1 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 0 \\ 5 & 1 \end{bmatrix}$, then value of $\alpha$ for which $A^2 = B$, is (2003S)
(a) 1  (b) -1  (c) 4  (d) no real values

11. If the system of equations $x + ay = 0, \quad az + y = 0$ and $ax + z = 0$ has infinite solutions, then the value of $a$ is (2003S)
(a) -1  (b) 1  (c) 0  (d) no real values

12. Given $2x - y + 2z = 2, \quad x - 2y + z = -4, \quad x + y + \lambda z = 4$
then the value of $\lambda$ such that the given system of equation has NO solution, is (2004S)
(a) 3  (b) 1  (c) 0  (d) -3

13. If $A = \begin{bmatrix} \alpha & 2 \\ 2 & \alpha \end{bmatrix}$ and $|A^3| = 125$ then the value of $\alpha$ is (2004S)
(a) $\pm 1$  (b) $\pm 2$  (c) $\pm 3$  (d) $\pm 5$

14. $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & -2 & 4 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$A^{-1} = \frac{1}{6}(A^2 + cA + dl)$, then the value of $c$ and $d$ are (2005S)
(a) $(-6, -11)$ (b) $(6, 11)$ (c) $(-6, 11)$ (d) $(6, -11)$

15. If $P = \begin{bmatrix} \sqrt{3} & 1 \\ 2 & \sqrt{3} \end{bmatrix}$ and $A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ and $Q = PAP^T$

$x = P^TQ^T P$ then $x$ is equal to (2005S)
(a) $\begin{bmatrix} 1 & 2005 \\ 0 & 1 \end{bmatrix}$
(b) $\begin{bmatrix} 4 + 2005\sqrt{3} & 6015 \\ 2005 & 4 - 2005\sqrt{3} \end{bmatrix}$
(c) $\begin{bmatrix} 3 & 1 \\ 0 & -2 \end{bmatrix}$
(d) $\begin{bmatrix} 2005 & 2 - \sqrt{3} \\ 2 + \sqrt{3} & 2005 \end{bmatrix}$

16. Consider three points
$P = (-\sin(\beta - \alpha), -\cos\beta), \quad Q = (\cos(\beta - \alpha), \sin\beta)$ and
$R = (\cos(\beta - \alpha + \theta), \sin(\beta - \theta))$, where $0 < \alpha, \beta, \theta < \frac{\pi}{4}$.

Then, (2008)
(a) $P$ lies on the line segment $RQ$
(b) $Q$ lies on the line segment $PR$
(c) $R$ lies on the line segment $QP$
(d) $P, Q, R$ are non-collinear

17. The number of $3 \times 3$ matrices $A$ whose entries are either 0 or 1 and for which the system $\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ has exactly two distinct solutions, is (2010)
(a) 0  (b) $2^3 - 1$  (c) 168  (d) 2
18. Let \( \omega \neq 1 \) be a cube root of unity and \( S \) be the set of all non-singular matrices of the form
\[
\begin{bmatrix}
1 & a & b \\
\omega & 1 & c \\
\omega^2 & \omega & 1
\end{bmatrix}
\]
where each of \( a, b \) and \( c \) is either \( \omega \) or \( \omega^2 \). Then the number of distinct matrices in the set \( S \) is \( 2011 \).

(a) 2   (b) 6   (c) 4   (d) 8

19. Let \( P = [a_{ij}] \) be a \( 3 \times 3 \) matrix and let \( Q = [b_{ij}] \), where \( b_{ij} = 2^{i+j} \) for \( 1 \leq i, j \leq 3 \). If the determinant of \( P \) is 2, then the determinant of the matrix \( Q \) is \( 2^{12} \).

(a) \( 2^{10} \) (b) \( 2^{11} \) (c) \( 2^{12} \) (d) \( 2^{13} \)

20. If \( P \) is a \( 3 \times 3 \) matrix such that \( P^T = P + I \), where \( P^T \) is the transpose of \( P \) and \( I \) is the \( 3 \times 3 \) identity matrix, then there exists a column matrix \( X = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \neq 0 \) such that
\[
P X = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \quad (2012)
\]

(a) \( PX = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \)  (b) \( PX = X \)
(c) \( PX = 2X \)  (d) \( PX = -X \)

21. Let \( P = \begin{bmatrix} 1 & 0 & 0 \\ 4 & 1 & 0 \\ 16 & 4 & 1 \end{bmatrix} \) and \( I \) be the identity matrix of order 3. If \( Q = [q_{ij}] \) is a matrix such that \( P^5 - Q = I \), then \( q_{11} + q_{33} = q_{21} \).

(a) 52   (b) 103   (c) 201   (d) 205

D  MCQs with One or More Than One Correct

1. The determinant \[
\begin{vmatrix}
a & b & a \alpha + b \\
b & c & b \alpha + c \\
a \alpha + b & b \alpha + c & 0
\end{vmatrix}
\]
is equal to \( 1986 - 2 \) Marks
zero, if
(a) \( a, b, c \) are in A. P.
(b) \( a, b, c \) are in G. P.
(c) \( a, b, c \) are in H. P.
(d) \( \alpha \) is a root of the equation \( ax^2 + bx + c = 0 \)
(e) \( (x - \alpha) \) is a factor of \( ax^2 + 2bx + c \).

2. If \[
\begin{vmatrix}
6i & -3i & 1 \\
4 & 3i & -1 \\
20 & 3 & i
\end{vmatrix} = x + iy, \text{ then} \quad (1998 - 2 \text{ Marks})
\]
(a) \( x = 3, y = 1 \)  (b) \( x = 1, y = 3 \)
(c) \( x = 0, y = 3 \)  (d) \( x = 0, y = 0 \)

3. Let \( M \) and \( N \) be two \( 3 \times 3 \) non-singular skew-symmetric matrices such that \( MN = NM \). If \( P^T \) denotes the transpose of \( P \), then \( M^2N^2 \left( M^TN\right)^{-1} (MN^{-1})^T \) is equal to \( 2011 \).

(a) \( M^2 \)  (b) \( -N^2 \)  (c) \( -M^2 \)  (d) \( MN \)

4. If the adjoint of a \( 3 \times 3 \) matrix \( P \) is
\[
\begin{bmatrix} 1 & 4 & 4 \\ 2 & 1 & 7 \\ 1 & 1 & 3 \end{bmatrix}, \text{ then the possible value(s) of the determinant of } P \text{ is (are) } (2012)
\]
(a) \(-2\)  (b) \(-1\)  (c) \(1\)  (d) \(2\)

5. For \( 3 \times 3 \) matrices \( M \) and \( N \), which of the following statement(s) is (are) NOT correct? \( JEE \text{ Adv. 2013} \)
(a) \( N^T M N \) is symmetric or skew symmetric, according as \( M \) is symmetric or skew symmetric
(b) \( MN - NM \) is skew symmetric for all symmetric matrices \( M \) and \( N \)
(c) \( MN \) is symmetric for all symmetric matrices \( M \) and \( N \)
(d) \( \text{adj}(M)(\text{adj}(N)) = \text{adj}(MN) \) for all invertible matrices \( M \) and \( N \)

6. Let \( \omega \) be a complex cube root of unity with \( \omega \neq 1 \) and \( P = [p_{ij}] \) be a \( n \times n \) matrix with \( p_{ij} = \omega^{i+j} \). Then \( p^2 \neq 0 \), when \( n = JEE \text{ Adv. 2013} \)
(a) 57   (b) 55   (c) 58   (d) 56

7. Let \( M \) be a \( 2 \times 2 \) symmetric matrix with integer entries. Then \( M \) is invertible if \( JEE \text{ Adv. 2014} \)
(a) The first column of \( M \) is the transpose of the second row of \( M \)
(b) The second row of \( M \) is the transpose of the first column of \( M \)
(c) \( M \) is a diagonal matrix with non-zero entries in the main diagonal
(d) The product of entries in the main diagonal of \( M \) is not the square of an integer

8. Let \( M \) and \( N \) be two \( 3 \times 3 \) matrices such that \( MN = NM \). Further, if \( M \neq N^2 \) and \( M^2 = N^4 \), then \( JEE \text{ Adv. 2014} \)
(a) \( \text{determinant of } (M^2 + MN^2) = 0 \)
(b) there is \( 3 \times 3 \) non-zero matrix \( U \) such that \( (M^2 + MN^2)U \) is the zero matrix
(c) \( \text{determinant of } (M^2 + MN^2) \geq 1 \)
(d) for a \( 3 \times 3 \) matrix \( U \), if \( (M^2 + MN^2)U \) equals the zero matrix then \( U \) is the zero matrix
9. Which of the following values of $\alpha$ satisfy the equation

$$\begin{vmatrix} (1+\alpha)^2 & (1+2\alpha)^2 & (1+3\alpha)^2 \\ (2+\alpha)^2 & (2+2\alpha)^2 & (2+3\alpha)^2 \\ (3+\alpha)^2 & (3+2\alpha)^2 & (3+3\alpha)^2 \end{vmatrix} = -648\alpha?$$

(JEE Adv. 2015)

(a) $-4$  (b) $9$  (c) $-9$  (d) $4$

10. Let $X$ and $Y$ be two arbitrary, $3 \times 3$, non-zero, skew-symmetric matrices and $Z$ be an arbitrary $3 \times 3$, non-zero, symmetric matrix. Then which of the following matrices is (are) skew symmetric?

(JEE Adv. 2015)

(a) $X^3Z^2 - Z^4Y^3$  (b) $X^{44} + Y^{44}$
(c) $X^4Z^3 - Z^3X^4$  (d) $X^{23} + Y^{23}$

11. Let $P = \begin{bmatrix} 3 & -1 & -2 \\ 2 & 0 & \alpha \\ 3 & -5 & 0 \end{bmatrix}$, where $\alpha \in \mathbb{R}$. Suppose $Q = [q_{ij}]$ is a matrix such that $PQ = kI$, where $k \in \mathbb{R}$, $k \neq 0$ and $I$ is the identity matrix of order 3. If $q_{23} = -\frac{k}{8}$ and $\det(Q) = \frac{k^2}{2}$, then

(JEE Adv. 2016)

(a) $a = 0, k = 8$  (b) $4a - k + 8 = 0$
(c) $\det(P) = 2^9$  (d) $\det(Q) = 2^{13}$

12. Let $a, \lambda, \mu \in \mathbb{R}$. Consider the system of linear equations

$$ax + 2y = \lambda$$

$$3x - 2y = \mu$$

Which of the following statement(s) is (are) correct?

(JEE Adv. 2016)

(a) If $a = -3$, then the system has infinitely many solutions for all values of $\lambda$ and $\mu$.
(b) If $a \neq -3$, then the system has a unique solution for all values of $\lambda$ and $\mu$.
(c) If $\lambda + \mu = 0$, then the system has infinitely many solutions for $a = -3$.
(d) If $\lambda + \mu \neq 0$, then the system has no solution for $a = -3$.

### Subjective Problems

1. For what value of $k$ do the following system of equations possess non trivial (i.e., not all zero) solution over the set of rationals $Q$?

$$x + ky + 3z = 0$$

$$3x + ky - 2z = 0$$

$$2x + 3y - 4z = 0$$

For that value of $k$, find all the solutions for the system.

(1979)

2. Let $a, b, c$ be positive and not all equal. Show that the value of the determinant

$$\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$$

is negative.

(1981 - 4 Marks)

3. Without expanding a determinant at any stage, show that

$$\begin{vmatrix} x^2 & x & 1 \\ 2x^2 & 3 & 1 \end{vmatrix} = 3$$

$$\begin{vmatrix} x^2 & 1 & 2 \\ 2x^2 & 3 & 1 \end{vmatrix} = xA + B$$

where $A$ and $B$ are determinants of order 3 not involving $x$.

(1982 - 5 Marks)

4. Show that

$$\begin{vmatrix} x & x & x \cr y & y & y \cr z & z & z \end{vmatrix} = \begin{vmatrix} x_{r+1} & x_{r+2} \\ y_{r+1} & y_{r+2} \\ z_{r+1} & z_{r+2} \end{vmatrix}$$

(1985 - 2 Marks)

5. Consider the system of linear equations in $x, y, z$:

$$\begin{align*}
\sin 30^\circ & \quad x - y + z = 0 \\
\cos 20^\circ & \quad x + 3y - 2z = 0 \\
2x + 7y + 7z & = 0
\end{align*}$$

Find the values of $\theta$ for which this system has nontrivial solutions.

(1986 - 5 Marks)

6. Let $\Delta a = \begin{vmatrix} a-1 & n & 6 \\ (a-1)^2 & 2n & 4n-2 \\ (a-1)^3 & 3n^2 & 3n^2-3n \end{vmatrix}$

Show that $\sum_{a=1}^{n} \Delta a = c$, a constant.

(1989 - 5 Marks)

7. Let the three digit numbers $AB9, 389$, and $62C$, where $A$, $B$, and $C$ are integers between 0 and 9, be divisible by a fixed integer $k$. Show that the determinant $A \begin{vmatrix} 3 & 6 \\ 8 & 9 \end{vmatrix}$ is divisible by $k$.

(1990 - 4 Marks)

8. If $a \neq p$, $b \neq q$, $c \neq r$ and

$$\begin{vmatrix} p & b & c \\ a & q & c \\ a & b & r \end{vmatrix} = 0.$$ 

Then find the value of $\frac{p}{p-a} + \frac{q}{q-b} + \frac{r}{r-c}$.

(1991 - 4 Marks)

9. For a fixed positive integer $n$, if

$$D = \begin{vmatrix} n & (n+1)! & (n+2)! \\ (n+1)! & (n+2)! & (n+3)! \\ (n+2)! & (n+3)! & (n+4)! \end{vmatrix}$$

then show that $\frac{D}{(n!)^3} - 4$ is divisible by $n$.

(1992 - 4 Marks)
10. Let \( \lambda \) and \( \alpha \) be real. Find the set of all values of \( \lambda \) for which the system of linear equations
\[
\lambda x + (\sin \alpha) y + (\cos \alpha) z = 0, \quad x + (\cos \alpha) y + (\sin \alpha) z = 0, \\
-x + (\sin \alpha) y - (\cos \alpha) z = 0
\]
has a non-trivial solution. For \( \lambda = 1 \), find all values of \( \alpha \).
(1993 - 5 Marks)

11. For all values of \( A, B, C \) and \( P, Q, R \), show that
\[
\begin{vmatrix}
\cos(A-P) & \cos(A-Q) & \cos(A-R) \\
\cos(B-P) & \cos(B-Q) & \cos(B-R) \\
\cos(C-P) & \cos(C-Q) & \cos(C-R)
\end{vmatrix} = 0
\]
(1994 - 4 Marks)

12. Let \( a > 0, \ d > 0 \). Find the value of the determinant
\[
\begin{vmatrix}
1 & \frac{1}{a} & \frac{1}{a(a+d)} \\
1 & \frac{1}{a+d} & \frac{1}{(a+d)(a+2d)} \\
1 & \frac{1}{a+2d} & \frac{1}{(a+2d)(a+3d)}
\end{vmatrix}
\]
(1996 - 5 Marks)

13. Prove that for all values of \( \theta \),
\[
\begin{vmatrix}
\sin \theta & \cos \theta & \sin 2\theta \\
\sin(\theta + \frac{2\pi}{3}) & \cos(\theta + \frac{2\pi}{3}) & \sin(2\theta + \frac{2\pi}{3}) \\
\sin(\theta - \frac{2\pi}{3}) & \cos(\theta - \frac{2\pi}{3}) & \sin(2\theta - \frac{2\pi}{3})
\end{vmatrix} = 0
\]
(2000 - 3 Marks)

14. If matrix \( A = \begin{bmatrix} a & b & c \\ c & a & b \end{bmatrix} \) where \( a, b, c \) are real positive numbers, \( abc = 1 \) and \( A^T A = I \), then find the value of \( a^3 + b^3 + c^3 \).
(2003 - 2 Marks)

15. If \( M \) is a \( 3 \times 3 \) matrix, where \( \text{det} M = 1 \) and \( MM^T = I \), where ‘I’ is an identity matrix, prove that \( \text{det} (M - I) = 0 \).
(2004 - 2 Marks)

16. If \( A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, B = \begin{bmatrix} a & 1 \\ 1 & b \end{bmatrix}, U = \begin{bmatrix} a^2 \\ g \end{bmatrix}, V = \begin{bmatrix} 0 \\ h \end{bmatrix}, X = \begin{bmatrix} x \\ y \end{bmatrix} \) and \( AX = U \) has infinitely many solutions, prove that \( BX = V \) has no unique solution. Also show that if \( x \neq 0 \), then \( BX = V \) has no solution.
(2004 - 4 Marks)

---

**Match the Following**

Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. Consider the lines given by
\[
L_1 : x + 3y - 5 = 0; L_2 : 3x - ky - 1 = 0; L_3 : 5x + 2y - 12 = 0
\]

Match the Statements / Expressions in Column I with the Statements / Expressions in Column II and indicate your answer by darkening the appropriate bubbles in the \( 4 \times 4 \) matrix given in the ORS.
(2008)

<table>
<thead>
<tr>
<th>Column I</th>
<th>Column II</th>
</tr>
</thead>
<tbody>
<tr>
<td>( A ) ( L_1, L_2, L_3 ) are concurrent, if</td>
<td>( p ) ( k = -9 )</td>
</tr>
<tr>
<td>( B ) One of ( L_1, L_2, L_3 ) is parallel to at least one of the other two, if</td>
<td>( q ) ( k = \frac{6}{5} )</td>
</tr>
<tr>
<td>( C ) ( L_1, L_2, L_3 ) from a triangle, if</td>
<td>( r ) ( k = \frac{5}{6} )</td>
</tr>
<tr>
<td>( D ) ( L_1, L_2, L_3 ) do not form a triangle, if</td>
<td>( s ) ( k = 5 )</td>
</tr>
</tbody>
</table>
2. Match the Statements/Expressions in Column I with the Statements/Expressions in Column II and indicate your answer by darkening the appropriate bubbles in the 4 × 4 matrix given in the ORS.

**Column I**

(A) The minimum value of \( \frac{x^2 + 2x + 4}{x + 2} \) is

(B) Let A and B be 3 × 3 matrices of real numbers, where A is symmetric, B is skew-symmetric, and \((A + B)(A - B) = (A - B)(A + B)\). If \((AB)^t = (-1)^k AB\), where \((AB)^t\) is the transpose of the matrix AB, then the possible values of \(k\) are

(C) Let \(a = \log_2 \log_3 2\). An integer \(k\) satisfying \(1 < 2^{(-k+3^a)} < 2\), must be less than

(D) If \(\sin \theta = \cos \phi\), then the possible values of \(\frac{1}{\pi} (\theta + \phi - \frac{\pi}{2})\) are

**Column II**

(p) 0

(q) 1

(r) 2

(s) 3

G  **Comprehension Based Questions**

**PASSAGE - 1**

Let \(A = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix}\), and \(U_1, U_2\) and \(U_3\) are columns of a 3 × 3 matrix \(U\). If column matrices \(U_1, U_2\) and \(U_3\) satisfying

\[ AU_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \quad AU_2 = \begin{bmatrix} 2 \\ 3 \\ 0 \end{bmatrix}, \quad AU_3 = \begin{bmatrix} 2 \\ 3 \\ 1 \end{bmatrix} \]
evaluate as directed in the following questions.

1. The value \([U]\) is \(2006 - 5M, -2\)

(a) 3

(b) -3

(c) \(\frac{3}{2}\)

(d) 2

2. The sum of the elements of the matrix \(U^{-1}\) is \(2006 - 5M, -2\)

(a) -1

(b) 0

(c) 1

(d) 3

3. The value of \(\begin{bmatrix} 3 \\ 2 \\ 0 \end{bmatrix} U \begin{bmatrix} 3 \\ 2 \\ 0 \end{bmatrix}\) is \(2006 - 5M, -2\)

(a) 5

(b) \(\frac{5}{2}\)

(c) 4

(d) \(\frac{3}{2}\)

**PASSAGE - 2**

Let \(\mathcal{S}\) be the set of all 3×3 symmetric matrices all of whose entries are either 0 or 1. Five of these entries are 1 and four of them are 0.

4. The number of matrices in \(\mathcal{S}\) is \(2009\)

(a) 12

(b) 6

(c) 9

(d) 3

5. The number of matrices \(A\) in \(\mathcal{S}\) for which the system of linear equations

\[ A \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \]

has a unique solution, is \(2009\)

(a) less than 4

(b) at least 4 but less than 7

(c) at least 7 but less than 10

(d) at least 10

6. The number of matrices \(A\) in \(\mathcal{S}\) for which the system of linear equations

\[ A \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \]

is inconsistent, is \(2009\)

(a) 0

(b) more than 2

(c) 2

(d) 1

**PASSAGE - 3**

Let \(p\) be an odd prime number and \(T_p\) be the following set of 2 × 2 matrices:

\[ T_p = \left\{ A = \begin{bmatrix} a & b \\ c & a \end{bmatrix} : a, b, c \in \{0, 1, 2, ..., p - 1\} \right\} \]

(2010)

7. The number of \(A\) in \(T_p\) such that \(A\) is either symmetric or skew-symmetric or both, and \(\det(A)\) divisible by \(p\) is \(2009\)

(a) \((p - 1)^2\)

(b) \(2(p - 1)\)

(c) \((p - 1)^2 + 1\)

(d) \(2p - 1\)

8. The number of \(A\) in \(T_p\) such that the trace of \(A\) is not divisible by \(p\) but \(\det(A)\) is divisible by \(p\) is \(\textbf{Note: The trace of a matrix is the sum of its diagonal entries.}\)

(a) \((p - 1)(p^2 - p + 1)\)

(b) \(p^3 - (p - 1)^2\)

(c) \((p - 1)^2\)

(d) \((p - 1)(p^2 - 2)\)

9. The number of \(A\) in \(T_p\) such that \(\det(A)\) is not divisible by \(p\) is \(\textbf{Note: The trace of a matrix is the sum of its diagonal entries.}\)

(a) \(2p^2\)

(b) \(p^3 - 5p\)

(c) \(p^3 - 3p\)

(d) \(p^3 - p^2\)
Let $a$, $b$ and $c$ be three real numbers satisfying $\begin{bmatrix} 1 & 9 & 7 \\ a & b & c \\ 7 & 3 & 7 \end{bmatrix} = [000] \quad \ldots (E)$

10. If the point $P(a, b, c)$, with reference to $(E)$, lies on the plane $2x + y + z = 1$, then the value of $7a + b + c$ is
   (a) 0  (b) 12  (c) 7  (d) 6

11. Let $\omega$ be a solution of $x^3 - 1 = 0$ with $\text{Im}(\omega) > 0$, if $a = 2$ with $b$ and $c$ satisfying $(E)$, then the value of $\frac{3}{\omega^a} + \frac{1}{\omega^b} + \frac{3}{\omega^c}$ is equal to
   (a) $-2$  (b) 2  (c) 3  (d) $-3$

12. Let $b = 6$, with $a$ and $c$ satisfying $(E)$. If $\alpha$ and $\beta$ are the roots of the quadratic equation $ax^2 + bx + c = 0$, then
   \[ \sum_{n=0}^{\infty} \left( \frac{1}{\alpha} + \frac{1}{\beta} \right)^n \]
   (a) 6  (b) 7  (c) $\frac{6}{7}$  (d) $\infty$

**Assertion & Reason Type Questions**

1. Consider the system of equations
   \[ \begin{align*}
   x - 2y + 3z &= -1 \\
   -x + y - 2z &= k \\
   x - 3y + 4z &= 1
   \end{align*} \]
   **STATEMENT - 1**: The system of equations has no solution for $k \neq 3$ and $k \neq 3$.
   **STATEMENT - 2**: The determinant $\begin{vmatrix} 1 & 3 & -1 \\ -1 & 2 & k \\ 1 & 4 & 1 \end{vmatrix} \neq 0$, for $k \neq 3$.
   (a) **STATEMENT - 1** is True, **STATEMENT - 2** is True; **STATEMENT - 2** is a correct explanation for **STATEMENT - 1**
   (b) **STATEMENT - 1** is True, **STATEMENT - 2** is True; **STATEMENT - 2** is NOT a correct explanation for **STATEMENT - 1**
   (c) **STATEMENT - 1** is True, **STATEMENT - 2** is False
   (d) **STATEMENT - 1** is False, **STATEMENT - 2** is True

2. Let $k$ be a positive real number and let
   \[ A = \begin{bmatrix} 2k - 1 & 2\sqrt{k} & 2\sqrt{k} \\ 2\sqrt{k} & 1 & -2k \\ -2\sqrt{k} & 2k & -1 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 0 & 2k - 1 & \sqrt{k} \\ 2\sqrt{k} & 1 & -2k \\ -\sqrt{k} & 2\sqrt{k} & 0 \end{bmatrix} \]
   If $\det(adj\ A) + \det(adj\ B) = 10^6$, then $[k]$ is equal to
   (a) $3^3$  (b) $3^5$  (c) $3^7$  (d) $3^9$

3. Let $M$ be a $3 \times 3$ matrix satisfying
   \[ \begin{bmatrix} 0 & -1 & 1 \\ 1 & 2 & 0 \\ 0 & 3 & -1 \end{bmatrix}, \quad M = \begin{bmatrix} 1 & 1 \\ 0 & 0 \\ 1 & 2 \end{bmatrix}. \text{ and } M = \begin{bmatrix} 1 & 1 \\ 0 & 0 \\ 1 & 2 \end{bmatrix}. \]
   Then the sum of the diagonal entries of $M$ is $10$.

4. The total number of distinct $x \in \mathbb{R}$ for which
   \[ \begin{vmatrix} x & x^2 & 1 + x^3 \\ 2x & 4x^2 & 1 + 8x^3 \\ 3x & 9x^2 & 1 + 27x^3 \end{vmatrix} = 10 \]
   is $10$. **(JEE Adv. 2016)**

5. Let $z = \frac{-1 + \sqrt{3}i}{2}$, where $i = \sqrt{-1}$, and $r, s \in \{1, 2, 3\}$. Let
   \[ P = \begin{bmatrix} (-z)^r & z^{2s} \\ z^{2s} & z^r \end{bmatrix} \]
   and $I$ be the identity matrix of order 2.
   Then the total number of ordered pairs $(r, s)$ for which $P^2 = -I$ is $10$, **(JEE Adv. 2016)**
1. If \( a > 0 \) and discriminant of \( ax^2 + 2bx + c \) is \(-ve\), then
\[
\begin{vmatrix}
 a & b & ax + b \\
 b & c & bx + c \\
 ax + b & bx + c & 0
\end{vmatrix}
\]
is equal to [2002]
(a) \(+ve\) \hspace{1cm} (b) \((ac-b^2)(ax^2+2bx+c)\) \\
(c) \(-ve\) \hspace{1cm} (d) 0

2. If the system of linear equations [2003]
\[
x + 2ay + az = 0 \quad ; \quad x + 3by + bz = 0 \quad ; \quad x + 4cy + cz = 0
\]
has a non-zero solution, then \(a, b, c\).
(a) satisfy \(a + 2b + 3c = 0\) \hspace{1cm} (b) are in A.P \\
(c) are in G.P \hspace{1cm} (d) are in H.P.

3. If \(1, \omega, \omega^2\) are the cube roots of unity, then
\[
\Delta = \begin{vmatrix}
 1 & \omega^n & \omega^{2n} \\
 \omega^n & \omega^{2n} & 1 \\
 \omega^{2n} & 1 & \omega^n
\end{vmatrix}
is equal to [2003]
(a) \(\omega^2\) \hspace{1cm} (b) 0 \hspace{1cm} (c) 1 \hspace{1cm} (d) \(\omega\)

4. If \( A = \begin{bmatrix} a & b \\ b & a \end{bmatrix} \) and \( A^2 = \begin{bmatrix} \alpha & \beta \\ \beta & \alpha \end{bmatrix} \), then [2003]
(a) \(\alpha = 2ab, \beta = a^2 + b^2\) \\
(b) \(\alpha = a^2 + b^2, \beta = ab\) \\
(c) \(\alpha = a^2 + b^2, \beta = 2ab\) \\
(d) \(\alpha = a^2 + b^2, \beta = a^2 - b^2\).

5. Let \( A = \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix} \). The only correct statement about the matrix \( A \) is [2004]
(a) \(A^2 = I\) \\
(b) \(A = (-1)I\), where \(I\) is a unit matrix \\
(c) \(A^{-1}\) does not exist \\
(d) \(A\) is a zero matrix

6. Let \( A = \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix} \) and \( 10B = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} \). If \( B \) is the inverse of matrix \( A \), then \(\alpha\) is [2004]
(a) 5 \hspace{1cm} (b) \(-1\) \hspace{1cm} (c) 2 \hspace{1cm} (d) \(-2\)

7. If \(a_1, a_2, a_3, \ldots, a_n, \ldots\) are in G.P., then the value of the determinant [2004]
\[
\begin{vmatrix}
 \log a_n & \log a_{n+1} & \log a_{n+2} \\
 \log a_{n+3} & \log a_{n+4} & \log a_{n+5} \\
 \log a_{n+6} & \log a_{n+7} & \log a_{n+8}
\end{vmatrix}
is equal to
(a) \(-2\) \hspace{1cm} (b) 1 \hspace{1cm} (c) \hspace{1cm} 2 \hspace{1cm} (d) 0

8. If \(A^2 - A - I = 0\), then the inverse of \(A\) is [2005]
(a) \(A + I\) \hspace{1cm} (b) \(A\) \hspace{1cm} (c) \(A - I\) \hspace{1cm} (d) \(1 - A\)

9. The system of equations [2005]
\[
\alpha x + y + z = \alpha - 1 \\
x + \alpha y + z = \alpha - 1 \\
x + y + \alpha z = \alpha - 1
\]
has infinite solutions, if \(\alpha\) is
(a) \(-2\) \hspace{1cm} (b) either \(-2\) or 1 \\
(c) not \(-2\) \hspace{1cm} (d) 1

10. If \(a_1^2 + b_2^2 + c^2 = -2\) and
\[
f(x) = \begin{vmatrix}
 1 + a^2 x & (1 + b^2) x & (1 + c^2) x \\
 (1 + a^2) x & 1 + b^2 x & (1 + c^2) x \\
 (1 + a^2) x & (1 + b^2) x & 1 + c^2 x
\end{vmatrix}
\]
then \(f(x)\) is a polynomial of degree
(a) 1 \hspace{1cm} (b) 0 \hspace{1cm} (c) 3 \hspace{1cm} (d) 2

11. If \(a_1, a_2, a_3, \ldots, a_n, \ldots\) are in G.P., then the determinant [2005]
\[
\Delta = \begin{vmatrix}
 \log a_n & \log a_{n+1} & \log a_{n+2} \\
 \log a_{n+3} & \log a_{n+4} & \log a_{n+5} \\
 \log a_{n+6} & \log a_{n+7} & \log a_{n+8}
\end{vmatrix}
is equal to
(a) 1 \hspace{1cm} (b) 0 \hspace{1cm} (c) 4 \hspace{1cm} (d) 2

12. If \(A\) and \(B\) are square matrices of size \(n \times n\) such that
\(A^2 - B^2 = (A - B)(A + B)\), then which of the following will always be true? [2006]
(a) \(A = B\) \\
(b) \(AB = BA\) \\
(c) either of \(A\) or \(B\) is a zero matrix \\
(d) either of \(A\) or \(B\) is identity matrix

13. Let \( A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \) and \( B = \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix} \), \(a, b \in N\). Then [2006]
(a) there cannot exist any \(B\) such that \(AB = BA\) \\
(b) there exist more then one but finite number of \(B\)'s such that \(AB = BA\)
(c) there exists exactly one B such that $AB = BA$
(d) there exist infinitely many B’s such that $AB = BA$

14. If $D = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$ for $x \neq 0, y \neq 0$, then $D$ is divisible by $x$ but not $y$.

(a) divisible by $x$ but not $y$  
(b) divisible by $y$ but not $x$  
(c) divisible by neither $x$ nor $y$  
(d) divisible by both $x$ and $y$

15. Let $A = \begin{vmatrix} 5 & 5a & \alpha \\ 0 & 5 & 0 \\ \alpha & 0 & 5 \end{vmatrix}$. If $|A^2| = 25$, then $|\alpha|$ equals

(a) 1/5  
(b) 5  
(c) $5^2$  
(d) 1

16. Let $A$ be a $2 \times 2$ matrix with real entries. Let $I$ be the $2 \times 2$ identity matrix. Denote by $tr(A)$, the sum of diagonal entries of $a$. Assume that $A^2 = I$.

**Statement-1**: If $A \neq I$ and $A \neq -I$, then $\det(A) = -1$

**Statement-2**: If $A \neq I$ and $A \neq -I$, then $tr(A) \neq 0$.

(a) Statement-1 is false, Statement-2 is true.
(b) Statement-1 is true, Statement-2 is false; Statement-2 is a correct explanation for Statement-1.

(c) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.
(d) Statement-1 is true, Statement-2 is false.

17. Let $a, b, c$ be any real numbers. Suppose that there are real numbers $x, y, z$ not all zero such that $x = cy + bz, y = az + cx$, and $z = bx + ay$. Then $a^2 + b^2 + c^2 + 2abc$ is equal to

(a) 2  
(b) $-1$  
(c) 0  
(d) 1

18. Let $A$ be a square matrix all of whose entries are integers. Then which one of the following is true? [2008]

(a) If $\det A = \pm 1$, then $A^{-1}$ exists but all its entries are not necessarily integers.
(b) If $\det A \neq \pm 1$, then $A^{-1}$ exists and all its entries are non-integers.
(c) If $\det A = \pm 1$, then $A^{-1}$ exists but all its entries are integers.
(d) If $\det A = \pm 1$, then $A^{-1}$ need not exist.

19. Let $A$ be a $2 \times 2$ matrix.

**Statement-1**: $\det(\text{adj} A) = A$

**Statement-2**: $|\det A| = |A|$

(a) Statement-1 is true, Statement-2 is true.
(b) Statement-1 is true, Statement-2 is not a correct explanation for Statement-1.
(c) Statement-1 is false, Statement-2 is false.
(d) Statement-1 is true, Statement-2 is true. Statement-2 is a correct explanation for Statement-1.

20. Let $a, b, c$ be such that $(a + c) \neq 0$ if

\[
\begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c+1 & c+1 \end{vmatrix} = 0, \quad a+1 \quad b+1 \quad c-1 \quad a-1 \quad b-1 \quad c+1 \quad (-1)^{n+2}a \quad (-1)^{n+1}b \quad (-1)^{n}c
\]

then the value of $n$ is:

(a) any even integer  
(b) any odd integer  
(c) any integer  
(d) zero

21. The number of $3 \times 3$ non-singular matrices, with four entries as 1 and all other entries as 0, is [2010]

(a) 5  
(b) 6  
(c) at least 7  
(d) less than 4

22. Let $A$ be a $2 \times 2$ matrix with non-zero entries and let $A^2 = I$, where $I$ is $2 \times 2$ identity matrix. Define $\text{Tr}(A)$ = sum of diagonal elements of $A$ and $|A|$ = determinant of matrix $A$.

**Statement-1**: $\text{Tr}(A) = 0$.

**Statement-2**: $|A| = 1$.

(a) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.

(b) Statement-1 is true, Statement-2 is false.

(c) Statement-1 is false, Statement-2 is true.

(d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.

23. Consider the system of linear equations;

\[
\begin{align*}
x_1 + 2x_2 + x_3 &= 3 \\
2x_1 + 3x_2 + x_3 &= 3 \\
3x_1 + 5x_2 + 2x_3 &= 1
\end{align*}
\]

The system has:

(a) exactly 3 solutions  
(b) a unique solution  
(c) no solution  
(d) infinite number of solutions

24. The number of values of $k$ for which the linear equations $4x + ky + 2z = 0$, $kx + 4y + z = 0$ and $2x + 2y + z = 0$ possess a non-zero solution is [2011]

(a) 2  
(b) 1  
(c) zero  
(d) 3

25. Let $A$ and $B$ be two symmetric matrices of order 3.

**Statement-1**: $(AB)A$ and $(BA)A$ are symmetric matrices.

**Statement-2**: $AB$ is symmetric matrix if matrix multiplication of $A$ with $B$ is commutative.

(a) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.

(b) Statement-1 is true, Statement-2 is false.

(c) Statement-1 is false, Statement-2 is true.

(d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.

26. Let $A = \begin{pmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{pmatrix}$. If $u_1$ and $u_2$ are column matrices such that $Au_1 = 1$ and $Au_2 = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$, then $u_1 + u_2$ is equal to:

(a) $\begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix}$  
(b) $\begin{pmatrix} 1 \\ -1 \\ 0 \end{pmatrix}$  
(c) $\begin{pmatrix} 1 \\ -1 \\ 0 \end{pmatrix}$  
(d) $\begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix}$

27. Let $P$ and $Q$ be $3 \times 3$ matrices $P \neq Q$. If $P^3 = Q^3$ and $P^2Q = Q^2P$ then determinant of $(P^2 + Q^2)$ is equal to: [2012]

(a) $-2$  
(b) 1  
(c) 0  
(d) $-1$
28. If \( P = \begin{bmatrix} 1 & \alpha & 3 \\ 1 & 3 & 3 \\ 2 & 4 & 4 \end{bmatrix} \) is the adjoint of a 3 \( \times \) 3 matrix \( A \) and \(|A| = 4\), then \( \alpha \) is equal to: 

(a) 4 \hspace{1cm} (b) 11 \hspace{1cm} (c) 5 \hspace{1cm} (d) 0 

29. If \( \alpha, \beta \neq 0 \) and \( f(n) = \alpha^n + \beta^n \) and 

\[
\begin{vmatrix} 3 & 1 + f(1) & 1 + f(2) \\ 1 + f(1) & 1 + f(2) & 1 + f(3) \\ 1 + f(2) & 1 + f(3) & 1 + f(4) \end{vmatrix} = K (1 - \alpha)^2 (1 - \beta)^2 (\alpha - \beta)^2 . \]

Then \( K \) is equal to: 

(a) 1 \hspace{1cm} (b) -1 \hspace{1cm} (c) \( \alpha \beta \) \hspace{1cm} (d) \( \frac{1}{\alpha \beta} \) 

30. If \( A \) is a 3 \( \times \) 3 non-singular matrix such that \( AA' = A'A \) and \( B = A^{-1}A' \), then \( BB' \) equals: 

(a) \( B^{-1} \) \hspace{1cm} (b) \( (B^{-1})' \) \hspace{1cm} (c) \( I + B \) \hspace{1cm} (d) \( I \) 

31. The set of all values of \( \lambda \) for which the system of linear equations: 

\[
\begin{align*}
2x_1 - 2x_2 + x_3 &= \lambda x_1 \\
2x_1 - 3x_2 + 2x_3 &= \lambda x_2 \\
x_1 + 2x_2 &= \lambda x_3
\end{align*}
\]

has a non-trivial solution 

(a) contains two elements 
(b) contains more than two elements 
(c) is an empty set 
(d) is a singleton 

32. If \( A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ 1 & 2 & b \end{bmatrix} \) is a matrix satisfying the equation \( AA' = 9I \), where \( I \) is 3 \( \times \) 3 identity matrix, then the ordered pair \((a, b)\) is equal to: 

(a) (2, 1) \hspace{1cm} (b) (-2, -1) \hspace{1cm} (c) (2, -1) \hspace{1cm} (d) (-2, 1) 

33. The system of linear equations 

\[
\begin{align*}
x + \lambda y - z &= 0 \\
\lambda x - y - z &= 0 \\
x + y - \lambda z &= 0
\end{align*}
\]

has a non-trivial solution for: 

(a) exactly two values of \( \lambda \) 
(b) exactly three values of \( \lambda \) 
(c) infinitely many values of \( \lambda \) 
(d) exactly one value of \( \lambda \) 

34. If \( A = \begin{bmatrix} 5a & -b \\ 3 & 2 \end{bmatrix} \) and \( A \) \( \text{adj} \) \( A = A A' \), then \( 5a + b \) is equal to: 

(a) 4 \hspace{1cm} (b) 13 \hspace{1cm} (c) -1 \hspace{1cm} (d) 5
CHAPTER 16

Applications of Derivatives

Section-A

A. Fill in the Blanks

1. The larger of \( \cos (\ln \theta) \) and \( \ln (\cos \theta) \) if \( e^{-\pi/2} < \theta < \frac{\pi}{2} \) is ___________.
   \((1983 - 1 \text{ Mark})\)

2. The function \( y = 2x^2 - \ln |x| \) is monotonically increasing for values of \( x \neq 0 \) satisfying the inequalities ___________ and monotonically decreasing for values of \( x \) satisfying the inequalities ___________.
   \((1983 - 2 \text{ Marks})\)

3. The set of all \( x \) for which \( \ln(1 + x) \leq x \) is equal to ___________.
   \((1987 - 2 \text{ Marks})\)

4. Let \( P \) be a variable point on the ellipse \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \) with foci \( F_1 \) and \( F_2 \). If \( A \) is the area of the triangle \( PF_1F_2 \), then the maximum value of \( A \) is ___________.
   \((1994 - 2 \text{ Marks})\)

5. Let \( C \) be the curve \( y^2 = 3x + 2 = 0 \). If \( H \) is the set of points on the curve \( C \) where the tangent is horizontal and \( V \) is the set of points on the curve \( C \) where the tangent is vertical, then \( H = \ldots \ldots \) and \( V = \ldots \ldots \).
   \((1994 - 2 \text{ Marks})\)

B. True / False

1. If \( x \rightarrow r \) is a factor of the polynomial \( f(x) = a_nx^n + \ldots + a_0 \), repeated \( m \) times (\( 1 < m \leq n \)), then \( r \) is a root of \( f'(x) = 0 \) repeated \( m \) times.
   \((1983 - 1 \text{ Mark})\)

2. For \( 0 < a < x \), the minimum value of the function \( \log_a x + \log_x a \) is 2.
   \((1984 - 1 \text{ Mark})\)

C. MCQs with One Correct Answer

1. If \( a + b + c = 0 \), then the quadratic equation \( 3ax^2 + 2bx + c = 0 \) has
   (a) at least one root in \([0, 1]\)
   (b) one root in \([2, 3]\) and the other in \([-2, -1]\)
   (c) imaginary roots
   (d) none of these
   \((1983 - 1 \text{ Mark})\)

2. \( AB \) is a diameter of a circle and \( C \) is any point on the circumference of the circle. Then
   (a) the area of \( \Delta ABC \) is maximum when it is isosceles
   (b) the area of \( \Delta ABC \) is minimum when it is isosceles
   (c) the perimeter of \( \Delta ABC \) is minimum when it is isosceles
   (d) none of these
   \((1983 - 1 \text{ Mark})\)

3. The normal to the curve \( x = a (\cos \theta + \theta \sin \theta) \), \( y = a (\sin \theta - \theta \cos \theta) \) at any point \( '0' \) is such that
   \((1983 - 1 \text{ Mark})\)
   (a) it makes a constant angle with the \( x \)-axis
   (b) it passes through the origin
   (c) it is at a constant distance from the origin
   (d) none of these

4. If \( y = a \ln x + bx^2 + x \) has its extremum values at \( x = -1 \) and \( x = 2 \), then
   \((1983 - 1 \text{ Mark})\)
   (a) \( a = 2, b = -1 \)
   (b) \( a = 2, b = -\frac{1}{2} \)
   (c) \( a = -2, b = \frac{1}{2} \)
   (d) none of these

5. Which one of the following curves cut the parabola \( y^2 = 4ax \) at right angles?
   \((1994)\)
   (a) \( x^2 + y^2 = a^2 \)
   (b) \( y = e^{-x^2} \)
   (c) \( y = ax \)
   (d) \( x^2 = 4ay \)

6. The function defined by \( f(x) = (x + 2) e^{-x} \) is
   \((1994)\)
   (a) decreasing for all \( x \)
   (b) decreasing in \((-\infty, -1)\) and increasing in \((-1, \infty)\)
   (c) increasing for all \( x \)
   (d) decreasing in \((-1, \infty)\) and increasing in \((-\infty, -1)\)

7. The function \( f(x) = \frac{\ln (\pi + x)}{\ln (e + x)} \) is
   \((1995S)\)
   (a) increasing on \((0, \infty)\)
   (b) decreasing on \((0, \infty)\)
   (c) increasing on \((0, \pi/e)\), decreasing on \((\pi/e, \infty)\)
   (d) decreasing on \((0, \pi/e)\), increasing on \((\pi/e, \infty)\)

8. On the interval \([0, 1]\) the function \( x^{25} (1 - x)^{75} \) takes its maximum value at the point
   \((1995S)\)
   (a) 0
   (b) \( \frac{1}{4} \)
   (c) \( \frac{1}{2} \)
   (d) \( \frac{1}{3} \)

9. The slope of the tangent to a curve \( y = f(x) \) at \([x, f(x)]\) is \( 2x + 1 \). If the curve passes through the point \((1, 2)\), then the area bounded by the curve, the \( x \)-axis and the line \( x = 1 \) is
   \((1995S)\)
   (a) \( \frac{5}{6} \)
   (b) \( \frac{6}{5} \)
   (c) \( \frac{1}{6} \)
   (d) 6
10. If \( f(x) = \frac{x}{\sin x} \) and \( g(x) = \frac{x}{\tan x} \), where \( 0 < x \leq 1 \), then in this interval (1997 - 2 Marks) 
(a) both \( f(x) \) and \( g(x) \) are increasing functions 
(b) both \( f(x) \) and \( g(x) \) are decreasing functions 
(c) \( f(x) \) is an increasing function 
(d) \( g(x) \) is an increasing function.

11. The function \( f(x) = \sin^4 x + \cos^4 x \) increases if (1999 - 2 Marks) 
(a) \( 0 < x < \pi/8 \) 
(b) \( \pi/4 < x < 3\pi/8 \) 
(c) \( 3\pi/8 < x < 5\pi/8 \) 
(d) \( 5\pi/8 < x < 3\pi/4 \)

12. Consider the following statements in S and R (2000S) 
S: Both \( \sin x \) and \( \cos x \) are decreasing functions in the interval \( \left[ \frac{\pi}{2}, \pi \right] \)
R: If a differentiable function decreases in an interval \( (a, b) \), then its derivative also decreases in \( (a, b) \). Which of the following is true? 
(a) Both S and R are correct 
(b) Both S and R are correct, but R is not the correct explanation of S 
(c) S is correct and R is the correct explanation for S 
(d) S is correct and R is wrong.

13. Let \( f(x) = \int e^x(1-x^2)dx \). Then \( f \) decreases in the interval (2000S) 
(a) \( (-\infty, -2) \) 
(b) \( (-2, -1) \) 
(c) \( (1, 2) \) 
(d) \( (2, +\infty) \)

14. If the normal to the curve \( y = f(x) \) at the point \( (3, 4) \) makes an angle \( \frac{3\pi}{4} \) with the positive x-axis, then \( f'(3) = \) (2000S) 
(a) \(-1\) 
(b) \(-\frac{3}{4}\) 
(c) \(\frac{4}{3}\) 
(d) \(1\)

15. Let \( f(x) = \begin{cases} \frac{x}{x} & \text{for } 0 < |x| \leq 2 \\ 1 & \text{for } x = 0 \end{cases} \) then at \( x = 0, f \) has 
(a) a local maximum 
(b) no local maximum 
(c) a local minimum 
(d) no extremum (2000S)

16. For all \( x \in (0,1) \) (2000S) 
(a) \( e^x < 1 + x \) 
(b) \( \log_e(1 + x) < x \) 
(c) \( \sin x > 0 \) 
(d) \( \log_e x > 0 \)

17. If \( f(x) = xe^{x(1-x)} \), then \( f(x) \) is (2001S) 
(a) increasing on \([-1/2, 1]\) 
(b) decreasing on \( R \) 
(c) increasing on \( R \) 
(d) decreasing on \([-1/2, 1] \)

18. The triangle formed by the tangent to the curve \( f(x) = x^2 + bx \) at the point \((1, 1)\) and the coordinate axes, lies in the first quadrant. If its area is 2, then the value of \( b \) is (2001S) 
(a) \(-1\) 
(b) \(3\) 
(c) \(-3\) 
(d) \(1\)

19. Let \( f(x) = (1 + b^2)x^2 + 2bx + 1 \) and let \( m(b) \) be the minimum value of \( f(x) \). As \( b \) varies, the range of \( m(b) \) is (2001S) 
(a) \([0, 1]\) 
(b) \((0, 1/2]\) 
(c) \([1/2, 1] \) 
(d) \((0, 1]\)

20. The length of the longest interval in which the function \( 3 \sin x - 4 \sin^3x \) is increasing, is (2002S) 
(a) \( \frac{\pi}{3} \) 
(b) \( \frac{\pi}{2} \) 
(c) \( \frac{3\pi}{2} \) 
(d) \( \pi \)

21. The point(s) on the curve \( y^3 + 3x^2 = 12y \) where the tangent is vertical, is (are) (2002S) 
(a) \( \left( \pm \frac{4}{\sqrt{3}}, -2 \right) \) 
(b) \( \left( \pm \frac{11}{3}, 1 \right) \) 
(c) \( (0, 0) \) 
(d) \( \left( \pm \frac{4}{\sqrt{3}}, 2 \right) \)

22. In \([0,1]\) Lagrange's Mean Value theorem is NOT applicable to (2003S) 
(a) \( f(x) = \begin{cases} \frac{1}{2} - x & x < \frac{1}{2} \\
(\frac{1}{2} - x)^2 & x \geq \frac{1}{2} \end{cases} \) 
(b) \( f(x) = \begin{cases} \sin x & x \neq 0 \\
1 & x = 0 \end{cases} \) 
(c) \( f(x) = x|x| \) 
(d) \( f(x) = |x| \)

23. Tangent is drawn to ellipse \( \frac{x^2}{27} + y^2 = 1 \) at \( \left(3\sqrt{3}\cos\theta, \sin\theta\right) \) (where \( \theta \in (0, \pi/2) \)). Then the value of \( \theta \) such that sum of intercepts on axes made by this tangent is minimum, is (2003S) 
(a) \( \pi/3 \) 
(b) \( \pi/6 \) 
(c) \( \pi/8 \) 
(d) \( \pi/4 \)

24. If \( f(x) = x^3 + bx^2 + cx + d \) and \( 0 < b^2 < c \), then in \(( -\infty, \infty) \) (2004S) 
(a) \( f(x) \) is a strictly increasing function 
(b) \( f(x) \) has a local maxima 
(c) \( f(x) \) is a strictly decreasing function 
(d) \( f(x) \) is bounded

25. If \( f(x) = x^\alpha \log x \) and \( f(0) = 0 \), then the value of \( \alpha \) for which Rolle's theorem can be applied in \([0, 1]\) is (2004S) 
(a) \(-2\) 
(b) \(-1\) 
(c) \(0\) 
(d) \(1/2\)

26. If \( P(x) \) is a polynomial of degree less than or equal to 2 and \( S \) is the set of all such polynomials so that \( P(0) = 0, P(1) = 1 \) and \( P(x) > 0 \) \( \forall x \in [0, 1] \), then (2005S) 
(a) \( S = \emptyset \) 
(b) \( S = ax + (1 - a)x^2 \) \( \forall a \in (0, 2) \) 
(c) \( S = ax + (1 - a)x^2 \) \( \forall a \in (0, \infty) \) 
(d) \( S = ax + (1 - a)x^2 \) \( \forall a \in (0, 1) \)

27. The tangent to the curve \( y = e^x \) drawn at the point \((c, e^c)\) intersects the line joining the points \((c - 1, e^{c-1})\) and \((c + 1, e^{c+1})\) (2007 - 3 marks) 
(a) on the left of \( x = c \) 
(b) on the right of \( x = c \) 
(c) at no point 
(d) at all points
Applications of Derivatives

28. Consider the two curves $C_1: y^2 = 4x$, $C_2: x^2 + y^2 - 6x + 1 = 0$. Then,
   (a) $C_1$ and $C_2$ touch each other only at one point. (2008)
   (b) $C_1$ and $C_2$ touch each other exactly at two points
   (c) $C_1$ and $C_2$ intersect (but do not touch) at exactly two points
   (d) $C_1$ and $C_2$ neither intersect nor touch each other

29. The total number of local maxima and local minima of the function $f(x) = \begin{cases} (2 + x)^3, & -3 < x \leq -1 \\ x^{2/3}, & -1 < x < 2 \end{cases}$ is (2008)
   (a) 0 (b) 1 (c) 2 (d) 3

30. Let the function $g: (-\infty, \infty) \to \left(\frac{-\pi}{2}, \frac{\pi}{2}\right)$ be given by
    
    $$g(u) = 2 \tan^{-1}(e^u) - \frac{\pi}{2}$$
    Then, $g$ is (2008)
    (a) even and is strictly increasing in $(0, \infty)$
    (b) odd and is strictly decreasing in $(-\infty, 0)$
    (c) odd and is strictly increasing in $(-\infty, \infty)$
    (d) neither even nor odd, but is strictly increasing in $(-\infty, \infty)$

31. The least value of $a \in \mathbb{R}$ for which $4a\sqrt{x} + \frac{1}{x} \geq 1$, for all $x > 0$, is (JEE Adv. 2016)
    (a) $\frac{1}{64}$ (b) $\frac{1}{32}$ (c) $\frac{1}{27}$ (d) $\frac{1}{25}$

MCQs with One or More than One Correct

1. Let $P(x) = a_0 + a_1 x + a_2 x^2 + \ldots + a_n x^n$ be a polynomial in a real variable $x$ with
   $0 < a_0 < a_1 < a_2 < \ldots < a_n$. The function $P(x)$ has
   (a) neither a maximum nor a minimum (1986 - 2 Marks)
   (b) only one minimum
   (c) only one maximum
   (d) only one maximum and only one minimum
   (e) none of these.

2. If the line $ax + by + c = 0$ is a normal to the curve $xy = 1$, then (1986 - 2 Marks)
   (a) $a > 0, b > 0$ (b) $a > 0, b < 0$ (c) $a < 0, b > 0$ (d) $a < 0, b < 0$ (e) none of these.

3. The smallest positive root of the equation, $\tan x \cdot x = 0$ lies in (1987 - 2 Marks)
   (a) $\left(0, \frac{\pi}{2}\right)$ (b) $\left(\frac{\pi}{2}, \pi\right)$
   (c) $\left(\pi, \frac{3\pi}{2}\right)$ (d) $\left(\frac{3\pi}{2}, 2\pi\right)$ (e) None of these

4. Let $f$ and $g$ be increasing and decreasing functions, respectively from $[0, \infty)$ to $[0, \infty)$. Let $h(x) = f(g(x))$. If $h(0) = 0$, then $h(x) - h(1)$ is (1987 - 2 Marks)
   (a) always zero (b) always negative
   (c) always positive (d) strictly increasing
   (e) None of these.

5. If $f(x) = \begin{cases} 3x^2 + 12x - 1, & -1 \leq x \leq 2 \\ 37 - x, & 2 < x \leq 3 \end{cases}$ then: (1993 - 2 Marks)
   (a) $f(x)$ is increasing on $[-1, 2]$ (b) $f(x)$ is continuous on $[-1, 3]$
   (c) $f''(2)$ does not exist (d) $f(x)$ has the maximum value at $x = 2$

6. Let $h(x) = (f(x))^2 + (f'(x))^2$ for every real number $x$. Then (1998 - 2 Marks)
   (a) $h$ is increasing whenever $f$ is increasing
   (b) $h$ is increasing whenever $f$ is decreasing
   (c) $h$ is decreasing whenever $f$ is decreasing
   (d) nothing can be said in general.

7. If $f(x) = \frac{x^2 - 1}{x^2 + 1}$, for every real number $x$, then the minimum value of $f$ (1998 - 2 Marks)
   (a) does not exist because $f$ is unbounded
   (b) is not attained even though $f$ is bounded
   (c) is equal to 1
   (d) is equal to $-1$

8. The number of values of $x$ where the function
   $$f(x) = \cos x + \cos \left(\sqrt{2}x\right)$$
   attains its maximum is (1998 - 2 Marks)
   (a) 0 (b) 1 (c) 2 (d) infinite

9. The function $f(x) = \int_{x^2}^{x^3} t(e^t - 1)(t - 1)(t - 2)^2(t - 3)^2 \, dt$ has
   a local minimum at $x = a$ (1999 - 3 Marks)
   (a) 0 (b) 1 (c) 2 (d) 3

10. $f(x)$ is cubic polynomial with $f(2) = 18$ and $f(1) = -1$. Also $f(x)$ has local minima at $x = -1$ and $f''(x)$ has local minima at $x = 0$, then (2006 - 5M, -1)
    (a) the distance between $(-1, 2)$ and $(a, f(a))$, where $x = a$ is the point of local minima is $2\sqrt{5}$
    (b) $f(x)$ is increasing for $x \in [1, 2\sqrt{5}]$
    (c) $f(x)$ has local minima at $x = 1$
    (d) the value of $f(0)$ is 15

11. Let $f(x) = \begin{cases} e^x, & 0 \leq x \leq 1 \\ 2 - e^{x-1}, & 1 < x \leq 2 \end{cases}$ and $g(x) = \int_{0}^{x} f(t) \, dt$, $x \in [1, 3]$ then $g(x)$ has (2006 - 5M, -1)
    (a) local maxima at $x = 1 + \ln 2$ and local minima at $x = e$
    (b) local maxima at $x = 1$ and local minima at $x = 2$
    (c) no local maxima
    (d) no local minima
12. For the function 
\[ f(x) = x \cos \frac{1}{x} \quad x \geq 1, \]  
(a) for at least one \( x \) in the interval \([1, \infty)\), \( f'(x + 2) < f(x) < 2 \) 
(b) \( \lim_{x \to \infty} f'(x) = 1 \) 
(c) for all \( x \) in the interval \([1, \infty)\), \( f(x + 2) > f(x) \) 
(d) \( f''(x) \) is strictly decreasing in the interval \([1, \infty)\) 

[2009]

13. If \( f(x) = \int_0^x e^{(t-2)(t-3)} \) for all \( x \in (0, \infty) \), then 
(a) \( f \) has a local maximum at \( x = 2 \) 
(b) \( f \) is decreasing on \((2, 3)\) 
(c) there exists some \( c \in (0, \infty) \), such that \( f''(c) = 0 \) 
(d) \( f \) has a local minimum at \( x = 3 \) 

[2012]

14. A rectangular sheet of fixed perimeter with sides having their lengths in the ratio 8 : 15 is converted into an open rectangular box by folding after removing squares of equal area from all four corners. If the total area of removed squares is 100, the resulting box has maximum volume. Then the lengths of the sides of the rectangular sheet are 
[a] 24 \( \) [b] 32 \( \) [c] 45 \( \) [d] 60 

[2013]

15. Let \( f : (0, \infty) \to R \) be given by 
\[ f(x) = \int_1^x \frac{t}{e^{(t-1)/t}} \text{d}t. \] 
Then 
(a) \( f(x) \) is monotonically increasing on \([1, \infty)\) 
(b) \( f(x) \) is monotonically decreasing on \((0, 1)\) 
(c) \( f(x) + f\left(\frac{1}{x}\right) = 0 \), for all \( x \in (0, \infty) \) 
(d) \( f(2^x) \) is an odd function of \( x \) on \( R \) 

[2014]

16. Let \( f, g : [-1, 2] \to R \) be continuous functions which are twice differentiable on the interval \((-1, 2)\). Let the values of \( f \) and \( g \) at the points -1, 0 and 2 be given in the following table:

<table>
<thead>
<tr>
<th>( x )</th>
<th>-1</th>
<th>0</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td>3</td>
<td>6</td>
<td>0</td>
</tr>
<tr>
<td>( g(x) )</td>
<td>0</td>
<td>1</td>
<td>-1</td>
</tr>
</tbody>
</table>

In each of the intervals \((-1, 0)\) and \((0, 2)\) the function \( f - 3g \) never vanishes. Then the correct statement(s) is(are) 
(a) \( f'(x) - 3g'(x) = 0 \) has exactly three solutions in \((-1, 0)\) 
(b) \( f'(x) - 3g'(x) = 0 \) has exactly one solution in \((-1, 0)\) 
(c) \( f''(x) - 3g''(x) = 0 \) has exactly one solution in \((0, 2)\) 
(d) \( f''(x) - 3g''(x) = 0 \) has exactly two solutions in \((-1, 0)\) and exactly two solutions in \((0, 2)\) 

[2015]

17. Let \( f : \mathbb{R} \to (0, \infty) \) and \( g : \mathbb{R} \to \mathbb{R} \) be twice differentiable functions such that \( f'' \) and \( g'' \) are continuous functions on \( \mathbb{R} \). Suppose \( f''(2) = g(2) = 0 \), \( f''(2) \neq 0 \) and \( g'(2) \neq 0 \). If 
\[ \lim_{x \to 2} \frac{f(x)g(x)}{f'(x)g'(x)} = 1, \] 
then 
(a) \( f \) has a local minimum at \( x = 2 \) 
(b) \( f \) has a local maximum at \( x = 2 \) 
(c) \( f''(2) > f(2) \) 
(d) \( f(x) - f''(x) = 0 \) for at least one \( x \in \mathbb{R} \) 

[2016]

E. Subjective Problems

1. Prove that the minimum value of \( \frac{(a+x)(b+x)}{(c+x)} \), 
\( a, b > c, x < -c \) is \( \left(\sqrt{a-c} + \sqrt{b-c}\right)^2 \). 

[2019]

2. Let \( x \) and \( y \) be two real variables such that \( x > 0 \) and \( xy = 1 \). Find the minimum value of \( x^4y^4 \). 

[2018 - 2 Marks]

3. For all \( x \in [0, 1] \), let the second derivative \( f''(x) \) of a function \( f(x) \) exist and satisfy \( f''(x) < 1 \). If \( f(0) = f(1) \), then show that \( |f'(x)| < 1 \) for all \( x \in [0, 1] \). 

[2018 - 4 Marks]

4. Use the function \( f(x) = x^{1/x} \), \( x > 0 \), to determine the bigger of the two numbers \( e^x \) and \( \pi^e \). 

[2018 - 4 Marks]

5. If \( f(x) \) and \( g(x) \) are differentiable function for \( 0 \leq x \leq 1 \) such that \( f(0) = 2, g(0) = 0, f(1) = 6, g(1) = 2 \), then show that there exist \( x \) satisfying \( 0 < c < 1 \) and \( f'(c) = 2g'(c) \). 

[2018 - 2 Marks]

6. Find the shortest distance of the point \((0, c)\) from the parabola \( y = x^2 \) where \( 0 \leq c \leq 5 \). 

[2018 - 2 Marks]

7. If \( ax^2 + bx \geq c \) for all positive \( x \) where \( a > 0 \) and \( b > 0 \) show that \( 27ab^2 \geq 4c^3 \). 

[2018 - 2 Marks]

8. Show that \( 1 + x \ln(x + \sqrt{x^2 + 1}) \geq \sqrt{1 + x^2} \) for all \( x \geq 0 \) 

[2018 - 2 Marks]

9. Find the coordinates of the point on the curve \( y = \frac{x}{1 + x^2} \) where the tangent to the curve has the greatest slope. 

[2018 - 4 Marks]

10. Find all the tangents to the curve \( y = \cos(x + y) \), \( -2 \pi \leq x \leq 2 \pi \), that are parallel to the line \( x + 2y = 0 \). 

[2018 - 5 Marks]

11. Let \( f(x) = \sin^3 x + \lambda \sin^2 x \), \( -\frac{\pi}{2} < x < \frac{\pi}{2} \). Find the intervals in which \( \lambda \) should lie in order that \( f(x) \) has exactly one minimum and exactly one maximum. 

[2018 - 5 Marks]

12. Find the point on the curve \( 4x^2 + a^2y^2 = 4a^2 \), \( 4 < a^2 < 8 \) that is farthest from the point \((0, -2)\). 

[2018 - 4 Marks]
13. Investigate for maxima and minima the function
   \[ f(x) = \frac{2}{t} [2(t-1)(t-2)^3 + 3(t-1)^2(t-2)^2]dt \]
   (1988 - 5 Marks)

14. Find all maxima and minima of the function
   \[ y = x(x-1)^2, 0 \leq x \leq 2 \]
   (1989 - 5 Marks)
   Also determine the area bounded by the curve \( y = x(x-1)^2 \),
   the y-axis and the line \( y = 2 \).

15. Show that \( 2\sin x + \tan x \geq 3x \) where \( 0 \leq x \leq \frac{\pi}{2} \).
   (1990 - 4 Marks)

16. A point \( P \) is given on the circumference of a circle of radius \( r \).
    Chord \( QR \) is parallel to the tangent at \( P \). Determine
    the maximum possible area of the triangle \( PQR \).
    (1990 - 4 Marks)

17. A window of perimeter \( P \) (including the base of the arch) is
    in the form of a rectangle surrounded by a semi-circle. The
    semi-circular portion is fitted with coloured glass while the
    rectangular part is fitted with clear glass transmits three
    times as much light per square meter as the coloured glass
    does.
    What is the ratio for the sides of the rectangle so that the
    window transmits the maximum light? (1991 - 4 Marks)

18. A cubic \( f(x) \) vanishes at \( x = 2 \) and has relative minimum /
    maximum at \( x = -1 \) and \( x = \frac{1}{3} \) if \( \int_{-1}^{1} f(x)dx = \frac{14}{3} \), find the
    cubic \( f(x) \). (1992 - 4 Marks)

19. What normal to the curve \( y = x^2 \) forms the shortest chord?
    (1992 - 6 Marks)

20. Find the equation of the normal to the curve
    \( y = (1+x)^\alpha + \sin^{-1}(\sin^2 x) \) at \( x = 0 \)
    (1993 - 3 Marks)

21. Let \( f(x) = \begin{cases} -x^3 + \frac{b^3 - b^2 + b - 1}{b^2 + 3b + 2}, & 0 \leq x < 1 \\ 2x - 3, & 1 \leq x \leq 3 \end{cases} \)
    (1993 - 5 Marks)
    Find all possible real values of \( b \) such that \( f(x) \) has the
    smallest value at \( x = 1 \).

22. The curve \( y = ax^3 + bx^2 + cx + 5 \), touches the x-axis at
    \( P(2,0) \) and cuts the y-axis at a point \( Q \), where its gradient
    is 3. Find \( a, b, c \). (1994 - 5 Marks)

23. The circle \( x^2 + y^2 = 1 \) cuts the x-axis at \( P \) and \( Q \).
    Another circle with centre at \( Q \) and variable radius intersects
    the first circle at \( R \) above the x-axis and the line segment \( PQ \) at \( S \).
    Find the maximum area of the triangle \( QSR \). (1994 - 5 Marks)

24. Let \( (h, k) \) be a fixed point, where \( h > 0, k > 0 \). A straight line
    passing through this point cuts the positive direction of the
    coordinate axes at the points \( P \) and \( Q \). Find the minimum area
    of the triangle \( OPQ \), \( O \) being the origin. (1995 - 5 Marks)

25. A curve \( y = f(x) \) passes through the point \( P(1,1) \). The normal
    to the curve at \( P \) is \( ax + (y - 1) + (x - 1) = 0 \). If the slope of
    the tangent at any point on the curve is proportional to the
    ordinate of the point, determine the equation of the curve.
    Also obtain the area bounded by the y-axis, the curve and
    the normal to the curve at \( P \). (1996 - 5 Marks)

26. Determine the points of maxima and minima of the function
    \[ f(x) = \frac{1}{8} \ln(x - bx + x^2), x > 0, \text{ where } b \geq 0 \text{ is a constant.} \]
    (1996 - 5 Marks)

27. Let \( f(x) = \begin{cases} \frac{xe^{ax}}{x}, & x \leq 0 \\ \frac{x + ax^2 - x^3}{x}, & x > 0 \end{cases} \)
    (1996 - 3 Marks)
    Where \( a \) is a positive constant. Find the interval in which
    \( f'(x) \) is increasing.

28. Let \( a + b = 4 \), where \( a < 2 \), and let \( g(x) \) be a differentiable
    function.
    If \( \frac{dg}{dx} > 0 \) for all \( x \), prove that \( \int_{0}^{a} g(x)dx + \int_{0}^{b} g(x)dx \)
    increases as \( (b - a) \) increases. (1997 - 5 Marks)

29. Suppose \( f(x) \) is a function satisfying the following conditions
    (a) \( f(0) = 2, f(1) = 1 \),
    (b) \( f \) has a minimum value at \( x = 5/2 \), and
    (c) for all \( x \),
    \[ f'(x) = \begin{vmatrix} 2ax & 2ax - 1 & 2ax + b + 1 \\ b & b + 1 & -1 \\ 2(ax+b) & 2ax + 2b + 1 & 2ax + b \end{vmatrix} \]
    where \( a, b \) are some constants. Determine the constants \( a, b \)
    and the function \( f(x) \).

30. A curve \( C \) has the property that if the tangent drawn at any
    point \( P \) on \( C \) meets the co-ordinate axes at \( A \) and \( B \), then \( P \)
    is the mid-point of \( AB \). The curve passes through the point
    \( (1,1) \). Determine the equation of the curve. (1998 - 8 Marks)

31. Suppose \( p(x) = a_0 + a_1x + a_2x^2 + \ldots + a_nx^n \). If
    \( |p(x)| \leq e^{x-1} \) for all \( x \geq 0 \), prove that
    \[ a_1 + 2a_2 + \ldots + na_n \leq 1. \] (2000 - 5 Marks)

32. Let \( -1 \leq p \leq 1 \). Show that the equation \( 4x^3 - 3x - p = 0 \)
    has a unique root in the interval \([1/2, 1]\) and identify it. (2001 - 5 Marks)

33. Find a point on the curve \( x^2 + 2y^2 = 6 \) whose distance from
    the line \( x + y = 7 \) is minimum. (2003 - 2 Marks)

34. Using the relation \( 2(1 - \cos x) < x^2, x \neq 0 \) or otherwise,
    prove that \( \sin (\tan x) \geq x, \forall x \in \left[0, \frac{\pi}{4}\right] \). (2003 - 4 Marks)
35. If the function \( f: [0,4] \to \mathbb{R} \) is differentiable then show that 
   (i) For \( a, b \in (0,4) \), \( f(4)^2 - f(0)^2 = 8f'(a)f(b) \) 
   (ii) \( \int_0^4 f(t) \, dt = 2[af'(\alpha^2) + bf'(\beta^2)] \forall \ 0 < \alpha, \beta < 2 \) 

   (2003 - 4 Marks) 

36. If \( P(1) = 0 \) and \( \frac{dP(x)}{dx} > P(x) \) for all \( x \geq 1 \) then prove that 
   \( P(x) > 0 \) for all \( x > 1 \). 

   (2003 - 4 Marks) 

37. Using Rolle’s theorem, prove that there is at least one root in \( (45^{1/100}, 46) \) of the polynomial 
   \( P(x) = 51x^{101} - 2323x^{100} - 45x + 1035 \). 

   (2004 - 2 Marks) 

38. Prove that for \( x \in \left[ 0, \frac{\pi}{2} \right] \), \( \sin x + 2x \geq \frac{3x(x+1)}{\pi} \). Explain the identity if any used in the proof. 

   (2004 - 4 Marks) 

39. If \( f(x_1) - f(x_2) < (x_1 - x_2)^2 \), for all \( x_1, x_2 \in R \). Find the equation of tangent to the curve \( y = f(x) \) at the point \( (1, 2) \). 

   (2005 - 2 Marks) 

40. If \( p(x) \) be a polynomial of degree 3 satisfying \( p(-1) = 10, p(1) = -6 \) and \( p(x) \) has maxima at \( x = -1 \) and \( p'(x) \) has minima at \( x = 1 \). Find the distance between the local maxima and local minima of the curve. 

   (2005 - 4 Marks) 

41. For a twice differentiable function \( f(x) \), \( g(x) \) is defined as 
   \( g(x) = \left( f'(x)^2 + f''(x) \right) f(x) \) on \( [a, b] \). If \( a < b < c < d < c, f(a) = 0, f(b) = 2, f(c) = 1, f(d) = 2, f(e) = 0 \) then find the minimum number of zeros of \( g(x) \). 

   (2006 - 6M) 

---

**Match the Following**

Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. In this questions there are entries in columns I and II. Each entry in column I is related to exactly one entry in column II. Write the correct letter from column II against the entry number in column I in your answer book.

   Let the functions defined in column I have domain \( \left( -\frac{\pi}{2}, \frac{\pi}{2} \right) \) 

<table>
<thead>
<tr>
<th>Column I</th>
<th>Column II</th>
</tr>
</thead>
<tbody>
<tr>
<td>(A) ( x + \sin x )</td>
<td>(p) increasing</td>
</tr>
<tr>
<td>(B) ( \sec x )</td>
<td>(q) decreasing</td>
</tr>
<tr>
<td></td>
<td>(r) neither increasing nor decreasing</td>
</tr>
</tbody>
</table>

   (1992 - 2 Marks)

**Comprehension Based Questions**

**PASSAGE - 1**

If a continuous function \( f \) defined on the real line \( R \), assumes positive and negative values in \( R \) then the equation \( f(x) = 0 \) has a root in \( R \). For example, if it is known that a continuous function \( f \) on \( R \) is positive at some point and its minimum value is negative then the equation \( f(x) = 0 \) has a root in \( R \).

Consider \( f(x) = ke^x - x \) for all real \( x \) where \( k \) is a real constant.

1. The line \( y = x \) meets \( y = ke^x \) for \( k \leq 0 \) at 
   | (a) no point | (b) one point |
   | (c) two points | (d) more than two points |

   (2007 - 4 marks) 

2. The positive value of \( k \) for which \( ke^x - x = 0 \) has only one root is 
   | (a) no point | (b) one point |
   | (c) two points | (d) more than two points |

   (2007 - 4 marks) 

3. For \( k > 0 \), the set of all values of \( k \) for which \( ke^x - x = 0 \) has two distinct roots is 
   | (a) \( 0, \frac{1}{e} \) | (b) \( \frac{1}{e}, 1 \) |
   | (c) \( \frac{1}{e}, -\infty \) | (d) \( 0, 1 \) |

   (2007 - 4 marks) 

**PASSAGE - 2**

Let \( f(x) = (1 - x)^2 \sin^2 x + x^2 \) for all \( x \in \mathbb{R} \) and let 

\[ g(x) = \int_1^x f(t) \, dt \] 

for all \( x \in (1, \infty) \). 

(2012) 

4. Consider the statements:
   \[ P : \text{There exists some } x \in \mathbb{R} \text{ such that } f(x) + 2x = 2(1 + x^2) \]
   \[ Q : \text{There exists some } x \in \mathbb{R} \text{ such that } 2f(x) + 1 = 2x(1 + x) \]
   Then
   (a) both \( P \) and \( Q \) are true
   (b) \( P \) is true and \( Q \) is false
   (c) \( P \) is false and \( Q \) is true
   (d) both \( P \) and \( Q \) are false

5. Which of the following is true?
   (a) \( g \) is increasing on \((1, \infty)\)
   (b) \( g \) is decreasing on \((1, \infty)\)
   (c) \( g \) is increasing on \((1, 2)\) and decreasing on \((2, \infty)\)
   (d) \( g \) is decreasing on \((1, 2)\) and increasing on \((2, \infty)\)

PASSAGE - 3

Let \( f : [0, 1] \rightarrow \mathbb{R} \) (the set of all real numbers) be a function. Suppose the function \( f \) is twice differentiable, \( f(0) = 0 \) and satisfies \( f''(x) - 2f'(x) + f(x) \geq e^x, x \in [0, 1] \).

6. Which of the following is true for \( 0 < x < 1 \)? \textit{(JEE Adv. 2013)}
   (a) \( 0 < f(x) < \infty \)
   (b) \( -\frac{1}{2} < f(x) < \frac{1}{2} \)
   (c) \( -\frac{1}{4} < f(x) < 1 \)
   (d) \( -\infty < f(x) < 0 \)

7. If the function \( e^x f(x) \) assumes its minimum in the interval \([0, 1]\) at \( x = \frac{1}{4} \), which of the following is true?
   (a) \( f(x) < f(x), \frac{1}{4} < x < \frac{3}{4} \) \textit{(JEE Adv. 2013)}
   (b) \( f(x) > f(x), 0 < x < \frac{1}{4} \)
   (c) \( f(x) < f(x), 0 < x < \frac{1}{4} \)
   (d) \( f(x) < f(x), \frac{3}{4} < x < 1 \)

I \hspace{1cm} \textbf{Integer Value Correct Type}

1. The maximum value of the function \( f(x) = 2x^3 - 15x^2 + 36x - 48 \) on the set \( A = \{ x \mid x^2 + 20 \leq 9x \} \) is \textit{(2009)}

2. Let \( p(x) \) be a polynomial of degree 4 having extremum at \( x = 1, 2 \) and \( \lim_{x \to 0} \left( 1 + \frac{p(x)}{x^4} \right) = 2. \)
   Then the value of \( p(2) \) is \textit{(2009)}

3. Let \( f \) be a real-valued differentiable function on \( \mathbb{R} \) (the set of all real numbers) such that \( f(1) = 1 \). If the y-intercept of the tangent at any point \( P(x, y) \) on the curve \( y = f(x) \) is equal to the cube of the abscissa of \( P \), then find the value of \( f(-3) \) \textit{(2010)}

4. Let \( f \) be a function defined on \( \mathbb{R} \) (the set of all real numbers) such that \( f''(x) = x - 2009(x - 2010)^2(x - 2010)^3(x - 2012)^4 \) for all \( x \in \mathbb{R} \).
   If \( g \) is a function defined on \( \mathbb{R} \) with values in the interval \((0, \infty)\) such that \( f(x) = \ln (g(x)) \), for all \( x \in \mathbb{R} \)
   then the number of points in \( R \) at which \( g \) has a local maximum is \textit{(2010)}

5. Let \( f : \mathbb{R} \rightarrow \mathbb{R} \) be defined as \( f(x) = |x| + |x^2 - 1| \). The total number of points at which \( f \) attains either a local maximum or a local minimum is \textit{(2012)}

6. Let \( p(x) \) be a real polynomial of least degree which has a local maximum at \( x = 1 \) and a local minimum at \( x = 3 \). If \( p(1) = 6 \) and \( p(3) = 2 \), then \( p'(0) \) is \textit{(2012)}

7. A vertical line passing through the point \( (h, 0) \) intersects the ellipse \( \frac{x^2}{4} + \frac{y^2}{3} = 1 \) at the points \( P \) and \( Q \). Let the tangents to the ellipse at \( P \) and \( Q \) meet at the point \( R \). If \( \Delta(h) = \text{area of the triangle PQR} \), \( \Delta_1 = \min_{h/2 \in \mathbb{Z}} \Delta(h) \) and \( \Delta_2 = \max_{h/2 \in \mathbb{Z}} \Delta(h) \),
   then \( \frac{8}{\sqrt{5}} \Delta_1 - 8 \Delta_2 = \textit{(JEE Adv. 2013)} \)

8. The slope of the tangent to the curve \( (y-x^5)^2 = x(1+x^2)^2 \) at the point \( (1, 3) \) is \textit{(JEE Adv. 2014)}

9. A cylindrical container is to be made from certain solid material with the following constraints: It has a fixed inner volume of \( V \) mm\(^3\), has a 2 mm thick solid wall and is open at the top. The bottom of the container is a solid circular disc of thickness 2 mm and is of radius equal to the outer radius of the container.
   If the volume of the material used to make the container is minimum when the inner radius of the container is 10 mm, then the value of \( \frac{V}{250\pi} \) is \textit{(JEE Adv. 2015)}
1. The maximum distance from origin of a point on the curve
   \[ x = a \sin t - b \sin \left( \frac{at}{b} \right) \]
   \[ y = a \cos t - b \cos \left( \frac{at}{b} \right), \text{ both } a, b > 0 \] is [2002]
   (a) \( a - b \)  (b) \( a + b \)  (c) \( \sqrt{a^2 + b^2} \)  (d) \( \sqrt{a^2 - b^2} \)

2. If \( 2a + 3b + 6c = 0 \), \((a, b, c \in R)\) then the quadratic equation
   \( ax^2 + bx + c = 0 \) has [2002]
   (a) at least one root in \([0, 1]\)  (b) at least one root in \([2, 3]\)
   (c) at least one root in \([4, 5]\)  (d) none of these

3. If the function \( f(x) = 2x^3 - 9ax^2 + 12a^2x + 1 \), where \( a > 0 \), attains its maximum and minimum at \( p \) and \( q \)
   respectively such that \( p^2 = q \), then \( p = q \) equals [2003]
   (a) \( \frac{1}{2} \)  (b) \( 3 \)  (c) \( 1 \)  (d) \( 2 \)

4. A point on the parabola \( y^2 = 18x \) at which the ordinate increases at twice the rate of the abscissa is [2004]
   (a) \( \left( \frac{9}{8}, \frac{9}{2} \right) \)  (b) \( (2, -4) \)  (c) \( \left( \frac{-9}{8}, \frac{9}{2} \right) \)  (d) \( (2, 4) \)

5. A function \( y = f(x) \) has a second order derivative \( f''(x) = 6(x - 1) \). If its graph passes through the point \((2, 1)\)
   and at that point the tangent to the graph is \( y = 3x - 5 \), then the function is [2004]
   (a) \((x + 1)^2 \)  (b) \((x - 1)^3 \)  (c) \((x + 1)^3 \)  (d) \((x - 1)^2 \)

6. The normal to the curve \( x = a(1 + \cos \theta), y = a \sin \theta \) at ‘\( \theta \)’ always passes through the fixed point [2004]
   (a) \((a, a)\)  (b) \((0, a)\)  (c) \((0, 0)\)  (d) \((a, 0)\)

7. If \( 2a + 3b + 6c = 0 \), then at least one root of the equation
   \( ax^2 + bx + c = 0 \) lies in the interval [2004]
   (a) \((1, 3)\)  (b) \((1, 2)\)  (c) \((2, 3)\)  (d) \((0, 1)\)

8. Area of the greatest rectangle that can be inscribed in the ellipse \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \) is [2005]
   (a) \( 2ab \)  (b) \( ab \)  (c) \( \sqrt{ab} \)  (d) \( \frac{a}{b} \)

9. The normal to the curve \( x = a(\cos \theta + \theta \sin \theta), y = a(\sin \theta - \theta \cos \theta) \) at any point \( \theta \) is such that [2005]
   (a) it passes through the origin
   (b) it makes an angle \( \frac{\pi}{2} + \theta \) with the \( x \)-axis
   (c) it passes through \( \left( \frac{a\pi}{2}, -a \right) \)
   (d) it is at a constant distance from the origin

10. A spherical iron ball 10 cm in radius is coated with a layer of ice of uniform thickness that melts at a rate of 50 \( cm^3/min \).
    When the thickness of ice is 5 cm, then the rate at which the thickness of ice decreases is [2005]
    (a) \( \frac{1}{36\pi} \) \( cm/min \)  (b) \( \frac{1}{18\pi} \) \( cm/min \)
    (c) \( \frac{1}{54\pi} \) \( cm/min \)  (d) \( \frac{5}{6\pi} \) \( cm/min \)

11. If the equation \( a_n x^n + a_{n-1} x^{n-1} + \ldots + a_1 x = 0 \)
    \( a_1 \neq 0, n \geq 2 \), has a positive root \( x = \alpha \), then the equation
    \( na_n x^{n-1} + (n-1) a_{n-1} x^{n-2} + \ldots + a_1 = 0 \) has a positive root, which is [2005]
    (a) greater than \( \alpha \)
    (b) smaller than \( \alpha \)
    (c) greater than or equal to \( \alpha \)
    (d) equal to \( \alpha \)

12. The function \( f(x) = \frac{x^2}{2} + \frac{2}{x} \) has a local minimum at [2006]
    (a) \( x = 2 \)  (b) \( x = -2 \)
    (c) \( x = 0 \)  (d) \( x = 1 \)

13. A triangular park is enclosed on two sides by a fence and on the third side by a straight river bank. The two sides having fence are of same length \( x \). The maximum area enclosed by the park is [2006]
    (a) \( \frac{3}{2} x^2 \)  (b) \( \frac{x^3}{8} \)
    (c) \( \frac{1}{2} x^2 \)  (d) \( \pi x^2 \)

14. A value of \( c \) for which conclusion of Mean Value Theorem holds for the function \( f(x) = \frac{1}{x} \log_e x \) on the interval \([1, 3]\) is [2007]
    (a) \( \log_3 e \)  (b) \( \log_3 e \)
    (c) \( 2 \log_3 e \)  (d) \( \frac{1}{2} \log_3 e \)
15. The function \( f(x) = \tan^{-1}(\sin x + \cos x) \) is an increasing function in
   \[ [007] \]
   (a) \( \left( 0, \frac{\pi}{2} \right) \)  
   (b) \( \left( -\frac{\pi}{2}, \frac{\pi}{2} \right) \)  
   (c) \( \left( \frac{\pi}{4}, \frac{\pi}{2} \right) \)  
   (d) \( \left( -\frac{\pi}{2}, -\frac{\pi}{4} \right) \)

16. If \( p \) and \( q \) are positive real numbers such that \( p^2 + q^2 = 1 \), then the maximum value of \((p + q)\) is
   \[ [007] \]
   (a) \( \frac{1}{2} \)  
   (b) \( \frac{1}{\sqrt{2}} \)  
   (c) \( \sqrt{2} \)  
   (d) 2

17. Suppose the cubic \( x^3 - px + q \) has three distinct real roots where \( p > 0 \) and \( q > 0 \). Then which one of the following holds?
   \[ [008] \]
   (a) The cubic has minima at \( \sqrt[3]{\frac{p}{3}} \) and maxima at \(-\sqrt[3]{\frac{p}{3}}\)
   (b) The cubic has minima at \(-\sqrt[3]{\frac{p}{3}}\) and maxima at \( \sqrt[3]{\frac{p}{3}} \)
   (c) The cubic has minima at both \( \sqrt[3]{\frac{p}{3}} \) and \(-\sqrt[3]{\frac{p}{3}}\)
   (d) The cubic has maxima at both \( \sqrt[3]{\frac{p}{3}} \) and \(-\sqrt[3]{\frac{p}{3}}\)

18. How many real solutions does the equation \( x^7 + 14x^5 + 16x^3 + 30x - 560 = 0 \) have?
   \[ [008] \]
   (a) 7  
   (b) 1  
   (c) 3  
   (d) 5

19. Let \( f(x) = |x| \) and \( g(x) = \sin x \).
   \textbf{Statement-1} : \( gof \) is differentiable at \( x = 0 \) and its derivative is continuous at that point.
   \textbf{Statement-2} : \( gof \) is twice differentiable at \( x = 0 \).
   \[ [009] \]
   (a) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.
   (b) Statement-1 is true, Statement-2 is false.
   (c) Statement-1 is false, Statement-2 is true.
   (d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.

20. Given \( P(x) = x^4 + ax^3 + bx^2 + cx + d \) such that \( x = 0 \) is the only real root of \( P'(x) = 0 \). If \( P(-1) < P(1) \), then in the interval \([-1,1] \):
   \[ [009] \]
   (a) \( P(-1) \) is not minimum but \( P(1) \) is the maximum of \( P \)
   (b) \( P(-1) \) is the minimum but \( P(1) \) is not the maximum of \( P \)
   (c) Neither \( P(-1) \) is the minimum nor \( P(1) \) is the maximum of \( P \)
   (d) \( P(-1) \) is the minimum and \( P(1) \) is the maximum of \( P \)

21. The equation of the tangent to the curve \( y = x + \frac{4}{x^2} \), that is parallel to the x-axis, is
   \[ [10] \]
   (a) \( y = 1 \)  
   (b) \( y = 2 \)  
   (c) \( y = 3 \)  
   (d) \( y = 0 \)

22. Let \( f: \mathbb{R} \to \mathbb{R} \) be defined by
   \[ f(x) = \begin{cases} k-2x, & \text{if } x \leq -1 \\ 2x+3, & \text{if } x > -1 \end{cases} \]
   If \( f \) has a local minimum at \( x = -1 \), then a possible value of \( k \) is
   \[ [10] \]
   (a) 0  
   (b) \( -\frac{1}{2} \)  
   (c) -1  
   (d) 1

23. Let \( f: \mathbb{R} \to \mathbb{R} \) be a continuous function defined by
   \[ f(x) = \frac{1}{e^x + 2e^{-x}} \]
   \[ [10] \]
   
   \textbf{Statement-1} : \( f(c) = \frac{1}{3} \), for some \( c \in \mathbb{R} \).

   \textbf{Statement-2} : \( 0 < f(x) \leq \frac{1}{2\sqrt{2}} \), for all \( x \in \mathbb{R} \)
   \[ [11] \]
   (a) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.
   (b) Statement-1 is true, Statement-2 is false.
   (c) Statement-1 is false, Statement-2 is true.
   (d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.

24. The shortest distance between line \( y - x = 1 \) and curve \( x = y^2 \) is
   \[ [11] \]
   (a) \( \frac{3\sqrt{2}}{8} \)  
   (b) \( \frac{8}{3\sqrt{2}} \)  
   (c) \( \frac{4}{\sqrt{3}} \)  
   (d) \( \frac{\sqrt{3}}{4} \)

25. For \( x \in \left( 0, \frac{5\pi}{2} \right) \), define \( f(x) = \int_{0}^{x} \sin t \, dt \). Then \( f \) has
   \[ [11] \]
   (a) local minimum at \( \pi \) and \( 2\pi \)
   (b) local minimum at \( \pi \) and local maximum at \( 2\pi \)
   (c) local maximum at \( \pi \) and local minimum at \( 2\pi \)
   (d) local maximum at \( \pi \) and \( 2\pi \)

26. A spherical balloon is filled with 4500\pi cubic meters of helium gas. If a leak in the balloon causes the gas to escape at the rate of 72\pi cubic meters per minute, then the rate (in meters per minute) at which the radius of the balloon decreases 49 minutes after the leakage began is:
   \[ [12] \]
   (a) \( \frac{9}{7} \)  
   (b) \( \frac{7}{9} \)  
   (c) \( \frac{2}{9} \)  
   (d) \( \frac{9}{2} \)

27. Let \( a, b \in \mathbb{R} \) be such that the function \( f \) given by \( f(x) = \ln |x| + bx^2 + ax \) has extreme values at \( x = -1 \) and \( x = 2 \).
   \textbf{Statement-1} : \( f \) has local maximum at \( x = -1 \) and at \( x = 2 \).
   \[ [12] \]
   (a) \( a = \frac{1}{2} \) and \( b = \frac{-1}{4} \)  
   (b) \( a = \frac{1}{2} \) and \( b = \frac{-1}{4} \)  
   (c) \( a = \frac{1}{2} \) and \( b = \frac{-1}{4} \)  
   (d) \( a = \frac{1}{2} \) and \( b = \frac{-1}{4} \)
31. Let \( f(x) \) be a polynomial of degree four having extreme values at \( x = 1 \) and \( x = 2 \). If \( \lim_{x \to 0} \left[ 1 + \frac{f(x)}{x^2} \right] = 3 \), then \( f(2) \) is equal to:

\[ f(x) = \frac{1}{4} \]

[JEE M 2015]

(a) 0  (b) 4  (c) \(-8\)  (d) \(-4\)

32. Consider:

\[ f(x) = \tan^{-1} \left( \frac{\sqrt{1 + \sin x}}{\sqrt{1 - \sin x}} \right), \quad x \in \left( 0, \frac{\pi}{2} \right) \]

A normal to \( y = f(x) \) at \( x = \frac{\pi}{6} \) also passes through the point:

\[ \left( \frac{\pi}{6}, 0 \right) \]  (b)  \[ \left( \frac{\pi}{4}, 0 \right) \]  (c) \( (0,0) \)  (d)  \[ \left( \frac{2\pi}{3}, 0 \right) \]

[JEE M 2016]

33. A wire of length 2 units is cut into two parts which are bent respectively to form a square of side \( x \) units and a circle of radius \( x \) units. If the sum of the areas of the square and the circle so formed is minimum, then:

\[ x = 2r \]  (b)  \( 2x = r \)  (c) \( 2x = (\pi + 4)r \)  (d)  \( (4 - \pi) \cdot x = \pi r \)

[JEE M 2016]
CHAPTER 17

Indefinite Integrals

Section-A

A. Fill in the Blanks

1. If \( \int \frac{4e^x + 6e^{-x}}{9e^x - 4e^{-x}} \, dx = A x + B \log (9e^{2x} - 4) + C \), then \( A = \ldots \), \( B = \ldots \) and \( C = \ldots \). (1990 - 2 Marks)

C. MCQs with One Correct Answer

1. The value of the integral \( \int \frac{\cos^3 x + \cos^5 x}{\sin^2 x + \sin^4 x} \, dx \) is (1995S)
   (a) \( \sin x - 6 \tan^{-1}(\sin x) + C \)
   (b) \( \sin x - 2(\sin x)^{-1} + C \)
   (c) \( \sin x - 2(\sin x)^{-1} - 6 \tan^{-1}(\sin x) + C \)
   (d) \( \sin x - 2(\sin x)^{-1} + 5 \tan^{-1}(\sin x) + C \)

2. If \( \int \frac{1}{\sin x} \, dt = 1 - \sin x \), then \( f \left( \frac{1}{\sqrt{3}} \right) \) is (2005S)
   (a) \( \frac{1}{3} \)
   (b) \( \frac{1}{\sqrt{3}} \)
   (c) 3
   (d) \( \sqrt{3} \)

3. \( \int \frac{x^2 - 1}{x^3 \sqrt{2x^4 - 2x^2 + 1}} \, dx = \) (2006 - 3M, -1)
   (a) \( \frac{\sqrt{2x^4 - 2x^2 + 1}}{x^2} + C \)
   (b) \( \frac{\sqrt{2x^4 - 2x^2 + 1}}{x^3} + C \)
   (c) \( \frac{\sqrt{2x^4 - 2x^2 + 1}}{x} + C \)
   (d) \( \frac{\sqrt{2x^4 - 2x^2 + 1}}{2x^2} + C \)

4. Let \( I = \int e^x \, dx \), \( J = \int e^{-x} \, dx \). Then, for an arbitrary constant \( C \), the value of \( J - I \) equals (2008)

E. Subjective Problems

1. Evaluate \( \int \frac{\sin x}{\sin x - \cos x} \, dx \) (1978)

2. Evaluate \( \int \frac{x^2 \, dx}{(a + bx)^2} \) (1979)

3. Evaluate \( \int (e^{\log x} + \sin x) \cos x \, dx \). (1981 - 2 Marks)

4. Evaluate : \( \int \frac{(x-1)e^x}{(x+1)^3} \, dx \) (1983 - 2 Marks)
5. Evaluate the following \[ \int \frac{dx}{x^2(x^4 + 1)^{3/4}} \] (1984 - 2 Marks)

6. Evaluate the following \[ \int \frac{1 - \sqrt{x}}{\sqrt{1 + \sqrt{x}}} \] (1985 - 2½ Marks)

7. Evaluate \[ \int \left( \frac{\cos 2x}{\sin x} \right)^{1/2} dx \] (1987 - 6 Marks)

8. Evaluate \[ \int (\sqrt{\tan x} + \sqrt{\cot x}) \] (1989 - 3 Marks)

9. Find the indefinite integral \[ \int \left( \frac{1}{\sqrt{x} + \sqrt{4}} + \frac{\ln (1 + \sqrt{x})}{\sqrt{x} + \sqrt{x}} \right) dx \] (1992 - 4 Marks)

10. Find the indefinite integral \[ \int \cos 20 \ln \left( \frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) d\theta \] (1994 - 5 Marks)

11. Evaluate \[ \int \frac{(x+1)}{x(1+xe^x)^2} dx. \] (1996 - 2 Marks)

12. Integrate \[ \int \frac{x^3 + 3x + 2}{(x^2 + 1)^2(x+1)} \] (1999 - 5 Marks)

13. Evaluate \[ \int \sin^{-1} \left( \frac{2x + 2}{\sqrt{4x^2 + 8x + 13}} \right) dx. \] (2001 - 5 Marks)

14. For any natural number m, evaluate \[ \int \left( x^{3m} + x^{2m} + x^m \right) \left( 2x^{2m} + 3x^m + 6 \right)^{1/m} dx, x > 0. \] (2002 - 5 Marks)

**Assertion & Reason Type Questions**

1. Let \( F(x) \) be an indefinite integral of \( \sin^2 x \).
   
   **STATEMENT-1**: The function \( F(x) \) satisfies \( F(x + \pi) = F(x) \) for all real \( x \). **because**
   
   **STATEMENT-2**: \( \sin^2(x + \pi) = \sin^2 x \) for all real \( x \). (2007 - 3 marks)

   (a) Statement-1 is True, statement-2 is True; Statement-2 is a correct explanation for Statement-1.
   
   (b) Statement-1 is True, Statement-2 is True; Statement-2 is NOT a correct explanation for Statement-1.
   
   (c) Statement-1 is True, Statement-2 is False.
   
   (d) Statement-1 is False, Statement-2 is True.
Section-B

1. If \[\int \frac{\sin x}{\sin(x-\alpha)} \, dx = Ax + B \log \sin(x-\alpha) + C,\] then value of \((A, B)\) is
(a) \((-\cos \alpha, \sin \alpha)\)
(b) \((\cos \alpha, \sin \alpha)\)
(c) \((-\sin \alpha, \cos \alpha)\)
(d) \((\sin \alpha, \cos \alpha)\) [2004]

2. \[\int \frac{dx}{\cos x - \sin x}\] is equal to
(a) \(\frac{1}{\sqrt{2}} \log \left| \tan \left(\frac{x}{2} + \frac{3\pi}{8}\right) \right| + C\)
(b) \(\frac{1}{\sqrt{2}} \log \left| \cot \left(\frac{x}{2}\right) \right| + C\)
(c) \(\frac{1}{\sqrt{2}} \log \left| \tan \left(\frac{x}{2} - \frac{3\pi}{8}\right) \right| + C\)
(d) \(\frac{1}{\sqrt{2}} \log \left| \tan \left(\frac{x}{2} - \frac{\pi}{4}\right) \right| + C\) [2004]

3. \[\int \left( \frac{\log x - 1}{1 + (\log x)^2} \right)^2 \, dx\] is equal to
(a) \(\frac{\log x}{(\log x)^2 + 1} + C\)
(b) \(\frac{x}{x^2 + 1} + C\)
(c) \(\frac{x}{x^2 + 1} + C\)
(d) \(\frac{x}{(\log x)^2 + 1} + C\) [2005]

4. \[\int \frac{dx}{\cos x + \sqrt{3} \sin x}\] equals
(a) \(\log \tan \left(\frac{x}{2} + \frac{\pi}{12}\right) + C\)
(b) \(\log \tan \left(\frac{x}{2} - \frac{\pi}{12}\right) + C\)
(c) \(\frac{1}{2} \log \tan \left(\frac{x}{2} + \frac{\pi}{12}\right) + C\)
(d) \(\frac{1}{2} \log \tan \left(\frac{x}{2} - \frac{\pi}{12}\right) + C\) [2007]

5. The value of \(\sqrt{2} \int \frac{\sin x dx}{\sin \left(x - \frac{\pi}{4}\right)}\) is \(x + \log |\cos \left(x - \frac{\pi}{4}\right)| + C\) [2008]

6. If the \(\int \frac{5 \tan x}{\tan x - 2} \, dx = x + a \ln |\sin x - 2 \cos x| + k,\) then \(a\) is equal to:
(a) \(-1\)
(b) \(-2\)
(c) \(1\)
(d) \(2\) [2012]

7. If \(\int f(x) \, dx = \psi(x),\) then \(\int x^5 f(x^3) \, dx\) is equal to
(a) \(\frac{1}{3} \left[ x^3 \psi(x^3) - \int x^2 \psi(x^3) \, dx \right] + C\) [JEE M 2013]
(b) \(\frac{1}{3} x^3 \psi(x^3) - 3 \int x^2 \psi(x^3) \, dx + C\)
(c) \(\frac{1}{3} x^3 \psi(x^3) - \int x^2 \psi(x^3) \, dx + C\)
(d) \(\frac{1}{3} \left[ x^3 \psi(x^3) - \int x^2 \psi(x^3) \, dx \right] + C\)

8. The integral \(\int \left(1 + x - \frac{1}{x}\right) e^{x + 1} x \, dx\) is equal to [JEE M 2014]
(a) \((x+1)e^{x^3 + 1} + c\)
(b) \(-xe^{x + 1} + c\)
(c) \((x-1)e^{x^3 + 1} + c\)
(d) \(xe^{x^3 + 1} + c\)
9. The integral \( \int \frac{dx}{x^2(x^4+1)^{3/4}} \) equals: \[ \text{[JEE M 2015]} \]

\[ \begin{align*}
(a) \quad & -\frac{1}{x^4 + 1} + c \\
(b) \quad & -\left(\frac{x^4 + 1}{x^4}\right)^{1/4} + c \\
(c) \quad & \left(\frac{x^4 + 1}{x^4}\right)^{1/4} + c \\
(d) \quad & (x^4 + 1)^{1/4} + c
\end{align*} \]

10. The integral \( \int \frac{2x^{12} + 5x^9}{(x^5 + x^3 + 1)^3} dx \) is equal to: \[ \text{[JEE M 2016]} \]

\[ \begin{align*}
(a) \quad & \frac{x^5}{2(x^5 + x^3 + 1)^2} + C \\
(b) \quad & \frac{-x^{10}}{2(x^5 + x^3 + 1)^2} + C \\
(c) \quad & \frac{-x^5}{2(x^5 + x^3 + 1)^2} + C \\
(d) \quad & \frac{x^{10}}{2(x^5 + x^3 + 1)^2} + C
\end{align*} \]

where \( C \) is an arbitrary constant.
Definite Integrals and Applications of Integrals

Section-A

A. Fill in the Blanks

1. \( f(x) = \frac{\sec x \cos x}{\sec^2 x + \cot x \csc x} \)

2. \( \int_0^{\pi/2} f(x) \, dx = \ldots \) (1987 - 2 Marks)

3. \( \int_{-2}^{2} |1 - x^2| \, dx = \ldots \) (1989 - 2 Marks)

4. \( \int_0^{\pi/4} \frac{\phi}{1 + \sin \phi} \, d\phi = \ldots \) (1993 - 2 Marks)

5. \( \int_2^3 \frac{\sqrt{x}}{\sqrt{5 - x + \sqrt{x}}} \, dx = \ldots \) (1994 - 2 Marks)

6. If for nonzero \( x \), \( a f(x) + b f\left(\frac{1}{x}\right) = \frac{1}{x} - 5 \) where \( a \neq b \), then \( \int_1^2 f(x) \, dx = \ldots \) (1996 - 2 Marks)

7. For \( n > 0 \), \( \int_0^{2\pi} \frac{x \sin 2n x}{\sin 2n x + \cos 2n x} \, dx = \ldots \) (1996 - 1 Mark)

8. The value of \( \int_1^e \frac{\pi \sin(\pi \ln x)}{x} \, dx = \ldots \) (1997 - 2 Marks)

9. Let \( \frac{d}{dx} F(x) = e^{\sin x} \frac{\sin x}{x} \), \( x > 0 \). If \( \int_1^4 2 e^{\sin x} \frac{\sin x}{x} \, dx = F(k) - F(1) \)

B. True / False

1. The value of the integral \( \int_0^{2a} \frac{f(x)}{f(x) + f(2a-x)} \, dx \) is equal to \( a \). (1988 - 1 Mark)

2. Let \( a, b, c \) be non-zero real numbers such that

   \( \int_0^1 (1 + \cos^8 x)(ax^2 + bx + c) \, dx = \int_0^2 (1 + \cos^8 x)(ax^2 + bx + c) \, dx \)

   Then the quadratic equation \( ax^2 + bx + c = 0 \) has

   (a) no root in (0, 2)  (b) at least one root in (0, 2)
   (c) a double root in (0, 2)  (d) two imaginary roots

   (1981 - 2 Marks)

3. The area bounded by the curves \( y = f(x) \), the x-axis and the ordinates \( x = 1 \) and \( x = b \) is \( (b - 1) \) \( \sin (3b + 4) \). Then \( f(x) \) is

   (a) \( x - 1 \) \( \cos (3x + 4) \)
   (b) \( \sin (3x + 4) \)
   (c) \( \sin (3x + 4) + 3(x - 1) \) \( \cos (3x + 4) \)
   (d) none of these

   (1982 - 2 Marks)

4. The value of the integral \( \int_0^{\pi/2} \frac{\sqrt{\cot x}}{\sqrt{\cot x + \sqrt{\tan x}}} \, dx \) is

   (a) \( \pi/4 \)  (b) \( \pi/2 \) (c) \( \pi \)  (d) none of these

   (1983 - 1 Mark)

5. For any integer \( n \) the integral —

   \( \int_0^\pi e^{\cos^2 x} \cos^n (2n+1) x \, dx \) has the value

   (a) \( \pi \)  (b) \( 1 \)
   (c) \( 0 \)  (d) none of these

   (1985 - 2 Marks)

C. MCQs with One Correct Answer
6. Let \( f : R \rightarrow R \) and \( g : R \rightarrow R \) be continuous functions. Then the value of the integral
\[
\int_{-\pi/2}^{\pi/2} [f(x) + f(-x)] g(x) - g(-x)] \, dx \text{ is } (1990 - 2 \text{ Marks})
\]
(a) \( \pi \) (b) 1 (c) -1 (d) 0

7. The value of \( \int_{0}^{\pi/2} \frac{dx}{1 + \tan^3 x} \text{ is } (1993 - 1 \text{ Marks}) \)
(a) 0 (b) 1 (c) \( \pi/2 \) (d) \( \pi/4 \)

8. If \( f(x) = A \sin \left( \frac{\pi x}{2} \right) + B \), then \( f(1/2) = \sqrt{2} \) and
\[
\frac{1}{\pi} \int_{0}^{\pi} f(x) \, dx = \frac{2A}{\pi} \text{, then constants } A \text{ and } B \text{ are } (1995S)
\]
(a) \( \frac{\pi}{2} \) and \( \frac{\pi}{2} \) (b) \( \frac{2}{\pi} \) and \( \frac{3}{\pi} \) (c) 0 and \( -\frac{4}{\pi} \) (d) \( \frac{4}{\pi} \) and 0

9. The value of \( \int \lfloor 2 \sin x \rfloor \, dx \) where \( \lfloor . \rfloor \) represents the greatest integer function is \( (1995S) \)
(a) \( -\frac{5\pi}{3} \) (b) \( -\pi \) (c) \( \frac{5\pi}{3} \) (d) \( -2\pi \)

10. If \( g(x) = \int_{0}^{x} \cos^4 t \, dt \), then \( g(x+\pi) \) equals \( (1997 - 2 \text{ Marks}) \)
(a) \( g(x) + g(\pi) \) (b) \( g(x) - g(\pi) \) (c) \( g(x)g(\pi) \) (d) \( \frac{g(x)}{g(\pi)} \)

11. \( \int_{\pi/4}^{3\pi/4} \frac{dx}{1 + \cos x} \text{ is equal to } (1999 - 2 \text{ Marks}) \)
(a) 2 (b) -2 (c) \( 1/2 \) (d) \( -1/2 \)

12. If for a real number \( y \), \( [y] \) is the greatest integer less than or equal to \( y \), then the value of the integral \( \int_{\pi/2}^{3\pi/2} [2\sin x] \, dx \text{ is } (1999 - 2 \text{ Marks}) \)
(a) \(-\pi\) (b) 0 (c) \(-\pi/2\) (d) \( \pi/2 \)

13. Let \( f(x) = \int_{0}^{x} f(t) \, dt \), where \( f \) is such that
\[
\frac{1}{2} \leq f(t) \leq 1, \text{ for } t \in [0,1] \text{ and } 0 \leq f(t) \leq \frac{1}{2}, \text{ for } t \in [1,2].
\]
Then \( g(2) \) satisfies the inequality \( (2000S) \)
(a) \( -\frac{3}{2} \leq g(2) < \frac{1}{2} \) (b) \( 0 \leq g(2) < 2 \) (c) \( \frac{3}{2} < g(2) \leq \frac{5}{2} \) (d) \( 2 < g(2) < 4 \)

14. If \( f(x) = \begin{cases} e^{\cos x} \sin x, & \text{for } |x| \leq 2 \\ 0, & \text{otherwise} \end{cases} \), then \( \int_{-2}^{3} f(x) \, dx = (2000S) \)
(a) 0 (b) 1 (c) 2 (d) 3

15. The value of the integral \( \int_{e^{-1}}^{e^2} \frac{\log_e x}{x} \, dx \text{ is } (2000S) \)
(a) \( 3/2 \) (b) \( 5/2 \) (c) 3 (d) 5

16. The value of \( \int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + a^x} \, dx \), \( a > 0 \), is \( (2001S) \)
(a) \( \pi \) (b) \( a\pi \) (c) \( \pi/2 \) (d) \( 2\pi \)

17. The area bounded by the curves \( y = |x| - 1 \) and \( y = -|x| + 1 \) is \( (2002S) \)
(a) 1 (b) 2 (c) \( 2\sqrt{2} \) (d) 4

18. Let \( f(x) = \frac{x}{\sqrt{2 - t^2}} \). Then the real roots of the equation \( x^2 - f'(x) = 0 \) are \( (2002S) \)
(a) \( \pm 1 \) (b) \( \pm \frac{1}{\sqrt{2}} \) (c) \( \pm \frac{1}{2} \) (d) 0 and 1

19. Let \( T > 0 \) be a fixed real number. Suppose \( f \) is a continuous function such that for all \( x \) \( R \), \( f(x + T) = f(x) \).
If \( I = \int_{0}^{T} f(x) \, dx \) then the value of \( \int_{0}^{3+3T} f(2x) \, dx \) is \( (2002S) \)
(a) \( 3T \) (b) \( 2T \) (c) \( 3T \) (d) \( 6T \)

20. The integral \( \int_{-1/2}^{1/2} \left[ x + \ln \left( \frac{1 + x}{1 - x} \right) \right] \, dx \) equal to \( (2002S) \)
(a) \( -\frac{1}{2} \) (b) 0 (c) 1 (d) \( 2\ln \left( \frac{1}{2} \right) \)

21. If \( l(m,n) = \int_{0}^{1} t^m (1+t)^n \, dt \), then the expression for \( l(m,n) \) in terms of \( l(m+1, n-1) \) is \( (2003S) \)
(a) \( \frac{2^n}{m+1} - \frac{n}{m+1} l(m+1, n-1) \) (b) \( \frac{n}{m+1} l(m+1, n-1) \) (c) \( \frac{2^n}{m+1} + \frac{n}{m+1} l(m+1, n-1) \) (d) \( \frac{m}{n+1} l(m+1, n-1) \)

22. If \( f(x) = \int_{0}^{x^2+1} e^{-t^2} \, dt \), then \( f(x) \) increases in \( (2003S) \)
(a) \( -2, 2 \) (b) no value of \( x \) (c) \( 0, \infty \) (d) \( -\infty, 0 \)
23. The area bounded by the curves \( y = \sqrt{x} \), \( 2y + 3 = x \) and x-axis in the 1st quadrant is \( \frac{27}{4} \) \( \text{(2003S)} \) (a) 9 (b) 27/4 (c) 36 (d) 18

24. If \( f(x) \) is differentiable and \( \int_0^2 x f(x) dx = \frac{2}{5} \), then \( f\left(4 \frac{4}{25}\right) \) equals \( 2/5 \) \( \text{(2004S)} \) (a) 2/5 (b) -5/2 (c) 1 (d) 5/2

25. The value of the integral \( \int \frac{\sqrt{1-x}}{1+x} dx \) is \( \sqrt{\pi} \) \( \text{(2004S)} \) (a) \( \frac{\pi}{2} + 1 \) (b) \( \frac{\pi}{2} - 1 \) (c) \( -1 \) (d) 1

26. The area enclosed between the curves \( y = ax^2 \) and \( x = ay^2 \) (a > 0) is 1 sq. unit, then the value of \( a \) is \( \text{(2004S)} \) (a) 1\(/\sqrt{3} \) (b) 1/2 (c) 1 (d) 1/3

27. \( \int \left[ x^2 + 3x^2 + 3x + 3 + (x + 1)\cos(x + 1) \right] dx \) is equal to \( \sqrt{n} \) \( \text{(2005S)} \) (a) -4 (b) 0 (c) 4 (d) 6

28. The area bounded by the parabolas \( y = (x + 1)^2 \) and \( y = (x - 1)^2 \) and the line \( y = 1/4 \) is \( \text{(2005S)} \) (a) 4 sq. units (b) 1/6 sq. units (c) 4/3 sq. units (d) 1/3 sq. units

29. The area of the region between the curves \( y = \sqrt{\frac{1 + \sin x}{\cos x}} \) and \( y = \sqrt{\frac{1 - \sin x}{\cos x}} \) bounded by the lines \( x = 0 \) and \( x = \frac{\pi}{4} \) is \( \sqrt{\pi} - 1 \) \( \text{(2008)} \) (a) \( \int_0^{\sqrt{2}} \frac{t}{(1 + t^2)^{1/2}} dt \) (b) \( \int_0^{\pi/2} \frac{4t}{(1 + t^2)^{1/2}} dt \) (c) \( \int_0^{\sqrt{2} - 1} \frac{4t}{(1 + t^2)^{1/2}} dt \) (d) \( \int_0^{\sqrt{2} + 1} \frac{4t}{(1 + t^2)^{1/2}} dt \)

30. Let \( f \) be a non-negative function defined on the interval \( [0, 1] \). If \( \int_0^x \sqrt{1 - (f'(t))^2} dt = f(t) dt, \quad 0 \leq t \leq 1 \), and \( f(0) = 0 \), then \( \pi/2 \) \( \text{(2009)} \) (a) \( \frac{f(1)}{2} < \frac{1}{2} \) and \( \frac{f(1)}{3} > \frac{1}{3} \) (b) \( \frac{f(1)}{2} > \frac{1}{2} \) and \( \frac{f(1)}{3} < \frac{1}{3} \) (c) \( \frac{f(1)}{2} < \frac{1}{2} \) and \( \frac{f(1)}{3} < \frac{1}{3} \) (d) \( \frac{f(1)}{2} > \frac{1}{2} \) and \( \frac{f(1)}{3} > \frac{1}{3} \)

31. The value of \( \lim_{x \to 0} \frac{1}{x^3} \int_0^x t\ln(1+t) dt \) is \( \text{(2010)} \) (a) 0 (b) \( \frac{1}{12} \) (c) \( \frac{1}{24} \) (d) \( \frac{1}{64} \)

32. Let \( f \) be a real-valued function defined on the interval \( (-1, 1) \) such that \( e^{-x} f(x) = 2 + \int_{-1}^{x} \sqrt{t^4 + 1} \ dt \), for all \( x \in (-1, 1) \), and let \( f^{-1} \) be the inverse function of \( f \). Then \( (f^{-1})'(2) \) is equal to \( \text{(2010)} \) (a) 1 (b) \( \frac{1}{3} \) (c) \( \frac{1}{2} \) (d) \( \frac{1}{e} \)

33. The value of \( \int \frac{\sqrt{n} \sin x}{\sqrt{\sin x^2 + \sin(\ell n 6 - x^2)}} dx \) is \( \text{(2011)} \) (a) \( \frac{\ell n}{2} \) (b) \( \frac{\ell n}{3} \) (c) \( \frac{\ell n}{2} \) (d) \( \frac{\ell n}{6} \)

34. Let the straight line \( x = b \) divide the area enclosed by \( y = (1-x)^2 \), \( y = 0 \), and \( x = 0 \) into two parts \( R_1 (0 \leq x \leq b) \) and \( R_2 (b \leq x \leq 1) \) such that \( R_1 - R_2 = \frac{1}{4} \). Then \( b \) equals \( \text{(2011)} \) (a) \( \frac{3}{4} \) (b) \( \frac{1}{2} \) (c) \( \frac{1}{3} \) (d) \( \frac{1}{4} \)

35. Let \( f: [-1, 2] \to [0, \infty) \) be a continuous function such that \( f(x) = f(1-x) \) for all \( x \in [-1, 2] \). Let \( R_1 = \int_{-1}^{2} x f(x) dx \), and \( R_2 \) be the area of the region bounded by \( y = f(x), x = -1, x = 2, \) and the x-axis. Then \( \text{(2011)} \) (a) \( R_1 = 2R_2 \) (b) \( R_1 = 3R_2 \) (c) \( 2R_1 = R_2 \) (d) \( 3R_1 = R_2 \)

36. The value of the integral \( \int_{-\pi/2}^{\pi/2} \left(x^2 + \ln \frac{\pi + x}{\pi - x}\right) \cos x dx \) is \( \pi^2 \) \( \text{(2012)} \) (a) 0 (b) \( \frac{\pi^2}{2} - 4 \) (c) \( \frac{\pi^2}{2} + 4 \) (d) \( \frac{\pi^2}{2} \)

37. The area enclosed by the curves \( y = \sin x + \cos x \) and \( y = |\cos x - \sin x| \) over the interval \( \left[0, \frac{\pi}{2}\right] \) is \( \text{(JEE Adv. 2013)} \) (a) \( 4(\sqrt{2} - 1) \) (b) \( 2\sqrt{2} (\sqrt{2} - 1) \) (c) \( 2(\sqrt{2} + 1) \) (d) \( 2\sqrt{2} (\sqrt{2} + 1) \)
38. Let \( f: \left[ \frac{1}{2}, 1 \right] \to \mathbb{R} \) (the set of all real number) be a positive, non-constant and differentiable function such that
\[ f'(x) < 2f(x) \text{ and } f\left(\frac{1}{2}\right) = 1. \]
Then the value of \( \int_{1/2}^{1} f(x) \, dx \) lies in the interval (JEE Adv. 2013)
(a) \((2e-1, 2e)\) (b) \((e-1, 2e-1)\)
(c) \((\frac{e-1}{2}, e-1)\) (d) \((0, \frac{e-1}{2})\)

39. The following integral \( \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} (2\sec x)^{17} \, dx \) is equal to (JEE Adv. 2014)
(a) \(\int_{0}^{1} 2(1+e^{-u})^{16} \, du\)
(b) \(\int_{0}^{1} (1+e^{-u})^{17} \, du\)
(c) \(\int_{0}^{1} (1+e^{u}-e^{-u})^{17} \, du\)
(d) \(\int_{0}^{1} 2(1+e^{-u})^{16} \, du\)

40. The value of \( \int_{\frac{\pi}{2}}^{\frac{\pi}{4}} x^{2} \cos x \, dx \) is equal to (JEE Adv. 2016)
(a) \(\frac{\pi^{2}}{4} - 2\) (b) \(\frac{\pi^{2}}{4} + 2\)
(c) \(\pi^{2} - e^{\pi}\) (d) \(\pi^{2} + e^{\pi}\)

41. Area of the region \( \{(x, y) \in \mathbb{R}^2 : y \geq \sqrt{|x+3|}, 5y \leq x + 9 \leq 15\} \) is equal to (JEE Adv. 2016)
(a) \(\frac{1}{6}\) (b) \(\frac{4}{3}\)
(c) \(\frac{3}{2}\) (d) \(\frac{5}{3}\)

### MCQs with One or More than One Correct

1. If \( \int_{0}^{x} f(t) \, dt = x + \int_{x}^{1} t \, f(t) \, dt \), then the value of \( f(1) \) is (1998 - 2 Marks)
   (a) \(\frac{1}{2}\) (b) \(0\) (c) \(1\) (d) \(-\frac{1}{2}\)

2. Let \( f(x) = x - [x] \), for every real number \( x \), where \([x]\) is the integral part of \( x \). Then \( \int_{1}^{4} f(x) \, dx \) is (1999 - 3 Marks)
   (a) \(-4\) (b) \(-2\) (c) \(2\) (d) \(4\)

3. For which of the following values of \( m \), is the area of the region bounded by the curve \( y = x - x^{2} \) and the line \( y = mx \) equals 9/2? (1999 - 3 Marks)
   (a) \(-4\) (b) \(-2\) (c) \(2\) (d) \(4\)

4. Let \( f(x) \) be a non-constant twice differentiable function defined on \((-\infty, \infty)\) such that \( f(x) = f(1 - x) \) and \( f''\left(\frac{1}{4}\right) = 0 \). Then, (2008)
   (a) \(f''(x)\) vanishes at least twice on \([0, 1]\)
   (b) \(f''\left(\frac{1}{2}\right) = 0\)
   (c) \(\int_{-1/2}^{1/2} f\left(x + \frac{1}{2}\right) \sin x \, dx = 0\)
   (d) \(\int_{0}^{1/2} f(t) e^{\sin nt} \, dt = \int_{1/2}^{1} f(1-t) e^{\sin nt} \, dt\)

5. Area of the region bounded by the curve \( y = e^{x} \) and lines \( x = 0 \) and \( y = e \) is (2009)
   (a) \(e - 1\) (b) \(\int_{1}^{e} \ln(e+1-y) \, dy\)
   (c) \(e - \frac{1}{e} e^{x} \, dx\) (d) \(\int_{1}^{e} \ln y \, dy\)

6. If \( I_{n} = \int_{-\pi}^{\pi} \frac{\sin nx}{(1+\pi^{2})^{2}} \, dx \), \( n = 0, 1, 2, \ldots \), then (2009)
   (a) \(I_{n} = I_{n+2}\) (b) \(\sum_{m=1}^{10} I_{2m+1} = 10\pi\)
   (c) \(\sum_{m=1}^{10} I_{2m} = 0\) (d) \(I_{n} = I_{n+1}\)

7. The value(s) of \( \int_{0}^{1} x^{4}(1-x)^{4} \, dx \) is (are) (2010)
   (a) \(\frac{22}{7} - \pi\) (b) \(\frac{2}{105}\)
   (c) \(0\) (d) \(\frac{71}{15} - \frac{3\pi}{2}\)
8. Let $f$ be a real-valued function defined on the interval $(0, \infty)$ by $f(x) = \ln x + \int_0^x \frac{1}{\sqrt{1 + \sin t}} \, dt$. Then which of the following statement(s) is (are) true? 

(a) $f''(x)$ exists for all $x \in (0, \infty)$
(b) $f'(x)$ exists for all $x \in (0, \infty)$ and $f'$ is continuous on $(0, \infty)$, but not differentiable on $(0, \infty)$
(c) there exists $\alpha > 1$ such that $|f'(x)| < |f(x)|$ for all $x \in (\alpha, \infty)$
(d) there exists $\beta > 0$ such that $|f'(x)| + |f''(x)| \leq \beta$ for all $x \in (0, \infty)$

10. Let $S$ be the area of the region enclosed by $y = e^{-x^2}$, $y = 0$, $x = 0$ and $x = 1$; then

(a) $S \geq \frac{1}{e}$
(b) $S \geq \frac{1}{e}$
(c) $S \leq \frac{1}{4} \left(1 + \frac{1}{\sqrt{e}}\right)$
(d) $S \leq \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{e}} \left(1 - \frac{1}{\sqrt{2}}\right)$

11. Let $f(x) = 7\tan^8 x + 7\tan^6 x - 3\tan^4 x - 3\tan^2 x$ for all $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$. Then the correct expression(s) is(are)

(a) $\int_0^{\pi/4} xf'(x) \, dx = \frac{1}{12}$
(b) $\int_0^{\pi/4} f(x) \, dx = 0$
(c) $\int_0^{\pi/4} xf'(x) \, dx = \frac{1}{6}$
(d) $\int_0^{\pi/4} f(x) \, dx = 1$

12. Let $f'(x) = \frac{192x^3}{2 + \sin^3 \pi x}$ for all $x \in \mathbb{R}$ with $f\left(\frac{1}{2}\right) = 0$. If $m \leq \int_0^{1/2} f(x) \, dx \leq M$, then the possible values of $m$ and $M$ are

(a) $m = 13, M = 24$
(b) $m = \frac{1}{4}, M = \frac{1}{2}$
(c) $m = -11, M = 0$
(d) $m = 1, M = 12$

13. Let $f(x) = \lim_{n \to \infty} \left(\frac{n^x (x+n)(x+n^2) \cdots (x+n^n)}{n!(x^2 + n^2)(x^2 + n^4) \cdots (x^2 + n^{2n})}\right)^{x/n}$ for all $x > 0$. Then

(a) $f\left(\frac{1}{2}\right) \geq f(1)$
(b) $f\left(\frac{1}{3}\right) \leq f\left(\frac{2}{3}\right)$
(c) $f'(2) \leq 0$
(d) $f'(3) \geq f'(2)$

E Subjective Problems

1. Find the area bounded by the curve $x^2 = 4y$ and the straight line $x = 4y - 2$. 

2. Show that: $\lim_{n \to \infty} \left(1 + \frac{1}{n+1} + \frac{1}{n+2} + \cdots + \frac{1}{6n}\right) = \log 6$

3. Show that $\int_0^{\pi/4} xf'(\sin x) \, dx = \frac{\pi}{2} f(\sin x) \, dx$

4. Find the value of $\int_{-1}^{3/2} |x \sin \pi x| \, dx$

5. For any real $t$, $x = \frac{e^t + e^{-t}}{2}$, $y = \frac{e^t - e^{-t}}{2}$ is a point on the hyperbola $x^2 - y^2 = 1$. Show that the area bounded by this hyperbola and the lines joining its centre to the points corresponding to $t$ and $-t$ is $t^2$.

6. Evaluate: $\int_0^{\pi/4} \sin x + \cos x \, dx$

7. Find the area bounded by the $x$-axis, part of the curve $y = \left(1 + \frac{8}{x^2}\right)$ and the ordinates at $x = 2$ and $x = 4$. If the ordinate at $x = a$ divides the area into two equal parts, find $a$.

8. Evaluate the following $\int_0^{\pi/2} \frac{1}{2} x \frac{\sin^{-1} x}{\sqrt{1 - x^2}} \, dx$

9. Find the area of the region bounded by the $x$-axis and the curves defined by

$y = \tan x$, $\frac{\pi}{3} \leq x \leq \frac{\pi}{2}$
$y = \cot x$, $\frac{\pi}{6} \leq x \leq \frac{3\pi}{2}$
16. Given a function $f(x)$ such that
   (1) it is integrable over every interval on the real line and
   (2) $f(t+x) = f(x)$, for every $x$ and a real $t$, then show that
      the integral $\int_0^a f(x) \, dx$ is independent of $a$.

11. Evaluate the following: $\int_0^{\pi/2} \frac{x \sin x \cos x}{\cos^4 x + \sin^4 x} \, dx$ (1985 - 2½ Marks)

12. Sketch the region bounded by the curves $y = \sqrt{5 - x^2}$ and $y = x - 1$ and find its area. (1985 - 5 Marks)

13. Evaluate: $\int_0^\pi \frac{x \, dx}{1 + \cos \alpha \sin x}, \; 0 < \alpha < \pi$ (1986 - 2½ Marks)

14. Find the area bounded by the curves, $x^2 + y^2 = 25$, $4y = |4 - x^2|$ and $x = 0$ above the x-axis. (1987 - 6 Marks)

15. Find the area of the region bounded by the curve C: $y = \tan x$, tangent drawn to C at $x = \frac{\pi}{4}$ and the x-axis. (1988 - 5 Marks)

16. Evaluate $\int_0^1 \log(\sqrt{1-x} + \sqrt{1+x}) \, dx$ (1988 - 5 Marks)

17. If $f$ and $g$ are continuous functions on $[0, a]$ satisfying $f(x) = f(a-x)$ and $g(x) + g(a-x) = 2$,
   then show that $\int_0^a f(x)g(x) \, dx = \int_0^a f(x) \, dx$ (1989 - 4 Marks)

18. Show that $\int_0^{\pi/2} f(2x) \sin x \, dx = \sqrt{2} \int_0^{\pi/4} f(2x) \cos x \, dx$ (1990 - 4 Marks)

19. Prove that for any positive integer $k$,
   $$\frac{\sin 2kx}{\sin x} = 2[\cos x + \cos 3x + \cdots + \cos (2k-1)x]$$
   Hence prove that $\int_0^{\pi/2} \sin 2kx \cot x \, dx = \frac{\pi}{2}$ (1990 - 4 Marks)

20. Compute the area of the region bounded by the curves $y = e^x \ln x$ and $y = \frac{\ln x}{e^x}$ where $\ln e = 1$. (1990 - 4 Marks)

21. Sketch the curves and identify the region bounded by $x = \frac{1}{2}$, $x = 2$, $y = \ln x$ and $y = 2^x$. Find the area of this region. (1991 - 4 Marks)

22. Let $m$ be a continuous function with $\int_0^x f(t) \, dt \to \infty$ as $|x| \to \infty$,
   then show that every line $y = mx$ intersects the curve $y^2 + \int_0^x f(t) \, dt = 2$! (1991 - 4 Marks)

23. Evaluate $\int_0^\pi \frac{x \sin 2x \sin \left(\frac{\pi \cos x}{2}\right)}{2x - \pi} \, dx$ (1991 - 4 Marks)

24. Sketch the region bounded by the curves $y = x^2$ and $y = \frac{2}{1 + x^2}$, and find the area. (1992 - 4 Marks)

25. Determine a positive integer $n \leq 5$, such that $\int_0^1 e^x(x-1)^n \, dx = 16 - 6e$ (1992 - 4 Marks)

26. Evaluate $\int_2^\infty \frac{2x^3 + x^4 - 2x^3 + 2x^2 + 1}{(x^2 + 1)(x^4 - 1)} \, dx$. (1993 - 5 Marks)

27. Show that $\int 2^n \sin^n \cos v \, dv = 2n + 1 - \cos v$ where $n$ is a positive integer and $0 \leq v < \pi$. (1994 - 4 Marks)

28. In what ratio does the x-axis divide the area of the region bounded by the parabolas $y = 4x - x^2$ and $y = x^2 - x$? (1994 - 5 Marks)

29. Let $I_m = \int_0^\pi \frac{1 - \cos mx}{1 - \cos x} \, dx$. Use mathematical induction to prove that $I_m = m \pi$, $m = 0, 1, 2, \ldots$ (1995 - 5 Marks)

30. Evaluate the definite integral:
   $$\int_{-1/\sqrt{3}}^{1/\sqrt{3}} \left( \frac{x^4}{1-x^4} \right) \cos^{-1} \left( \frac{2x}{1+x^2} \right) \, dx$$ (1995 - 5 Marks)

31. Consider a square with vertices at $(1, 1), (-1, 1), (-1, -1)$ and $(1, -1)$. Let $S$ be the region consisting of all points inside the square which are nearer to the origin than to any edge. Sketch the region $S$ and find its area. (1995 - 5 Marks)
32. Let \( A_n \) be the area bounded by the curve \( y = (\tan x)^n \) and the lines \( x = 0, y = 0 \) and \( x = \frac{\pi}{4} \). Prove that for \( n > 2 \),
\[
A_n + A_{n-2} = \frac{1}{n-1} \quad \text{and deduce} \quad \frac{1}{2n+2} < A_n < \frac{1}{2n-2}.
\]
(1996 - 5 Marks)

33. Determine the value of \( \int_{-\pi}^{\pi} \frac{2x(1 + \sin x)}{1 + \cos^2 x} \, dx \).
(1997 - 5 Marks)

34. Let \( f(x) = \max \{ x^2, (1-x)^2, 2x(1-x) \} \), where \( 0 \leq x \leq 1 \). Determine the area of the region bounded by the curves \( y = f(x) \), x-axis, \( x = 0 \) and \( x = 1 \).
(1997 - 5 Marks)

35. Prove that \( \int_{0}^{1} \tan^{-1} \left( \frac{1}{1-x^2} \right) \, dx = 2 \int_{0}^{1} \tan^{-1} x \, dx \).
Hence or otherwise, evaluate the integral
\[
\int_{0}^{1} \tan^{-1} (1-x+x^2) \, dx.
\]
(1998 - 8 Marks)

36. Let \( C_1 \) and \( C_2 \) be the graphs of the functions \( y = x^2 \) and \( y = 2x \), \( 0 \leq x \leq 1 \) respectively. Let \( C_3 \) be the graph of a function \( y = f(x) \), \( 0 \leq x \leq 1, f(0) = 0 \). For a point \( P \) on \( C_1 \), let the lines through \( P \), parallel to the axes, meet \( C_1 \) and \( C_2 \) at \( Q \) and \( R \) respectively (see figure). If for every position of \( P \) on \( C_1 \), the areas of the shaded regions \( OPRQ \) and \( ORP \) are equal, determine the function \( f(x) \).
(1998 - 8 Marks)

37. Integrate \( \int_{0}^{\pi} \frac{e^{\cos x}}{e^{\cos x} + e^{-\cos x}} \, dx \).
(1999 - 5 Marks)

38. Let \( f(x) \) be a continuous function given by
\[
f(x) = \begin{cases} 
2x, & |x| \leq 1 \\
x^2 + ax + b, & |x| > 1
\end{cases}
\]
(1999 - 10 Marks)

Find the area of the region in the third quadrant bounded by the curves \( x = -2y^2 \) and \( y = f(x) \) lying on the left of the line \( 8x + 1 = 0 \).

39. For \( x > 0 \), let \( f(x) = \int_{1}^{x} \frac{\ln t}{t+1} \, dt \). Find the function \( f(x) + f \left( \frac{1}{x} \right) \) and show that \( f(e) + f \left( \frac{1}{e} \right) = \frac{1}{2} \).
(2000 - 5 Marks)

40. Let \( a \neq 0 \) and for \( j = 0, 1, 2, \ldots, n \), let \( S_j \) be the area of the region bounded by the \( y \)-axis and the curve \( xe^{\theta y} = \sin y \), \( \frac{\pi}{b} \leq y \leq \frac{(j+1)\pi}{b} \) . Show that \( S_0, S_1, S_2, \ldots, S_n \) are in geometric progression. Also, find their sum for \( a = -1 \) and \( b = \pi \).
(2001 - 5 Marks)

41. Find the area of the region bounded by the curves \( y = x^2, y = |2-x^2| \) and \( y = 2 \), which lies to the right of the line \( x = 1 \).
(2002 - 5 Marks)

42. If \( f \) is an even function then prove that
\[
\frac{\pi}{2} \int_{0}^{\pi/2} f(\cos 2x) \cos x \, dx = \sqrt{2} \int_{0}^{\pi/4} f(\sin 2x) \cos x \, dx.
\]
(2003 - 2 Marks)

43. If \( y(x) = \int_{\pi^2/16}^{x^2} \frac{\cos x \cos \sqrt{\theta}}{1 + \sin^2 \sqrt{\theta}} \, d\theta \), then find \( \frac{dy}{dx} \) at \( x = \pi \).
(2004 - 2 Marks)

44. Find the value of \( \int_{-\pi/3}^{\pi/3} \frac{\pi + 4x^3}{2 - 2 \cos \left( x + \frac{\pi}{3} \right)} \, dx \).
(2004 - 4 Marks)

45. Evaluate \( \int_{0}^{\pi} e^{\cos x} \left( 2 \sin \left( \frac{1}{2} \cos x \right) + 3 \cos \left( \frac{1}{2} \cos x \right) \right) \sin x \, dx \).
(2005 - 2 Marks)

46. Find the area bounded by the curves \( x^2 = y, y^2 = x^2 - 3 \).
(2005 - 4 Marks)

47. \( f(x) \) is a differentiable function and \( g(x) \) is a double differentiable function such that \( f(0) \leq 1 \) and \( f'(0) = g(0) \). If \( f'(0) + g'(0) = 9 \). Prove that there exists some \( c \in (-3, 3) \) such that \( g(c)g''(c) < 0 \).
(2005 - 6 Marks)

48. If \[
\begin{bmatrix} 4a^2 & 4a & 1 \\ 4b^2 & 4b & 1 \\ 4c^2 & 4c & 1 \end{bmatrix} \begin{bmatrix} f(-1) \\ f(1) \\ f(2) \end{bmatrix} = \begin{bmatrix} 3a^2 + 3a \\ 3b^2 + 3b \\ 3c^2 + 3c \end{bmatrix},
\]
\( f(x) \) is a quadratic function and its maximum value occurs at a point \( V \). A is a point of intersection of \( y = f(x) \) with \( x \)-axis and point \( B \) is such that chord \( AB \) subtends a right angle at \( V \). Find the area enclosed by \( f(x) \) and chord \( AB \).
(2005 - 6 Marks)

49. The value of \( \int_{0}^{1} \frac{1}{(1-x^{100})} \, dx \) is.
(2006 - 6M)
**Match the Following**

**DIRECTIONS (Q. 1 and 2):** Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. Match the following :

   **Column I**
   - A \( \int_{0}^{\pi/2} (\sin x)^{\cos x} \left( \cos x \cot x - \log(\sin x)^{\sin x} \right) \, dx \)
   - (A) Area bounded by \(-4y^2 = x + 1 = -5y\)
   - (B) Cosine of the angle of intersection of curves \(y = 3^{x-1} \log x\) and \(y = x^x - 1\)
   - (C) Let \( \frac{dy}{dx} = \frac{6}{x+y} \) where \(y(0) = 0\) then value of \(y\) when \(x + y = 6\)
   - (D) \( \int_{0}^{\pi/2} \frac{dx}{\sqrt{1-x^2}} \)

   **Column II**
   - (p) 1
   - (q) 0
   - (r) 6 \ln 2
   - (s) \(\frac{4}{3}\)

2. Match the integrals in Column I with the values in Column II and indicate your answer by darkening the appropriate bubbles in the 4 \(\times\) 4 matrix given in the ORS.

   **Column I**
   - (A) \( \int_{-1}^{1} \frac{dx}{1+x^2} \)
   - (B) \( \int_{0}^{1} \frac{dx}{\sqrt{1-x^2}} \)
   - (C) \( \int_{1}^{2} \frac{dx}{\sqrt{1-x^2}} \)
   - (D) \( \int_{1}^{2} \frac{dx}{x\sqrt{x^2 - 1}} \)

   **Column II**
   - (p) \(\frac{1}{2} \log \left(\frac{2}{3}\right)\)
   - (q) 2 \log \left(\frac{2}{3}\right)
   - (r) \(\frac{\pi}{3}\)
   - (s) \(\frac{\pi}{2}\)

**DIRECTIONS (Q. 3):** Following question has matching lists. The codes for the list have choices (a), (b), (c) and (d) out of which ONLY ONE is correct.

3. **List - I**
   - P. The number of polynomials \(f(x)\) with non-negative integer coefficients of degree \(\leq 2\), satisfying \(f(0) = 0\) and \(\int_{0}^{1} f(x) \, dx = 1\), is
   - Q. The number of points in the interval \([-\sqrt{13}, \sqrt{13}]\) at which \(f(x) = \sin(x^2) + \cos(x^2)\) attains its maximum value, is
   - R. \( \int_{-2}^{2} \frac{3x^2}{1+e^{x^2}} \, dx \) equals

   **List - II**
   - 1. 8
   - 2. 2
   - 3. 4
\[
\begin{align*}
\int_{-1}^{1} \frac{1 + x}{1 - x} \cos 2x \log \left( \frac{1 + x}{1 - x} \right) dx & = 0 \\
(\text{JEE Adv. 2014})
\end{align*}
\]
PASSAGE - 3
Consider the function \( f: (-\infty, \infty) \rightarrow (-\infty, \infty) \) defined by
\[
 f(x) = \frac{x^2 - ax + 1}{x^2 + ax + 1}, \quad 0 < a < 2.
\]
7. Which of the following is true? (2008)
- (a) \((2 + a)^2 f'(1) + (2 - a)^2 f''(1) = 0\)
- (b) \((2 - a)^2 f''(1) - (2 + a)^2 f''(1) = 0\)
- (c) \(f'(1) f''(1) = (2 - a)^2\)
- (d) \(f'(1) f''(1) = -(2 + a)^2\)

8. Which of the following is true? (2008)
- (a) \(f(x)\) is decreasing on \((-1, 1)\) and has a local minimum at \(x = 1\)
- (b) \(f(x)\) is increasing on \((-1, 1)\) and has a local minimum at \(x = 1\)
- (c) \(f(x)\) is increasing on \((-1, 1)\) but has neither a local maximum nor a local minimum at \(x = 1\)
- (d) \(f(x)\) is decreasing on \((-1, 1)\) but has neither a local maximum nor a local minimum at \(x = 1\)

9. Let \(g(x) = \int_0^x \frac{f(t)}{1 + t^2} \, dt\). Which of the following is true? (2008)
- (a) \(g'(x)\) is positive on \((-\infty, 0)\) and negative on \((0, \infty)\)
- (b) \(g'(x)\) is negative on \((-\infty, 0)\) and positive on \((0, \infty)\)
- (c) \(g'(x)\) changes sign on both \((-\infty, 0)\) and \((0, \infty)\)
- (d) \(g'(x)\) does not change sign on \((-\infty, \infty)\)

PASSAGE - 4
Consider the polynomial \( f(x) = 1 + 2x + 3x^2 + 4x^3 \).
Let \( s \) be the sum of all distinct real roots of \( f(x) \) and let \( t = |s| \).
10. The real numbers lie in the interval
- (a) \(-\frac{1}{4}, 0\)
- (b) \(-11, -\frac{3}{4}\)
- (c) \(-\frac{3}{4}, -\frac{1}{2}\)
- (d) \(0, \frac{1}{4}\)

11. The area bounded by the curve \( y = f(x) \) and the lines \( x = 0, y = 0 \) and \( x = t \), lies in the interval
- (a) \(\frac{3}{4}, 3\)
- (b) \(\frac{21}{16}, 11\)
- (c) \(9, 10\)
- (d) \(0, \frac{21}{64}\)

12. The function \( f'(x) \) is
- (a) increasing in \((-t, -\frac{1}{4})\) and decreasing in \((-\frac{1}{4}, t)\)
- (b) decreasing in \((-t, -\frac{1}{4})\) and increasing in \((-\frac{1}{4}, t)\)
- (c) increasing in \((-t, t)\)
- (d) decreasing in \((-t, t)\)

PASSAGE - 5
Given that for each \( a \in (0, 1) \), \( \lim_{h \to 0^+} \int_0^1 \frac{1}{1 + t^a} (1-t)^{a-1} \, dt \) exists. Let this limit be \( g(a) \). In addition, it is given that the function \( g(a) \) is differentiable on \((0, 1)\). (JEE Adv. 2014)
13. The value of \( g\left(\frac{1}{2}\right) \) is
- (a) \(\pi\)
- (b) \(2\pi\)
- (c) \(\frac{\pi}{2}\)
- (d) \(\frac{\pi}{4}\)

14. The value of \( g'\left(\frac{1}{2}\right) \) is
- (a) \(\pi\)
- (b) \(2\pi\)
- (c) \(-\frac{\pi}{2}\)
- (d) \(0\)

PASSAGE - 6
Let \( F: \mathbb{R} \to \mathbb{R} \) be a thrice differentiable function. Suppose that
\( F(1) = 0, F(3) = -4 \) and \( F(x) < 0 \) for all \( x \in \left(\frac{1}{2}, \frac{3}{2}\right) \).
Let \( f(x) = x F(x) \) for all \( x \in \mathbb{R} \). (JEE Adv. 2015)
15. The correct statement(s) is(are)
- (a) \( f'(1) < 0 \)
- (b) \( f(2) < 0 \)
- (c) \( f'(x) \neq 0 \) for any \( x \in (1, 3) \)
- (d) \( f'(x) = 0 \) for some \( x \in (1, 3) \)

16. If \( \int_1^3 x^2 F'(x) \, dx = -12 \) and \( \int_1^3 x^3 F''(x) \, dx = 40 \), then the correct expression(s) is(are)
- (a) \( 9 f'(3) + f'(1) - 32 = 0 \)
- (b) \( \int_1^3 f(x) \, dx = 12 \)
- (c) \( 9 f'(3) - f'(1) + 32 = 0 \)
- (d) \( \int_1^3 f(x) \, dx = -12 \)
Definite Integrals and Applications of Integrals

I  Integer Value Correct Type

1. Let \( f: \mathbb{R} \rightarrow \mathbb{R} \) be a continuous function which satisfies

\[
f(x) = \int_0^x f(t) \, dt.
\]

Then the value of \( f(\ln 5) \) is \( 2009 \) \( (2009) \)

2. For any real number \( x \), let \([x]\) denote the largest integer less than or equal to \( x \). Let \( f \) be a real valued function defined on the interval \([-10, 10]\) by

\[
f(x) = \begin{cases} x - [x] & \text{if } [x] \text{ is odd,} \\ 1 + [x] - x & \text{if } [x] \text{ is even} \end{cases}
\]

Then the value of \( \int_{-10}^{10} f(x) \cos \pi x \, dx \) is \( 2010 \) \( (2010) \)

3. The value of \( \int_0^4 \frac{1}{x^3} \left( \frac{d^2}{dx^2} \left( 1 - x^2 \right)^5 \right) \, dx \) is \( 2014 \) \( (JEE \text{ Adv. 2014}) \)

4. Let \( f: \mathbb{R} \rightarrow \mathbb{R} \) be a function defined by

\[
f(x) = \begin{cases} [x], & x \leq 2 \\ 0, & x > 2 \end{cases}
\]

where \([x]\) is the greatest integer less than or equal to \( x \), if

\[
I = \int_{-1}^{2} \frac{xf(x^2)}{2 + f(x + 1)} \, dx,
\]

then the value of \((4I - 1)\) is \( 2015 \) \( (JEE \text{ Adv. 2015}) \)

5. Let \( F(x) = \int_x^\infty 2 \cos^2 t \, dt \) for all \( x \in \mathbb{R} \) and \( f: [0, \frac{1}{2}] \rightarrow [0, \infty) \) be a continuous function. For

\[
a \in \left[ 0, \frac{1}{2} \right], \quad \text{if} \quad F'(a) + 2 \quad \text{is the area of the region bounded by} \quad x = 0, y = 0, y = f(x) \quad \text{and} \quad x = a, \quad \text{then} \quad f(0/2) \quad \text{is} \quad (JEE \text{ Adv. 2015})
\]

6. If \( \alpha = \int_0^1 \left( e^{9x + 3 \tan^{-1} x} \right) \left( \frac{12 + 9x^2}{1 + x^2} \right) \, dx \) where \( \tan^{-1} x \) takes only principal values, then the value of

\[
\log_e |1 + \alpha | \left( -\frac{3\pi}{4} \right)
\]

is \( 2015 \) \( (JEE \text{ Adv. 2015}) \)

7. Let \( f: \mathbb{R} \rightarrow \mathbb{R} \) be a continuous odd function, which vanishes exactly at one point and \( f(1) = \frac{1}{2} \). Suppose that

\[
F(x) = \int_{-1}^x f(t) \, dt \quad \text{for all} \quad x \in [-1, 2] \quad \text{and} \quad G(x) = \int_{-1}^x f(f(t)) \, dt \quad \text{for all} \quad x \in [-1, 2]. \quad \text{If} \quad \lim_{x \to 1} \frac{F(x)}{x} = \frac{1}{14}, \quad \text{then} \quad \text{value of} \quad f\left( \frac{1}{2} \right) \quad \text{is} \quad (JEE \text{ Adv. 2015})
\]

8. The total number of distinct \( x \in [0, 1] \) for which

\[
\int_0^x t^2 \, dt = 2x - 1
\]

is \( 2016 \) \( (JEE \text{ Adv. 2016}) \)
1. \( \int_0^{10\pi} |\sin x| \, dx \) is \[2002\] 
(a) 20 (b) 8 (c) 10 (d) 18

2. \( I_n = \int_0^{\pi/4} \tan^n x \, dx \) then \( \lim_{n \to \infty} n[I_n + I_{n+2}] \) equals \[2002\] 
(a) \( \frac{e^{\frac{\pi}{2}} - 5}{2} \) (b) \( \frac{e^{\frac{\pi}{2}} - 5}{2} \) 
(c) \( e^{\frac{\pi}{2}} - \frac{3}{2} \) (d) \( e^{\frac{\pi}{2}} - \frac{3}{2} \)

10. The value of the integral \( I = \int_0^1 x(1-x)^n \, dx \) is \[2003\] 
(a) \( \frac{1}{n+1} + \frac{1}{n+2} \) (b) \( \frac{1}{n+2} \) 
(c) \( \frac{1}{n+2} \) (d) \( \frac{1}{n+1} - \frac{1}{n+2} \)

11. \( \lim_{n \to \infty} \sum_{r=1}^{n} \frac{1}{e^r} \) is \[2004\] 
(a) \( e+1 \) (b) \( e-1 \) (c) \( 1-e \) (d) \( e \)

12. The value of \( \int_{-2}^{3} |x^2| \, dx \) is \[2004\] 
(a) \( \frac{1}{3} \) (b) \( \frac{14}{3} \) (c) \( \frac{7}{3} \) (d) \( \frac{28}{3} \)

13. The value of \( I = \int_0^{\pi/2} (\sin x + \cos x)^2 \, dx \) is \[2004\] 
(a) 3 (b) 1 (c) 2 (d) 0

14. If \( \int_0^{\pi/2} (\sin x \cdot x) \, dx = A \) \( \frac{\pi}{0} \) \( (\sin x \cdot x) \, dx \), then \( A \) is \[2004\] 
(a) \( 2\pi \) (b) \( \pi \) (c) \( \frac{\pi}{4} \) (d) 0

15. If \( f(x) = \frac{e^x}{1+e^x} \), \( I_1 = \int_{f(-a)}^{f(a)} xg[x(1-x)] \, dx \) and \( I_2 = \int_{f(-a)}^{f(a)} g[x(1-x)] \, dx \), then the value of \( \frac{I_2}{I_1} \) is \[2004\] 
(a) 1 (b) -3 (c) -1 (d) 2

16. The area of the region bounded by the curves \( y=|x-2| \), \( x=1 \), \( x=3 \) and the x-axis is \[2004\] 
(a) 4 (b) 2 (c) 3 (d) 1
17. If \( I_1 = \int_{0}^{1} x^2 \, dx \), \( I_2 = \int_{0}^{2} x^3 \, dx \), \( I_3 = \int_{1}^{2} 2x^2 \, dx \) and \( I_4 = \int_{1}^{2} x^3 \, dx \) then \[ I_2 > I_1 \quad (b) \quad I_1 > I_2 \quad (c) \quad I_3 = I_4 \quad (d) \quad I_3 > I_4 \] [2005]

18. The area enclosed between the curve \( y = \log_e (x + e) \) and the coordinate axes is \[ (a) \quad 1 \quad (b) \quad 2 \quad (c) \quad 3 \quad (d) \quad 4 \] [2005]

19. The parabolas \( y^2 = 4x \) and \( x^2 = 4y \) divide the square region bounded by the lines \( x = 4 \), \( y = 4 \) and the coordinate axes. If \( S_1 \), \( S_2 \), \( S_3 \) are respectively the areas of these parts numbered from top to bottom; then \( S_1 : S_2 : S_3 \) is \[ (a) \quad 1 : 2 : 1 \quad (b) \quad 1 : 2 \quad (c) \quad 2 : 1 : 2 \quad (d) \quad 1 : 1 : 1 \] [2005]

20. Let \( f(x) \) be a non-negative continuous function such that the area bounded by the curve \( y = f(x) \), \( x \) - axis and the ordinates \( x = \frac{\pi}{4} \) and \( x = \beta > \frac{\pi}{4} \) is \[ \left( \beta \sin \beta + \frac{\pi}{4} \cos \beta + \sqrt{2}\beta \right) \]. Then \( f \left( \frac{\pi}{2} \right) \) is \[ (a) \quad \left( \frac{\pi}{4} + \sqrt{2} - 1 \right) \quad (b) \quad \left( \frac{\pi}{4} - \sqrt{2} + 1 \right) \quad (c) \quad \left( 1 - \frac{\pi}{4} - \sqrt{2} \right) \quad (d) \quad \left( 1 - \frac{\pi}{4} + \sqrt{2} \right) \] [2005]

21. The value of \[ \int_{-\pi}^{\pi} \frac{\cos^2 x \, dx}{1 + a^x} \], \( a > 0 \), is \[ (a) \quad a \pi \quad (b) \quad \frac{\pi}{2} \quad (c) \quad \frac{\pi}{a} \quad (d) \quad 2\pi \] [2005]

22. The value of integral \( \int_{0}^{3} \sqrt{\frac{\sqrt{x}}{9 - x + \sqrt{x}}} \, dx \) is \[ (a) \quad \frac{1}{2} \quad (b) \quad \frac{3}{2} \quad (c) \quad 2 \quad (d) \quad 1 \] [2005]

23. \( \int_{0}^{\pi} x f'(\sin x) \, dx \) is equal to \[ (a) \quad \frac{\pi}{2} \int_{0}^{\pi} f'(\cos x) \, dx \quad (b) \quad \pi \int_{0}^{\pi} f'(\sin x) \, dx \quad (c) \quad \frac{\pi}{2} \int_{0}^{\pi/2} f'(\sin x) \, dx \quad (d) \quad \pi \int_{0}^{\pi/2} f'(\cos x) \, dx \] [2006]

24. \( \int_{0}^{\pi/2} [(x + \pi)^2 + \cos^2(x + 3\pi)] \, dx \) is equal to \[ (a) \quad \frac{\pi}{2} \quad (b) \quad \frac{\pi^4}{32} + \pi/2 \quad (c) \quad \frac{\pi}{2} \quad (d) \quad \frac{\pi}{4} - 1 \] [2006]

25. The value of \( \int_{1}^{a} f'(x) \, dx \), \( a > 1 \) where \([x]\) denotes the greatest integer not exceeding \( x \) is \[ (a) \quad a f(a) - \{ f(1) + f(2) + ... + f([a]) \} \quad (b) \quad [a] f(a) - \{ f(1) + f(2) + ... + f([a]) \} \quad (c) \quad [a] f([a]) - \{ f(1) + f(2) + ... + f([a]) \} \quad (d) \quad a f([a]) - \{ f(1) + f(2) + ... + f([a]) \} \] [2006]

26. Let \( F(x) = \int_{1}^{x} f'(x) \, dx \), where \( f(x) = \int_{1}^{x} \log_t \frac{t}{1 + t} \, dt \), then \( F(e) \) equals \[ (a) \quad 1 \quad (b) \quad 2 \quad (c) \quad 1/2 \quad (d) \quad 0 \] [2007]

27. The solution for \( x \) of the equation \( \int_{\sqrt{2}}^{x} \frac{dt}{\sqrt{t^2 - 1}} = \pi/2 \) is \[ (a) \quad \frac{\sqrt{2}}{2} \quad (b) \quad 2\sqrt{2} \quad (c) \quad 2 \quad (d) \quad \text{None} \] [2007]

28. The area enclosed between the curves \( y^2 = x \) and \( y = |x| \) is \[ (a) \quad 1/6 \quad (b) \quad 1/3 \quad (c) \quad 2/3 \quad (d) \quad 1 \] [2007]

29. Let \( I = \int_{0}^{1} \sin x \sqrt{x} \, dx \) and \( J = \int_{0}^{1} \cos x \sqrt{x} \, dx \). Then which one of the following is true? \[ (a) \quad I > \frac{2}{3} \text{ and } J > \frac{2}{3} \quad (b) \quad I < \frac{2}{3} \text{ and } J < \frac{2}{3} \quad (c) \quad I < \frac{2}{3} \text{ and } J > \frac{2}{3} \quad (d) \quad I > \frac{2}{3} \text{ and } J < \frac{2}{3} \] [2007]

30. The area of the plane region bounded by the curves \( x + 2y^2 = 0 \) and \( x + 3y^2 = 1 \) is equal to \[ (a) \quad \frac{5}{3} \quad (b) \quad \frac{1}{3} \quad (c) \quad \frac{2}{3} \quad (d) \quad \frac{4}{3} \] [2008]

31. The area of the region bounded by the parabola \((y - 2)^2 = x - 1\), the tangent of the parabola at the point \((2, 3)\) and the \(x\)-axis is: \[ (a) \quad 6 \quad (b) \quad 9 \quad (c) \quad 12 \quad (d) \quad 3 \] [2009]
32. \[ \int_0^{\pi} \cot x \, dx \] where \( \lfloor . \rfloor \) denotes the greatest integer function, is equal to: \[ \text{[2009]} \]
(a) 1 (b) -1 (c) \( \frac{\pi}{2} \) (d) \( \frac{\pi}{2} \)

33. The area bounded by the curves \( y = \cos x \) and \( y = \sin x \) between the ordinates \( x = 0 \) and \( x = \frac{3\pi}{2} \) is \[ \text{[2010]} \]
(a) \( 4\sqrt{2} + 2 \) (b) \( 4\sqrt{2} - 1 \) (c) \( 4\sqrt{2} + 1 \) (d) \( 4\sqrt{2} - 2 \)

34. Let \( p(x) \) be a function defined on \( \mathbb{R} \) such that \( p'(x) = p(1-x) \), for all \( x \in [0, 1] \), \( p(0) = 1 \) and \( p(1) = 41 \). Then \[ \int_0^1 p(x) \, dx \] equals \[ \text{[2010]} \]
(a) 21 (b) 41 (c) 42 (d) \( \sqrt{41} \)

35. The value of \[ \int_0^\infty \frac{8 \log(1+x)}{1+x^2} \, dx \]
is \[ \text{[2011]} \]
(a) \( \frac{\pi}{8} \log 2 \) (b) \( \frac{\pi}{2} \log 2 \)
(c) \( \log 2 \) (d) \( \pi \log 2 \)

36. The area of the region enclosed by the curves \( y = x, \, x = e, \, y = \frac{1}{x} \) and the positive \( x \)-axis is \[ \text{[2011]} \]
(a) 1 square unit (b) \( \frac{3}{2} \) square units
(c) \( \frac{5}{2} \) square units (d) \( \frac{1}{2} \) square unit

37. The area between the parabolas \( y^2 = \frac{x}{4} \) and \( x^2 = 9y \) and the straight line \( y = 2 \) is: \[ \text{[2012]} \]
(a) \( 20\sqrt{2} \) (b) \( \frac{10\sqrt{2}}{3} \) (c) \( \frac{20\sqrt{2}}{3} \) (d) \( 10\sqrt{2} \)

38. If \( g(x) = \int_0^x \cos t \, dt \), then \( g(x + \pi) \) equals \[ \text{[2012]} \]
(a) \( \frac{g(x)}{g(\pi)} \) (b) \( g(x) + g(\pi) \)
(c) \( g(x) - g(\pi) \) (d) \( g(x) \cdot g(\pi) \)

39. Statement-1: The value of the integral \[ \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan x}} \] is equal to \( \pi/6 \). \[ \text{[JEE 2013]} \]

Statement-2: \[ \int_a^b f(x) \, dx = \int_a^b (f(a + b - x)) \, dx. \]
(a) Statement-1 is true; Statement-2 is true; Statement-2 is a correct explanation for Statement-1.
(b) Statement-1 is true; Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.
(c) Statement-1 is true; Statement-2 is false.
(d) Statement-1 is false; Statement-2 is true.

40. The area (in square units) bounded by the curves \( y = \sqrt{x} \), \( 2y - x + 3 = 0 \), \( x \)-axis, and lying in the first quadrant is: \[ \text{[JEE 2013]} \]
(a) 9 (b) 36 (c) 18 (d) \( \frac{27}{4} \)

41. The integral \[ \int_0^\pi \sqrt{\frac{1 + 4 \sin^2 \frac{x}{2}}{2} - 4 \sin \frac{x}{2}} \, dx \]
equals: \[ \text{[JEE 2014]} \]
(a) \( 4\sqrt{3} - 4 \) (b) \( 4\sqrt{3} - 4 - \frac{\pi}{3} \)
(c) \( \pi - 4 \) (d) \( \frac{2\pi}{3} - 4 - 4\sqrt{3} \)

42. The area of the region described by \( A = \{ (x, y) : x^2 + y^2 \leq 1 \text{ and } y^2 \leq 1 - x \} \) is: \[ \text{[JEE 2014]} \]
(a) \( \frac{\pi}{2} - \frac{2}{3} \) (b) \( \frac{\pi}{2} + \frac{2}{3} \) (c) \( \frac{\pi}{2} + \frac{4}{3} \) (d) \( \frac{\pi}{2} - \frac{4}{3} \)

43. The area (in sq. units) of the region described by \( \{ (x, y) : y^2 \leq 2x \text{ and } y \geq 4x - 1 \} \) is \[ \text{[JEE 2015]} \]
(a) \( \frac{15}{64} \) (b) \( \frac{9}{32} \) (c) \( \frac{7}{32} \) (d) \( \frac{5}{64} \)

44. The integral \[ \frac{4}{\log 2} \int_2^4 \log x^2 \, dx \] is equal to: \[ \text{[JEE 2015]} \]
(a) 1 (b) 6 (c) 2 (d) 4

45. The area (in sq. units) of the region \( \{ (x, y) : y^2 \geq 2x \text{ and } x^2 + y^2 \leq 4x, x \geq 0, y \geq 0 \} \) is: \[ \text{[JEE 2016]} \]
(a) \( \frac{\pi}{3} - \frac{4\sqrt{2}}{3} \) (b) \( \frac{\pi}{2} - \frac{2\sqrt{2}}{3} \)
(c) \( \frac{\pi}{3} - \frac{8}{3} \) (d) \( \frac{\pi}{3} \)
CHAPTER 19

Differential Equations

Section-A

MCQs with One Correct Answer

1. A solution of the differential equation \( (1999 - 2 \text{ Marks}) \)
   \[
   \left( \frac{dy}{dx} \right)^2 - x \frac{dy}{dx} + y = 0
   \]
   is
   
   (a) \( y = 2 \)
   (b) \( y = 2x \)
   (c) \( y = 2x - 4 \)
   (d) \( y = 2x^2 - 4 \)

2. If \( x^2 + y^2 = 1 \), then \( (2000S) \)
   (a) \( x y'' - 2(y')^2 + 1 = 0 \)
   (b) \( x y'' + (y')^2 + 1 = 0 \)
   (c) \( y y'' + (y')^2 - 1 = 0 \)
   (d) \( y y'' + 2(y')^2 + 1 = 0 \)

3. If \( y(t) \) is a solution of \( (1 + t) \frac{dy}{dt} - ty = 1 \) and \( y(0) = -1 \), then \( y(1) \) is equal to \( (2003S) \)
   (a) \( -1/2 \)
   (b) \( e + 1/2 \)
   (c) \( e - 1/2 \)
   (d) \( 1/2 \)

4. If \( y = y(x) \) and \( \frac{dy}{dx} + \frac{2 + \sin x}{y + 1} \frac{dy}{dx} = -\cos x \), \( y(0) = 1 \), then \( y\left(\frac{\pi}{2}\right) \) equals \( (2004S) \)
   (a) \( 1/3 \)
   (b) \( 2/3 \)
   (c) \( -1/3 \)
   (d) \( 1 \)

5. If \( y = y(x) \) and it follows the relation \( x \cos y + y \cos x = \pi \), then \( y''(0) = \) \( (2005S) \)
   (a) \( 1 \)
   (b) \( -1 \)
   (c) \( \pi - 1 \)
   (d) \( -\pi \)

6. The solution of primitive integral equation \( (x^2 + y^2) dy = xy \) \( dx \) is \( y = y(x) \). If \( y(1) = 1 \) and \( (x_0) = e \), then \( x_0 \) is equal to \( (2005S) \)
   (a) \( \sqrt{2(e^2 - 1)} \)
   (b) \( \sqrt{2(e^2 + 1)} \)
   (c) \( \sqrt{3} \)
   (d) \( \sqrt{\frac{e^2 + 1}{2}} \)

7. For the primitive integral equation \( y dy + y^2 dy = xy \) \( dy \), \( x \in R, y > 0, y = y(x), y(1) = 1 \), then \( y(-3) \) is \( (2005S) \)
   (a) \( 3 \)
   (b) \( 2 \)
   (c) \( 1 \)
   (d) \( 5 \)

8. The differential equation \( \frac{dy}{dx} = \sqrt{1 - y^2} / y \) determines a family of circles with \( (2005S) \)
   (a) \( \text{variable radii and a fixed centre at (0, 1)} \)
   (b) \( \text{variable radii and a fixed centre at (0, -1)} \)
   (c) \( \text{fixed radius 1 and variable centres along the x-axis} \)
   (d) \( \text{fixed radius 1 and variable centres along the y-axis} \)

9. The function \( y = f(x) \) is the solution of the differential equation
   \[
   \frac{dy}{dx} + \frac{xy}{x^2 - 1} = \frac{x^4 + 2x}{\sqrt{1-x^2}}
   \]
   in \( (-1, 1) \) satisfying \( f(0) = 0 \). Then
   \[
   \sqrt{\int f(x) \, dx} = \frac{\pi}{2}
   \]
   \( (JEE \text{ Adv. 2014}) \)

   (a) \( \frac{\pi}{3} - \frac{\sqrt{3}}{2} \)
   (b) \( \frac{\pi}{3} - \frac{\sqrt{3}}{4} \)
   (c) \( \frac{\pi}{6} - \frac{\sqrt{3}}{4} \)
   (d) \( \frac{\pi}{6} - \frac{\sqrt{3}}{2} \)

MCQs with One or More than One Correct

1. The order of the differential equation whose general solution is given by
   \( y = (C_1 + C_2 + C_3 - C_4 \text{e}^{-x} + C_5 \text{e}^{x}) \), where \( C_1, C_2, C_3, C_4, \)
   \( C_5 \), are arbitrary constants, is \( (1998 - 2 \text{ Marks}) \)
   (a) \( 5 \)
   (b) \( 4 \)
   (c) \( 3 \)
   (d) \( 2 \)

2. The differential equation representing the family of curves
   \( y^2 = 2c \left( x + \sqrt{c} \right) \), where \( c \) is a positive parameter, is of \( (1999 - 3 \text{ Marks}) \)
   (a) \( \text{order 1} \)
   (b) \( \text{order 2} \)
   (c) \( \text{degree 3} \)
   (d) \( \text{degree 4} \)

   A curve \( y = f(x) \) passes through \( (1, 1) \) and at \( P(x, y) \), tangent cuts the x-axis and y-axis at \( A \) and \( B \) respectively such that \( BP : AP = 3 : 1 \), then \( (2006 - 5M, -1) \)
   (a) \( \text{equation of curve is } xy' - 3y = 0 \)
   (b) \( \text{normal at } (1, 1) \) is \( x + 3y = 4 \)
   (c) \( \text{curve passes through } (2, 1/8) \)
   (d) \( \text{equation of curve is } xy' + 3y = 0 \)
4. If \( y(x) \) satisfies the differential equation \( y' - y \tan x = 2x \sec x \) and \( y(0) = 0 \), then

\[
\begin{align*}
(\text{a}) \quad y'\left(\frac{\pi}{4}\right) &= \frac{\pi^2}{8\sqrt{2}} \\
(\text{b}) \quad y'\left(\frac{\pi}{4}\right) &= \frac{\pi^2}{18} \\
(\text{c}) \quad y'\left(\frac{\pi}{3}\right) &= \frac{\pi^2}{9} \\
(\text{d}) \quad y'\left(\frac{\pi}{3}\right) &= \frac{4\pi^2}{3} + \frac{2\pi^2}{3\sqrt{3}}
\end{align*}
\]

5. A curve passes through the point \( \left(1, \frac{\pi}{6}\right) \). Let the slope of the curve at each point \( (x, y) \) be \( \frac{y}{x} + \sec \left(\frac{y}{x}\right) \). \( x \geq 0 \).

Then the equation of the curve is

\[
\begin{align*}
(\text{JEE Adv. 2013})
\end{align*}
\]

\[
\begin{align*}
(\text{a}) \quad \sin \left(\frac{y}{x}\right) &= \log x + \frac{1}{2} \\
(\text{b}) \quad \cos \left(\frac{y}{x}\right) &= \log x + 2 \\
(\text{c}) \quad \sec \left(\frac{2y}{x}\right) &= \log x + 2 \\
(\text{d}) \quad \cos \left(\frac{2y}{x}\right) &= \log x + \frac{1}{2}
\end{align*}
\]

6. Let \( y(x) \) be a solution of the differential equation \( (1 + e^x)y' + ye^x = 1 \). If \( y(0) = 2 \), then which of the following statements is (are) true?

\[
\begin{align*}
(\text{JEE Adv. 2015})
\end{align*}
\]

\[
\begin{align*}
(\text{a}) \quad y(-4) &= 0 \\
(\text{b}) \quad y(-2) &= 0 \\
(\text{c}) \quad y(x) \text{ has a critical point in the interval } (-1, 0) \\
(\text{d}) \quad y(x) \text{ has no critical point in the interval } (-1, 0)
\end{align*}
\]

7. Consider the family of all circles whose centers lie on the straight line \( y = x \). If this family of circle is represented by the differential equation \( Py'' + Qy' + 1 = 0 \), where \( P, Q \) are functions of \( x, y \) and \( y' \) \[ \text{here} \ y'' = \frac{dy}{dx}, y' = \frac{dy}{dx} \], then which of the following statements is (are) true?

\[
\begin{align*}
(\text{JEE Adv. 2015})
\end{align*}
\]

\[
\begin{align*}
(\text{a}) \quad P &= y + x \\
(\text{b}) \quad P &= y - x \\
(\text{c}) \quad P + Q &= 1 - x + y + y' + (y')^2 \\
(\text{d}) \quad P - Q &= x + y - y' - (y')^2
\end{align*}
\]

8. Let \( f : (0, \infty) \to \mathbb{R} \) be a differentiable function such that \( f'(x) = 2 - \frac{f(x)}{x} \), for all \( x \in (0, \infty) \) and \( f(1) \neq 1 \). Then

\[
\begin{align*}
(\text{JEE Adv. 2016})
\end{align*}
\]

\[
\begin{align*}
(\text{a}) \quad \lim_{x \to 0^+} f'\left(\frac{1}{x}\right) &= 1 \\
(\text{b}) \quad \lim_{x \to 0^+} \frac{xf'\left(\frac{1}{x}\right)}{x} &= 2 \\
(\text{c}) \quad \lim_{x \to 0^+} x^2 f'(x) &= 0 \\
(\text{d}) \quad |f(x)| \leq 2 \text{ for all } x \in (0, 2)
\end{align*}
\]

9. A solution curve of the differential equation

\[
\begin{align*}
(\text{x}^2 + xy + 4x + 2y^4 + 4) \frac{dy}{dx} = y^2 = 0, x > 0
\end{align*}
\]

passes through the point \( (1, 3) \). Then the solution curve \( \text{(JEE Adv. 2016)} \)

\[
\begin{align*}
(\text{a}) \quad \text{intersects } y = x + 2 \text{ exactly at one point} \\
(\text{b}) \quad \text{intersects } y = x + 2 \text{ exactly at two points} \\
(\text{c}) \quad \text{intersects } y = (x + 2)^2 \\
(\text{d}) \quad \text{does NOT intersect } y = (x + 3)^2
\end{align*}
\]

---

**Subjective Problems**

1. If \( (a + bx) e^{ix} = x \), then prove that

\[
\left( x^3 + \frac{d^2 y}{dx^2} \right) = \left( \frac{dy}{dx} - y \right)^2
\]

\( (1983 - 3 \text{ Marks}) \)

Find the equation of such a curve passing through \( (0, k) \).

2. A normal is drawn at a point \( P(x, y) \) of a curve. It meets the \( x \)-axis at \( Q \). If \( PQ \) is of constant length \( k \), then show that the differential equation describing such curves is

\[
y \frac{dy}{dx} = \pm \sqrt{k^2 - y^2}
\]

\( (1994 - 5 \text{ Marks}) \)

3. Let \( y = f(x) \) be a curve passing through \( (1, 1) \) such that the triangle formed by the coordinate axes and the tangent at any point of the curve lies in the first quadrant and has area \( 2 \). Form the differential equation and determine all such possible curves.

\( (1995 - 5 \text{ Marks}) \)

4. Determine the equation of the curve passing through the origin, in the form \( y = f(x) \), which satisfies the differential equation

\[
y \frac{dy}{dx} = \sin (10x + 6y).
\]

\( (1996 - 5 \text{ Marks}) \)

5. Let \( u(x) \) and \( v(x) \) satisfy the differential equation

\[
\frac{du}{dx} + p(x) u = f(x) \quad \text{and} \quad \frac{dv}{dx} + p(x) v = g(x), \text{ where } p(x), f(x) \text{ and } g(x) \text{ are continuous functions. If } u(x_1) > v(x_1) \text{ for some } x_1 \text{ and } f(x) > g(x) \text{ for all } x > x_1, \text{ prove that any point } (x, y) \text{ where } x > x_1, \text{ does not satisfy the equations } y = u(x) \text{ and } y = v(x).
\]

\( (1997 - 5 \text{ Marks}) \)

6. A curve passing through the point \( (1, 1) \) has the property that the perpendicular distance of the origin from the normal at any point \( P \) of the curve is equal to the distance of \( P \) from the \( x \)-axis. Determine the equation of the curve.

\( (1999 - 10 \text{ Marks}) \)

7. A country has a food deficit of 10%. Its population grows continuously at a rate of 3% per year. Its annual food production every year is 4% more than that of the last year. Assuming that the average food requirement per person remains constant, prove that the country will become self-sufficient in food after \( n \) years, where \( n \) is the smallest integer bigger than or equal to

\[
\frac{\ln 10 - \ln 9}{\ln(1.04) - 0.03}.
\]

\( (2000 - 10 \text{ Marks}) \)
8. A hemispherical tank of radius 2 metres is initially full of water and has an outlet of 12 cm² cross-sectional area at the bottom. The outlet is opened at some instant. The flow through the outlet is according to the law \( v(t) = 0.6 \sqrt{2gh(t)} \), where \( v(t) \) and \( h(t) \) are respectively the velocity of the flow through the outlet and the height of water level above the outlet at time \( t \), and \( g \) is the acceleration due to gravity. Find the time it takes to empty the tank. (Hint: Form a differential equation by relating the decrease of water level to the outflow). \( 2001 - 10 \text{ Marks} \)

9. A right circular cone with radius \( R \) and height \( H \) contains a liquid which evaporates at a rate proportional to its surface area in contact with air (proportionality constant = \( k > 0 \)). Find the time after which the cone is empty. \( 2003 - 4 \text{ Marks} \)

10. A curve ‘C’ passes through \((2, 0)\) and the slope at \((x, y)\) as \( \frac{(x + 1)^2 + (y - 3)}{x + 1} \). Find the equation of the curve. Find the area bounded by curve and \(x\)-axis in fourth quadrant. \( 2004 - 4 \text{ Marks} \)

11. If length of tangent at any point on the curve \( y = f(x) \) intercepted between the point and the \(x\)-axis is of length 1. Find the equation of the curve. \( 2005 - 4 \text{ Marks} \)

---

**Match the Following**

Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are \( A-p, s \) and \( t; B-q \) and \( r; C-p \) and \( q; \) and \( D-s \) then the correct darkening of bubbles will look like the given.

---

1. Match the statements/expressions in Column I with the open intervals in Column II. \( 2009 \)

Assertion & Reason Type Questions

1. Let a solution \( y = y(x) \) of the differential equation

\[
x \sqrt{x^2 - 1} \frac{dy}{dx} - y \sqrt{y^2 - 1} = 0\]

satisfy

\[y(2) = \frac{2}{\sqrt{3}}.\]

\[\text{STATEMENT-1: } y(x) = \sec\left(\sec^{-1} x - \frac{\pi}{6}\right)\]

\[\text{and}\]

\[\text{STATEMENT-2: } y(x) \text{ is given by } \frac{1}{y} = \frac{2\sqrt{3}}{x} - \sqrt{1 - \frac{1}{x^2}}.\]

(a) STATEMENT - 1 is True, STATEMENT - 2 is True;
(b) STATEMENT - 1 is True, STATEMENT - 2 is True;
(c) STATEMENT - 1 is False, STATEMENT - 2 is False
(d) STATEMENT - 1 is False, STATEMENT - 2 is True

Integer Value Correct Type

1. Let \( y'(x) + y(x) g'(x) = g(x), \) \( y(0) = 0, x \in \mathbb{R}, \) where \( f'(x) \) denotes \( \frac{df(x)}{dx} \) and \( g(x) \) is a given non-constant differentiable function on \( R \) with \( g(0) = g(2) = 0. \) Then the value of \( y(2) \) is

\[2011\]
1. The order and degree of the differential equation\[\left(1 + 3 \frac{dy}{dx}\right)^{2/3} = 4 \frac{d^2y}{dx^2}\] are \[2002\]
(a) $\left(1, \frac{2}{3}\right)$ 
(b) $(3, 1)$ 
(c) $(3, 3)$ 
(d) $(1, 2)$

2. The solution of the equation \[\frac{d^2y}{dx^2} = e^{-2x}\] is \[2002\]
(a) $\frac{e^{-2x}}{4}$ 
(b) $\frac{e^{-2x}}{4} + cx + d$ 
(c) $\frac{1}{4}e^{-2x} + cx^2 + d$ 
(d) $\frac{1}{4}e^{-4x} + cx + d$

3. The degree and order of the differential equation of the family of all parabolas whose axis is $x$-axis, are respectively. \[2003\]
(a) $2, 3$ 
(b) $2, 1$ 
(c) $1, 2$ 
(d) $3, 2$

4. The solution of the differential equation \[(1 + y^2) + (x - e^{\tan^{-1}y}) \frac{dy}{dx} = 0,\] is \[2003\]
(a) $xe^{2\tan^{-1}y} = e^{\tan^{-1}y} + k$ 
(b) $(x - 2) = ke^{2\tan^{-1}y}$ 
(c) $2xe^{\tan^{-1}y} = e^{2\tan^{-1}y} + k$ 
(d) $xe^{\tan^{-1}y} = \tan^{-1}y + k$

5. The differential equation for the family of the circle $x^2 + y^2 - 2ay = 0$, where $a$ is an arbitrary constant is \[2004\]
(a) $(x^2 + y^2)y' = 2xy$ 
(b) $2(x^2 + y^2)y' = xy$ 
(c) $(x^2 - y^2)y' = 2xy$ 
(d) $2(x^2 - y^2)y' = xy$

6. Solution of the differential equation \[y' + (x + x^2)y = 0\] is \[2004\]
(a) $\log y = Cx$ 
(b) $-\frac{1}{xy} + \log y = C$ 
(c) $\frac{1}{xy} + \log y = C$ 
(d) $-\frac{1}{xy} = C$

7. The differential equation representing the family of curves $y^2 = 2c(x + \sqrt{c})$, where $c > 0$, is a parameter, is of order and degree as follows: \[2005\]
(a) order 1, degree 2 
(b) order 1, degree 1 
(c) order 1, degree 3 
(d) order 2, degree 2

8. If \[x \frac{dy}{dx} = y (\log y - \log x + 1),\] then the solution of the equation is \[2005\]
(a) $y \log \left(\frac{x}{y}\right) = cx$ 
(b) $x \log \left(\frac{y}{x}\right) = cy$ 
(c) $\log \left(\frac{y}{x}\right) = cx$ 
(d) $\log \left(\frac{x}{y}\right) = cy$

9. The differential equation whose solution is \[Ax^2 + By^2 = 1\] where $A$ and $B$ are arbitrary constants is of \[2006\]
(a) second order and second degree 
(b) first order and second degree 
(c) first order and first degree 
(d) second order and first degree

10. The differential equation of all circles passing through the origin and having their centres on the $x$-axis is \[2007\]
(a) $y^2 = x^2 + 2xy \frac{dy}{dx}$ 
(b) $y^2 = x^2 - 2xy \frac{dy}{dx}$ 
(c) $x^2 = y^2 + xy \frac{dy}{dx}$ 
(d) $x^2 = y^2 + 3xy \frac{dy}{dx}$

11. The solution of the differential equation \[\frac{dy}{dx} = \frac{x + y}{x}\] satisfying the condition $y(1) = 1$ is \[2008\]
(a) $y = \ln x + x$ 
(b) $y = x \ln x + x^2$ 
(c) $y = xe^{x-1}$ 
(d) $y = x \ln x + x$

12. The differential equation which represents the family of curves $y = a_1e^{2x}$, where $c_1$, and $c_2$ are arbitrary constants, is \[2009\]
(a) $y'' = y'y$ 
(b) $y'y'' = y'$ 
(c) $yy'' = (y')^2$ 
(d) $y' = y^2$

13. Solution of the differential equation \[\cos x \frac{dy}{dx} = y (\sin x - y), 0 < x < \frac{\pi}{2}\] is \[2010\]
(a) $y \sec x = \tan x + c$ 
(b) $y \tan x = \sec x + c$ 
(c) $\tan x = (\sec x + c)y$ 
(d) $\sec x = (\tan x + c)y$

14. If \[\frac{dy}{dx} = y + 3 > 0\] and $y(0) = 2$, then $y(\ln 2)$ is equal to: \[2011\]
(a) 5 
(b) 13 
(c) -2 
(d) 7
15. Let \( t \) be the purchase value of an equipment and \( V(t) \) be the value after it has been used for \( t \) years. The value \( V(t) \) depreciates at a rate given by differential equation 
\[
\frac{dV(t)}{dt} = -k(T - t), \text{ where } k > 0 \text{ is a constant and } T \text{ is the total life in years of the equipment. Then the scrap value } \ V(T) \text{ of the equipment is } \quad [2011]
\]
(a) \( I - \frac{kT^2}{2} \)  
(b) \( I - \frac{k(T - t)^2}{2} \)  
(c) \( e^{-kT} \)  
(d) \( T^2 - \frac{1}{k} \)

16. The population \( p(t) \) at time \( t \) of a certain mouse species satisfies the differential equation \( \frac{dp(t)}{dt} = 0.5 \ p(t) - 450. \) If \( p(0) = 850, \) then the time at which the population becomes zero is: \quad [2012]
(a) \( 2 \ln 18 \)  
(b) \( \ln 9 \)  
(c) \( \frac{1}{2} \ln 18 \)  
(d) \( \ln 18 \)

17. At present, a firm is manufacturing 2000 items. It is estimated that the rate of change of production \( P \) w.r.t. additional number of workers \( x \) is given by \( \frac{dP}{dx} = 100 - 12\sqrt{x}. \) If the firm employs 25 more workers, then the new level of production of items is \quad [JEE M 2013]
(a) 2500  
(b) 3000  
(c) 3500  
(d) 4500

18. Let the population of rabbits surviving at time \( t \) be governed by the differential equation \( \frac{dp(t)}{dt} = \frac{1}{2} \ p(t) - 200. \) If \( p(0) = 100, \) then \( p(t) \) equals: \quad [JEE M 2014]
(a) \( 600 - 500 \ e^{t/2} \)  
(b) \( 400 - 300 \ e^{-t/2} \)  
(c) \( 400 - 300 \ e^{t/2} \)  
(d) \( 300 - 200 \ e^{-t/2} \)

19. Let \( y(x) \) be the solution of the differential equation
\[
(x \log x) \frac{dy}{dx} + y = 2x \ \log x, \ (x \geq 1). \] Then \( y(e) \) is equal to: \quad [JEE M 2015]
(a) \( 2 \)  
(b) \( 2e \)  
(c) \( e \)  
(d) \( 0 \)

20. If a curve \( y = f(x) \) passes through the point \((1, -1)\) and satisfies the differential equation, \( y(1 + xy) \ dx = x \ dy, \) then \( f\left(-\frac{1}{2}\right) \) is equal to: \quad [JEE M 2016]
(a) \( \frac{2}{5} \)  
(b) \( \frac{4}{5} \)  
(c) \( -\frac{2}{5} \)  
(d) \( -\frac{4}{5} \)
VECTOR ALGEBRA AND THREE DIMENSIONAL GEOMETRY

SECTION-A

**JEE Advanced/ IIT-JEE**

A. **Fill in the Blanks**

1. Let \( \vec{a} \), \( \vec{b} \), \( \vec{c} \) be vectors of length 3, 4, 5 respectively. Let \( \vec{a} \) be perpendicular to \( \vec{b} + \vec{c} \), \( \vec{b} \) to \( \vec{c} + \vec{a} \) and \( \vec{c} \) to \( \vec{a} + \vec{b} \).
   
   Then the length of vector \( \vec{a} + \vec{b} + \vec{c} \) is ......  
   (1981 - 2 Marks)

2. The unit vector perpendicular to the plane determined by \( P(1,-1,2), Q(2,0,-1) \) and \( R(0,2,1) \) is ...... 
   (1983 - 1 Mark)

3. The area of the triangle whose vertices are \( A(1,-1,2), B(2,1,-1), C(3,-1,2) \) is ......  
   (1983 - 1 Mark)

4. \( \vec{a}, \vec{b}, \vec{c}, \vec{d} \) are four points in a plane with position vectors \( a, b, c, d \) respectively such that
   
   \[(\vec{a} - \vec{d})(\vec{b} - \vec{c}) = (\vec{b} - \vec{d})(\vec{c} - \vec{a}) = 0 \]  
   (1984 - 2 Marks)
   The point \( D \), then, is the ................. of the triangle \( ABC \).

5. If \( \begin{vmatrix} a & a^2 & a^3 \\ b & b^2 & b^3 \\ c & c^2 & c^3 \end{vmatrix} = 0 \) and the vectors \( \vec{a} = (1,a,a^2), \vec{b} = (1,b,b^2), \vec{c} = (1,c,c^2) \), are non-coplanar, then the product \( abc = ....... \)  
   (1985 - 2 Marks)

6. If \( \vec{a} \times \vec{b} \times \vec{c} \) are three non-coplanar vectors, then
   
   \[
   \frac{\vec{a} \cdot \vec{b} \times \vec{c}}{\vec{b} \cdot \vec{a} \times \vec{c}} + \frac{\vec{b} \cdot \vec{a} \times \vec{c}}{\vec{c} \cdot \vec{a} \times \vec{b}} = ....... \]  
   (1985 - 2 Marks)

7. If \( \vec{a} = (1,1,1), \vec{b} = (0,1,-1) \) are given vectors, then a vector \( \vec{b} \) satisfying the equations \( \vec{a} \times \vec{b} = \vec{c} \) and \( \vec{a} \cdot \vec{b} = 3 \) ......  
   (1985 - 2 Marks)

8. If the vectors \( ai + j + k, bi + j + k \) and \( i + j + ck \) \((a \neq b \neq c \neq 1)\) are coplanar, then the value of \( \frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} = ....... \)  
   (1987 - 2 Marks)

9. Let \( \vec{b} = 4i + 3j \) and \( \vec{c} \) be two vectors perpendicular to each other in the \( xy \)-plane. All vectors in the same plane having projections 1 and 2 along \( \vec{b} \) and \( \vec{c} \), respectively, are given by ........  
   (1987 - 2 Marks)

10. The components of a vector \( \vec{a} \) along and perpendicular to a non-zero vector \( \vec{b} \) are ... and ....... respectively.  
    (1988 - 2 Marks)

11. Given that \( \vec{a} = (1,1,1), \vec{c} = (0,1,-1), \vec{a} \times \vec{b} = 3 \) and \( \vec{a} \times \vec{b} = \vec{c} \), then \( \vec{b} = ....... \)  
    (1991 - 2 Marks)

12. A unit vector coplanar with \( \vec{i} + \vec{j} + \vec{k} \) and \( \vec{i} + 2\vec{j} + \vec{k} \) and perpendicular to \( \vec{i} + \vec{j} + \vec{k} \) is .......  
    (1992 - 2 Marks)

13. A unit vector perpendicular to the plane determined by the points \( P(1,-1,2), Q(2,0,-1) \) and \( R(0,2,1) \) is .......  
    (1994 - 2 Marks)

14. A nonzero vector \( \vec{a} \) is parallel to the line of intersection of the plane determined by the vectors \( \vec{i}, \vec{j} + \vec{k} \) and the plane determined by the vectors \( \vec{i} - \vec{j}, \vec{i} + \vec{k} \). The angle between \( \vec{a} \) and the vector \( \vec{i} - 2\vec{j} + 2\vec{k} \) is .......  
    (1996 - 2 Marks)

15. If \( \vec{b} \) and \( \vec{c} \) are any two non-collinear unit vectors and \( \vec{a} \) is any vector, then \( \frac{(a.b)\vec{b} + (a.c)\vec{c} + \vec{a} \times \vec{b} \times \vec{c}}{|\vec{b} \times \vec{c}|} = ....... \)  
    (1996 - 2 Marks)

16. Let \( O\bar{A} = a, O\bar{B} = 10a + 2b \) and \( O\bar{C} = b \) where \( O, \bar{A}, \bar{B} \) and \( \bar{C} \) are non-collinear points. Let \( p \) denote the area of the quadrilateral \( OABC \), and let \( q \) denote the area of the parallelogram with \( O\bar{A} \) and \( O\bar{C} \) as adjacent sides. If \( p = qa \), then \( k = ....... \)  
    (1997 - 2 Marks)

B. **True / False**

1. Let \( \vec{a}, \vec{b}, \vec{c} \) be unit vectors suppose that \( \vec{a} \cdot \vec{b} = \vec{a} \cdot \vec{c} = 0 \), and that the angle between \( \vec{b} \) and \( \vec{c} \) is \( \pi/6 \). Then \( \vec{a} = \pm (\vec{b} \times \vec{c}) \)  
    (1981 - 2 Marks)
2. If \( X: A = 0, X: B = 0, X: C = 0 \) for some non-zero vector \( X \), then \( [A \quad B \quad C] = 0 \) \( (1983 - 1 \text{ Mark}) \)

3. The points with position vectors \( a + b, a - b \), and \( a + kb \) are collinear for all real values of \( k \). \( (1984 - 1 \text{ Mark}) \)

4. For any three vectors \( \vec{a}, \vec{b}, \) and \( \vec{c} \),
\[
(\vec{a} - \vec{b}) \cdot (\vec{b} - \vec{c}) \times (\vec{c} - \vec{a}) = 2\vec{a} \times \vec{b} \times \vec{c}. \quad (1989 - 1 \text{ Mark})
\]

C MCQs with One Correct Answer

1. The scalar \( \vec{A} \cdot (\vec{B} + \vec{C}) \times (\vec{A} + \vec{B} + \vec{C}) \) equals :
\( (1981 - 2 \text{ Marks}) \)
(a) 0  
(b) \( [\vec{A} \quad \vec{B} \quad \vec{C}] + [\vec{B} \quad \vec{C} \quad \vec{A}] \)  
(c) \( [\vec{A} \quad \vec{B} \quad \vec{C}] \)  
(d) None of these

2. For non-zero vectors \( \vec{a}, \vec{b}, \vec{c} \), \( (\vec{a} \times \vec{b}) \cdot \vec{c} = |\vec{a} \parallel \vec{b} \parallel \vec{c}| \)
holds if and only if \( (1982 - 2 \text{ Marks}) \)
(a) \( \vec{a} \cdot \vec{b} = 0, \vec{b} \cdot \vec{c} = 0 \)  
(b) \( \vec{b} \cdot \vec{c} = 0, \vec{c} \cdot \vec{a} = 0 \)  
(c) \( \vec{c} \cdot \vec{a} = 0 \)  
(d) \( \vec{a} \cdot \vec{b} = \vec{b} \cdot \vec{c} = \vec{c} \cdot \vec{a} = 0 \)

3. The volume of the parallelepiped whose sides are given by \( \overrightarrow{OA} = 2i - 2j, \overrightarrow{OB} = i + j - k, \overrightarrow{OC} = 3i - k \), is \( (1983 - 1 \text{ Mark}) \)
(a) 4/3  
(b) 4  
(c) 2/7  
(d) none of these

4. The points with position vectors \( 60i + 3j, 40i - 8j, ai - 52j \) are collinear if \( (1983 - 1 \text{ Mark}) \)
(a) \( a = -40 \)  
(b) \( a = 40 \)  
(c) \( a = -20 \)  
(d) none of these

5. Let \( \vec{a}, \vec{b}, \vec{c} \), be three non-coplanar vectors and \( \vec{p}, \vec{q}, \vec{r} \), are vectors defined by the relations
\[
\vec{p} = \frac{\vec{b} \times \vec{c}}{[\vec{a} \vec{b} \vec{c}]}, \quad \vec{q} = \frac{\vec{c} \times \vec{a}}{[\vec{a} \vec{b} \vec{c}]}, \quad \vec{r} = \frac{\vec{a} \times \vec{b}}{[\vec{a} \vec{b} \vec{c}]}
\]
\( (1988 - 2 \text{ Marks}) \)
(a) 0  
(b) 1  
(c) 2  
(d) 3

6. Let \( a, b, c \) be distinct non-negative numbers. If the vectors \( a\vec{i} + b\vec{j} + c\vec{k}, i + \vec{k} \) and \( c\vec{i} + \vec{c} + b\vec{k} \) lie in a plane, then \( c \) is \( (1993 - 1 \text{ Mark}) \)
(a) the Arithmetic Mean of \( a \) and \( b \)  
(b) the Geometric Mean of \( a \) and \( b \)  
(c) the harmonic Mean of \( a \) and \( b \)  
(d) equal to zero

7. Let \( \vec{p} \) and \( \vec{q} \) be the position vectors of \( P \) and \( Q \) respectively, with respect to \( O \) and \( |\vec{p}| = p, |\vec{q}| = q \). The points \( R \) and \( S \) divide \( PQ \) internally and externally in the ratio 2 : 3 respectively. If \( OR \) and \( OS \) are perpendicular then \( (1994) \)
(a) \( 9q^2 = 4q^2 \)  
(b) \( 4p^2 = 9q^2 \)  
(c) \( 9p = 4q \)  
(d) \( 4p = 9q \)

8. Let \( \alpha, \beta, \gamma \) be distinct real numbers. The points with position vectors \( \alpha\vec{i} + \beta\vec{j} + \gamma\vec{k}, \beta\vec{i} + \gamma\vec{j} + \alpha\vec{k}, \gamma\vec{i} + \alpha\vec{j} + \beta\vec{k} \) \( (1994) \)
(a) are collinear  
(b) form an equilateral triangle  
(c) form a scalene triangle  
(d) form a right angled triangle

9. Let \( \vec{a} = \vec{i} - \vec{j}, \vec{b} = \vec{j} - \vec{k}, \vec{c} = \vec{k} - \vec{i} \). If \( \vec{a}, \vec{b}, \vec{c} \) is a unit vector such that \( \vec{a} \cdot \vec{d} = 0 = [\vec{b} \vec{c} \vec{d}] \), then \( \vec{d} \) equals \( (1995S) \)
(a) \( \pm \frac{i + j - 2k}{\sqrt{6}} \)  
(b) \( \pm \frac{i + j - k}{\sqrt{3}} \)  
(c) \( \pm \frac{i + j + k}{\sqrt{3}} \)  
(d) \( \pm k \)

10. If \( \vec{a}, \vec{b}, \vec{c} \) are non-coplanar unit vectors such that \( \vec{a} \times (\vec{b} \times \vec{c}) = \frac{(\vec{b} + \vec{c})}{\sqrt{2}} \), then the angle between \( \vec{a} \) and \( \vec{b} \) is \( (1995S) \)
(a) \( \frac{3\pi}{4} \)  
(b) \( \frac{\pi}{4} \)  
(c) \( \frac{\pi}{2} \)  
(d) \( \pi \)

11. Let \( \vec{u}, \vec{v}, \vec{w} \) be vectors such that \( \vec{u} + \vec{v} + \vec{w} = 0 \). If \( |\vec{u}| = 3, |\vec{v}| = 4 \) and \( |\vec{w}| = 5 \), then \( \vec{u} + \vec{v} + \vec{w} + \vec{u} \vec{v} + \vec{w} \) \( (1995S) \)
(a) 47  
(b) -25  
(c) 0  
(d) 25

12. If \( \vec{a}, \vec{b}, \vec{c} \) are three non-coplanar vectors, then \( (1995S) \)
\[
(\vec{a} + \vec{b} + \vec{c}).(\vec{a} \times \vec{b} + \vec{b} \times \vec{c}) \]
equals \( (a)\)
(b) \( [\vec{a} \vec{b} \vec{c}] \)
(c) \( 2 [\vec{a} \vec{b} \vec{c}] \)
(d) \( -[\vec{a} \vec{b} \vec{c}] \)

13. Let \( \vec{a} = 2i + j - k, \vec{b} = i + j \). If \( c \) is a vector such that \( c = |c|, |c - \vec{a}| = 2\sqrt{2} \) and the angle between \( (\vec{a} \times \vec{b}) \) and \( c \) is 30°, then \( (1999 - 2 \text{ Marks}) \)
(a) \( \frac{1}{\sqrt{2}} \)  
(b) \( \frac{1}{\sqrt{3}} \)  
(c) \( \frac{1}{\sqrt{5}} \)  
(d) \( \frac{1}{\sqrt{3}} \)

14. Let \( \vec{a} = 2i + j + k, \vec{b} = i + 2j - k \) and a unit vector \( c \) be coplanar. If \( c \) is perpendicular to \( \vec{a} \), then \( c \) is \( (1999 - 2 \text{ Marks}) \)
(a) \( \vec{a} \)  
(b) \( \frac{1}{\sqrt{2}} (-i - j - k) \)  
(c) \( \frac{1}{\sqrt{5}} (i - 2j) \)  
(d) \( \frac{1}{\sqrt{3}} (i - j - k) \)
15. If the vectors \( \vec{a}, \vec{b}, \text{ and } \vec{c} \) form the sides \( BC, CA \text{ and } AB \) respectively of a triangle \( ABC \), then

(a) \( \vec{a} \cdot \vec{b} + \vec{b} \cdot \vec{c} + \vec{c} \cdot \vec{a} = 0 \)
(b) \( \vec{a} \times \vec{b} = \vec{b} \times \vec{c} = \vec{c} \times \vec{a} \)
(c) \( \vec{a} \cdot \vec{b} = \vec{b} \cdot \vec{c} = \vec{c} \cdot \vec{a} \)
(d) \( \vec{a} \times \vec{b} + \vec{b} \times \vec{c} + \vec{c} \times \vec{a} = 0 \)

16. Let the vectors \( \vec{a}, \vec{b}, \vec{c} \text{ and } \vec{d} \) be such that

\[
(\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d}) = 0 .
\]
Let \( P_1 \) and \( P_2 \) be planes determined by the pairs of vectors \( \vec{a}, \vec{b} \) and \( \vec{c}, \vec{d} \) respectively. Then the angle between \( P_1 \) and \( P_2 \) is

(a) \( 0 \)  (b) \( \frac{\pi}{4} \)  (c) \( \frac{\pi}{3} \)  (d) \( \frac{\pi}{2} \)

17. If \( \vec{a}, \vec{b} \) and \( \vec{c} \) are unit coplanar vectors, then the scalar triple product

\[
[2 \vec{a} - \vec{b}, 2 \vec{b} - \vec{c}, 2 \vec{c} - \vec{a}] = \]

(a) \( 0 \)  (b) \( 1 \)  (c) \( -\sqrt{3} \)  (d) \( \sqrt{3} \)

18. Let \( \vec{a} = \vec{i} - \vec{k}, \vec{b} = x\vec{i} + \vec{j} + (1-x)\vec{k} \) and

\( \vec{c} = y\vec{i} + x\vec{j} + (1-x+y)\vec{k} \). Then \( [\vec{a} \vec{b} \vec{c}] \) depends on

(a) only \( x \)  (b) only \( y \)  (c) Neither \( x \) Nor \( y \)  (d) both \( x \) and \( y \)

19. If \( \vec{a}, \vec{b} \) and \( \vec{c} \) are unit vectors, then

\[
|\vec{a} - \vec{b}|^2 + |\vec{b} - \vec{c}|^2 + |\vec{c} - \vec{a}|^2 \]

does NOT exceed \( 2001 \)

(a) \( 4 \)  (b) \( 9 \)  (c) \( 8 \)  (d) \( 6 \)

20. If \( \vec{a} \) and \( \vec{b} \) are two unit vectors such that \( \vec{a} + 2\vec{b} \) and

\( 5\vec{a} - 4\vec{b} \) are perpendicular to each other then the angle between \( \vec{a} \) and \( \vec{b} \) is

(a) \( 45^\circ \)  (b) \( 60^\circ \)  (c) \( \cos^{-1}\left(\frac{1}{3}\right) \)  (d) \( \cos^{-1}\left(\frac{2}{7}\right) \)

21. Let \( \vec{V} = 2\vec{i} + \vec{j} - \vec{k} \) and \( \vec{W} = \vec{i} + 3\vec{k} \). If \( \vec{V} \) is a unit vector, then the maximum value of the scalar triple product \( |\vec{V} \vec{W} \vec{W}| \) is

(a) \( -1 \)  (b) \( \sqrt{10 + 6} \)  (c) \( \sqrt{59} \)  (d) \( \sqrt{60} \)

22. The value of \( k \) such that \( \frac{x-4}{1} = \frac{y-2}{1} = \frac{z-k}{2} \) lies in the plane \( 2x - 4y + z = 7 \), is

(a) \( 7 \)  (b) \( -7 \)  (c) no real value  (d) \( 4 \)

23. The value of \( a \) so that the volume of parallelepiped formed by \( \vec{i} + a\vec{j} + \vec{k}, \vec{j} + a\vec{k} \) and \( a\vec{i} + \vec{k} \) becomes minimum is \( 2003 \)

(a) \( -3 \)  (b) \( 3 \)  (c) \( \sqrt[3]{3} \)  (d) \( \sqrt{3} \)

24. If \( \vec{a} = (i + j + k), \vec{b} = 1 \) and \( \vec{a} \times \vec{b} = j - k \), then \( \vec{b} \) is

(a) \( \vec{i} - \vec{j} + \vec{k} \)  (b) \( 2\vec{j} - \vec{k} \)  (c) \( \vec{i} \)  (d) \( 2\vec{i} \)

25. If the lines

\[
\frac{x-1}{2} = \frac{y+1}{3} = \frac{z-1}{4} \quad \text{and} \quad \frac{x-3}{1} = \frac{y-k}{2} = \frac{z}{1}
\]
intersect, then the value of \( k \) is \( 2004 \)

(a) \( \frac{3}{2} \)  (b) \( 3 \)  (c) \( -\frac{2}{9} \)  (d) \( -\frac{3}{2} \)

26. The unit vector which is orthogonal to the vector \( 3\vec{i} + 2\vec{j} + 6\vec{k} \) and is coplanar with the vectors \( 2\vec{i} + \vec{j} + \vec{k} \) and \( \vec{i} - \vec{j} + \vec{k} \) is \( 2004 \)

(a) \( \frac{2\vec{i} - 6\vec{j} + \vec{k}}{\sqrt{41}} \)  (b) \( \frac{2\vec{i} - 3\vec{j}}{\sqrt{13}} \)  (c) \( \frac{3\vec{i} - \vec{k}}{\sqrt{10}} \)  (d) \( \frac{4\vec{i} + 3\vec{j} - 3\vec{k}}{\sqrt{34}} \)

27. A variable plane at a distance of the one unit from the origin cuts the coordinates axes at \( A, B \) and \( C \). If the centroid \( D(x,y,z) \) of triangle \( ABC \) satisfies the relation

\[
\frac{1}{x^2} + \frac{1}{y^2} + \frac{1}{z^2} = k
\]
then the value of \( k \) is \( 2005 \)

(a) \( 3 \)  (b) \( 1 \)  (c) \( \frac{1}{3} \)  (d) \( 9 \)

28. If \( \vec{a}, \vec{b}, \vec{c} \) are three non-zero, non-coplanar vectors and

\[
\vec{b}_1 = \frac{\vec{b} \cdot \vec{a}}{|\vec{a}|^2} \vec{a}, \quad \vec{b}_2 = \frac{\vec{b} \cdot \vec{a}}{|\vec{a}|^2} \vec{b}_1, \quad \vec{c}_1 = \frac{\vec{c} \cdot \vec{a}}{|\vec{a}|^2} \vec{a} + \frac{\vec{b} \cdot \vec{c}}{|\vec{b}|^2} \vec{b}_1, \quad \vec{c}_2 = \frac{\vec{c} \cdot \vec{a}}{|\vec{a}|^2} \vec{a} + \frac{\vec{b} \cdot \vec{c}}{|\vec{b}|^2} \vec{b}_1, \quad \vec{c}_3 = \frac{\vec{c} \cdot \vec{a}}{|\vec{a}|^2} \vec{a} + \frac{\vec{b} \cdot \vec{c}}{|\vec{b}|^2} \vec{b}_1, \quad \vec{c}_4 = \frac{\vec{c} \cdot \vec{a}}{|\vec{a}|^2} \vec{a} + \frac{\vec{b} \cdot \vec{c}}{|\vec{b}|^2} \vec{b}_1,
\]
then the set of orthogonal vectors is \( 2005 \)

(a) \( \vec{a}, \vec{b}_1, \vec{c}_3 \)  (b) \( \vec{a}, \vec{b}_1, \vec{c}_2 \)  (c) \( \vec{a}, \vec{b}_1, \vec{c}_1 \)  (d) \( \vec{a}, \vec{b}_2, \vec{c}_2 \)

29. A plane which is perpendicular to two planes \( 2x - 2y + z = 0 \) and \( x - y + 2z = 4 \) passes through \((1, -2, 1)\). The distance of the plane from the point \((1, 2, 2)\) is \( 2006 \)

(a) \( 0 \)  (b) \( 1 \)  (c) \( \sqrt{2} \)  (d) \( 2\sqrt{2} \)
30. Let \( \vec{a} = i + 2j + k, \vec{b} = i - j + k \) and \( \vec{c} = i + j - k \). A vector in the plane of \( \vec{a} \) and \( \vec{b} \) whose projection on \( \vec{c} \) is \( \frac{1}{\sqrt{3}} \) is \( \boxed{2006 - 3M, -1} \).
   (a) \( 4i - j + 4k \)  
   (b) \( 3i + j - 3k \)  
   (c) \( 2i + j - 2k \)  
   (d) \( 4i + j - 4k \)

31. The number of distinct real values of \( \lambda \), for which the vectors \( -\lambda^2 i + j + k, \lambda^2 j - k \) and \( i + j - 2\lambda \) are coplanar, is \( \boxed{2007 - 3 \text{ marks}} \).
   (a) zero  
   (b) one  
   (c) two  
   (d) three

32. Let \( \vec{a}, \vec{b}, \vec{c} \) be unit vectors such that \( \vec{a} + \vec{b} + \vec{c} = \vec{0} \). Which one of the following is correct? \( \boxed{2007 - 3 \text{ marks}} \).
   (a) \( \vec{a} \times \vec{b} = \vec{b} \times \vec{c} = \vec{c} \times \vec{a} = \vec{0} \)  
   (b) \( \vec{a} \times \vec{b} = \vec{b} \times \vec{c} = \vec{c} \times \vec{a} \neq \vec{0} \)  
   (c) \( \vec{a} \times \vec{b} = \vec{b} \times \vec{c} = \vec{c} \times \vec{a} = \vec{0} \)  
   (d) \( \vec{a} \times \vec{b}, \vec{b} \times \vec{c}, \vec{c} \times \vec{a} \) are mutually perpendicular

33. The edges of a parallelepiped are of unit length and are parallel to non-coplanar unit vectors \( \vec{a}, \vec{b}, \vec{c} \) such that \( \vec{a} \cdot \vec{b} = \vec{b} \cdot \vec{c} = \vec{c} \cdot \vec{a} = \frac{1}{2} \). Then, the volume of the parallelepiped is \( \boxed{2008} \).
   (a) \( \frac{1}{\sqrt{2}} \)  
   (b) \( \frac{1}{2\sqrt{2}} \)  
   (c) \( \frac{\sqrt{3}}{2} \)  
   (d) \( \frac{1}{\sqrt{3}} \)

34. Let two non-collinear unit vectors \( \hat{a} \) and \( \hat{b} \) form an acute angle. A point \( P \) moves so that at any time \( t \) the position vector \( \overrightarrow{OP} \) (where \( O \) is the origin) is given by \( \hat{a} \cos t + \hat{b} \sin t \). When \( P \) is farthest from origin \( O \), let \( M \) be the length of \( \overrightarrow{OP} \) and \( \hat{u} \) be the unit vector along \( \overrightarrow{OP} \). Then, \( \boxed{2008} \).
   (a) \( \hat{u} = \frac{\hat{a} + \hat{b}}{|\hat{a} + \hat{b}|} \) and \( M = (1 + \hat{a} \cdot \hat{b})^{1/2} \)  
   (b) \( \hat{u} = \frac{\hat{a} - \hat{b}}{|\hat{a} - \hat{b}|} \) and \( M = (1 + \hat{a} \cdot \hat{b})^{1/2} \)  
   (c) \( \hat{u} = \frac{\hat{a} + \hat{b}}{|\hat{a} + \hat{b}|} \) and \( M = (1 + 2\hat{a} \cdot \hat{b})^{1/2} \)  
   (d) \( \hat{u} = \frac{\hat{a} - \hat{b}}{|\hat{a} - \hat{b}|} \) and \( M = (1 + 2\hat{a} \cdot \hat{b})^{1/2} \)

35. Let \( P(3, 2, 6) \) be a point in space and \( Q \) be a point on the line \( \vec{r} = (i - j + 2k) + \mu(-3i + j + 5k) \).

Then the value of \( \mu \) for which the vector \( \overrightarrow{PQ} \) is parallel to the plane \( x - 4y + 3z = 1 \) is \( \boxed{2009} \).
   (a) \( \frac{1}{4} \)  
   (b) \( \frac{1}{4} \)  
   (c) \( \frac{1}{8} \)  
   (d) \( \frac{1}{8} \)

36. If \( \vec{a}, \vec{b}, \vec{c} \) and \( \vec{d} \) are unit vectors such that \( (\vec{a} \times \vec{b}) \cdot (\vec{c} \times \vec{d}) = 1 \) and \( \vec{a} \cdot \vec{c} = \frac{1}{2} \), then \( \boxed{2009} \).
   (a) \( \vec{a}, \vec{b}, \vec{c} \) are non-coplanar  
   (b) \( \vec{b}, \vec{c}, \vec{d} \) are non-coplanar  
   (c) \( \vec{b}, \vec{d} \) are non-parallel  
   (d) \( \vec{a}, \vec{d} \) are parallel and \( \vec{b}, \vec{c} \) are parallel

37. A line with positive direction cosines passes through the point \( P(2, -1, 2) \) and makes equal angles with the coordinate axes. The line meets the plane \( 2x + y + z = 9 \) at point \( Q \). The length of the line segment \( PQ \) equals \( \boxed{2009} \).
   (a) \( 1 \)  
   (b) \( \sqrt{2} \)  
   (c) \( \sqrt{3} \)  
   (d) \( 2 \)

38. Let \( P, Q, R \) and \( S \) be the points on the plane with position vectors \( -2i - j, 4i, 3i + 3j \) and \( -3i + 2j \) respectively. The quadrilateral \( PQRS \) must be a \( \boxed{2010} \).
   (a) parallelogram, which is neither a rhombus nor a rectangle  
   (b) square  
   (c) rectangle, but not a square  
   (d) rhombus, but not a square

39. Equation of the plane containing the straight line \( \frac{x}{2} = \frac{y}{3} = \frac{z}{4} \) and perpendicular to the plane containing the straight lines \( \frac{x}{3} = \frac{y}{4} = \frac{z}{2} \) and \( \frac{x}{4} = \frac{y}{2} = \frac{z}{3} \) is \( \boxed{2010} \).
   (a) \( \frac{8}{3} \) \( \frac{4}{3} \) \( \frac{7}{3} \)  
   (b) \( \frac{4}{3} \) \( \frac{4}{3} \) \( \frac{1}{3} \)  
   (c) \( \frac{1}{3} \) \( \frac{2}{3} \) \( \frac{10}{3} \)  
   (d) \( \frac{2}{3} \) \( \frac{1}{3} \) \( \frac{5}{3} \)

40. If the distance of the point \( P(1, -2, 1) \) from the plane \( x + 2y - 2z = \alpha \), where \( \alpha > 0 \), is 5, then the foot of the perpendicular from \( P \) to the plane is \( \boxed{2010} \).
   (a) \( \left( \frac{8}{3}, -rac{4}{3}, -rac{7}{3} \right) \)  
   (b) \( \left( \frac{4}{3}, -rac{4}{3}, rac{1}{3} \right) \)  
   (c) \( \left( \frac{1}{3}, \frac{2}{3}, \frac{10}{3} \right) \)  
   (d) \( \left( \frac{2}{3}, \frac{1}{3}, \frac{5}{3} \right) \)

41. Two adjacent sides of a parallelogram \( ABCD \) are given by \( \overrightarrow{AB} = 2i + 10j + 11k \) and \( \overrightarrow{AD} = i + 2j + 2k \).

The side \( AD \) is rotated by an acute angle \( \alpha \) in the plane of the parallelogram so that \( AD \) becomes \( AD' \). If \( AD' \) makes a right angle with the side \( AB \), then the cosine of the angle \( \alpha \) is given by \( \boxed{2010} \).
   (a) \( \frac{8}{9} \)  
   (b) \( \frac{\sqrt{17}}{9} \)  
   (c) \( \frac{1}{9} \)  
   (d) \( \frac{4\sqrt{5}}{9} \)

42. Let \( \vec{a} = i + j + k, \vec{b} = i - j + k \) and \( \vec{c} = i - j - k \) be three vectors. A vector \( \vec{v} \) in the plane of \( \vec{a} \) and \( \vec{b} \), whose projection on \( \vec{c} \) is \( \frac{1}{\sqrt{3}} \), is given by \( \boxed{2011} \).
Vector Algebra and Three Dimensional Geometry

(a) \( \hat{i} - 3\hat{j} + 3\hat{k} \)  
(b) \(-3\hat{i} - 3\hat{j} - \hat{k}\)  
(c) \(3\hat{i} - \hat{j} + 3\hat{k}\)  
(d) \(\hat{i} + 3\hat{j} - 3\hat{k}\)  

43. The point \(P\) is the intersection of the straight line joining the points \(Q(2, 3, 5)\) and \(R(1, -1, 4)\) with the plane \(5x - 4y - z = 1\). If \(S\) is the foot of the perpendicular drawn from the point \(T(2, 1, 4)\) to \(QR\), then the length of the line segment \(PS\) is \(2\sqrt{2}\) (2012)  

(a) \(\frac{1}{\sqrt{2}}\)  
(b) \(\sqrt{2}\)  
(c) 2  
(d) \(2\sqrt{2}\)

44. The equation of a plane passing through the line of intersection of the planes \(x + 2y + 3z = 2\) and \(x - y + z = 3\) and at a distance \(\frac{2}{\sqrt{3}}\) from the point \((3, 1, -1)\) is (2012)  

(a) \(5x - 11y + z = 17\)  
(b) \(\sqrt{2}x + y = 3\sqrt{2} - 1\)  
(c) \(x + y + z = \sqrt{3}\)  
(d) \(x - \sqrt{2}y = 1 - \sqrt{2}\)

45. If \(\vec{a}\) and \(\vec{b}\) are vectors such that \(|\vec{a} + \vec{b}| = \sqrt{29}\) and \(\vec{a} \times (2\hat{i} + 3\hat{j} + 4\hat{k}) = (2\hat{i} + 3\hat{j} + 4\hat{k}) \times \vec{b}\), then a possible value of \(\vec{a} + \vec{b}\) is \(-7\hat{i} + 2\hat{j} + 3\hat{k}\) (2012)  

(a) 0  
(b) 3  
(c) 4  
(d) 8

46. Let \(P\) be the image of the point \((3, 1, 7)\) with respect to the plane \(x - y + z = 3\). Then the equation of the plane passing through \(P\) and containing the straight line \(\frac{x}{1} = \frac{y}{1} = \frac{z}{1}\) is (JEE Adv. 2016)  

(a) \(x + y - 3z = 0\)  
(b) \(3x + z = 0\)  
(c) \(x - 4y + 7z = 0\)  
(d) \(2x - y = 0\)

\[ \text{D } \text{ MCQs with One or More than One Correct} \]

1. Let \(\vec{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}\), \(\vec{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}\) and \(\vec{c} = c_1\hat{i} + c_2\hat{j} + c_3\hat{k}\) be three non-zero vectors such that \(\vec{c}\) is a unit vector perpendicular to both the vectors \(\vec{a}\) and \(\vec{b}\). If the angle between \(\vec{a}\) and \(\vec{b}\) is \(\frac{\pi}{6}\), then  
\[
\left| \begin{array}{ccc}
a_1 & a_2 & a_3 \\
b_1 & b_2 & b_3 \\
c_1 & c_2 & c_3
\end{array} \right|^2
\]  
(a) 0  
(b) 1  
(c) \(\frac{1}{4} (a_1^2 + a_2^2 + a_3^2)\)  
(d) \(\frac{3}{4} (a_1^2 + a_2^2 + a_3^2)\) (1986 - 2 Marks)

2. The number of vectors of unit length perpendicular to vectors \(\vec{a} = (1, 1, 0)\) and \(\vec{b} = (0, 1, 1)\) is (1987 - 2 Marks)  
(a) one  
(b) two  
(c) three  
(d) infinite  
(e) None of these.

3. Let \(\vec{a} = 2\hat{i} - \hat{j} + \hat{k}, \vec{b} = \hat{i} + 2\hat{j} - \hat{k}\) and \(\vec{c} = \hat{i} + \hat{j} - 2\hat{k} - \hat{k}\) be three vectors. A vector in the plane of \(\vec{b}\) and \(\vec{c}\), whose projection on \(\vec{a}\) is of magnitude \(\sqrt{2}/3\), is: (1993 - 2 Marks)  
(a) \(2\hat{i} + 3\hat{j} - 3\hat{k}\)  
(b) \(2\hat{i} + \hat{j} + 3\hat{k}\)  
(c) \(-2\hat{i} - \hat{j} + 5\hat{k}\)  
(d) \(2\hat{i} + \hat{j} + 5\hat{k}\)

4. The vector \(\frac{1}{3}(2\hat{i} - 2\hat{j} + \hat{k})\) is (1994)  
(a) a unit vector  
(b) makes an angle \(\frac{\pi}{3}\) with the vector \((2\hat{i} - 4\hat{j} + 3\hat{k})\)  
(c) parallel to the vector \((-\hat{i} + \hat{j} - \frac{1}{2}\hat{k})\)  
(d) perpendicular to the vector \(3\hat{i} + 2\hat{j} - 2\hat{k}\)

5. If \(a = i + j + k, b = 4i + 3j + 4k\) and \(c = i + aj + bk\) are linearly dependent vectors and \(|c| = \sqrt{3}\), then (1998 - 2 Marks)  
(a) \(\alpha = 1, \beta = -1\)  
(b) \(\alpha = 1, \beta = \pm 1\)  
(c) \(\alpha = -1, \beta = \pm 1\)  
(d) \(\alpha = \pm 1, \beta = 1\)

6. For three vectors \(u, v, w\) which of the following expression is not equal to any of the remaining three? (1998 - 2 Marks)  
(a) \(u \cdot (v \times w)\)  
(b) \((v \times w) \cdot u\)  
(c) \(v \cdot (u \times w)\)  
(d) \((u \times v) \cdot w\)

7. Which of the following expressions are meaningful? (1998 - 2 Marks)  
(a) \(u \cdot (v \times w)\)  
(b) \((u \cdot v) \times w\)  
(c) \((u \cdot v) w\)  
(d) \(u \times (v \cdot w)\)

8. Let \(a\) and \(b\) be two non-collinear unit vectors. If \(u = a - (a \cdot b)\) and \(v = a \times b\), then \(|v|\) is (1999 - 3 Marks)  
(a) \(|u|\)  
(b) \(|u| + |a\cdot b|\)  
(c) \(|u| + |a\cdot b|\)  
(d) \(|u| + |a|\cdot |b|\)

9. Let \(\vec{A}\) be vector parallel to line of intersection of planes \(P_1\) and \(P_2\). Plane \(P_1\) is parallel to the vectors \(2\hat{j} + 3\hat{k}\) and \(4\hat{j} - 3\hat{k}\) and that \(P_2\) is parallel to \(\hat{j} - \hat{k}\) and \(3\hat{i} + 3\hat{j}\), then the angle between vector \(\vec{A}\) and a given vector \(2\hat{i} + \hat{j} - 2\hat{k}\) is (2006 - 5M, -1)  
(a) \(\frac{\pi}{2}\)  
(b) \(\frac{\pi}{4}\)  
(c) \(\frac{\pi}{6}\)  
(d) \(\frac{3\pi}{4}\)

10. The vector which is/are coplanar with vectors \(\hat{i} + \hat{j} + 2\hat{k}\) and \(\hat{i} + 2\hat{j} + \hat{k}\), and perpendicular to the vector \(\hat{i} + \hat{j} + \hat{k}\) is/are (2011)  
(a) \(\hat{j} - \hat{k}\)  
(b) \(-\hat{i} + \hat{j}\)  
(c) \(\hat{i} - \hat{j}\)  
(d) \(-\hat{j} + \hat{k}\)
11. If the straight lines \( \frac{x-1}{2} = \frac{y+1}{k} = \frac{z}{2} \) and \( \frac{x+1}{2} = \frac{y+1}{k} = \frac{z}{k} \) are coplanar, then the plane(s) containing these two lines is (are) \( 2012 \)
(a) \( y + 2z = -1 \)  
(b) \( y + z = -1 \)  
(c) \( y - z = -1 \)  
(d) \( y - 2z = -1 \)

12. A line \( l \) passing through the origin is perpendicular to the lines \( l_1 : (3 + t) \hat{i} + (-1 + 2t) \hat{j} + (4 + 2t) \hat{k}, -\infty < t < \infty \) and \( l_2 : (3 + 2s) \hat{i} + (3 + 2s) \hat{j} + (2 + s) \hat{k}, -\infty < s < \infty \)
Then, the coordinate(s) of the point(s) on \( l_2 \) at a distance of \( \sqrt{7} \) from the point of intersection of \( l \) and \( l_1 \) is (are)
(a) \( \left( \frac{7}{3}, \frac{7}{3}, \frac{5}{3} \right) \)  
(b) \( (-1, -1, 0) \)  
(c) \( (1, 1, 1) \)  
(d) \( \left( \frac{7}{9}, \frac{7}{9}, \frac{8}{9} \right) \)

13. Two lines \( L_1 : x = 5, \frac{y}{3} - \alpha = \frac{z}{2} \) and \( L_2 : x = \alpha, \frac{y}{1 - \alpha} = \frac{z}{2 - \alpha} \) are coplanar. Then \( \alpha \) can take value(s) \( 2013 \)
(a) 1  
(b) 2  
(c) 3  
(d) 4

14. Let \( \vec{x}, \vec{y}, \vec{z} \) be three vectors each of magnitude \( \sqrt{2} \) and the angle between each pair of them is \( \frac{\pi}{3} \).
If \( \vec{a} \) is a non-zero vector perpendicular to \( \vec{x} \) and \( \vec{y} \times \vec{z} \) and \( \vec{b} \) is a non-zero vector perpendicular to \( \vec{y} \) and \( \vec{z} \times \vec{x} \), then
\( \vec{a} \times \vec{b} = -\vec{a} \cdot \vec{y} \)
\( \vec{a} \cdot \vec{b} = -\vec{a} \cdot \vec{y} \)
\( \vec{a} = -\vec{a} \cdot \vec{y} \)
\( \vec{a} = -\vec{a} \cdot \vec{y} \)
\( \vec{a} = -\vec{a} \cdot \vec{y} \)
\( \vec{a} = -\vec{a} \cdot \vec{y} \)

15. From a point \( P(h, \lambda, \lambda) \), perpendicular \( PQ \) and \( PR \) are drawn respectively on the lines \( y = x, z = 1 \) and \( y = -x, z = -1 \). If \( P \) is such that \( \angle QPR \) is a right angle, then the possible value(s) of \( \lambda \) is (are) \( 2014 \)
(a) \( \sqrt{2} \)  
(b) 1  
(c) -1  
(d) -\sqrt{2}

16. In \( R^3 \), consider the planes \( P_1 : y = 0 \) and \( P_2 : x + z = 1 \). Let \( P_3 \) be the plane, different from \( P_1 \) and \( P_2 \), which passes through the intersection of \( P_1 \) and \( P_2 \). If the distance of the point \( (0, 1, 0) \) from \( P_1 \) is 1 and the distance of a point \( (\alpha, \beta, \gamma) \) from \( P_2 \) is 2, then which of the following relations is (are) true? \( 2015 \)
(a) \( 2\alpha + \beta + 2\gamma + 2 = 0 \)  
(b) \( 2\alpha - \beta + 2\gamma + 4 = 0 \)  
(c) \( 2\alpha + \beta - 2\gamma - 10 = 0 \)  
(d) \( 2\alpha - \beta + 2\gamma - 8 = 0 \)

17. In \( R^3 \), let \( L \) be a straight line passing through the origin. Suppose that all the points on \( L \) are at a constant distance from the two planes \( P_1 : x + 2y - z + 1 = 0 \) and \( P_2 : 2x - y + z - 1 = 0 \). Let \( M \) be the locus of the feet of the perpendiculars drawn from the points on \( L \) to the plane \( P_1 \). Which of the following points lie(s) on \( M \)? \( 2015 \)
(a) \( \left( 0, -\frac{5}{6}, -\frac{2}{3} \right) \)  
(b) \( \left( -\frac{1}{6}, -\frac{1}{6}, \frac{1}{6} \right) \)  
(c) \( \left( -\frac{5}{6}, 0, \frac{1}{6} \right) \)  
(d) \( \left( -\frac{1}{3}, 0, \frac{2}{3} \right) \)

18. Let \( \triangle PQR \) be a triangle. Let \( \vec{a} = \overrightarrow{QR}, \vec{b} = \overrightarrow{RP} \) and \( \vec{c} = \overrightarrow{PQ} \). If \( |\vec{a}| = 12, |\vec{b}| = 4\sqrt{3}, \vec{b} \cdot \vec{c} = -24 \), then which of the following is (are) true? \( 2015 \)
(a) \( \frac{|\vec{c}|^2}{2} - |\vec{a}| = 12 \)  
(b) \( |\vec{c}|^2 - |\vec{a}| = 30 \)  
(c) \( |\vec{a} \times \vec{b} + \vec{c} \times \vec{a}| = 48\sqrt{3} \)  
(d) \( \vec{a} \cdot \vec{b} = -72 \)

19. Consider a pyramid \( OQRS \) located in the first octant \( (x \geq 0, \ y \geq 0, \ z \geq 0) \) with \( O \) as origin, and \( OP \) and \( OR \) along the \( x \)-axis and the \( y \)-axis, respectively. The base \( OPQR \) of the pyramid is a square with \( OP = 3 \). The point \( S \) is directly above the mid-point, \( T \) of diagonal \( OQ \) such that \( TS = 3 \). Then \( 2016 \)
(a) the acute angle between \( OQ \) and \( OS \) is \( \frac{\pi}{3} \)  
(b) the equation of the plane containing the triangle \( OQS \) is \( x - y = 0 \)  
(c) the length of the perpendicular from \( P \) to the plane containing the triangle \( OQS \) is \( \frac{3}{\sqrt{2}} \)  
(d) the perpendicular distance from \( O \) to the straight line containing \( RS \) is \( \frac{\sqrt{15}}{2} \)

20. Let \( \hat{u} = u_1 \hat{i} + u_2 \hat{j} + u_3 \hat{k} \) be a unit vector in \( R^3 \) and \( \hat{w} = \frac{1}{6} \left( \hat{i} + \hat{j} + 2\hat{k} \right) \). Given that there exists a vector \( \hat{v} \) in \( R^3 \) such that \( \hat{u} \times \hat{v} = 1 \) and \( \hat{v} \left( \hat{u} \times \hat{v} \right) = 1 \). Which of the following statement(s) is (are) correct? \( 2016 \)
Vector Algebra and Three Dimensional Geometry

(a) There is exactly one choice for such $\vec{v}$
(b) There are infinitely many choices for such $\vec{v}$
(c) If $\vec{u}$ lies in the xy-plane then $|\vec{u}| = |\vec{u}_i|$
(d) If $\vec{u}$ lies in the xz-plane then $2 |\vec{u}_i| = |\vec{u}|$

E Subjective Problems

1. From a point $O$ inside a triangle $ABC$, perpendiculars $OD$, $OE$, $OF$ are drawn to the sides $BC$, $CA$, $AB$ respectively. Prove that the perpendiculars from $A$, $B$, $C$ to the sides $EF$, $FD$, $DE$ are concurrent. (1978)

2. $A_1$, $A_2$, $A_3$, $A_4$ are the vertices of a regular plane polygon with $n$ sides and $O$ is its centre. Show that
$$\sum_{i=1}^{n-1} (\overrightarrow{O A_i} \times \overrightarrow{O A_{i+1}}) = (1-n)(\overrightarrow{O A_2} \times \overrightarrow{O A_1})$$
(1982 - 2 Marks)

3. Find all values of $\lambda$ such that $x, y, z, \neq (0,0,0)$ and
$$(\vec{i} + \vec{j} + 3\vec{k})x + (3\vec{i} - 3\vec{j} + \vec{k})y + (-4 \vec{i} + 5 \vec{j})z$$
$$= \lambda(x\vec{i} + y\vec{j} + z\vec{k})$$
where $\vec{i}$, $\vec{j}$, $\vec{k}$ are unit vectors along the coordinate axes. (1982 - 2 Marks)

4. A vector $\vec{A}$ has components $A_1$, $A_2$, $A_3$ in a right-handed rectangular Cartesian coordinate system $\text{Oxyz}$. The coordinate system is rotated about the $x$-axis through an angle $\frac{\pi}{2}$. Find the components of $A$ in the new coordinate system, in terms of $A_1$, $A_2$, $A_3$. (1983 - 2 Marks)

5. The position vectors of the points $A$, $B$, $C$ and $D$ are $3\vec{i} - 2\vec{j} - \vec{k}, 2\vec{i} + 3\vec{j} - 4\vec{k}, -\vec{i} + \vec{j} + 2\vec{k}$ and $4\vec{i} + 5\vec{j} + \lambda\vec{k}$ respectively. If the points $A$, $B$, $C$ and $D$ lie on a plane, find the value of $\lambda$. (1986 - 2½ Marks)

6. If $A$, $B$, $C$, $D$ are any four points in space, prove that
$$\left| \overrightarrow{AB} \times \overrightarrow{CD} + \overrightarrow{BC} \times \overrightarrow{AD} + \overrightarrow{CA} \times \overrightarrow{BD} \right| = 4 \text{ (area of triangle } ABC)$$
(1987 - 2 Marks)

7. Let $OA$, $CB$ be a parallelogram with $O$ at the origin and $OC$ a diagonal. Let $D$ be the midpoint of $OA$. Using vector methods prove that $BD$ and $CO$ intersect in the same ratio. Determine this ratio. (1988 - 3 Marks)

8. If vectors $\vec{a}$, $\vec{b}$, $\vec{c}$ are coplanar, show that
$$\begin{vmatrix}
\vec{a} & \vec{b} & \vec{c} \\
\begin{array}{ccc}
a & a & a \\
\vec{a} & \vec{a} & \vec{a} \\
\vec{b} & \vec{b} & \vec{b} \\
\vec{c} & \vec{c} & \vec{c}
\end{array}
\end{vmatrix} = 0$$
(1989 - 2 Marks)

9. In a triangle $OAB$, $E$ is the midpoint of $BO$ and $D$ is a point on $AB$ such that $AD : DB = 2 : 1$. If $OD$ and $AE$ intersect at $P$, determine the ratio $OP : PD$ using vector methods. (1989 - 4 Marks)

10. Let $\vec{A} = 2\vec{i} + \vec{k}$, $\vec{B} = \vec{i} + \vec{j} + \vec{k}$, and
$$\vec{C} = 4\vec{i} - 3\vec{j} + 7\vec{k}$$. Determine a vector $\vec{R}$. Satisfying
$$\vec{R} \times \vec{B} = \vec{C} \times \vec{B} \text{ and } \vec{R} \cdot \vec{A} = 0$$
(1990 - 3 Marks)

11. Determine the value of $\lambda$ so that for all real $x$, the vector $c\vec{x} - \lambda \vec{b}$ and $x\vec{i} + 2\vec{j} + 2c\vec{k}$ make an obtuse angle with each other. (1991 - 4 Marks)

12. In a triangle $ABC$, $D$ and $E$ are points on $BC$ and $AC$ respectively, such that $BD = 2DC$ and $AE = 3EC$. Let $P$ be the point of intersection of $AD$ and $BE$. Find $BP/PE$ using vector methods. (1993 - 5 Marks)

13. If the vectors $\vec{b}$, $\vec{c}$, $\vec{d}$, are not coplanar, then prove that the vector
$$(\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d}) + (\vec{a} \times \vec{c}) \times (\vec{d} \times \vec{b}) + (\vec{a} \times \vec{d}) \times (\vec{b} \times \vec{c})$$
is parallel to $\vec{a}$. (1994 - 4 Marks)

14. The position vectors of the vertices $A$, $B$, $C$ of a tetrahedron $ABCD$ are $\vec{i} + \vec{j} + \vec{k}$, $\vec{i}$ and $3\vec{i}$ respectively. The altitude from vertex $D$ to the opposite face $ABC$ meets the median line through $A$ of the triangle $ABC$ at a point $E$. If the length of the side $AD$ is 4 and the volume of the tetrahedron is $\frac{2\sqrt{2}}{3}$, find the position vector of the point $E$ for all its possible positions. (1996 - 5 Marks)

15. If $A$, $B$ and $C$ are vectors such that $|B| = |C|$. Prove that $|[(A + B) \times (A + C)] \times (B + C)](B + C) = 0$ (1997 - 5 Marks)

16. Prove, by vector methods or otherwise, that the point of intersection of the diagonals of a trapezium lies on the line passing through the mid-points of the parallel sides. (You may assume that the trapezium is not a parallelogram.) (1998 - 8 Marks)

17. For any two vectors $u$ and $v$, prove that
$$\begin{align*}
& (a) \quad (u \cdot v)^2 + |u \times v|^2 = |u|^2 \cdot |v|^2 \\
& (b) \quad (1 + |u|^2)(1 + |v|^2) = (1 - u \cdot v)^2 + |u + v + (u \times v)|^2
\end{align*}$$
(1999 - 8 Marks)

18. Let $u$ and $v$ be unit vectors. If $w$ is a vector such that $w \cdot (w \times u) = v$, then prove that $(|u \times v| - |v|/2)^2$ and that the equality holds if and only if $u$ is perpendicular to $v$. (1999 - 10 Marks)

19. Show, by vector methods, that the angular bisectors of a triangle are concurrent and find an expression for the position vector of the point of concurrency in terms of the position vectors of the vertices. (2001 - 5 Marks)

20. Find 3-dimensional vectors $\vec{v}_1$, $\vec{v}_2$, $\vec{v}_3$ satisfying
$$\begin{align*}
\vec{v}_1 \cdot \vec{v}_1 &= 4, \quad \vec{v}_2 \cdot \vec{v}_2 = -2, \quad \vec{v}_1 \cdot \vec{v}_3 = 6, \quad \vec{v}_2 \cdot \vec{v}_3 = 29 \\
2\vec{v}_2 \cdot \vec{v}_3 &= -5, \quad \vec{v}_3 \cdot \vec{v}_3 = 29
\end{align*}$$
(2001 - 5 Marks)
21. Let \( \vec{A}(t) = f_1(t)\hat{i} + f_2(t)\hat{j} \) and 
\( \vec{B}(t) = g_1(t)\hat{i} + g_2(t)\hat{j}, \) \( t \in [0, 1]. \) 
where \( f_1, f_2, g_1, g_2 \) are continuous functions. If \( \vec{A}(t) \) and 
\( \vec{B}(t) \) are nonzero vectors for all \( t \) and \( \vec{A}(0) = 2\hat{i} + 3\hat{j}, \vec{A}(1) 
= 6\hat{i} + 2\hat{j}, \vec{B}(0) = 3\hat{i} + 2\hat{j} \) and \( \vec{B}(1) = 2\hat{i} + 6\hat{j}. \) Then show 
that \( \vec{A}(t) \) and \( \vec{B}(t) \) are parallel for some \( t. \) (2001 - 5 Marks) 

22. Let \( V \) be the volume of the parallelipiped formed by the vectors 
\( \vec{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}, \vec{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}, \) 
\( \vec{c} = c_1\hat{i} + c_2\hat{j} + c_3\hat{k}. \) If \( a_r, b_r, c_r \) where \( r \in \{1, 2, 3\} \) are non-
negative real numbers and \( \sum_{r=1}^{3} (a_r + b_r + c_r) = 3L \), show 
that \( V \leq L^3. \) (2002 - 5 Marks) 

23. (i) Find the equation of the plane passing through the 
points \( (2, 1, 0), (5, 0, 1) \) and \( (4, 1, 1). \) 
(ii) If \( P \) is the point \( (2, 1, 6) \) then find the point \( Q \) such that 
\( PQ \) is perpendicular to the plane in (i) and the midpoint of 
\( PQ \) lies on it. (2003 - 4 Marks) 

24. If \( \vec{u}, \vec{v}, \vec{w} \) are three non-coplanar unit vectors and \( \alpha, \beta, \gamma \) 
are the angles between \( \vec{u} \) and \( \vec{v} \) and \( \vec{w}, \vec{w} \) and \( \vec{u} \) 
respectively and \( \vec{x}, \vec{y}, \vec{z} \) are unit vectors along the bisectors 
of the angles \( \alpha, \beta, \gamma \) respectively. Prove that 
\[ \frac{[\vec{x} \times \vec{y} \times \vec{z}]}{[\vec{x} \times \vec{y} \times \vec{z}]} = \frac{1}{16}[\vec{u} \cdot \vec{v} \cdot \vec{w}]^2 \sec^2 \alpha \sec^2 \beta \sec^2 \gamma. \] 
(2003 - 4 Marks) 

25. If \( \vec{a}, \vec{b}, \vec{c} \) and \( \vec{d} \) are distinct vectors such that 
\( \vec{a} \times \vec{c} = \vec{b} \times \vec{d} \) and \( \vec{a} \times \vec{b} = \vec{c} \times \vec{d}. \) Prove that 
\( (\vec{a} - \vec{d})(\vec{b} - \vec{c}) \neq 0 \) i.e. \( \vec{a} \vec{b} + \vec{d} \vec{c} \neq \vec{a} \vec{d} + \vec{b} \vec{c}. \) (2004 - 2 Marks) 

26. Find the equation of plane passing through \((1, 1, 1)\) & the 
lines \( L_1, L_2 \) having direction ratios \((1, 0, -1), (1, -1, 0)\). 
Find the volume of tetrahedron formed by origin and 
the points where these planes intersect the coordinate 
axes. (2004 - 2 Marks) 

27. A parallelepiped ‘S’ has base points \( A, B, C \) and \( D \) 
and upper face points \( A’, B’, C’ \) and \( D’ \). This parallelepiped is 
compressed by upper face \( A’B’C’D’ \) to form a new 
parallelepiped ‘T’ having upper face points \( A”, B”, C” \) and 
\( D”. \) Volume of parallelepiped \( T \) is 90 percent of the volume 
of parallelepiped \( S. \) Prove that the locus of \( A’’ \), is a plane. 
(2004 - 2 Marks) 

28. \( P_1 \) and \( P_2 \) are planes passing through origin. \( L_1 \) and \( L_2 \) are 
two line on \( P_1 \) and \( P_2 \) respectively such that their 
intersection is origin. Show that there exists points \( A, B, C, \) 
whose permutation \( A’, B’, C’ \) can be chosen such that (i) \( A \) is 
on \( L_1, B \) on \( P_1 \) but not on \( L_1 \) and \( C \) not on \( P_1 \) (ii) \( A’ \) is on \( L_2, \) 
\( B’ \) on \( P_2 \) but not on \( L_2 \) and \( C’ \) not on \( P_2 \) (2004 - 4 Marks) 

29. Find the equation of the plane containing the line \( 2x - y + z \) 
\(-3 = 0, 3x + y + z = 5 \) and at a distance of \( \frac{1}{\sqrt{6}} \) from the point 
\((2, 1, -1). \) (2005 - 2 Marks) 

30. If the incident ray on a surface is along the unit vector \( \hat{v}. \) 
The reflected ray is along the unit vector \( \hat{w}. \) Express \( \hat{w} \) in terms of \( \hat{a} \) 
and \( \hat{v}. \) (2005 - 4 Marks) 

---

**Match the Following**

**DIRECTIONS (Q.1-6): Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:**

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

<table>
<thead>
<tr>
<th>P</th>
<th>q</th>
<th>r</th>
<th>s</th>
<th>t</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
<td>D</td>
<td></td>
</tr>
<tr>
<td>p</td>
<td>q</td>
<td>r</td>
<td>s</td>
<td></td>
</tr>
</tbody>
</table>

1. Match the following:
   (A) Two rays \( x + y = |a| \) and \( ax - y = 1 \) intersects each other in the 
   first quadrant in the interval \( a \in (a_0, \infty), \) the value of \( a_0 \) is 
   \( \frac{4}{3} \). 
   (B) Point \((\alpha, \beta, \gamma)\) lies on the plane \( x + y + z = 2. \)
   Let \( \vec{a} = \alpha \hat{i} + \beta \hat{j} + \gamma \hat{k} \), \( \vec{k} \times (\hat{k} \times \vec{a}) = 0, \) then \( \gamma = \) 
   (C) \[ \int_0^1 (1 - y^2) \] 
   \[ + \int_0^1 (y^2 - 1) \] 
   \[ \] 
   (D) If \( \sin A \sin B \sin C + \cos A \cos B = 1, \) then the value of \( \sin C = \) 
   \[ \int_0^1 \sqrt{1-x} \] 
   \[ + \int_{-1}^0 \sqrt{1+x} \] 

(2006 - 6M)
2. Consider the following linear equations
\[ ax + by + cz = 0; \quad bx + cy + az = 0; \quad cx + ay + bz = 0 \]
Match the conditions/expressions in Column I with statements in Column II and indicate your answer by darkening the appropriate bubbles in the 4 x 4 matrix given in the ORS.

<table>

Comprehension Based Questions

Consider the lines

\[ L_1 : \frac{x+1}{3} = \frac{y+2}{1} = \frac{z+1}{2} \quad L_2 : \frac{x-2}{1} = \frac{y+2}{2} = \frac{z-3}{3} \]

1. The unit vector perpendicular to both \( L_1 \) and \( L_2 \) is \( \frac{-\hat{i} + 7\hat{j} + 7\hat{k}}{\sqrt{99}} \) (2008)

   (a) \( \frac{-\hat{i} + 7\hat{j} + 7\hat{k}}{\sqrt{99}} \)  
   (b) \( \frac{-\hat{i} - 7\hat{j} + 5\hat{k}}{5\sqrt{3}} \)  
   (c) \( \frac{-\hat{i} + 7\hat{j} + 5\hat{k}}{5\sqrt{3}} \)  
   (d) \( \frac{7\hat{i} - 7\hat{j} - \hat{k}}{\sqrt{99}} \)

2. The shortest distance between \( L_1 \) and \( L_2 \) is \( \frac{17}{\sqrt{3}} \) (2008)

   (a) \( 0 \)  
   (b) \( \frac{17}{\sqrt{3}} \)  
   (c) \( \frac{41}{5\sqrt{3}} \)  
   (d) \( \frac{17}{5\sqrt{3}} \)

3. The distance of the point \((1, 1, 1)\) from the plane passing through the point \((-1, -2, -1)\) and whose normal is perpendicular to both the lines \( L_1 \) and \( L_2 \) is \( \frac{2}{\sqrt{75}} \) (2008)

   (a) \( \frac{2}{\sqrt{75}} \)  
   (b) \( \frac{7}{\sqrt{75}} \)  
   (c) \( \frac{13}{\sqrt{75}} \)  
   (d) \( \frac{23}{\sqrt{75}} \)

I

Integer Value Correct Type

1. If \( \vec{a} \) and \( \vec{b} \) are vectors in space given by \( \vec{a} = \frac{\vec{i} - 2\vec{j}}{\sqrt{5}} \) and \( \vec{b} = \frac{2\vec{i} + \vec{j} + 3\vec{k}}{\sqrt{14}} \), then find the value of \( \left( 2\vec{a} + \vec{b} \right) \cdot \left( \vec{a} - 2\vec{b} \right) \). (2010)

2. If the distance between the plane \( Ax - 2y + z = d \) and the plane containing the lines \( \frac{x-1}{2} = \frac{y-2}{3} = \frac{z-3}{4} \) and \( \frac{x-2}{3} = \frac{y-3}{4} = \frac{z-4}{5} \) is \( \sqrt{6} \), then find \( |d| \). (2010)

3. Let \( \vec{a} = -\vec{i} - \vec{k}, \vec{b} = -\vec{i} + \vec{j} \) and \( \vec{c} = \vec{i} + 2\vec{j} + 3\vec{k} \) be three given vectors. If \( \vec{r} \) is a vector such that \( \vec{r} \times \vec{b} = \vec{c} \times \vec{b} \) and \( \vec{r} \cdot \vec{a} = 0 \), then the value of \( \vec{r} \cdot \vec{b} \) is (2011)

4. If \( \vec{a}, \vec{b} \) and \( \vec{c} \) are unit vectors satisfying \( |\vec{a} - \vec{b}|^2 + |\vec{b} - \vec{c}|^2 + |\vec{c} - \vec{a}|^2 = 9 \), then \( |2\vec{a} + 5\vec{b} + 5\vec{c}| \) is (2012)

5. Consider the set of eight vectors \( V = \{ \vec{a} + \vec{b} + \vec{c}, \vec{a}, \vec{b}, \vec{c}, e \in \{-1, 1\} \} \). Three non-coplanar vectors can be chosen from \( V \) in \( 2^p \) ways. Then \( p \) is (JEE Adv. 2013)
6. A pack contains $n$ cards numbered from 1 to $n$. Two consecutive numbered cards are removed from the pack and the sum of the numbers on the remaining cards is 1224. If the smaller of the numbers on the removed cards is $k$, then $k - 20 = \frac{n}{2}$.

7. Let $\vec{a}$, $\vec{b}$ and $\vec{c}$ be three non-coplanar unit vectors such that the angle between every pair of them is $\frac{\pi}{3}$. If $\vec{a} \times \vec{b} + \vec{b} \times \vec{c} = p\vec{a} + q\vec{b} + r\vec{c}$, where $p$, $q$ and $r$ are scalars, then the value of $\frac{p^2 + 2q^2 + r^2}{q^2}$ is $\frac{1}{2}$.

8. Suppose that $\vec{p}$, $\vec{q}$ and $\vec{r}$ are three non-coplanar vectors in $\mathbb{R}^3$. Let the components of a vector $\vec{s}$ along $\vec{p}$, $\vec{q}$ and $\vec{r}$ be 4, 3 and 5, respectively. If the components of this vector $\vec{s}$ along $(-\vec{p} + \vec{q} + \vec{r})$, $(\vec{p} - \vec{q} + \vec{r})$ and $(-\vec{p} - \vec{q} + \vec{r})$ are $x$, $y$ and $z$, respectively, then the value of $2x + y + z$ is $\frac{1}{3}$.

---

**Section-B**

1. A plane which passes through the point $(3, 2, 0)$ and the line $\frac{x - 4}{1} = \frac{y - 7}{5} = \frac{z - 4}{4}$ is [2002]

   (a) $x - y + z = 1$  
   (b) $x + y + z = 5$  
   (c) $x + 2y - z = 1$  
   (d) $2x - y + z = 5$  

2. If $|\vec{a}| = 2$, $|\vec{b}| = 2$ and the angle between $\vec{a}$ and $\vec{b}$ is $\frac{\pi}{6}$, then $(\vec{a} \times \vec{b})^2$ is equal to [2002]

   (a) 48  
   (b) 16  
   (c) $\vec{a}$  
   (d) none of these

3. If $\vec{a}$, $\vec{b}$, $\vec{c}$ are vectors such that $[\vec{a} \vec{b} \vec{c}] = 4$ then $[\vec{a} \vec{b} \vec{c}] = 4 \times [\vec{a} \vec{b} \vec{c}]$ [2002]

   (a) 16  
   (b) 64  
   (c) 4  
   (d) 8

4. If $\vec{a}$, $\vec{b}$, $\vec{c}$ are vectors that show $\vec{a} + \vec{b} + \vec{c} = 0$ and $|\vec{a}| = 7$, $|\vec{b}| = 5$, $|\vec{c}| = 3$ then angle between vector $\vec{b}$ and $\vec{c}$ is [2002]

   (a) 60°  
   (b) 30°  
   (c) 45°  
   (d) 90°

5. If $|\vec{a}| = 5$, $|\vec{b}| = 4$, $|\vec{c}| = 3$ thus what will be the value of $|\vec{a} \vec{b} + \vec{b} \vec{c} + \vec{c} \vec{a}|$, given that $\vec{a} + \vec{b} + \vec{c} = 0$ [2002]

   (a) 25  
   (b) 50  
   (c) -25  
   (d) -50

6. If the vectors $\vec{c}$, $\vec{a} = \vec{i} + \vec{j} + \vec{k}$ and $\vec{b} = \vec{j}$ are such that $\vec{a}$, $\vec{c}$ and $\vec{b}$ form a right handed system then $\vec{c}$ is [2002]

   (a) $\vec{i} - \vec{x} \vec{k}$  
   (b) $\vec{0}$  
   (c) $\vec{j}$  
   (d) $-\vec{z} \vec{i} + \vec{x} \vec{k}$

7. $\vec{a} = 3\vec{i} - 5\vec{j}$ and $\vec{b} = 6\vec{i} + 3\vec{j}$ are two vectors and $\vec{c}$ is a vector such that $(\vec{c} = \vec{a} \times \vec{b})$ then $|\vec{a}||\vec{b}||\vec{c}|$

   (a) $\sqrt{34} : \sqrt{45} : \sqrt{39}$  
   (b) $\sqrt{34} : \sqrt{45} : 39$  
   (c) $34 : 39 : 45$  
   (d) $39 : 35 : 34$

8. If $\vec{a} \times \vec{b} = \vec{b} \times \vec{c} = \vec{c} \times \vec{a}$ then $\vec{a} + \vec{b} + \vec{c} = \vec{0}$ [2002]

   (a) $abc$  
   (b) -1  
   (c) 0  
   (d) 2

9. The d.r. of normal to the plane through $(1, 0, 0)$, $(0, 1, 0)$ which makes an angle $\frac{\pi}{4}$ with plane $x + y = 3$ are [2002]

   (a) $1, \sqrt{2}, 1$  
   (b) $1, 1, \sqrt{2}$  
   (c) $1, 1, 2$  
   (d) $\sqrt{2}, 1, 1$

10. Let $\vec{u} = \vec{i} + \vec{j}$, $\vec{v} = \vec{i} - \vec{j}$ and $\vec{w} = \vec{i} + 2\vec{j} + 3\vec{k}$. If $\vec{h}$ is a unit vector such that $\vec{u} \vec{h} = 0$ and $\vec{v} \vec{h} = 0$, then $|\vec{w} \vec{h}|$ is equal to [2003]

    (a) 3  
    (b) 0  
    (c) 1  
    (d) 2

11. A particle acted on by constant forces $4\vec{i} + \vec{j} - 3\vec{k}$ and $3\vec{i} + \vec{j} - \vec{k}$ is displaced from the point $\vec{i} + 2\vec{j} - 3\vec{k}$ to the point $5\vec{i} + 4\vec{j} + \vec{k}$. The total work done by the forces is [2003]

    (a) 50 units  
    (b) 20 units  
    (c) 30 units  
    (d) 40 units.

12. The vectors $\overrightarrow{AB} = 3\vec{i} + 4\vec{k}$ & $\overrightarrow{AC} = 5\vec{i} - 2\vec{j} + 4\vec{k}$ are the sides of a triangle ABC. The length of the median through A is [2003]

    (a) $\sqrt{288}$  
    (b) $\sqrt{18}$  
    (c) $\sqrt{72}$  
    (d) $\sqrt{33}$
13. The shortest distance from the plane \(12x + 4y + 3z = 327\) to the sphere \(x^2 + y^2 + z^2 + 4x - 2y - 6z = 155\) is
(a) 39           (b) 26           (c) \(11\frac{4}{13}\)           (d) 13

14. The two lines \(x = ay + b, z = cy + d\) and \(x = ax' + b', z = c'y + d'\) will be perpendicular, if and only if \([2003]\)
(a) \(a^2 + cc' + 1 = 0\)
(b) \(aa' + bb' + cc' + 1 = 0\)
(c) \(aa' + bb' - cc' = 0\)
(d) \((a + a')(b + b') + (c + c') = 0\).

15. The lines \(\frac{x - 2}{1} = \frac{y - 3}{1} = \frac{z - 4}{-k}\) and \(\frac{x - 1}{1} = \frac{y - 4}{1} = \frac{z - 5}{1}\) are coplanar if \([2003]\)
(a) \(k = 3\) or \(-2\)
(b) \(k = 0\) or \(-1\)
(c) \(k = 1\) or \(-1\)
(d) \(k = 0\) or \(-3\)

16. \(\vec{a}, \vec{b}, \vec{c}\) are 3 vectors, such that \(\vec{a} + \vec{b} + \vec{c} = 0\), \([2003]\)
\(|\vec{a}| = 1, |\vec{b}| = 2, |\vec{c}| = 3\), then \(\vec{a}\vec{b} + \vec{b}\vec{c} + \vec{c}\vec{a}\) is equal to \(\vec{a}\vec{b}\vec{c}\)
(a) 1           (b) 0           (c) \(-7\)           (d) 7

17. The radius of the circle in which the sphere \(x^2 + y^2 + z^2 + 2x - 2y - 4z - 19 = 0\) is cut by the plane \(x + 2y + 2z + 7 = 0\) is \([2003]\)
(a) 4           (b) 1           (c) 2           (d) 3

18. A tetrahedron has vertices at \(O(0, 0, 0), A(1, 2, 1), B(2, 1, 3), C(-1, 1, 2)\). Then the angle between the faces OAB and ABC will be \([2003]\)
(a) \(90^\circ\)           (b) \(\cos^{-1}\left(\frac{19}{35}\right)\)
(c) \(\cos^{-1}\left(\frac{17}{31}\right)\)           (d) \(30^\circ\)

19. If \(\begin{vmatrix} a & 2a & 1 + a^3 \\ b & b^2 & 1 + b^2 \\ c & c^2 & 1 + c^3 \end{vmatrix} = 0\) and vectors \((1,a,a^2),(b,b^2,c^2)\)
(1, b, b^2) and \((1, c, c^2)\) are non-coplanar, then the product abc equals \([2003]\)
(a) 0           (b) 2           (c) \(-1\)           (d) 1

20. Consider points A, B, C and D with position vectors \(7i - 4j + 7k, \hat{i} - 6j + 10k, \hat{i} - 3j + 4k\) and
\(5\hat{i} - \hat{j} + 5\hat{k}\) respectively. Then ABCD is a \([2003]\)
(a) parallelogram but not a rhombus
(b) square
(c) rhombus
(d) rectangle.

21. If \(\vec{u}, \vec{v}, \text{ and } \vec{w}\) are three non-coplanar vectors, then \((\vec{u} + \vec{v} - \vec{w}) \times (\vec{u} - \vec{v})\) equals \([2003]\)
(a) 3\(\vec{u}\)\(\times\vec{w}\)           (b) 0
(c) \(\vec{u}\)\(\times\)\(\vec{w}\) \(\times\)\(\vec{v}\)
(d) \(\vec{u}\)\(\times\)\(\vec{w}\) \(\times\)\(\vec{v}\)

22. Two system of rectangular axes have the same origin. If a plane cuts them at distances \(a, b, c\) and \(a', b', c'\) from the origin then \([2003]\)
(a) \(\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} + \frac{1}{a'^2} + \frac{1}{b'^2} + \frac{1}{c'^2} = 0\)
(b) \(\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} + \frac{1}{a'^2} + \frac{1}{b'^2} + \frac{1}{c'^2} = 0\)
(c) \(\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} + \frac{1}{a'^2} + \frac{1}{b'^2} + \frac{1}{c'^2} = 0\)
(d) \(\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} + \frac{1}{a'^2} + \frac{1}{b'^2} + \frac{1}{c'^2} = 0\)

23. Distance between two parallel planes \(2x + y + 2z = 8\) and \(4x + 2y + 4z + 5 = 0\) is \([2004]\)
(a) \(\frac{9}{2}\)           (b) \(\frac{5}{2}\)           (c) \(\frac{7}{2}\)           (d) \(\frac{3}{2}\)

24. A line with direction cosines proportional to 2, 1, 2 meets each of the lines \(x = y + a = z\) and \(x + a = 2y + 2z\). The co-ordinates of each of the points of intersection are given by \([2004]\)
(a) \((2a, 3a, 3a)\), \((2a, a, a)\)
(b) \((3a, 2a, 3a)\), \((a, a, a)\)
(c) \((3a, 2a, 3a)\), \((a, a, 2a)\)
(d) \((3a, 3a, 3a)\), \((a, a, a)\)

25. If the straight lines \([2004]\)
\(x = 1 + s, y = -3 - 3s, z = 1 + \lambda s\) and \(x = \frac{t}{2}, y = 1 + t, z = 2 - t\),
with parameters s and t respectively, are co-planar, then \(\lambda\) equals.
(a) 0           (b) \(-1\)
(c) \(-\frac{1}{2}\)           (d) \(-2\)

26. The intersection of the spheres \(x^2 + y^2 + z^2 + 7x - 2y - z = 13\) and \(x^2 + y^2 + z^2 - 3x + 3y + 4z = 8\) is the same as the intersection of one of the sphere and the plane \([2004]\)
(a) \(2x - y - z = 1\)
(b) \(x - 2y - z = 1\)
(c) \(x - y - 2z = 1\)
(d) \(x - y - z = 1\)
27. Let $\vec{a}, \vec{b}$ and $\vec{c}$ be three non-zero vectors such that no two of these are collinear. If the vector $\vec{a} + 2\vec{b}$ is collinear with $\vec{c}$ and $3\vec{a} + 3\vec{b}$ is collinear with $\vec{a}$ ($\lambda$ being some non-zero scalar) then $\vec{a} + 2\vec{b} + 6\vec{c}$ equals $\lambda\vec{a}$. 

(a) 0 (b) $\lambda\vec{b}$ (c) $\lambda\vec{c}$ (d) $\lambda\vec{a}$ 

28. A particle is acted upon by constant forces $4\vec{i} + 3\vec{j} - 3\vec{k}$ and $3\vec{i} + 2\vec{j} - \vec{k}$ which displace it from a point $\vec{i} + 2\vec{j} + 3\vec{k}$ to the point $5\vec{i} + 4\vec{j} + 3\vec{k}$. The work done in standard units by the forces is given by $\lambda$. 

(a) 15 (b) 30 (c) 25 (d) 40 

29. If $\vec{a}$, $\vec{b}$, $\vec{c}$ are non-coplanar vectors and $\lambda$ is a real number, then the vectors $\vec{a} + 2\vec{b} + 3\vec{c}$, $\lambda\vec{b} + 4\vec{c}$ and $(2\lambda - 1)\vec{c}$ are non coplanar for $\lambda$. 

(a) no value of $\lambda$ (b) all except one value of $\lambda$ (c) all except two values of $\lambda$ (d) all values of $\lambda$. 

30. Let $\vec{u}$, $\vec{v}$, $\vec{w}$ be such that $||\vec{u}|| = 1$, $||\vec{v}|| = 2$, $||\vec{w}|| = 3$. If the projection of $\vec{v}$ along $\vec{u}$ is equal to that of $\vec{w}$ along $\vec{u}$ and $\vec{v}$, $\vec{w}$ are perpendicular to each other then $|\vec{u} - \vec{v} + \vec{w}|$ equals $\sqrt{14}$. 

(a) 14 (b) $\sqrt{7}$ (c) $\sqrt{14}$ (d) 2 

31. Let $\vec{a}$, $\vec{b}$ and $\vec{c}$ be non-zero vectors such that $(\vec{a} \times \vec{b}) \times \vec{c} = \frac{1}{3} ||\vec{b}|| ||\vec{c}|| \vec{a}$. If $\theta$ is the acute angle between the vectors $\vec{b}$ and $\vec{c}$, then $\sin \theta$ equals $\frac{2}{3}$. 

(a) $\frac{2\sqrt{2}}{3}$ (b) $\frac{\sqrt{2}}{3}$ (c) $\frac{2}{3}$ (d) $\frac{1}{3}$ 

32. If $C$ is the mid point of $AB$ and $P$ is any point outside $AB$, then $PA + PB = 2PC$. 

(a) $PA + PB = 2PC$ (b) $PA + PB = PC$ (c) $PA + PB + 2PC = 0$ (d) $PA + PB + PC = 0$ 

33. If the angle $\theta$ between the line $x = \frac{y+1}{2} = \frac{z-2}{2}$ and the plane $2x - y + \sqrt{2}z + 4 = 0$ is such that $\sin \theta = \frac{1}{3}$ then the value of $\lambda$ is $\frac{5}{3}$. 

(a) $\frac{5}{3}$ (b) $\frac{-3}{5}$ (c) $\frac{3}{4}$ (d) $\frac{-4}{3}$ 

34. The angle between the lines $2x = 3y = -z$ and $6x = -y = -4z$ is $\lambda$. 

(a) $0^\circ$ (b) $90^\circ$ (c) $45^\circ$ (d) $30^\circ$ 

35. If the plane $2ax - 3ay + 4az + 6 = 0$ passes through the midpoint of the line joining the centres of the spheres $x^2 + y^2 + z^2 + 6x - 8y - 2z = 13$ and $x^2 + y^2 + z^2 - 10x + 4y - 2z = 8$ then $\lambda$ equals $\frac{10}{9}$. 

(a) $-1$ (b) 1 (c) $-2$ (d) 2 

36. The distance between the line $\vec{r} = 2\vec{i} - 2\vec{j} + 3\vec{k} + \lambda(i - j + 4\vec{k})$ and the plane $\vec{r} \cdot (\vec{i} + 5\vec{j} + \vec{k}) = 5$ is $\frac{10}{3\sqrt{3}}$. 

(a) $\frac{10}{9}$ (b) $\frac{10}{3\sqrt{3}}$ (c) $\frac{3}{10}$ (d) $\frac{10}{3}$ 

37. For any vector $\vec{a}$, the value of $(\vec{a} \times \vec{i})^2 + (\vec{a} \times \vec{j})^2 = (\vec{a} \times \vec{k})^2$ is equal to $3a^2$. 

(a) $3a^2$ (b) $\vec{a}$ (c) $2a^2$ (d) $4a^2$ 

38. If non zero numbers $a$, $b$, $c$ are in H.P., then the straight line $\frac{x}{a} + \frac{y}{b} + \frac{1}{c} = 0$ always passes through a fixed point. That point is $\left(\frac{1}{a}, \frac{1}{b}, \frac{1}{c}\right)$. 

(a) $(-1, 2)$ (b) $(-1, -2)$ (c) $(1, -2)$ (d) $\left(\frac{1}{b}, \frac{1}{c}, \frac{1}{2}\right)$ 

39. Let $a$, $b$ and $c$ be distinct non-negative numbers. If the vectors $a\vec{i} + a\vec{j} + c\vec{k}$, $\vec{i} + \vec{k}$ and $c\vec{i} + a\vec{j} + b\vec{k}$ lie in a plane, then $c$ is $\frac{1}{2}$. 

(a) the Geometric Mean of $a$ and $b$ (b) the Arithmetic Mean of $a$ and $b$ (c) equal to zero (d) the Harmonic Mean of $a$ and $b$
40. If $\vec{a}, \vec{b}, \vec{c}$ are non coplanar vectors and $\lambda$ is a real number then $[\lambda(\vec{a} + \vec{b}) \lambda^2 \vec{b} \lambda \vec{c}] = [\vec{a} \vec{b} + \vec{c}]$ for 2005
(a) exactly one value of $\lambda$
(b) no value of $\lambda$
(c) exactly three values of $\lambda$
(d) exactly two values of $\lambda$

41. Let $\vec{a} = \hat{i} - \hat{k}, \vec{b} = x \hat{i} + \hat{j} + (1 - x) \hat{k}$ and $\vec{c} = y \hat{i} + x \hat{j} + (1 + x - y) \hat{k}$. Then $[\vec{a} \vec{b} \vec{c}]$ depends on 2005
(a) only $y$
(b) only $x$
(c) both $x$ and $y$
(d) neither $x$ nor $y$

42. The plane $x + 2y - z = 4$ cuts the sphere $x^2 + y^2 + z^2 - x + z - 2 = 0$ in a circle of radius 2005
(a) 3
(b) 1
(c) 2
(d) $\sqrt{2}$

43. If $(\vec{a} \times \vec{b}) \times \vec{c} = \vec{a} \times (\vec{b} \times \vec{c})$ where $\vec{a}, \vec{b}$ and $\vec{c}$ are any three vectors such that $\vec{a} \vec{b} \neq 0, \vec{b} \vec{c} \neq 0$ then $\vec{a}$ and $\vec{c}$ are 2006
(a) inclined at an angle of $\frac{\pi}{3}$ between them
(b) inclined at an angle of $\frac{\pi}{6}$ between them
(c) perpendicular
(d) parallel

44. The values of $a$, for which points $A$, $B$, $C$ with position vectors $2\hat{i} - \hat{j} + \hat{k}, \hat{i} - 3\hat{j} - 5\hat{k}$ and $\vec{a} - 3\hat{j} + \hat{k}$ respectively are the vertices of a right angled triangle with $C = \frac{\pi}{2}$ are 2006
(a) 2 and 1
(b) $-2$ and $-1$
(c) $-2$ and 1
(d) 2 and $-1$

45. The two lines $x = ay + b$, $z = cy + d$; and $x = a'y + b'$, $z = c'y + d'$ are perpendicular to each other if 2006
(a) $aa' + cc' = -1$
(b) $aa' + cc' = 1$
(c) $\frac{a}{a'} + \frac{c}{c'} = -1$
(d) $\frac{a}{a'} + \frac{c}{c'} = 1$

46. The image of the point $(-1, 3, 4)$ in the plane $x - 2y = 0$ is 2006
(a) $\left(\frac{-17}{3}, \frac{-19}{3}, 4\right)$
(b) $(15, 11, 4)$
(c) $\left(\frac{-17}{3}, \frac{-19}{3}, 1\right)$
(d) None of these

47. If a line makes an angle of $\pi/4$ with the positive directions of each of $x$-axis and $y$-axis, then the angle that the line makes with the positive direction of the $z$-axis is 2007
(a) $\frac{\pi}{4}$
(b) $\frac{\pi}{2}$
(c) $\frac{\pi}{6}$
(d) $\frac{\pi}{3}$

48. If $\hat{u}$ and $\hat{v}$ are unit vectors and $\theta$ is the acute angle between them, then $2\hat{u} \times 3\hat{v}$ is a unit vector for 2007
(a) no value of $\theta$
(b) exactly one value of $\theta$
(c) exactly two values of $\theta$
(d) more than two values of $\theta$

49. If $(2, 3, 5)$ is one end of a diameter of the sphere $x^2 + y^2 + z^2 - 6x - 12y - 2z + 20 = 0$, then the coordinates of the other end of the diameter are 2007
(a) $(4, 3, 5)$
(b) $(4, 3, -3)$
(c) $(4, 9, -3)$
(d) $(4, -3, 3)$

50. Let $\vec{a} = \hat{i} + \hat{j} + \hat{k}, \vec{b} = \hat{i} - \hat{j} + 2\hat{k}$ and $\vec{c} = x\hat{i} + (x - 2)\hat{j} - \hat{k}$. If the vectors $\vec{c}$ lies in the plane of $\vec{a}$ and $\vec{b}$, then $x$ equals 2007
(a) $-4$
(b) $-2$
(c) 0
(d) 1

51. Let $L$ be the line of intersection of the planes $2x + 3y + z = 1$ and $x + 3y + 2z = 2$. If $L$ makes an angle $\alpha$ with the positive $x$-axis, then cos $\alpha$ equals 2007
(a) 1
(b) $\frac{1}{\sqrt{2}}$
(c) $\frac{1}{\sqrt{3}}$
(d) $\frac{1}{2}$

52. The vector $\vec{a} = \alpha \hat{i} + 2\hat{j} + \beta \hat{k}$ lies in the plane of the vectors $\vec{b} = \hat{i} + \hat{j}$ and $\vec{c} = \hat{j} + \hat{k}$ and bisects the angle between $\vec{b}$ and $\vec{c}$. Then which one of the following gives possible values of $\alpha$ and $\beta$? 2008
(a) $\alpha = 2, \beta = 2$
(b) $\alpha = 1, \beta = 2$
(c) $\alpha = 2, \beta = 1$
(d) $\alpha = 1, \beta = 1$

53. The non-zero vectors $\vec{a}, \vec{b}$ and $\vec{c}$ are related by $\vec{a} = 8\vec{b}$ and $\vec{c} = -7\vec{b}$. Then the angle between $\vec{a}$ and $\vec{c}$ is 2008
(a) 0
(b) $\frac{\pi}{4}$
(c) $\frac{\pi}{2}$
(d) $\pi$
54. The line passing through the points (5, 1, a) and (3, b, 1) crosses the yz-plane at the point \( \left(0, \frac{17}{2}, \frac{-13}{2}\right) \). Then
   (a) \( a = 2, b = 8 \)  \hspace{1cm} (b) \( a = 4, b = 6 \)
   (c) \( a = 6, b = 4 \)  \hspace{1cm} (d) \( a = 8, b = 2 \)

55. If the straight lines \( \frac{x-1}{k} = \frac{y-2}{2} = \frac{z-3}{3} \) and \( \frac{x-2}{3} = \frac{y-3}{k} = \frac{z-1}{2} \) intersect at a point, then the integer \( k \) is equal to \(2008\)
   (a) \(-5\)  \hspace{1cm} (b) \(5\)
   (c) \(2\)  \hspace{1cm} (d) \(-2\)

56. Let the line \( \frac{x-2}{3} = \frac{y-1}{-5} = \frac{z+2}{2} \) lie in the plane \( x + 3y - az + \beta = 0 \). Then \( (a, \beta) \) equals \(2009\)
   (a) \((-6, 7)\)  \hspace{1cm} (b) \((5, -15)\)
   (c) \((-5, 5)\)  \hspace{1cm} (d) \((6, -17)\)

57. The projections of a vector on the three coordinate axes are \( \overrightarrow{6}, -3, 2 \) respectively. The direction cosines of the vector are : \(2009\)
   (a) \(\frac{6}{5}, \frac{-3}{5}, \frac{2}{5}\)  \hspace{1cm} (b) \(\frac{6}{7}, \frac{-3}{7}, \frac{2}{7}\)
   (c) \(\frac{-6}{7}, \frac{-3}{7}, \frac{2}{7}\)  \hspace{1cm} (d) \(6, -3, 2\)

58. If \( \overrightarrow{u}, \overrightarrow{v}, \overrightarrow{w} \) are non-coplanar vectors and \( p, q \) are real numbers, then the equality \( [3\overrightarrow{u} p\overrightarrow{v} p\overrightarrow{u}] - [p\overrightarrow{v} \overrightarrow{o} q\overrightarrow{u}] - [2\overrightarrow{o} q\overrightarrow{v} q\overrightarrow{u}] = 0 \) holds for :
   (a) exactly two values of \((p, q)\)
   (b) more than two but not all values of \((p, q)\)
   (c) all values of \((p, q)\)
   (d) exactly one value of \((p, q)\) \(2009\)

59. Let \( \overrightarrow{a} = \hat{i} - \hat{j} - \hat{k} \) and \( \overrightarrow{c} = \hat{i} - \hat{j} - \hat{k} \). Then the vector \( \overrightarrow{b} \) satisfying \( \overrightarrow{a} \times \overrightarrow{b} + \overrightarrow{c} = 0 \) and \( \overrightarrow{a} \cdot \overrightarrow{b} = 3 \) \(2010\)
   (a) \(2\hat{i} - \hat{j} + 2\hat{k}\)  \hspace{1cm} (b) \(\hat{i} - \hat{j} - 2\hat{k}\)
   (c) \(\hat{i} + \hat{j} - 2\hat{k}\)  \hspace{1cm} (d) \(-\hat{i} + \hat{j} - 2\hat{k}\)

60. If the vectors \( \overrightarrow{a} = \hat{i} - \hat{j} + 2\hat{k} \), \( \overrightarrow{b} = 2\hat{i} + 4\hat{j} + \hat{k} \) and \( \overrightarrow{c} = \lambda \hat{i} + \hat{j} + \mu \hat{k} \) are mutually orthogonal, then \( (\lambda, \mu) = \) \(2010\)
   (a) \((2, -3)\)  \hspace{1cm} (b) \((-2, 3)\)
   (c) \((3, -2)\)  \hspace{1cm} (d) \((-3, 2)\)

61. Statement-1 : The point \( A(3, 1, 6) \) is the mirror image of the point \( B(1, 3, 4) \) in the plane \( x - y + z = 5 \).
   Statement-2: The plane \( x - y + z = 5 \) bisects the line segment joining \( A(3, 1, 6) \) and \( B(1, 3, 4) \). \(2010\)
   (a) Statement-1 is true, Statement-2 is true ; Statement-2 is not a correct explanation for Statement-1.
   (b) Statement-1 is true, Statement-2 is false.
   (c) Statement-1 is false, Statement-2 is true.
   (d) Statement-1 is true, Statement-2 is true ; Statement-2 is a correct explanation for Statement-1.

62. A line AB in three-dimensional space makes angles 45° and 120° with the positive x-axis and the positive y-axis respectively. If \( \angle AFB \) makes an acute angle \( \theta \) with the positive z-axis, then \( \theta \) equals \(2010\)
   (a) 45°  \hspace{1cm} (b) 60°  \hspace{1cm} (c) 75°  \hspace{1cm} (d) 30°

63. If the angle between the line \( x = \frac{y-1}{2} = \frac{z-3}{\lambda} \) and the plane \( x + 2y + 3z = 4 \) is \( \cos^{-1}\left(\frac{5}{\sqrt{14}}\right) \), then \( \lambda \) equals \(2011\)
   (a) \(\frac{3}{2}\)  \hspace{1cm} (b) \(\frac{2}{5}\)
   (c) \(\frac{5}{3}\)  \hspace{1cm} (d) \(\frac{2}{3}\)

64. If \( \overrightarrow{a} = \frac{1}{\sqrt{10}}(3\hat{i} + \hat{k}) \) and \( \overrightarrow{b} = \frac{1}{7}(2\hat{i} + 3\hat{j} - 6\hat{k}) \), then the value of \( (2\overrightarrow{a} - \overrightarrow{b})(\overrightarrow{a} \times \overrightarrow{b}) \) is \(2011\)
   (a) \(-3\)  \hspace{1cm} (b) \(5\)  \hspace{1cm} (c) \(3\)  \hspace{1cm} (d) \(-5\)

65. The vectors \( \overrightarrow{a} \) and \( \overrightarrow{b} \) are not perpendicular and \( \overrightarrow{c} \) and \( \overrightarrow{d} \) are two vectors satisfying \( \overrightarrow{b} \times \overrightarrow{c} = \overrightarrow{b} \times \overrightarrow{d} \) and \( \overrightarrow{a} \cdot \overrightarrow{d} = 0 \). Then the vector \( \overrightarrow{d} \) is equal to \(2011\)
   (a) \(\overrightarrow{c} + \left(\frac{\overrightarrow{a} \cdot \overrightarrow{c}}{\overrightarrow{a} \cdot \overrightarrow{b}}\right)\overrightarrow{b}\)
   (b) \(\overrightarrow{b} + \left(\frac{\overrightarrow{b} \cdot \overrightarrow{c}}{\overrightarrow{a} \cdot \overrightarrow{b}}\right)\overrightarrow{c}\)
   (c) \(\overrightarrow{c} - \left(\frac{\overrightarrow{a} \cdot \overrightarrow{c}}{\overrightarrow{a} \cdot \overrightarrow{b}}\right)\overrightarrow{b}\)
   (d) \(\overrightarrow{b} - \left(\frac{\overrightarrow{b} \cdot \overrightarrow{c}}{\overrightarrow{a} \cdot \overrightarrow{b}}\right)\overrightarrow{c}\)

66. Statement-1: The point \( A(1, 0, 7) \) is the mirror image of the point \( B(1, 6, 3) \) in the line : \( \frac{x}{1} = \frac{y-1}{2} = \frac{z-2}{3} \) \(2011\)
   Statement-2: The line \( \frac{x}{1} = \frac{y-1}{2} = \frac{z-2}{3} \) bisects the line segment joining \( A(1, 0, 7) \) and \( B(1, 6, 3) \).
   (a) Statement-1 is true, Statement-2 is true ; Statement-2 is not a correct explanation for Statement-1.
   (b) Statement-1 is true, Statement-2 is false.
   (c) Statement-1 is false, Statement-2 is true.
   (d) Statement-1 is true, Statement-2 is true ; Statement-2 is a correct explanation for Statement-1.
67. Let \( \vec{a} \) and \( \vec{b} \) be two unit vectors. If the vectors 
\( \vec{c} = \vec{a} + 2\vec{b} \) and \( \vec{d} = 5\vec{a} - 4\vec{b} \) are perpendicular to each other, 
then the angle between \( \vec{a} \) and \( \vec{b} \) is: \[2012\]
(a) \( \frac{\pi}{6} \)  
(b) \( \frac{\pi}{2} \)  
(c) \( \frac{\pi}{3} \)  
(d) \( \frac{\pi}{4} \)

68. A equation of a plane parallel to the plane \( x - 2y + 2z - 5 = 0 \) and at a unit distance from the origin is: 
\[2012\]
(a) \( x - 2y + 2z - 3 = 0 \)  
(b) \( x - 2y + 2z + 1 = 0 \)  
(c) \( x - 2y + 2z - 1 = 0 \)  
(d) \( x - 2y + 2z + 5 = 0 \)

69. If the line \( \frac{x - 1}{2} = \frac{y + 1}{3} = \frac{z - 1}{4} \) and \( \frac{x - 3}{1} = \frac{y - k}{2} = \frac{z}{1} \) 
intersect, then \( k \) is equal to: \[2012\]
(a) \( -1 \)  
(b) \( \frac{2}{9} \)  
(c) \( \frac{9}{2} \)  
(d) \( 0 \)

70. Let \( ABCD \) be a parallelogram such that \( \overrightarrow{AB} = \vec{a}, \overrightarrow{AD} = \vec{b} \) 
and \( \angle BAD \) be an acute angle. If \( \vec{r} \) is the vector that coincide 
with the altitude directed from the vertex B to the side \( AD \), 
then \( \vec{r} \) is given by: \[2012\]
(a) \( \vec{r} = 3\vec{a} - \frac{3}{\vec{a} \cdot \vec{b}} \vec{b} \)  
(b) \( \vec{r} = -\vec{a} + \frac{\vec{a} \cdot \vec{b}}{\vec{b} \cdot \vec{b}} \vec{b} \)  
(c) \( \vec{r} = \vec{a} - \frac{\vec{a} \cdot \vec{b}}{\vec{b} \cdot \vec{b}} \vec{b} \)  
(d) \( \vec{r} = 3\vec{a} - \frac{3}{\vec{a} \cdot \vec{b}} \vec{b} \)

71. Distance between two parallel planes \( 2x + y + 2z = 8 \) and 
\( 4x + 2y + 4z + 5 = 0 \) is \[JEE M 2013\]
(a) \( \frac{3}{2} \)  
(b) \( \frac{5}{2} \)  
(c) \( \frac{7}{2} \)  
(d) \( \frac{9}{2} \)

72. If the lines \( \frac{x - 2}{1} = \frac{y - 3}{1} = \frac{z - 4}{-k} \) and \( \frac{x - 1}{k} = \frac{y - 4}{2} \) 
\( \frac{z - 5}{1} \) are coplanar, then \( k \) can have \[JEE M 2013\]
(a) any value  
(b) exactly one value  
(c) exactly two values  
(d) exactly three values

73. If the vectors \( \overrightarrow{AB} = 3\hat{i} + 4\hat{k} \) and \( \overrightarrow{AC} = 5\hat{i} - 2\hat{j} + 4\hat{k} \) 
are the sides of a triangle ABC, then the length of the median through A is \[JEE M 2013\]
(a) \( \sqrt{18} \)  
(b) \( \sqrt{72} \)  
(c) \( \sqrt{33} \)  
(d) \( \sqrt{45} \)

74. The image of the line \( \frac{x - 1}{3} = \frac{y - 3}{1} = \frac{z - 4}{-5} \) in the plane 
\( 2x - y + z + 3 = 0 \) is the line: \[JEE M 2014\]
(a) \( \frac{x - 3}{3} = \frac{y + 5}{1} = \frac{z - 2}{-5} \)  
(b) \( \frac{x - 3}{-3} = \frac{y + 5}{-1} = \frac{z - 2}{5} \)  
(c) \( \frac{x + 3}{3} = \frac{y - 5}{1} = \frac{z - 2}{-5} \)  
(d) \( \frac{x + 3}{-3} = \frac{y - 5}{-1} = \frac{z + 2}{5} \)

75. The angle between the lines whose direction cosines satisfy 
the equations \( l + m + n = 0 \) and \( l^2 = m^2 + n^2 \) is \[JEE M 2014\]
(a) \( \frac{\pi}{6} \)  
(b) \( \frac{\pi}{2} \)  
(c) \( \frac{\pi}{3} \)  
(d) \( \frac{\pi}{4} \)

76. If \( \left[ \overrightarrow{a} \times \overrightarrow{b} \right] \overrightarrow{c} = \overrightarrow{a} \left[ \overrightarrow{b} \times \overrightarrow{c} \right] \) then \( \lambda \) is equal to \[JEE M 2014\]
(a) \( 0 \)  
(b) \( 1 \)  
(c) \( 2 \)  
(d) \( 3 \)

77. Let \( \overrightarrow{a}, \overrightarrow{b} \) and \( \overrightarrow{c} \) be three non-zero vectors such that no two 
of them are collinear and \( \overrightarrow{a} \times \overrightarrow{b} \times \overrightarrow{c} = \overrightarrow{a} \left[ \overrightarrow{b} \times \overrightarrow{c} \right] \). 
If \( \theta \) is the angle between vectors \( \overrightarrow{b} \) and \( \overrightarrow{c} \), then a value of sin \( \theta \) is: \[JEE M 2015\]
(a) \( \frac{2}{3} \)  
(b) \( \frac{-2\sqrt{3}}{3} \)  
(c) \( \frac{2\sqrt{2}}{3} \)  
(d) \( \frac{-\sqrt{2}}{3} \)

78. The equation of the plane containing the line \( 2x - 5y + z = 3; \) 
\( x + y + 4z = 5 \), and parallel to the plane, \( x + 3y + 6z = 1 \), is: \[JEE M 2015\]
(a) \( x + 3y + 6z = 7 \)  
(b) \( 2x + 6y + 12z = -13 \)  
(c) \( 2x + 6y + 12z = 13 \)  
(d) \( x + 3y + 6z = -7 \)

79. The distance of the point \((1, 0, 2)\) from the point of 
intersection of the line \( \frac{x - 2}{3} = \frac{y + 1}{4} = \frac{z - 2}{12} \) and the plane 
\( x - y + z = 16 \), is \[JEE M 2015\]
(a) \( 3\sqrt{21} \)  
(b) \( 13 \)  
(c) \( 2\sqrt{14} \)  
(d) \( 8 \)

80. If the line, \( \frac{x - 3}{2} = \frac{y + 2}{-1} = \frac{z + 4}{3} \) lies in the plane, \( lx + my - z = 9 \), 
then \( l^2 + m^2 \) is equal to: \[JEE M 2016\]
(a) \( 5 \)  
(b) \( 2 \)  
(c) \( 26 \)  
(d) \( 18 \)
81. Let \( \vec{a}, \vec{b} \) and \( \vec{c} \) be three unit vectors such that
\[
\vec{a} \times \left( \vec{b} \times \vec{c} \right) = \frac{\sqrt{3}}{2} \left( \vec{b} + \vec{c} \right).
\]
If \( \vec{b} \) is not parallel to \( \vec{c} \), then the angle between \( \vec{a} \) and \( \vec{b} \) is: [JEE M 2016]

(a) \( \frac{2\pi}{3} \)  
(b) \( \frac{5\pi}{6} \)  
(c) \( \frac{3\pi}{4} \)  
(d) \( \frac{\pi}{2} \)

82. The distance of the point \((1, -5, 9)\) from the plane \(x - y + z = 5\) measured along the line \(x = y = z\) is: [JEE M 2016]

(a) \( \frac{10}{\sqrt{3}} \)  
(b) \( \frac{20}{3} \)  
(c) \( 3\sqrt{10} \)  
(d) \( 10\sqrt{3} \)
CHAPTER 21

Probability

Section-A

A  Fill in the Blanks

1. For a biased die the probabilities for the different faces to turn up are given below:

<table>
<thead>
<tr>
<th>Face</th>
<th>Prob.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.1</td>
</tr>
<tr>
<td>2</td>
<td>0.32</td>
</tr>
<tr>
<td>3</td>
<td>0.21</td>
</tr>
<tr>
<td>4</td>
<td>0.15</td>
</tr>
<tr>
<td>5</td>
<td>0.05</td>
</tr>
<tr>
<td>6</td>
<td>0.17</td>
</tr>
</tbody>
</table>

This die is tossed and you are told that either face 1 or face 2 has turned up. Then the probability that it is face 1 is .................

(1981 - 2 Marks)

2. $P(A \cup B) = P(A \cap B)$ if and only if the relation between $P(A)$ and $P(B)$ is .................

(1985 - 2 Marks)

3. A box contains 100 tickets numbered 1, 2, ..., 100. Two tickets are chosen at random. It is given that the maximum number on the two chosen tickets is not more than 10. The minimum number on them is 5 with probability .................

(1985 - 2 Marks)

4. If $\frac{1+3p}{3}, \frac{1-p}{4}$ and $\frac{1-2p}{2}$ are the probabilities of three mutually exclusive events, then the set of all values of $p$ is .................

(1986 - 2 Marks)

5. Urn $A$ contains 6 red and 4 black balls and urn $B$ contains 4 red and 6 black balls. One ball is drawn at random from urn $A$ and placed in urn $B$. Then one ball is drawn at random from urn $B$ and placed in urn $A$. If one ball is now drawn at random from urn $A$, the probability that it is found to be red is .................

(1988 - 2 Marks)

6. A pair of fair dice is rolled together till a sum of either 5 or 7 is obtained. Then the probability that 5 comes before 7 is .................

(1989 - 2 Marks)

7. Let $A$ and $B$ be two events such that $P(A) = 0.3$ and $P(A \cup B) = 0.8$. If $A$ and $B$ are independent events then $P(B) =$ .................

(1990 - 2 Marks)

8. If the mean and the variance of a binomial variate $X$ are 2 and 1 respectively, then the probability that $X$ takes a value greater than one is equal to .................

(1991 - 2 Marks)

9. Three faces of a fair die are yellow, two faces red and one blue. The die is tossed three times. The probability that the colours, yellow, red and blue, appear in the first, second and the third tosses respectively is .................

(1992 - 2 Marks)

10. If two events $A$ and $B$ are such that $P(A') = 0.3$, $P(B) = 0.4$ and $P(A \cap B') = 0.5$, then $P(B(A \cup B')) =$ .................

(1994 - 2 Marks)

B  True / False

1. If the letters of the word “Assassin” are written down at random in a row, the probability that no two S’s occur together is $\frac{1}{35}$

(1983 - 1 Mark)

2. If the probability for $A$ to fail in an examination is 0.2 and that for $B$ is 0.3, then the probability that either $A$ or $B$ fails is 0.5.

(1989 - 1 Mark)

C  MCQs with One Correct Answer

1. Two fair dice are tossed. Let $x$ be the event that the first die shows an even number and $y$ be the event that the second die shows an odd number. The two events $x$ and $y$ are:

(a) Mutually exclusive
(b) Independent and mutually exclusive
(c) Dependent
(d) None of these

(1979)

2. Two events $A$ and $B$ have probabilities 0.25 and 0.50 respectively. The probability that both $A$ and $B$ occur simultaneously is 0.14. Then the probability that neither $A$ nor $B$ occurs is

(a) 0.39 (b) 0.25 (c) 0.11 (d) none of these

The probability that an event $A$ happens in one trial of an experiment is 0.4. Three independent trials of the experiment are performed. The probability that the event $A$ happens at least once is

(a) 0.936 (b) 0.784 (c) 0.904 (d) none of these

(1980)

3. If $A$ and $B$ are two events such that $P(A) > 0$, and $P(B) \neq 1$, then $P\left(\frac{A}{B}\right)$ is equal to

(a) $1 - P(A)B$ (b) $1 - P(\overline{A})B$

(1982 - 2 Marks)

(c) $\frac{1 - P(A \cup B)}{P(B)}$ (d) $\frac{P(A)}{P(B)}$

(Here $\overline{A}$ and $\overline{B}$ are complements of $A$ and $B$ respectively.)

Fifteen coupons are numbered 1, 2, ..., 15, respectively. Seven coupons are selected at random one at a time with replacement. The probability that the largest number appearing on a selected coupon is 9 is

(a) $\left(\frac{9}{16}\right)^6$ (b) $\left(\frac{8}{15}\right)^7$

(1983 - 1 Mark)

(c) $\left(\frac{3}{5}\right)^7$ (d) none of these

(1983 - 1 Mark)
6. Three identical dice are rolled. The probability that the same number will appear on each of them is (1984 - 2 Marks)
   (a) 1/6  (b) 1/36  (c) 1/18  (d) 3/28

7. A box contains 24 identical balls of which 12 are white and 12 are black. The balls are drawn at random from the box one at a time with replacement. The probability that a white ball is drawn for the 4th time on the 7th draw is (1984 - 2 Marks)
   (a) 5/64  (b) 27/32  (c) 5/32  (d) 1/2

8. One hundred identical coins, each with probability, p, of showing up heads are tossed once. If 0 < p < 1 and the probability of heads showing on 50 coins is equal to that of heads showing on 51 coins, then the value of p is (1988 - 2 Marks)
   (a) 1/2  (b) 49/101  (c) 50/101  (d) 51/101

9. India plays two matches each with West Indies and Australia. In any match the probabilities of India getting points 0, 1 and 2 are 0.45, 0.05 and 0.50 respectively. Assuming that the outcomes are independent, the probability of India getting at least 7 points is (1992 - 2 Marks)
   (a) 0.8750  (b) 0.0875  (c) 0.0625  (d) 0.0250

10. An unbiased die with faces marked 1, 2, 3, 4, 5 and 6 is rolled four times. Out of four face values obtained, the probability that the minimum face value is not less than 2 and the maximum face value is not greater than 5, is then: (1993 - 1 Mark)
    (a) 16/81  (b) 1/81  (c) 80/81  (d) 65/81

11. Let A, B, C be three mutually independent events. Consider the two statements S1 and S2
    S1: A and B ∪ C are independent
    S2: A and B ∩ C are independent
    Then,
    (a) Both S1 and S2 are true
    (b) Only S1 is true
    (c) Only S2 is true
    (d) Neither S1 nor S2 is true

12. The probability of India winning a test match against West Indies is 1/2. Assuming independence from match to match the probability that in a 5 match series India’s second win occurs at third test is (1995S)
    (a) 1/8  (b) 1/4  (c) 1/2  (d) 2/3

13. Three of the six vertices of a regular hexagon are chosen at random. The probability that the triangle with three vertices is equilateral equals (1995S)
    (a) 1/2  (b) 1/5  (c) 1/10  (d) 1/20

14. For the three events A, B, and C, P(exactly one of the events A or B occurs) = P(exactly one of the two events B or C occurs) = P(exactly one of the events C or A occurs) = P and P(all the three events occur simultaneously) = p², where 0 < p < 1/2. Then the probability of at least one of the three events A, B and C occurring is (1996 - 2 Marks)
    (a) \(\frac{3p+2p^2}{2}\)  (b) \(\frac{p+3p^2}{4}\)
    (c) \(\frac{p+3p^2}{2}\)  (d) \(\frac{3p+2p^2}{4}\)

15. If the integers m and n are chosen at random from 1 to 100, then the probability that a number of the form \(7^m + 7^n\) is divisible by 5 equals (1999 - 2 Marks)
    (a) 1/4  (b) 1/7  (c) 1/8  (d) 1/9

16. Two numbers are selected randomly from the set S = \{1, 2, 3, 4, 5, 6\} without replacement one by one. The probability that minimum of the two numbers is less than 4 is (2003S)
    (a) 1/15  (b) 14/15  (c) 1/5  (d) 4/5

17. If \(P(A) = \frac{1}{3}\), \(P(A ∩ B ∩ C) = \frac{1}{3}\) and \(P(A ∩ B ∩ C) = \frac{1}{3}\), then \(P(A ∩ B ∩ C) = \frac{1}{3}\)

18. If three distinct numbers are chosen randomly from the first 100 natural numbers, then the probability that all three of them are divisible by both 2 and 3 is (2004S)
    (a) 4/25  (b) 4/35  (c) 4/33  (d) 4/115

19. A six faced fair die is thrown until 1 comes, then the probability that 1 comes in even no. of trials is (2005S)
    (a) 5/11  (b) 5/6  (c) 6/11  (d) 1/6

20. One Indian and four American men and their wives are to be seated randomly around a circular table. Then the conditional probability that the Indian man is seated adjacent to his wife given that each American man is seated adjacent to his wife is (2007 - 3 marks)
    (a) \(\frac{1}{2}\)  (b) \(\frac{1}{3}\)  (c) \(\frac{2}{5}\)  (d) \(\frac{1}{5}\)

21. Let \(E^c\) denote the complement of an event E. Let E, F, G be pairwise independent events with \(P(G) > 0\) and \(P(E ∩ F ∩ G) = 0\). Then \(P(E^c ∩ F|G)\) equals (2007 - 3 marks)
    (a) \(P(E^c) + P(F)\)  (b) \(P(E^c) - P(F)\)
    (c) \(P(E^c) - P(F)\)  (d) \(P(E) - P(F)\)

22. An experiment has 10 equally likely outcomes. Let A and B be non-empty events of the experiment. If A consists of 4 outcomes, the number of outcomes that B must have so that A and B are independent, is (2008)
    (a) 2, 4 or 8  (b) 3, 6 or 9  (c) 4 or 8  (d) 5 or 10

23. Let \(ω\) be a complex cube root of unity with \(ω ≠ 1\). A fair die is thrown three times. If \(r_1, r_2, r_3\) are the numbers obtained on the die, then the probability that \(ω^1 + ω^2 + ω^3 = 0\) is (2010)
    (a) \(\frac{1}{18}\)  (b) \(\frac{1}{9}\)  (c) \(\frac{2}{9}\)  (d) \(\frac{1}{36}\)

24. A signal which can be green or red with probability \(\frac{4}{5}\) and \(\frac{1}{5}\) respectively, is received by station A and then transmitted to station B. The probability of each station receiving the signal correctly is \(\frac{3}{4}\). If the signal received at station B is green, then the probability that the original signal was green is (2010)
    (a) \(\frac{3}{5}\)  (b) \(\frac{6}{7}\)  (c) \(\frac{20}{23}\)  (d) \(\frac{9}{20}\)
25. Four fair dice $D_1, D_2, D_3$ and $D_4$; each having six faces numbered 1, 2, 3, 4, 5 and 6 are rolled simultaneously. The probability that $D_4$ shows a number appearing on one of $D_1, D_2$ and $D_3$ is \( (2012) \)

(a) $\frac{91}{216}$ (b) $\frac{108}{216}$ (c) $\frac{125}{216}$ (d) $\frac{127}{216}$

26. Three boys and two girls stand in a queue. The probability, that the number of boys ahead of every girl is at least one more than the number of girls ahead of her, is \( (JEE\ Adv.\ 2014) \)

(a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) $\frac{2}{3}$ (d) $\frac{3}{4}$

27. A computer producing factory has only two plants $T_1$ and $T_2$. Plant $T_1$ produces 20% and plant $T_2$ produces 80% of the total computers produced. 7% of computers produced in the factory turn out to be defective. It is known that $P(\text{computer turns out to be defective given that it is produced in plant } T_1) = 10P(\text{computer turns out to be defective given that it is produced in plant } T_2)$, where $P(E)$ denotes the probability of an event $E$. A computer produced in the factory is randomly selected and it does not turn out to be defective. Then the probability that it is produced in plant $T_2$ is \( (JEE\ Adv.\ 2016) \)

(a) $\frac{36}{73}$ (b) $\frac{47}{79}$ (c) $\frac{78}{93}$ (d) $\frac{75}{83}$

**MCQs with One or More than One Correct**

1. If $M$ and $N$ are any two events, the probability that exactly one of them occurs is \( (1984 - 3\text{ Marks}) \)

(a) $P(M) + P(N) - 2P(M \cap N)$
(b) $P(M) + P(N) - P(M \cap N)$
(c) $P(M^c) + P(N^c) - 2P(M^c \cap N^c)$
(d) $P(M \cap N^c) + P(M^c \cap N)$

2. A student appears for tests I, II and III. The student is successful if he passes either in tests I and II or tests I and III. The probabilities of the student passing in tests I, II and III are $p$, $q$ and $\frac{1}{2}$ respectively. If the probability that the student is successful is $\frac{1}{2}$, then \( (1986 - 2\text{ Marks}) \)

(a) $p = q = 1$  (b) $p = q = \frac{1}{2}$
(c) $p = 1, q = 0$  (d) $p = 1, q = \frac{1}{2}$
(e) none of these

3. The probability that at least one of the events $A$ and $B$ occurs is 0.6. If $A$ and $B$ occur simultaneously with probability 0.2, then $P(\overline{A}) + P(\overline{B})$ is \( (1987 - 2\text{ Marks}) \)

(a) 0.4  (b) 0.8  (c) 1.2  (d) 1.4
(e) none

(Here $\overline{A}$ and $\overline{B}$ are complements of $A$ and $B$, respectively).

4. For two given events $A$ and $B$, $P(A \cap B)$ \( (1988 - 2\text{ Marks}) \)

(a) not less than $P(A) + P(B) - 1$
(b) not greater than $P(A) + P(B)$
(c) equal to $P(A) + P(B) - P(A \cup B)$
(d) equal to $P(A) + P(B) + P(A \cup B)$

5. If $E$ and $F$ are independent events such that $0 < P(E) < 1$ and $0 < P(F) < 1$, then \( (1989 - 2\text{ Marks}) \)

(a) $E$ and $F$ are mutually exclusive
(b) $E$ and $F^c$ (the complement of the event $F$) are independent
(c) $E^c$ and $F^c$ are independent
(d) $P(E \mid F) + P(E^c \mid F) = 1$.

6. For any two events $A$ and $B$ in a sample space \( (1991 - 2\text{ Marks}) \)

(a) \( P(A \mid B) \geq \frac{P(A) + P(B) - 1}{P(B)} \), $P(B) \neq 0$ is always true
(b) \( P(A \cap \overline{B}) = P(A) - P(A \cap B) \) does not hold
(c) \( P(A \cup \overline{B}) = 1 - P(\overline{A}) P(\overline{B}) \), if $A$ and $B$ are independent
(d) \( P(A \cup B) = 1 - P(\overline{A}) P(\overline{B}) \), if $A$ and $B$ are disjoint.

7. $E$ and $F$ are two independent events. The probability that both $E$ and $F$ happen is $\frac{1}{12}$ and the probability that neither $E$ nor $F$ happens is $\frac{1}{2}$. Then, \( (1993 - 2\text{ Marks}) \)

(a) $P(E) = 1/3, P(F) = 1/4$
(b) $P(E) = 1/2, P(F) = 1/6$
(c) $P(E) = 1/6, P(F) = 1/2$
(d) $P(E) = 1/4, P(F) = 1/3$

8. Let $0 < P(A) < 1, 0 < P(B) < 1$ and \( P(A \cup B) = P(A) + P(B) - P(A)P(B) \) then \( (1995S) \)

(a) \( P(B/A) = P(B) - P(A) \)
(b) \( P(A' - B') = P(A') - P(B') \)
(c) \( P(A \cup B)' = P(A') P(B') \)
(d) \( P(A/B) = P(A) \)

9. If from each of the three boxes containing 3 white and 1 black, 2 white and 2 black, 1 white and 3 black balls, one ball is drawn at random, then the probability that 2 white and 1 black ball will be drawn is \( (1998 - 2\text{ Marks}) \)

(a) $\frac{13}{32}$  (b) $\frac{1}{4}$
(c) $\frac{1}{32}$  (d) $\frac{3}{16}$
10. If \( \overline{E} \) and \( \overline{F} \) are the complementary events of events \( E \) and \( F \) respectively and if \( 0 < P(F) < 1 \), then \( (1998 - 2 \text{ Marks}) \)

(a) \( P(E/F) + P(\overline{E}/F) = 1 \)
(b) \( P(E/F) + P(E/\overline{F}) = 1 \)
(c) \( P(\overline{E}/F) + P(E/\overline{F}) = 1 \)
(d) \( P(E/F) + P(\overline{E}/F) = 1 \)

11. There are four machines and it is known that exactly two of them are faulty. They are tested, one by one, in a random order till both the faulty machines are identified. Then the probability that only two tests are needed is \( (1998 - 2 \text{ Marks}) \)

(a) \( 1/3 \) (b) \( 1/6 \) (c) \( 1/2 \) (d) \( 1/4 \)

12. If \( E \) and \( F \) are events with \( P(E) \leq P(F) \) and \( P(E \cap F) > 0 \), then \( (1998 - 2 \text{ Marks}) \)

(a) occurrence of \( E \) \( \Rightarrow \) occurrence of \( F \)
(b) occurrence of \( F \) \( \Rightarrow \) occurrence of \( E \)
(c) non-occurrence of \( E \) \( \Rightarrow \) non-occurrence of \( F \)
(d) none of the above implications holds

13. A fair coin is tossed repeatedly. If the tail appears on first four tosses, then the probability of the head appearing on the fifth toss equals \( (1998 - 2 \text{ Marks}) \)

(a) \( 1/2 \) (b) \( 1/32 \) (c) \( 31/32 \) (d) \( 1/5 \)

14. Seven white balls and three black balls are randomly placed in a row. The probability that no two black balls are placed adjacent equals \( (1998 - 2 \text{ Marks}) \)

(a) \( 1/2 \) (b) \( 7/15 \) (c) \( 2/15 \) (d) \( 1/3 \)

15. The probabilities that a student passes in Mathematics, Physics and Chemistry are \( m, p \) and \( c \), respectively. Of these subjects, the student has a 75% chance of passing in at least one, a 50% chance of passing in at least two, and a 40% chance of passing in exactly two. Which of the following relations are true? \( (1999 - 3 \text{ Marks}) \)

(a) \( p + m + c = 19/20 \) (b) \( p + m + c = 27/20 \)
(c) \( pmc = 1/10 \) (d) \( pmc = 1/4 \)

16. Let \( E \) and \( F \) be two independent events. The probability that exactly one of them occurs is \( \frac{11}{25} \) and the probability of none of them occurring is \( \frac{2}{25} \). If \( P(T) \) denotes the probability of occurrence of the event \( T \), then \( (2011) \)

(a) \( P(E) = \frac{4}{5}, P(F) = \frac{3}{5} \) (b) \( P(E) = \frac{1}{5}, P(F) = \frac{2}{5} \)
(c) \( P(E) = \frac{2}{5}, P(F) = \frac{1}{5} \) (d) \( P(E) = \frac{3}{5}, P(F) = \frac{4}{5} \)

17. A ship is fitted with three engines \( E_1, E_2 \) and \( E_3 \). The engines function independently of each other with respective probabilities \( \frac{1}{2}, \frac{1}{4} \) and \( \frac{1}{4} \). For the ship to be operational at least two of its engines must function. Let \( X \) denote the event that the ship is operational and let \( X_1, X_2 \) and \( X_3 \) denote respectively the events that the engines \( E_1, E_2 \) and \( E_3 \) are functioning. Which of the following is(are) true? \( (2012) \)

(a) \( P[X_1 | X] = \frac{3}{16} \)
(b) \( P \) [Exactly two engines of the ship are functioning \( |X| = \frac{7}{8} \) ]
(c) \( P[X_1 X_2] = \frac{5}{16} \) (d) \( P[X | X_1] = \frac{7}{16} \)

18. Let \( X \) and \( Y \) be two events such that \( P(X|Y) = \frac{1}{2} \), \( P(Y/X) = \frac{1}{3} \) and \( P(X \cap Y) = \frac{1}{6} \). Which of the following is (are) correct? \( (2012) \)

(a) \( P(X \cup Y) = \frac{2}{3} \) (b) \( X \) and \( Y \) are independent
(c) \( X \) and \( Y \) are not independent
(d) \( P(X^c \cap Y) = \frac{1}{3} \)

19. Four persons independently solve a certain problem correctly with probabilities \( \frac{1}{2}, \frac{3}{4}, \frac{1}{4}, \frac{1}{8} \). Then the probability that the problem is solved correctly by at least one of them is \( (\text{JEE Adv. 2013}) \)

(a) \( \frac{235}{256} \) (b) \( \frac{21}{256} \) (c) \( \frac{3}{256} \) (d) \( \frac{253}{256} \)

**Subjective Problems**

1. Balls are drawn one-by-one without replacement from a box containing 2 black, 4 white and 3 red balls till all the balls are drawn. Find the probability that the balls drawn are in the order 2 black, 4 white and 3 red. \( (1978) \)

2. Six boys and six girls sit in a row randomly. Find the probability that
   (i) the six girls sit together
   (ii) the boys and girls sit alternately. \( (1979) \)

3. An anti-aircraft gun can take a maximum of four shots at an enemy plane moving away from it. The probabilities of hitting the plane at the first, second, third and fourth shot are 0.4, 0.3, 0.2 and 0.1 respectively. What is the probability that the gun hits the plane? \( (1981 - 2 \text{ Marks}) \)

4. \( A \) and \( B \) are two candidates seeking admission in IIT. The probability that \( A \) is selected is 0.5 and the probability that both \( A \) and \( B \) are selected is atmost 0.3. Is it possible that the probability of \( B \) getting selected is 0.9? \( (1982 - 2 \text{ Marks}) \)
5. Cards are drawn one by one at random from a well-shuffled full pack of 52 playing cards until 2 aces are obtained for the first time. If \( N \) is the number of cards required to be drawn, then show that 
\[
P_r \{ N = n \} = \frac{(n-1)(52-n)(51-n)}{50 \times 49 \times 17 \times 13}
\]
where 
\[2 \leq n \leq 50\]  
\((1983 - 3\) Marks\)

6. \( A, B, C \) are events such that  
\((1983 - 2\) Marks\)
\[
P(A) = 0.3, \ P(B) = 0.4, \ P(C) = 0.8
\]
\[
P(AB) = 0.08, \ P(AC) = 0.28, \ P(ABC) = 0.09
\]
If \( P(A \cup B \cup C) \geq 0.75 \), then show that \( P(BC) \) lies in the interval \(0.23 \leq x \leq 0.48\).  
\((1984 - 4\) Marks\)

7. In a certain city only two newspapers \( A \) and \( B \) are published, it is known that 25% of the city population reads \( A \) and 20% reads \( B \) while 8% reads both \( A \) and \( B \). It is also known that 30% of those who read \( A \) but not \( B \) look into advertisements and 40% of those who read \( B \) but not \( A \) look into advertisements while 50% of those who read both \( A \) and \( B \) look into advertisements. What is the percentage of the population that reads an advertisement?  
\((1985 - 5\) Marks\)

8. In a multiple-choice question there are four alternative answers, of which one or more are correct. A candidate will get marks in the question only if he ticks the correct answers. The candidate decides to tick the answers at random, if he is allowed upto three chances to answer the questions, find the probability that he will get marks in the questions.  
\((1986 - 5\) Marks\)

9. A lot contains 20 articles. The probability that the lot contains exactly 2 defective articles is 0.4 and the probability that the lot contains exactly 3 defective articles is 0.6. Articles are drawn from the lot at random one by one without replacement and are tested till all defective articles are found. What is the probability that the testing procedure ends at the twelfth testing.  
\((1987 - 5\) Marks\)

10. A man takes a step forward with probability 0.4 and backwards with probability 0.6. Find the probability that at the end of eleven steps he is one step away from the starting point.  
\((1987 - 3\) Marks\)

11. A box contains 2 fifty paisa coins, 5 twenty five paisa coins and a certain fixed number \( N \) (\( \geq 2 \)) of ten and five paisa coins. Five coins are taken out of the box at random. Find the probability that the total value of these 5 coins is less than one rupee and fifty paisa.  
\((1988 - 3\) Marks\)

12. Suppose the probability for \( A \) to win a game against \( B \) is 0.4. If \( A \) has an option of playing either a “best of 3 games” or a “best of 5 games” match against \( B \), which option should be chosen so that the probability of his winning the match is higher? (No game ends in a draw).  
\((1989 - 5\) Marks\)

13. \( A \) is a set containing \( n \) elements. A subset \( P \) of \( A \) is chosen at random. The set \( A \) is reconstructed by replacing the elements of \( P \). A subset \( Q \) of \( A \) is again chosen at random. Find the probability that \( P \) and \( Q \) have no common elements.  
\((1990 - 5\) Marks\)

14. In a test an examine either guesses or copies or knows the answer to a multiple choice question with four choices. The probability that he make a guess is 1/3 and the probability that he copies the answer is 1/6. The probability that his answer is correct given that he copied it, is 1/8. Find the probability that he knew the answer to the question given that he correctly answered it.  
\((1991 - 4\) Marks\)

15. A lot contains 50 defective and 50 non defective bulbs. Two bulbs are drawn at random, one at a time, with replacement. The events \( A, B, C \) are defined as:  
\( A \) = (the first bulb is defective)  
\( B \) = (the second bulb is non-defective)  
\( C \) = (the two bulbs are both defective or both non defective)  
Determine whether  
(i) \( A, B, C \) are pairwise independent  
(ii) \( A, B, C \) are independent  
\((1992 - 6\) Marks\)

16. Numbers are selected at random, one at a time, from the two-digit numbers 00, 01, 02,...,99 with replacement. An event \( E \) occurs if only if the product of the two digits of a selected number is 18. If four numbers are selected, find probability that the event \( E \) occurs at least 3 times.  
\((1993 - 5\) Marks\)

17. An unbiased coin is tossed. If the result is a head, a pair of unbiased dice is rolled and the number obtained by adding the numbers on the two faces is noted. If the result is a tail, a card from a well shuffled pack of eleven cards numbered 2, 3, 4,...,12 is picked and the number on the card is noted. What is the probability that the noted number is either 7 or 8?  
\((1994 - 5\) Marks\)

18. In how many ways three girls and nine boys can be seated in two vans, each having numbered seats, 3 in the front and 4 at the back? How many seating arrangements are possible if 3 girls should sit together in a back row on adjacent seats? Now, if all the seating arrangements are equally likely, what is the probability of 3 girls sitting together in a back row on adjacent seats?  
\((1996 - 5\) Marks\)

19. If \( p \) and \( q \) are chosen randomly from the set \( \{ 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 \} \), with replacement, determine the probability that the roots of the equation \( x^2 + px + q = 0 \) are real.  
\((1997 - 5\) Marks\)

20. Three players, \( A, B \) and \( C \), toss a coin cyclically in that order (that is \( A, B, C, A, B, C, A, B, \ldots \)) till a head shows. Let \( p \) be the probability that the coin shows a head. Let \( \alpha, \beta \) and \( \gamma \) be, respectively, the probabilities that \( A, B \) and \( C \) gets the first head. Prove that \( \beta = (1 - p) \alpha \). Determine \( \alpha, \beta \) and \( \gamma \) (in terms of \( p \)).  
\((1998 - 8\) Marks\)

21. Eight players \( P_1, P_2, \ldots, P_8 \) play a knock-out tournament. It is known that whenever the players \( P_i \) and \( P_j \) play, the player \( P_i \) will win if \( i < j \). Assuming that the players are paired at random in each round, what is the probability that the player \( P_k \) reaches the final?  
\((1999 - 10\) Marks\)

22. A coin has probability \( p \) of showing head when tossed. It is tossed \( n \) times. Let \( p_n \) denote the probability that no two (or more) consecutive heads occur. Prove that \( p_1 = 1, p_2 = 1 - p^2 \) and \( p_n = (1 - p) p_{n-2} \) for all \( n \geq 3 \).  
\((2000 - 5\) Marks\)
23. An urn contains m white and n black balls. A ball is drawn at random and is put back into the urn along with k additional balls of the same colour as that of the ball drawn. A ball is again drawn at random. What is the probability that the ball drawn now is white?  
(2001 - 5 Marks)

24. An unbiased die, with faces numbered 1, 2, 3, 4, 5, 6, is thrown n times and the list of n numbers showing up is noted. What is the probability that, among the numbers 1, 2, 3, 4, 5, 6, only three numbers appear in this list?  
(2001 - 5 Marks)

25. A box contains N coins, m of which are fair and the rest are biased. The probability of getting a head when a fair coin is tossed is 1/2, while it is 2/3 when a biased coin is tossed. A coin is drawn from the box at random and is tossed twice. The first time it shows head and the second time it shows tail. What is the probability that the coin drawn is fair?  
(2002 - 5 Marks)

26. For a student to qualify, he must pass at least two out of three exams. The probability that he will pass the 1st exam is p. If he fails in one of the exams then the probability of his passing in the next exam is \( P/2 \) otherwise it remains the same. Find the probability that he will qualify.  
(2003 - 2 Marks)

27. A is targeting to B, B and C are targeting to A. Probability of hitting the target by A, B and C are \( \frac{2}{3} \), \( \frac{3}{4} \) and \( \frac{1}{2} \) respectively. If A is hit then find the probability that B hits the target and C does not.  
(2003 - 2 Marks)

28. A and B are two independent events. C is an event in which exactly one of A or B occurs. Prove that \( P(C) \geq P(A \cup B)P(\overline{A} \cap \overline{B}) \)  
(2004 - 2 Marks)

29. A box contains 12 red and 6 white balls. Balls are drawn from the box one at a time without replacement. If 6 balls drawn there are at least 4 white balls, find the probability that exactly one white is drawn in the next two draws. (binomial coefficients can be left as such)  
(2004 - 4 Marks)

30. A person goes to office either by car, scooter, bus or train, the probability of which being \( \frac{2}{7}, \frac{3}{7}, \frac{2}{7} \) and \( \frac{1}{7} \) respectively. Probability that he reaches office late, if he takes car, scooter, bus or train is \( \frac{1}{9}, \frac{1}{9}, \frac{4}{9} \) and \( \frac{1}{9} \) respectively. Given that he reached office in time, then what is the probability that he travelled by a car.  
(2005 - 2 Marks)

G Comprehension Based Questions

PASSAGE - 1
There are n urns, each of these contain \( n + 1 \) balls. The ith urn contains i white balls and \( (n + 1 - i) \) red balls. Let \( u_i \) be the event of selecting ith urn, \( i = 1, 2, 3 \ldots \ldots, n \) and \( w \) the event of getting a white ball.

1. If \( P(u_i) \propto i \), where \( i = 1, 2, 3, \ldots, n \), then \( \lim_{n \to \infty} P(w) = \frac{2}{n + 1} \).  
(2006 - 5 Marks, -2)

2. If \( P(u_i) = c \), (a constant) then \( P(u_i \mid w) = \frac{2}{n + 1} \).  
(2006 - 5 Marks, -2)

3. Let \( P(u_i) = \frac{1}{n} \), if n is even and E denotes the event of choosing even numbered urn, then the value of \( P(w \mid E) \) is \( \frac{2}{n + 1} \).  
(2006 - 5 Marks, -2)

PASSAGE - 2
A fair die is tossed repeatedly until a six is obtained. Let \( X \) denote the number of tosses required.  
(2009)

4. The probability that \( X = 3 \) equals \( \frac{25}{216} \).  
(2009)

5. The probability that \( X \geq 3 \) equals \( \frac{125}{216} \).  
(2011)

6. The conditional probability that \( X \geq 6 \) given \( X > 3 \) equals \( \frac{25}{36} \).  
(2011)

PASSAGE - 3
Let \( U_1 \) and \( U_2 \) be two urns such that \( U_1 \) contains 3 white and 2 red balls, and \( U_2 \) contains only 1 white ball. A fair coin is tossed. If head appears then 1 ball is drawn at random from \( U_1 \) and put into \( U_2 \). However, if tail appears then 2 balls are drawn at random from \( U_1 \) and put into \( U_2 \). Now 1 ball is drawn at random from \( U_2 \).  
(2011)

7. The probability of the drawn ball from \( U_2 \) being white is \( \frac{13}{30} \).  
(2011)

8. Given that the drawn ball from \( U_2 \) is white, the probability that head appeared on the coin is \( \frac{17}{23} \).  
(2011)

PASSAGE - 4
A box \( B_1 \) contains 1 white ball, 3 red balls and 2 black balls. Another box \( B_2 \) contains 2 white balls, 3 red balls and 4 black balls. A third box \( B_3 \) contains 3 white balls, 4 red balls and 5 black balls.  
(2013)

9. If 1 ball is drawn from each of the boxes \( B_1 \), \( B_2 \) and \( B_3 \), the probability that all 3 drawn balls are of the same colour is \( \frac{55}{648} \).  
(2013)

10. If 2 balls are drawn (without replacement) from a randomly selected box and one of the balls is white and the other ball is red, the probability that these 2 balls are drawn from box \( B_2 \) is \( \frac{55}{181} \).  
(2013)
**PASSAGE - 5**

Box 1 contains three cards bearing numbers 1, 2, 3; box 2 contains five cards bearing numbers 1, 2, 3, 4, 5; and box 3 contains seven cards bearing numbers 1, 2, 3, 4, 5, 6, 7. A card is drawn from each of the boxes. Let \( x_i \) be number on the card drawn from the \( i \)th box, \( i = 1, 2, 3 \).

(JEE Adv. 2014)

11. The probability that \( x_1 + x_2 + x_3 \) is odd, is

(a) \( \frac{29}{105} \)  
(b) \( \frac{53}{105} \)  
(c) \( \frac{57}{105} \)  
(d) \( \frac{1}{2} \)

12. The probability that \( x_1, x_2, x_3 \) are in an arithmetic progression, is

(a) \( \frac{9}{105} \)  
(b) \( \frac{10}{105} \)  
(c) \( \frac{11}{105} \)  
(d) \( \frac{7}{105} \)

**PASSAGE - 6**

Let \( n_1 \) and \( n_2 \) be the number of red and black balls, respectively, in box I. Let \( n_3 \) and \( n_4 \) be the number of red and black balls, respectively, in box II. (JEE Adv. 2015)

13. One of the two boxes, box I and box II, was selected at random and a ball was drawn randomly out of this box. The ball was found to be red. If the probability that this red ball was drawn from box II is \( \frac{1}{3} \), then the correct option(s) with the possible values of \( n_1, n_2, n_3 \) and \( n_4 \) are

(a) \( n_1 = 3, n_2 = 3, n_3 = 5, n_4 = 15 \)  
(b) \( n_1 = 3, n_2 = 6, n_3 = 10, n_4 = 50 \)  
(c) \( n_1 = 8, n_2 = 6, n_3 = 5, n_4 = 20 \)  
(d) \( n_1 = 6, n_2 = 12, n_3 = 5, n_4 = 20 \)

14. A ball is drawn at random from box I and transferred to box II. If the probability of drawing a red ball from box I, after this transfer, is \( \frac{1}{3} \), then the correct option(s) with the possible values of \( n_1 \) and \( n_2 \) are

(a) \( n_1 = 4 \) and \( n_2 = 6 \)  
(b) \( n_1 = 2 \) and \( n_2 = 3 \)  
(c) \( n_1 = 10 \) and \( n_2 = 20 \)  
(d) \( n_1 = 3 \) and \( n_2 = 6 \)

**PASSAGE - 7**

Football teams \( T_1 \) and \( T_2 \) have to play two games against each other. It is assumed that the outcomes of the two games are independent. The probabilities of \( T_1 \) winning, drawing and losing a game against \( T_2 \) are \( \frac{1}{2}, \frac{1}{6}, \) and \( \frac{1}{3} \) respectively. Each team gets 3 points for a win, 1 point for a draw and 0 point for a loss in a game. Let \( X \) and \( Y \) denote the total points scored by teams \( T_1 \) and \( T_2 \) respectively after two games.

15. \( P(X > Y) \) is

(JEE Adv. 2016)

(a) \( \frac{1}{4} \)  
(b) \( \frac{5}{12} \)  
(c) \( \frac{1}{2} \)  
(d) \( \frac{7}{12} \)

16. \( P(X = Y) \) is

(JEE Adv. 2016)

(a) \( \frac{11}{36} \)  
(b) \( \frac{1}{3} \)  
(c) \( \frac{13}{36} \)  
(d) \( \frac{1}{2} \)

**H Assertion & Reason Type Questions**

1. Let \( H_1, H_2, \ldots, H_n \) be mutually exclusive and exhaustive events with \( P(H_i) > 0, i = 1, 2, \ldots, n \). Let \( E \) be any other event with \( 0 < P(E) < 1 \).

**STATEMENT-1:**

\( P(H_i | E) > P(E | H_i) \). \( P(H_i) \) for \( i = 1, 2, \ldots, n \) because

**STATEMENT-2:** \( \sum_{i=1}^{n} P(H_i) = 1 \). (2007 - 3 marks)

(a) Statement-1 is True, statement-2 is True; Statement-2 is a correct explanation for Statement-1.

(b) Statement-1 is True, Statement-2 is True; Statement-2 is NOT a correct explanation for Statement-1

(c) Statement-1 is True, Statement-2 is False

(d) Statement-1 is False, Statement-2 is True

2. Consider the system of equations \( ax + by = 0; cx + dy = 0 \), where \( a, b, c, d \in \{0, 1\} \).

**STATEMENT - 1:** The probability that the system of equations has a unique solution is \( \frac{3}{8} \).

and

**STATEMENT - 2:** The probability that the system of equations has a solution is 1. (2008)

(a) STATEMENT - 1 is True, STATEMENT - 2 is True; STATEMENT - 2 is a correct explanation for STATEMENT - 1

(b) STATEMENT - 1 is True, STATEMENT - 2 is True; STATEMENT - 2 is NOT a correct explanation for STATEMENT - 1

(c) STATEMENT - 1 is True, STATEMENT - 2 is False

(d) STATEMENT - 1 is False, STATEMENT - 2 is True

**I Integer Value Correct Type**

1. Of the three independent events \( E_1, E_2 \) and \( E_3 \), the probability that only \( E_1 \) occurs is \( \alpha \), only \( E_2 \) occurs is \( \beta \) and only \( E_3 \) occurs is \( \gamma \). Let the probability \( p \) that none of events \( E_1, E_2 \) or \( E_3 \) occurs satisfy the equations \( (\alpha 2\beta) p = \alpha \beta \) and \( (\beta - 3\gamma) p = 2\beta \). All the given probabilities are assumed to lie in the interval \( 0, 1 \). (JEE Adv. 2013)

Then \( \frac{\text{Probability of occurrence of } E_1}{\text{Probability of occurrence of } E_3} \)

2. The minimum number of times a fair coin needs to be tossed, so that the probability of getting at least two heads is at least 0.96, is (JEE Adv. 2015)
1. A problem in mathematics is given to three students $A, B, C$ and their respective probability of solving the problem is $\frac{1}{2}$, $\frac{1}{3}$, and $\frac{1}{4}$. Probability that the problem is solved is $\frac{3}{4}$. Probability that the problem is solved is $\frac{1}{5}$. Probability that the problem is solved is $\frac{1}{8}$.

2. $A$ and $B$ are events such that $P(A \cup B) = \frac{3}{4}$, $P(A \cap B) = \frac{1}{4}$, $P(A) = \frac{2}{3}$ then $P(A \cap B)$ is $\frac{1}{3}$. $P(A \cap B)$ is $\frac{1}{4}$.

3. A dice is tossed 5 times. Getting an odd number is considered a success. Then the variance of distribution of success is $\frac{2}{3}$, $\frac{3}{5}$, $\frac{4}{5}$, $\frac{5}{4}$.

4. The mean and variance of a random variable $X$ having binomial distribution are 4 and 2 respectively, then $P(X = 1)$ is $\frac{1}{4}$, $\frac{1}{32}$, $\frac{1}{16}$, $\frac{1}{8}$.

5. Events $A$, $B$, $C$ are mutually exclusive events such that $P(A) = \frac{3x + 1}{3}$, $P(B) = \frac{1-x}{4}$ and $P(C) = \frac{1-2x}{2}$. The set of possible values of $x$ are in the interval $[0, 1]$.

6. Five horses are in a race. Mr. A selects two of the horses at random and bets on them. The probability that Mr. A selected the winning horse is $\frac{2}{5}$, $\frac{4}{5}$, $\frac{3}{5}$, $\frac{1}{5}$.

7. The probability that $A$ speaks truth is $\frac{4}{5}$, while the probability for $B$ is $\frac{3}{4}$. The probability that they contradict each other when asked to speak on a fact is $\frac{4}{5}$, $\frac{1}{5}$, $\frac{7}{20}$, $\frac{3}{20}$.

8. A random variable $X$ has the probability distribution:

<table>
<thead>
<tr>
<th>X</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>p(X)</td>
<td>0.2</td>
<td>0.2</td>
<td>0.1</td>
<td>0.1</td>
<td>0.2</td>
<td>0.1</td>
<td>0.1</td>
<td>0.1</td>
</tr>
</tbody>
</table>

For the events $E = \{X \text{ is a prime number}\}$ and $F = \{X < 4\}$, the $P(E \cup F)$ is $0.50$, $0.77$, $0.35$, $0.87$.

9. The mean and the variance of a binomial distribution are 4 and 2 respectively. Then the probability of 2 successes is $\frac{28}{256}$, $\frac{219}{256}$, $\frac{128}{256}$, $\frac{37}{256}$.

10. Three houses are available in a locality. Three persons apply for the houses. Each applies for one house without consulting others. The probability that all the three apply for the same house is $\frac{2}{9}$, $\frac{1}{9}$, $\frac{8}{9}$, $\frac{7}{9}$.

11. A random variable $X$ has Poisson distribution with mean 2. Then $P(X > 1.5)$ equals $\frac{2}{e^2}$, $0$, $\frac{1-\frac{3}{e^2}}{e}$, $\frac{3}{e^2}$.

12. Let $A$ and $B$ be two events such as $P(A \cup B) = \frac{1}{6}$, $P(A \cap B) = \frac{1}{4}$ and $P(A) = \frac{1}{4}$. Where $\bar{A}$ stands for complement of event $A$. Then events $A$ and $B$ are

- (a) equally likely and mutually exclusive
- (b) equally likely but not independent
- (c) independent but not equally likely
- (d) mutually exclusive and independent.

13. At a telephone enquiry system the number of phone cells regarding relevant enquiry follow Poisson distribution with an average of 5 phone calls during 10 minute time intervals. The probability that there is at most one phone call during a 10-minute time period is $\frac{6}{5e}$, $\frac{5}{6}$, $\frac{6}{55}$, $\frac{6}{e^3}$.

14. Two aeroplanes I and II bomb a target in succession. The probabilities of I and II scoring a hit correctly are 0.3 and 0.2, respectively. The second plane will bomb only if the first misses the target. The probability that the target is hit by the second plane is $0.2$, $0.2$, $0.06$, $0.14$.

15. A pair of fair dice is thrown independently three times. The probability of getting a score of exactly 9 twice is $\frac{8}{729}$, $\frac{8}{243}$, $\frac{1}{729}$, $8/9$.

16. It is given that the events $A$ and $B$ are such that $P(A) = \frac{1}{4}$, $P(A \setminus B) = \frac{1}{2}$ and $P(B \setminus A) = \frac{2}{3}$. Then $P(B)$ is $\frac{1}{6}$, $\frac{1}{3}$, $\frac{2}{3}$, $\frac{1}{2}$.
17. A die is thrown. Let $A$ be the event that the number obtained is greater than 3. Let $B$ be the event that the number obtained is less than 5. Then $P(A \cup B)$ is

(a) $\frac{3}{5}$  
(b) 0  
(c) 1  
(d) $\frac{2}{5}$

18. In a binomial distribution $B(n, p = \frac{1}{4})$, if the probability of at least one success is greater than or equal to $\frac{9}{10}$, then $n$ is greater than:

(a) $\frac{1}{\log_{10} 4 + \log_{10} 3}$  
(b) $\frac{9}{\log_{10} 4 - \log_{10} 3}$  
(c) $\frac{4}{\log_{10} 4 - \log_{10} 3}$  
(d) $\frac{1}{\log_{10} 4 - \log_{10} 3}$

19. One ticket is selected at random from 50 tickets numbered 00, 01, 02, ..., 49. Then the probability that the sum of the digits on the selected ticket is 8, given that the product of these digits is zero, equals:

(a) $\frac{1}{7}$  
(b) $\frac{5}{14}$  
(c) $\frac{1}{50}$  
(d) $\frac{1}{14}$

20. Four numbers are chosen at random (without replacement) from the set $\{1, 2, 3, ..., 20\}$. 

Statement -1: The probability that the chosen numbers when arranged in some order will form an AP is $\frac{1}{85}$.

Statement -2: If the four chosen numbers form an AP, then the set of all possible values of common difference is $(\pm 1, \pm 2, \pm 3, \pm 4, \pm 5)$.

(a) Statement -1 is true, Statement -2 is true; Statement -2 is not a correct explanation for Statement -1  
(b) Statement -1 is true, Statement -2 is false  
(c) Statement -1 is false, Statement -2 is true.  
(d) Statement -1 is true, Statement -2 is true; Statement -2 is a correct explanation for Statement -1.

21. An urn contains nine balls of which three are red, four are blue and two are green. Three balls are drawn at random without replacement from the urn. The probability that the three balls have different colours is $\frac{2}{7}$, $\frac{1}{21}$, $\frac{2}{23}$, $\frac{1}{3}$.

22. Consider 5 independent Bernoulli’s trials each with probability of success $p$. If the probability of at least one failure is greater than or equal to $\frac{31}{32}$, then $p$ lies in the interval $[0.12, 0.5]$. 

(a) $\frac{3}{4}, \frac{11}{12}$  
(b) $\left[0, \frac{1}{2}\right]$  
(c) $\left[\frac{11}{12}, 1\right]$  
(d) $\left[\frac{13}{24}, \frac{3}{4}\right]$ 

23. If $C$ and $D$ are two events such that $C \subset D$ and $P(D) \neq 0$, then the correct statement among the following is $P(C | D) = \frac{P(D)}{P(C)}$.

(a) $P(C | D) \geq P(C)$  
(b) $P(C | D) < P(C)$  
(c) $P(C | D) = \frac{P(D)}{P(C)}$  
(d) $P(C | D) = P(C)$

24. Three numbers are chosen at random without replacement from the set $\{1, 2, 3, ..., 8\}$. The probability that their minimum is 3, given that their maximum is 6, is $\frac{2}{5}$.

(a) $\frac{3}{8}$  
(b) $\frac{1}{5}$  
(c) $\frac{1}{4}$  
(d) $\frac{2}{5}$

25. A multiple choice examination has 5 questions. Each question has three alternative answers of which exactly one is correct. The probability that a student will get 4 or more correct answers just by guessing is $\frac{17}{35}, \frac{13}{35}$.

(a) $\frac{17}{35}$  
(b) $\frac{13}{35}$  
(c) $\frac{11}{35}$  
(d) $\frac{10}{35}$

26. Let $A$ and $B$ be two events such that $P(A \cup B) = \frac{1}{6}$, $P(A \cap B) = \frac{1}{4}$ and $P(A) = \frac{1}{4}$, where $\overline{A}$ stands for the complement of the event A. Then the events A and B are independent but not equally likely.

(a) independent but not equally likely.  
(b) independent and equally likely.  
(c) mutually exclusive and independent.  
(d) equally likely but not independent.
27. If 12 identical balls are to be placed in 3 identical boxes, then the probability that one of the boxes contains exactly 3 balls is:

\[ 22 \left( \frac{1}{3} \right)^{11} \]

(a) \( 220 \left( \frac{1}{3} \right)^{12} \) \hspace{1cm} (b) \( 22 \left( \frac{1}{3} \right)^{11} \)

(c) \( \frac{55}{3} \left( \frac{2}{3} \right)^{11} \) \hspace{1cm} (d) \( 55 \left( \frac{2}{3} \right)^{10} \)

28. Let two fair six-faced dice A and B be thrown simultaneously. If \( E_1 \) is the event that die A shows up four, \( E_2 \) is the event that die B shows up two and \( E_3 \) is the event that the sum of numbers on both dice is odd, then which of the following statements is NOT true?

(a) \( E_1 \) and \( E_3 \) are independent.
(b) \( E_1, E_2 \) and \( E_3 \) are independent.
(c) \( E_1 \) and \( E_2 \) are independent.
(d) \( E_2 \) and \( E_3 \) are independent.
CHAPTER 22

MISCELLANEOUS
(Sets, Relations, Statistics & Mathematical Reasoning)

Section-A

A Fill in the Blanks

1. A variable takes value x with frequency \( n+x \cdot l C_x \), \( x = 0, 1, 2, \ldots, n \). The mode of the variable is .

(1982 - 2 Marks)

B True / False

1. For real numbers \( x \) and \( y \), we write \( x \ast y \) if \( x - y + \sqrt{2} \) is an irrational number. Then, the relation \( \ast \) is an equivalence relation.

(1981 - 2 Marks)

C MCQs with One Correct Answer

1. If \( X \) and \( Y \) are two sets, then \( X \cap (Y \cap Y)^c \) equals .
   (a) \( X \) (b) \( Y \) (c) \( \phi \) (d) None of these.

(1979)

2. The expression \( \frac{12}{3 + \sqrt{5} + 2\sqrt{2}} \) is equal to .
   (a) \( 1 - \sqrt{5} + \sqrt{2} + \sqrt{10} \) (b) \( 1 + \sqrt{5} + \sqrt{2} - \sqrt{10} \)
   (c) \( 1 + \sqrt{5} - \sqrt{2} + \sqrt{10} \) (d) \( 1 - \sqrt{5} - \sqrt{2} + \sqrt{10} \)

(1980)

3. Select the correct alternative in each of the following. Indicate your choice by the appropriate letter only.
   Let \( S \) be the standard deviation of \( n \) observations. Each of the \( n \) observations is multiplied by a constant \( c \). Then the standard deviation of the resulting number is .
   (a) \( s \) (b) \( cs \)
   (c) \( \frac{s}{\sqrt{c}} \) (d) None of these

(1980)

4. The standard deviation of 17 numbers is zero. Then
   (a) the numbers are in geometric progression with common ratio not equal to one.
   (b) eight numbers are positive, eight are negative and one is zero.
   (c) either (a) or (b)
   (d) None of these

(1980)

5. Consider any set of 201 observations \( x_1, x_2, \ldots, x_{200}, x_{201} \). It is given that \( x_1 < x_2 < \ldots < x_{200} < x_{201} \). Then the mean deviation of this set of observations about a point \( k \) is minimum when \( k \) equals .
   (a) \( \frac{x_1 + x_2 + \ldots + x_{200} + x_{201}}{201} \)
   (b) \( x_1 \)
   (c) \( x_{101} \)
   (d) \( x_{201} \)

(1981 - 2 Marks)

6. If \( x_1, x_2, \ldots, x_n \) are any real numbers and \( n \) is any positive integer, then
   \( \sum_{i=1}^{n} x_i^2 \leq \left( \sum_{i=1}^{n} x_i \right)^2 \)
   (a) \( \sum_{i=1}^{n} x_i^2 > \left( \sum_{i=1}^{n} x_i \right)^2 \)
   (b) \( \sum_{i=1}^{n} x_i^2 \geq \left( \sum_{i=1}^{n} x_i \right)^2 \)
   (c) \( \sum_{i=1}^{n} x_i^2 \geq n \left( \sum_{i=1}^{n} x_i \right)^2 \)
   (d) None of these

(1982 - 2 Marks)

7. Let \( S = \{1, 2, 3, 4\} \). The total number of unordered pairs of disjoint subsets of \( S \) is equal to .
   (a) 25 (b) 34 (c) 42 (d) 41

(2010)

8. Let \( P = \{0: \sin \theta - \cos \theta = \sqrt{2} \sin \theta \} \) and \( Q = \{0: \sin \theta + \cos \theta = \sqrt{2} \sin \theta \} \) be two sets. Then
   (a) \( P \subset Q \) and \( Q - P \neq \phi \) (b) \( Q \subset P \)
   (c) \( P \varsubsetneq Q \) (d) \( P = Q \)

(2011)

D MCQs with One or More than One Correct

1. In a college of 300 students every student reads 5 newspapers and every newspaper is read by 60 students.
   The number of newspapers is .
   (a) at least 30 (b) at most 20
   (c) exactly 25 (d) None of these

(1998 - 2 Marks)

2. Let \( S_1, S_2, \ldots, \) be squares such that for each \( n \geq 1 \), the length of a side of \( S_n \) equals the length of a diagonal of \( S_{n+1} \). If the length of a side of \( S_1 \) is 10 cm, then for which of the following values of \( n \) is the area of \( S_n \) less than 1 sq. cm?
   (a) 7 (b) 8 (c) 9 (d) 10

(1999 - 3 Marks)

E Subjective Problems

1. An investigator interviewed 100 students to determine their preferences for the three drinks: milk (M), coffee (C) and tea (T). He reported the following: 10 students had all the three drinks \( M, C \) and \( T \); 20 had \( M \) and \( C \); 30 had \( C \) and \( T \); 25 had \( M \) and \( T \); 12 had \( M \) only; 5 had \( C \) only; and 8 had \( T \) only.
   Using a Venn diagram find how many did not take any of the three drinks.

(1978)
2. (a) Construct a triangle with base 9 cm and altitude 4 cm, the ratio of the other two sides being 2 : 1.
(b) Construct a triangle in which the sum of the three sides is 15 cm with base angles 60° and 45°. Justify your steps. (1979)

3. A tent is made in the form of a frustrum A of a right circular cone surmounted by another right circular cone B. The diameter of the ends of the frustrum A are 8 m and 4 m, its height is 3 m and the height of the cone B is 2 m. Find the area of the canvas required. (1979)

4. In calculating the mean and variance of 10 readings, a student wrongly used the figure 52 for the correct figure of 25. He obtained the mean and variance as 45.0 and 16.0 respectively. Determine the correct mean and variance. (1979)

5. The diameter PQ of a semicircle is 6 cm. Construct a square ABCD with points A, B on the circumference, and the side CD on the diameter PQ. Describe briefly the method of construction. (1980)

6. C and D are any two points on the same side of a line L. Show how to find a point P on the line L such that PC and PD are equally inclined to the line L. Justify your steps. (1980)

7. (i) Set A has 3 elements, and set B has 6 elements. What can be the minimum number of elements in the set A ∪ B? (1980)
(ii) P, Q, R are subsets of a set A. Is the following equality true?
\[ R \times (P \cup Q) = (R \times P) \cup (R \times Q)? \] (1980)

8. Suppose \( A_1, A_2, \ldots, A_{30} \) are thirty sets each with five elements and \( B_1, B_2, \ldots, B_n \) are \( n \) sets each with three elements. Let \( \bigcup_{i=1}^{30} A_i = \bigcup_{j=1}^{n} B_j = S \). Assume that each element of S belongs to exactly ten of the \( A_i \)'s and to exactly nine of the \( B_j \)'s. Find \( n \). (1981 - 2 Marks)

9. The mean square deviations of a set of observations \( x_1, x_2, \ldots, x_n \) about a points \( c \) is defined to be \( \frac{1}{n} \sum_{i=1}^{n} (x_i - c)^2 \). The mean square deviations about -1 and +1 of a set of observations are 7 and 3 respectively. Find the standard deviation of this set of observations. (1981 - 2 Marks)

10. The marks obtained by 40 students are grouped in a frequency table in class intervals of 10 marks each. The mean and the variance obtained from this distribution are found to be 40 and 49 respectively. It was later discovered that two observations belonging to the class interval (21–30) were included in the class interval (31–40) by mistake. Find the mean and the variance after correcting the error. (1982 - 3 Marks)

11. A relation \( R \) on the set of complex numbers is defined by \( z_1 R z_2 \) if and only if \( \frac{z_1 - z_2}{z_1 + z_2} \) is real. Show that \( R \) is an equivalence relation. (1982 - 2 Marks)

---

**Match the Following**

Each question contains statements given in two columns, which have to be matched. The statements in Column-I are labelled A, B, C and D, while the statements in Column-II are labelled p, q, r, s and t. Any given statement in Column-I can have correct matching with ONE OR MORE statement(s) in Column-II. The appropriate bubbles corresponding to the answers to these questions have to be darkened as illustrated in the following example:

If the correct matches are A-p, s and t; B-q and r; C-p and q; and D-s then the correct darkening of bubbles will look like the given.

1. Match the statements given in Column-I with the intervals/union of intervals given in Column-II. (2011)

<table>
<thead>
<tr>
<th>Column-I</th>
<th>Column-II</th>

</table>
I Integer Value Correct Type

1. The value of $6 + \log_3 \left( \frac{1}{3} \sqrt[3]{\frac{1}{3}} \right) \left( \frac{1}{3} \sqrt[3]{\frac{1}{3}} \right) \left( \frac{1}{3} \sqrt[3]{\frac{1}{3}} \right) ...$ is $2012$.

2. The sum of two forces is 18 N and resultant whose direction is at right angles to the smaller force is 12 N. The magnitude of the two forces are $[2002]$
(a) 13, 5 (b) 12, 6 (c) 14, 4 (d) 11, 7

3. A bead of weight $w$ can slide on smooth circular wire in a vertical plane. The bead is attached by a light thread to the highest point of the wire and in equilibrium, the thread is taut and make an angle $\theta$ with the vertical then tension of the thread and reaction of the wire on the bead are $[2002]$
(a) $T = w \cos \theta, R = w \tan \theta$ (b) $T = 2w \cos \theta, R = w$ (c) $T = w, R = w \sin \theta$ (d) $T = w \sin \theta, R = w \cos \theta$

4. The median of a set of 9 distinct observations is 20.5. If each of the largest 4 observations of the set is increased by 2, then the median of the new set $[2003]$
(a) remains the same as that of the original set (b) is increased by 2 (c) is decreased by 2 (d) is two times the original median.

5. A couple is of moment $\vec{G}$ and the force forming the couple is $\vec{p}$. If $\vec{p}$ is turned through a right angle the moment of the couple thus formed is $\vec{H}$. If instead, the force $\vec{p}$ are turned through an angle $\alpha$, then the moment of couple becomes $\vec{H} \sin \alpha - \vec{G} \cos \alpha$ $[2003]$
(a) $\vec{H} \sin \alpha - \vec{G} \cos \alpha$ (b) $\vec{G} \sin \alpha - \vec{H} \cos \alpha$ (c) $\vec{H} \sin \alpha + \vec{G} \cos \alpha$ (d) $\vec{G} \sin \alpha + \vec{H} \cos \alpha$.

6. The resultant of forces $\vec{p}$ and $\vec{q}$ is $\vec{r}$. If $\vec{q}$ is doubled then $\vec{r}$ is doubled. If the direction of $\vec{q}$ is reversed, then $\vec{r}$ is again doubled. Then $P^2 : Q^2 : R^2$ is $[2003]$
(a) 2 : 3 : 1 (b) 3 : 1 : 1 (c) 2 : 3 : 2 (d) 1 : 2 : 3

7. A body travels a distance $s$ in $t$ seconds. It starts from rest and ends at rest. In the first part of the journey, it moves with constant acceleration $f$ and in the second part with constant retardation $r$. The value of $t$ is given by $[2003]$
(a) $\sqrt{\frac{2s}{f + r}}$ (b) $2s \left( \frac{f + r}{s^2} \right)$ (c) $\frac{2s}{f + r}$ (d) $\sqrt{2sf + r}$

8. Two stones are projected from the top of a cliff $2$ metres high, with the same speed $u$, so as to hit the ground at the same spot. If one of the stones is projected horizontally and the other is projected horizontally and the other is projected at an angle $\theta$ to the horizontal then tan $\theta$ equals $[2003]$
(a) $\frac{2u}{gh}$ (b) $\frac{2u^2}{gh}$ (c) $2g \frac{u}{h}$ (d) $2h \frac{u}{g}$

9. Two particles start simultaneously from the same point and move along two straight lines, one with uniform velocity $\vec{u}$ and the other with uniform acceleration $\vec{f}$. Let $\alpha$ be the angle between their directions of motion. The relative velocity of the second particle w.r.t. the first is least after a time $[2003]$
(a) $\frac{u \cos \alpha}{f}$ (b) $\frac{u \sin \alpha}{f}$ (c) $\frac{f \cos \alpha}{u}$ (d) $u \sin \alpha$

10. The upper $\frac{3}{4}$ th portion of a vertical pole subtends an angle $\tan^{-1} \frac{3}{5}$ at a point in the horizontal plane through its foot and at a distance $40$ m from the foot. A possible height of the vertical pole is $[2003]$
(a) 80 m (b) 20 m (c) 40 m (d) 60 m.

11. Let $R_1$ and $R_2$ respectively be the maximum ranges up and down an inclined plane and $R$ be the maximum range on the horizontal plane. Then $R_1/R_2$ are in $[2003]$
(a) H.P (b) A.G.P (c) A.P (d) G.P.
12. In an experiment with 15 observations on \( x \), the following results were available:

\[ \Sigma x^2 = 2830, \quad \Sigma x = 170 \]

One observation that was 20 was found to be wrong and was replaced by the correct value 30. The corrected variance is  
(a) 8.33  
(b) 78.00  
(c) 188.66  
(d) 177.33

13. Let \( R = \{ (1,3), (4,2), (2,4), (2,3) \} \) be a relation on the set \( A = \{ 1, 2, 3, 4 \} \). The relation \( R \) is  
(a) reflexive  
(b) transitive  
(c) not symmetric  
(d) a function

14. Consider the following statements:

(A) Mode can be computed from histogram  
(B) Median is not independent of change of scale  
(C) Variance is independent of change of origin and scale.

Which of these is / are correct?  
(a) (A), (B) and (C)  
(b) only (B)  
(c) only (A) and (B)  
(d) only (A)

15. In a series of 2 \( n \) observations, half of them equal \( a \) and remaining half equal \( -a \). If the standard deviation of the observations is 2, then \( |a| \) equals.  
(a) \( \frac{\sqrt{2}}{n} \)  
(b) \( \sqrt{2} \)  
(c) 2  
(d) \( \frac{1}{n} \)

16. With two forces acting at point, the maximum effect is obtained when their resultant is 4N. If they act at right angles, then their resultant is 3N. Then the forces are

(a) \( 2 + \frac{1}{2} \sqrt{3} \) N and \( 2 - \frac{1}{2} \sqrt{3} \) N  
(b) \( 2 + \sqrt{3} \) N and \( 2 - \sqrt{3} \) N  
(c) \( 2 + \frac{1}{2} \sqrt{2} \) N and \( 2 - \frac{1}{2} \sqrt{2} \) N  
(d) \( 2 + \sqrt{2} \) N and \( 2 - \sqrt{2} \) N

17. In a right angle \( \angle ABC \), \( \angle A = 90^\circ \) and sides \( a, b, c \) are respectively, 5 cm, 4 cm and 3 cm. If a force \( \vec{F} \) has moments 0, 9 and 16 in N cm. units respectively about vertices \( A, B \) and \( C \), then magnitude of \( \vec{F} \) is  
(a) 9  
(b) 4  
(c) 5  
(d) 3

18. Three forces \( \vec{P}, \vec{Q} \) and \( \vec{R} \) acting along \( IA, IB \) and \( IC \), where \( I \) is the incentre of a \( \triangle ABC \) are in equilibrium. Then \( \vec{P} : \vec{Q} : \vec{R} \) is  
(a) \( \cos \frac{A}{2} : \cos \frac{B}{2} : \cos \frac{C}{2} \)  
(b) \( \sin \frac{A}{2} : \sin \frac{B}{2} : \sin \frac{C}{2} \)  
(c) \( \sec \frac{A}{2} : \sec \frac{B}{2} : \sec \frac{C}{2} \)  
(d) \( \cos \frac{A}{2} : \cos \frac{B}{2} : \cos \frac{C}{2} \)

19. A particle moves towards east from a point \( A \) to a point \( B \) at the rate of 4 km/h and then towards north from \( B \) to \( C \) at the rate of 5 km/hr. If \( AB = 12 \) km and \( BC = 5 \) km, then its average speed for its journey from \( A \) to \( C \) and resultant average velocity direct from \( A \) to \( C \) are respectively

(a) \( \frac{13}{9} \) km/h and \( \frac{17}{9} \) km/h  
(b) \( \frac{13}{4} \) km/h and \( \frac{17}{4} \) km/h  
(c) \( \frac{17}{9} \) km/h and \( \frac{13}{9} \) km/h  
(d) \( \frac{17}{4} \) km/h and \( \frac{13}{4} \) km/h

20. A velocity \( \frac{1}{4} \) m/s is resolved into two components along \( OA \) and \( OB \) making angles 30° and 45° respectively with the given velocity. Then the component along \( OB \) is  
(a) \( \frac{1}{8} (\sqrt{6} - \sqrt{2}) \) m/s  
(b) \( \frac{1}{4} (\sqrt{3} - 1) \) m/s  
(c) \( \frac{1}{4} \) m/s  
(d) \( \frac{1}{8} \) m/s

21. If \( t_1 \) and \( t_2 \) are the times of flight of two particles having the same initial velocity \( u \) and range \( R \) on the horizontal, then \( t_1^2 + t_2^2 \) is equal to  
(a) 1  
(b) \( 4u^2 \)  
(c) \( \frac{u^2}{2g} \)  
(d) \( \frac{u^2}{g} \)
22. Let \( R = \{(3, 3), (6, 6), (9, 9), (12, 12), (6, 12), (3, 9), (3, 12), (3, 6)\} \) be a relation on the set \( A = \{3, 6, 9, 12\} \). The relation is (a) reflexive and transitive only \[2005\] (b) reflexive only \[2005\] (c) an equivalence relation \[2005\] (d) reflexive and symmetric only \[2005\]

23. \( \triangle ABC \) is a triangle. Forces \( \vec{P}, \vec{Q}, \vec{R} \) acting along \( IA, IB, IC \) respectively are in equilibrium, where \( I \) is the incentre of \( \triangle ABC \). Then \( P : Q : R \) is \[2005\] (a) \( \sin A : \sin B : \sin C \) \[2005\] (b) \( \sin \frac{A}{2} : \sin \frac{B}{2} : \sin \frac{C}{2} \) \[2005\] (c) \( \cos \frac{A}{2} : \cos \frac{B}{2} : \cos \frac{C}{2} \) \[2005\] (d) \( \cos A : \cos B : \cos C \) \[2005\]

24. If in a frequency distribution, the mean and median are 21 and 22 respectively, then its mode is approximately \[2005\] (a) 22.0 \[2005\] (b) 20.5 \[2005\] (c) 25.5 \[2005\] (d) 24.0 \[2005\]

25. A lizard, at an initial distance of 21 cm behind an insect, moves from rest with an acceleration of 2 cm/s\(^2\) and pursues the insect which is crawling uniformly along a straight line at a speed of 20 cm/s. Then the lizard will catch the insect after (a) 20 s \[2005\] (b) 1 s \[2005\] (c) 21 s \[2005\] (d) 24 s \[2005\]

26. Two points A and B move from rest along a straight line with constant acceleration \( f \) and \( f' \) respectively. If A takes m sec. more than B and describes ‘\( n \)’ units more than B in acquiring the same speed then \[2005\] (a) \( (f - f')m^2 = ff' \) \[2005\] (b) \( (f + f')m^2 = ff' \) \[2005\] (c) \( \frac{1}{2} (f + f')m = ff' \) \[2005\] (d) \( (f - f)n = \frac{1}{2} ff'm^2 \) \[2005\]

27. A and B are two like parallel forces. A couple of moment \( H \) lies in the plane of A and B and is contained with them. The resultant of A and B after combining is displaced through a distance (a) \( \frac{2H}{A-B} \) \[2005\] (b) \( \frac{H}{A+B} \) \[2005\] (c) \( \frac{H}{2(A+B)} \) \[2005\] (d) \( \frac{H}{A-B} \) \[2005\]

28. Let \( x_1, x_2, \ldots, x_n \) be \( n \) observations such that \( \sum x_i^2 = 400 \) and \( \sum x_i = 80 \). Then the possible value of \( n \) among the following is \[2005\] (a) 15 \[2005\] (b) 18 \[2005\] (c) 9 \[2005\] (d) 12 \[2005\]

29. A particle is projected from a point \( O \) with velocity \( u \) at an angle of \( 60^\circ \) with the horizontal. When it is moving in a direction at right angles to its direction at \( O \), its velocity then is given by \[2005\] (a) \( \frac{u}{3} \) \[2005\] (b) \( \frac{u}{2} \) \[2005\] (c) \( \frac{2u}{3} \) \[2005\] (d) \( \frac{u}{\sqrt{3}} \) \[2005\]

30. The resultant \( R \) of two forces acting on a particle is at right angles to one of them and its magnitude is one-third of the other force. The ratio of larger force to the smaller one is \[2005\] (a) 2 : 1 \[2005\] (b) \( 3 : \sqrt{2} \) \[2005\] (c) 3 : 2 \[2005\] (d) \( 3 : 2\sqrt{2} \) \[2005\]

31. \( \triangle ABC \) is a triangle, right angled at \( A \). The resultant of the forces acting along \( AB, BC \) with magnitudes \( \frac{1}{AB} \) and \( \frac{1}{AC} \) respectively is the force along \( AD \), where \( D \) is the foot of the perpendicular from \( A \) onto \( BC \). The magnitude of the resultant is \[2006\] (a) \( \frac{AB^2 + AC^2}{(AB)^2(AC)^2} \) \[2006\] (b) \( \frac{(AB)(AC)}{AB + AC} \) \[2006\] (c) \( \frac{1}{AB} + \frac{1}{AC} \) \[2006\] (d) \( \frac{1}{AD} \) \[2006\]

32. Let \( W \) denote the words in the English dictionary. Define the relation \( R \) by \( R = \{(x, y) \in W \times W \mid \text{the words } x \text{ and } y \text{ have at least one letter in common.} \} \). Then \( R \) is (a) not reflexive, symmetric and transitive \[2006\] (b) reflexive, symmetric and not transitive \[2006\] (c) reflexive, symmetric and transitive \[2006\] (d) reflexive, not symmetric and transitive \[2006\]

33. Suppose a population \( A \) has 100 observations 101, 102, \ldots, 200 and another population \( B \) has 100 observations 151, 152, \ldots, 250. If \( V_A \) and \( V_B \) represent the variances of the two populations, respectively then \( \frac{V_A}{V_B} \) is \[2006\] (a) 1 \[2006\] (b) \( \frac{9}{4} \) \[2006\] (c) \( \frac{4}{9} \) \[2006\] (d) \( \frac{2}{3} \) \[2006\]

34. A particle has two velocities of equal magnitude inclined to each other at an angle \( \theta \). If one of them is halved, the angle between the other and the original resultant velocity is bisected by the new resultant. Then \( \theta \) is \[2006\] (a) 90° \[2006\] (b) 120° \[2006\] (c) 45° \[2006\] (d) 60° \[2006\]

35. A body falling from rest under gravity passes a certain point \( P \). It was at a distance of 400 m from \( P \), 4s prior to passing through \( P \). If \( g = 10 \text{m/s}^2 \), then the height above the point \( P \) from where the body began to fall is \[2006\] (a) 720m \[2006\] (b) 900m \[2006\] (c) 320m \[2006\] (d) 680m
36. The resultant of two forces \( Pn \) and \( 3n \) is a force of \( 7n \). If the direction of \( 3n \) force were reversed, the resultant would be \( \sqrt{19} \ n \). The value of \( P \) is [2007]
(a) \( 3 \) \( n \) \hspace{1cm} (b) \( 4 \) \( n \) \hspace{1cm} (c) \( 5 \) \( n \) \hspace{1cm} (d) \( 6 \) \( n \).

37. A particle just clears a wall of height \( b \) at a distance \( a \) and strikes the ground at a distance \( c \) from the point of projection. The angle of projection is [2007]
(a) \( \tan^{-1} \frac{bc}{a(c-a)} \) \hspace{1cm} (b) \( \tan^{-1} \frac{bc}{a} \)
(c) \( \tan^{-1} \frac{b}{ac} \) \hspace{1cm} (d) \( 45^\circ \).

38. The average marks of boys in class is 52 and that of girls is 42. The average marks of boys and girls combined is 50. The percentage of boys in the class is [2007]
(a) \( 80 \) \hspace{1cm} (b) \( 60 \) \hspace{1cm} (c) \( 40 \) \hspace{1cm} (d) \( 20 \).

39. A body weighing 13 kg is suspended by two strings 5m and 12m long, their other ends being fastened to the extremities of a rod 13m long. If the rod be so held that the body hangs immediately below the middle point, then tensions in the strings are [2007]
(a) \( 5 \) \( kg \) and \( 12 \) \( kg \) \hspace{1cm} (b) \( 5 \) \( kg \) and \( 13 \) \( kg \)
(c) \( 12 \) \( kg \) and \( 13 \) \( kg \) \hspace{1cm} (d) \( 5 \) \( kg \) and \( 5 \) \( kg \).

40. The mean of the numbers \( a, b, 8, 5, 10 \) is 6 and the variance is 6.80. Then which one of the following gives possible values of \( a \) and \( b \)? [2008]
(a) \( a = 0, b = 7 \) \hspace{1cm} (b) \( a = 5, b = 2 \)
(c) \( a = 1, b = 6 \) \hspace{1cm} (d) \( a = 3, b = 4 \).

41. Let \( p \) be the statement “\( x \) is an irrational number”, \( q \) be the statement “\( y \) is a transcendental number”, and \( r \) be the statement “\( x \) is a rational number if \( y \) is a transcendental number”. [2008]

Statement-1 : \( r \) is equivalent to either \( q \) or \( p \)

Statement-2 : \( r \) is equivalent to \( \neg (p \leftrightarrow q) \).

(a) Statement-1 is false, Statement-2 is true
(b) Statement-1 is true, Statement-2 is true
(c) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1
(d) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1

Statement-1 is true, Statement-2 is false

42. The statement \( p \to (q \to p) \) is equivalent to [2008]
(a) \( p \to (p \to q) \) \hspace{1cm} (b) \( p \to (p \lor q) \)
(c) \( p \to (p \land q) \) \hspace{1cm} (d) \( p \to (p \leftrightarrow q) \).

43. Statement-1 : \( \neg (p \leftrightarrow q) \) is equivalent to \( p \leftrightarrow q \).

Statement-2 : \( \neg (p \leftrightarrow q) \) is a tautology [2009]

(a) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1.
(b) Statement-1 is true, Statement-2 is false.
(c) Statement-1 is false, Statement-2 is true.
(d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for statement -1

44. Statement-1 : The variance of first \( n \) even natural numbers is \( \frac{n^2 - 1}{4} \).

Statement-2 : The sum of first \( n \) natural numbers is \( \frac{n(n+1)}{2} \) and the sum of squares of first \( n \) natural numbers is \( \frac{n(n+1)(2n+1)}{6} \). [2009]

(a) Statement-1 is true, Statement-2 is true
(b) Statement-1 is true, Statement-2 is false.
(c) Statement-1 is false, Statement-2 is true.
(d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.

45. If \( A, B \) and \( C \) are three sets such that \( A \cap B = A \cap C \) and \( A \cup B = A \cup C \), then [2009]

(a) \( A = C \) \hspace{1cm} (b) \( B = C \)
(c) \( A \cap B = \emptyset \) \hspace{1cm} (d) \( A = B \).

46. If the mean deviation of the numbers 1, 1 + d, 1 + 2d, ..., 1 + 100d from their mean is 255, then \( d \) is equal to: [2009]
(a) 20.0 \hspace{1cm} (b) 10.1 \hspace{1cm} (c) 20.2 \hspace{1cm} (d) 10.0.

47. Let \( S \) be a non-empty subset of \( \mathbb{R} \). Consider the following statement:

\( P \) : There is a rational number \( x \in S \) such that \( x > 0 \).

Which of the following statements is the negation of the statement \( P \)? [2010]

(a) There is no rational number \( x \in S \) such that \( x \leq 0 \).
(b) Every rational number \( x \in S \) satisfies \( x \leq 0 \).
(c) \( x \in S \) and \( x \leq 0 \) \( \implies \) \( x \) is not rational.
(d) There is a rational number \( x \in S \) such that \( x \leq 0 \).

48. Consider the following relations:

\( R = \{(x, y) \mid x, y \text{ are real numbers and } x = wy \text{ for some rational number } w\} \).

\( S = \left\{ \left( \frac{m}{n}, \frac{p}{q} \right) \mid m, n, p \text{ and } q \text{ are integers such that } n, q \neq 0 \right\} \)

and \( qm = pn \).

Then [2010]

(a) Neither \( R \) nor \( S \) is an equivalence relation
(b) \( S \) is an equivalence relation but \( R \) is not an equivalence relation
(c) \( R \) and \( S \) both are equivalence relations
(d) \( R \) is an equivalence relation but \( S \) is not an equivalence relation.
49. For two data sets, each of size 5, the variances are given to be 4 and 5 and the corresponding means are given to be 2 and 4, respectively. The variance of the combined data set is \[ \frac{11}{2} \] \[ \text{(a)} \quad \frac{13}{2} \quad \text{(b)} \quad 6 \quad \text{(c)} \quad \frac{5}{2} \quad \text{(d)} \quad \frac{5}{2} \] \[ 2010 \]  

50. Let \( R \) be the set of real numbers.  

**Statement-1**: \( A = \{(x, y) \in R \times R : y - x \text{ is an integer} \} \) is an equivalence relation on \( R \). 

**Statement-2**: \( B = \{(x, y) \in R \times R : x = \alpha y \text{ for some rational number } \alpha \} \) is an equivalence relation on \( R \). \[ 2011 \]  

(a) Statement-1 is true, Statement-2 is true; Statement-2 is not a correct explanation for Statement-1. 
(b) Statement-1 is true, Statement-2 is false. 
(c) Statement-1 is false, Statement-2 is true. 
(d) Statement-1 is true, Statement-2 is true; Statement-2 is a correct explanation for Statement-1.  

51. Consider the following statements \[ 2011 \]  

\( P \) : Suman is brilliant 
\( Q \) : Suman is rich 
\( R \) : Suman is honest 

The negation of the statement “Suman is brilliant and dishonest if and only if Suman is rich” can be expressed as 

(a) \( \sim (Q \leftrightarrow (P \land R)) \) 
(b) \( \sim Q \leftrightarrow \sim P \land R \) 
(c) \( \sim (P \land R) \leftrightarrow Q \) 
(d) \( \sim P \land (Q \leftrightarrow \sim R) \)  

52. If the mean deviation about the median of the numbers \( a, 2a, \ldots, 50a \) is 50, then \( |a| \) equals \[ 2011 \]  

(a) \( 3 \) 
(b) \( 4 \) 
(c) \( 5 \) 
(d) \( 2 \)  

53. The negation of the statement “If I become a teacher, then I will open a school”, is : 

(a) I will become a teacher and I will not open a school. 
(b) I will not become a teacher or I will open a school. 
(c) I will become a teacher but I will not open a school. 
(d) I will not become a teacher or I will open a school. \[ 2012 \]  

54. Let \( x_1, x_2, \ldots, x_n \) be \( n \) observations, and let \( \bar{x} \) be their arithmetic mean and \( \sigma^2 \) be the variance. \[ 2012 \]  

**Statement-1**: Variance of \( 2x_1, 2x_2, \ldots, 2x_n \) is \( 4\sigma^2 \). 

**Statement-2**: Arithmetic mean of \( 2x_1, 2x_2, \ldots, 2x_n \) is \( 4\bar{x} \). 

(a) Statement-1 is false, Statement-2 is true. 
(b) Statement-1 is true, statement-2 is true; statement-2 is a correct explanation for Statement-1. 
(c) Statement-1 is true, statement-2 is true; statement-2 is not a correct explanation for Statement-1. 
(d) Statement-1 is true, statement-2 is false.  

55. Let \( X = \{1, 2, 3, 4, 5\} \). The number of different ordered pairs \( (Y, Z) \) that can formed such that \( Y \subseteq X, Z \subseteq X \) and \( Y \cap Z \) is empty is \[ 2012 \]  

(a) \( 5^2 \) 
(b) \( 3^5 \) 
(c) \( 2^5 \) 
(d) \( 5^3 \)  

56. Let \( A \) and \( B \) two sets containing 2 elements and 4 elements respectively. The number of subsets of \( A \times B \) having 3 or more elements is \[ 2013 \]  

(a) 256 
(b) 220 
(c) 219 
(d) 211  

57. Consider the following statements \[ 2013 \]  

**Statement-1**: \( (p \land q) \land (\sim p \land q) \) is a fallacy. 

**Statement-2**: \( (p \rightarrow q) \leftrightarrow (\sim q \rightarrow \sim p) \) is a tautology. 

(a) Statement-1 is true; Statement-2 is true; Statement-2 is a correct explanation for Statement-1. 
(b) Statement-1 is true; Statement-2 is true; Statement-2 is not a correct explanation for Statement-1. 
(c) Statement-1 is true; Statement-2 is false. 
(d) Statement-1 is false; Statement-2 is true.  

58. All the students of a class performed poorly in Mathematics. The teacher decided to give grace marks of 10 to each of the students. Which of the following statistical measures will not change even after the grace marks were given? \[ 2013 \]  

(a) mean 
(b) median 
(c) mode 
(d) variance  

59. If \( X = \{4^n - 3n - 1 : n \in N\} \) and \( Y = \{9(n-1) : n \in N\} \), where \( N \) is the set of natural numbers, then \( X \cup Y \) is equal to: \[ 2014 \]  

(a) \( X \) 
(b) \( Y \) 
(c) \( N \) 
(d) \( Y \setminus X \) 

60. The variance of first 50 even natural numbers is \[ 2014 \]  

(a) \( \frac{437}{4} \) 
(b) \( \frac{437}{4} \) 
(c) \( \frac{833}{4} \) 
(d) \( 833 \)  

61. The statement \( \sim (p \leftrightarrow q) \) is: \[ 2014 \]  

(a) a tautology 
(b) a fallacy 
(c) equivalent to \( p \leftrightarrow q \) 
(d) equivalent to \( \sim p \leftrightarrow q \)  

62. Let \( A \) and \( B \) be two sets containing four and two elements respectively. Then the number of subsets of the set \( A \times B \), each having at least three elements is: \[ 2015 \]  

(a) 275 
(b) 510 
(c) 219 
(d) 256  

63. The negation of \( \sim s \lor (\sim r \land s) \) is equivalent to: \[ 2015 \]  

(a) \( s \lor (r \land \sim s) \) 
(b) \( s \land r \) 
(c) \( s \land \sim r \) 
(d) \( s \lor (r \land \sim s) \)  

64. The mean of the data set comprising of 16 observations is 16. If one of the observation valued 16 is deleted and three new observations valued 3, 4 and 5 are added to the data, then the mean of the resultant data is: \[ 2015 \]  

(a) 15.8 
(b) 14.0 
(c) 16.8 
(d) 16.0
65. If \( f(x) + 2f\left(\frac{1}{x}\right) = 3x, x \neq 0 \) and
   \[ S = \{x \in \mathbb{R}: f(x) = f(-x)\}; \text{ then } S: \]
   (a) contains exactly two elements.  
   (b) contains more than two elements.  
   (c) is an empty set.  
   (d) contains exactly one element.

66. The Boolean Expression \((p \land \sim q) \lor q \lor (\sim p \land q)\) is equivalent to: \[ \text{[JEE M 2016]} \]
   (a) \(p \lor q\)  
   (b) \(p \lor \sim q\)  
   (c) \(\sim p \land q\)  
   (d) \(p \land q\)

67. If the standard deviation of the numbers 2, 3, a and 11 is 3.5, then which of the following is true? \[ \text{[JEE M 2016]} \]
   (a) \(3a^2 - 34a + 91 = 0\)
   (b) \(3a^2 - 23a + 44 = 0\)
   (c) \(3a^2 - 26a + 55 = 0\)
   (d) \(3a^2 - 32a + 84 = 0\)

68. A man is walking towards a vertical pillar in a straight path, at a uniform speed. At a certain point A on the path, he observes that the angle of elevation of the top of the pillar is 30°. After walking for 10 minutes from A in the same direction, at a point B, he observes that the angle of elevation of the top of the pillar is 60°. Then the time taken (in minutes) by him, from B to reach the pillar, is: \[ \text{[JEE M 2016]} \]
   (a) 20  
   (b) 5  
   (c) 6  
   (d) 10

Section-A  JEE Advanced/ IIT-JEE

A. Fill in the Blanks

1. Given $\sin^3 x \sin 3x = \sum_{m=0}^{n} C_m \cos mx$

\[
\sin^3 x \sin 3x = \frac{1}{4} \left[ 3 \sin x - \sin 3x \right] \sin 3x
\]

\[
= \frac{1}{4} \left[ \sin 3x \right]
\]

\[
= \frac{3}{2} \sin x \sin 3x - \sin^2 3x
\]
\[
\frac{1}{4} \left[ \frac{3}{2} (\cos 2x - \cos x) - \frac{1}{2} (1 - \cos 6x) \right] \\
= \frac{1}{8} \left[ \cos 6x + 3 \cos 2x - 3 \cos x - 1 \right]
\]

We observe that on LHS 6 is the max value of \(m\).
\[\therefore \quad n = 6\]

2. The equations are \(x + y = \frac{2}{3} \pi \) \(\ldots (i)\)
\[\cos x + \cos y = \frac{3}{2} \]

From eq. (ii) \(2 \cos \frac{x+y}{2} \cos \frac{x-y}{2} = \frac{3}{2}\)
\[\Rightarrow 2 \cos \frac{\pi}{3} \cos \frac{x-y}{2} = \frac{3}{2} \quad [\text{Using eq. (i)}]\]
\[\Rightarrow 2 \cdot \frac{1}{2} \cos \frac{x-y}{2} = \frac{3}{2} \Rightarrow \cos \frac{x-y}{2} = \frac{3}{2} > 1\]
Which has no solution.
\[\therefore \quad \text{The solution of given equations is } \phi.\]

3. We have \(2 \sin^2 x - 3 \sin x + 1 \geq 0\)
\[\Rightarrow (2 \sin x - 1) (\sin x - 1) \geq 0\]
\[\Rightarrow \left( \sin x - \frac{1}{2} \right) (\sin x - 1) \geq 0 \Rightarrow \sin x \leq \frac{1}{2} \text{ or } \sin x \geq 1\]
But we know that \(\sin x \leq 1\) and \(\sin x \geq 0\) for \(x \in [0, \pi] \)
\[\Rightarrow \text{ either } \sin x = 1 \quad \text{or} \quad 0 \leq \sin x \leq \frac{1}{2}\]
\[\Rightarrow \text{ either } x = \pi/2 \text{ or } x \in [0, \pi/6] \cup [5\pi/6, \pi]\]
Combining, we get \(x \in [0, \pi/6] \cup \{\pi/2\} \cup [5\pi/6, \pi]\)

4. We know that A.M. \(\geq\) G.M.
\[\Rightarrow \text{Min value of AM. is obtained when AM} = \text{GM} \]
\[\Rightarrow \text{The quantities whose AM is being taken are equal.}\]
\[i.e., \cos \left( \frac{\alpha + \pi}{2} \right) = \cos \left( \beta + \frac{\pi}{2} \right) \]
\[= \cos \left( \gamma + \frac{\pi}{2} \right) \]
\[\Rightarrow \sin \alpha = \sin \beta = \sin \gamma\]
Also \(\alpha + \beta + \gamma = 360^\circ \Rightarrow \alpha = \beta = \gamma = 120^\circ = 2\pi/3\)

\[\therefore \quad \cos \left( \frac{2\pi}{3} + \frac{\pi}{2} \right) + \cos \left( \frac{2\pi}{3} + \frac{\pi}{2} \right) + \cos \left( \frac{2\pi}{3} + \frac{\pi}{2} \right) \]
\[= \frac{3}{2} \]
\[= \frac{-\sin \frac{2\pi}{3}}{2} = \frac{-\sqrt{3}}{2}\]

5. \(\sin \frac{\pi}{14} \sin \frac{3\pi}{14} \sin \frac{5\pi}{14} \sin \frac{7\pi}{14} \sin \frac{9\pi}{14} \sin \frac{11\pi}{14} \sin \frac{13\pi}{14}\)
\[= \left( \sin \frac{\pi}{14} \sin \frac{3\pi}{14} \sin \frac{5\pi}{14} \right)^2\]
\[= \left[ \cos \left( \frac{\pi}{2} \right) \cos \left( \frac{3\pi}{2} \right) \cos \left( \frac{5\pi}{2} \right) \right]^2\]
\[= \left[ \cos \frac{3\pi}{7} \cos \frac{2\pi}{7} \cos \frac{\pi}{7} \right]^2 \quad [\text{Using } \cos \left( \frac{\pi}{2} \right) = 0]\]
\[= \left( \frac{1}{8} \sin \frac{\pi}{7} \sin \frac{8\pi}{7} \right)^2 = \left( \sin \left( \pi + \pi/7 \right) \right)^2 \]
\[= \frac{\sin \pi/7}{8 \sin \pi/7} \frac{8 \pi}{7} = \frac{1}{8} \frac{1}{64}\]

6. \(K = \sin \frac{\pi}{18} \sin \frac{5\pi}{18} \sin \frac{7\pi}{18}\)
\[= \cos \left( \frac{\pi}{2} - \frac{\pi}{18} \right) \cos \left( \frac{\pi}{2} - \frac{5\pi}{18} \right) \cos \left( \frac{\pi}{2} - \frac{7\pi}{18} \right) \]
\[= \cos \frac{9\pi}{9} \cos \frac{2\pi}{9} \cos \frac{4\pi}{9} = \frac{1}{2^{3 \sin \frac{\pi}{9}}} \sin \frac{8\pi}{9}\]
\[\quad [\text{Using } \cos \alpha \cos 2\alpha \cos 2^{n-1}\alpha\]
\[= \frac{1}{2^n \sin \alpha}]\]
\[= \frac{1}{2^{\sin \pi/9}} \sin \pi/9 = \frac{1}{8}\]

7. \(A + B = \pi/3 \Rightarrow \tan (A + B) = \sqrt{3}\)
\[\Rightarrow \tan A + \tan B \frac{1 - \tan A \tan B}{1 - \tan A} = \sqrt{3} \Rightarrow \frac{\tan A + \frac{y}{1-y}}{\tan A} = \sqrt{3}\]
\[\Rightarrow \tan^2 A + \sqrt{3} (y-1) \tan A + y = 0\]
For real value of \(\tan A\), \(3(y-1)^2 - 4y \geq 0\)
\[\Rightarrow 3y^2 - 10y + 3 \geq 0 \Rightarrow (y-3) (y-\frac{1}{3}) \geq 0\]
Trigonometric Functions & Equations

\[ y \leq \frac{1}{3} \text{ or } y \geq 3 \]

But \( A, B > 0 \) and \( A + B = \pi/3 \) \( \Rightarrow \) \( A, B < \pi/3 \)
\[ \Rightarrow \tan A \tan B < 3 \]
\[ \therefore y \leq \frac{1}{3} \text{ i.e., max. value of } y \text{ is } 1/3. \]

8. \[ \tan^2 \theta + \sec 20^\circ = 1 \]
\[ t^2 + \frac{1 + t^2}{1 - t^2} = 1 \text{ where } t = \tan \theta \]
\[ \therefore t^2(t^2 - 3) = 0 \quad \therefore \tan \theta = 0, \pm \sqrt{3} \text{ etc.} \]
which means \( \theta = n\pi \text{ and } \theta = n\pi \pm \pi/3 \)

9. \[ \cos^7 x = 1 - \sin^4 x = (1 - \sin^2 x)(1 + \sin^2 x) \]
\[ = \cos^2 x(1 + \sin^2 x) \]
\[ \therefore \cos x = 0 \text{ or } x = \pi/2, -\pi/2 \]
\[ \text{or } \cos^5 x = 1 + \sin^2 x \text{ or } \cos^8 x - \sin^2 x = 1 \]
Now maximum value of each \( \cos x \) or \( \sin x \) is 1.
Hence the above equation will hold when \( \cos x = 1 \) and \( \sin x = 0 \). Both these imply \( x = 0 \)
Hence \( x = \frac{\pi}{2}, 0 \)

B. True/False

1. \[ \tan A = \frac{1 - \cos B}{\sin B} = \frac{2\sin^2 B/2}{2\sin B \cos B/2} = \tan B/2 \]
Hence \( \tan 2A = \frac{2\tan A}{1 - \tan^2 A} = \frac{2\tan B/2}{1 - \tan^2 B/2} = \tan B \)
\[ \therefore \text{ Statement is true.} \]

2. Given equation is \( \sin^4 \theta - 2\sin^2 \theta - 1 = 0 \)
Here, \( D = 4 + 4 = 8 \)
\[ \therefore \sin^2 \theta = \frac{2 \pm \sqrt{8}}{2} = 1 \pm \sqrt{2}. \]
But \( \sin^2 \theta \) can not be \( -ve \) \( \therefore \sin^2 \theta = \sqrt{2} + 1 \)
But as \( -1 \leq \sin \theta \leq 1 \) \( \therefore \sin^2 \theta \neq \sqrt{2} + 1 \)
Thus there is no value of \( \theta \) which satisfy the given equation.
\[ \therefore \text{ Statement is false.} \]

C. MCQs with ONE Correct Answer

1. (b) \( \tan \theta = -\frac{4}{3} \Rightarrow \theta \in \Pi \text{ quad or IV quad} \)
\[ \therefore 0 < \sin \theta < 1 \text{ or } -1 < \sin \theta < 0 \]
\[ \therefore \sin \theta \text{ may be } \frac{4}{5} \text{ or } -\frac{4}{5} \]

2. (a) \[ \alpha + \beta + \gamma = 2\pi \Rightarrow \frac{\alpha}{2} + \frac{\beta}{2} + \frac{\gamma}{2} = \pi \]
\[ \therefore \tan \left( \frac{\alpha}{2} + \frac{\beta}{2} \right) = \tan \left( \frac{\pi - \gamma}{2} \right) = -\tan \frac{\gamma}{2} \]
\[ \Rightarrow \frac{\tan \alpha/2 + \tan \beta/2}{1 - \tan \alpha/2 \tan \beta/2} = -\tan \gamma/2 \]
\[ \Rightarrow \tan \alpha/2 + \tan \beta/2 + \tan \gamma/2 \]
\[ \text{= tan } \alpha/2 \tan \beta/2 \tan \gamma/2 \]

3. (b) \[ A = \sin^2 \theta + \cos^4 \theta = \sin^2 \theta + (1 - \sin^2 \theta)^2 \]
\[ = \sin^2 \theta - \sin^2 \theta + 1 \Rightarrow A = \left( \sin^2 \theta - \frac{1}{2} \right)^2 + \frac{3}{4} \]
But \( 0 \leq \left( \sin^2 \theta - \frac{1}{2} \right)^2 \leq \frac{1}{4} \)
\[ \therefore \frac{3}{4} \leq \left( \sin^2 \theta - \frac{1}{2} \right)^2 + \frac{3}{4} \leq 1 \text{ or } \frac{3}{4} \leq A \leq 1 \]

4. (a) The given equation is
\[ 2\cos^2 \left( \frac{x}{2} \right) \sin^2 x = x^2 + \frac{1}{x^2} \text{ where } 0 < x \leq \frac{\pi}{2} \]
LHS = \[ 2\cos^2 \frac{x}{2} \sin^2 x = (1 + \cos x) \sin^2 x \]
\[ \therefore 1 + \cos x < 2 \text{ and } \sin^2 x \leq 1 \text{ for } 0 < x \leq \frac{\pi}{2} \]
\[ \therefore (1 + \cos x) \sin^2 x < 2 \]
And R.H.S. = \[ x^2 + \frac{1}{x^2} \geq 2 \]
\[ \therefore \text{ For } 0 < x \leq \frac{\pi}{2}, \text{ given equation is not possible for any real value of } x. \]

5. (c) \[ \sin x + \cos x = 1 \]
\[ \Rightarrow \frac{1}{\sqrt{2}} \sin x + \frac{1}{\sqrt{2}} \cos x = \frac{1}{\sqrt{2}} \]
\[ \Rightarrow \sin x \cos \frac{\pi}{4} + \cos x \sin \frac{\pi}{4} = \sin \frac{\pi}{4} \]
\[ \Rightarrow \sin (x + \pi/4) = \sin \pi/4 \]
\[ \Rightarrow x + \pi/4 = n \pi + (-1)^n \pi/4, n \in \mathbb{Z} \text{ (the set of integers)} \]
\[ \Rightarrow x = n \pi + (-1)^n \pi/4 - \pi/4 \]
where \( n = 0, \pm 1, \pm 2, \ldots \)

6. (c) The given expression is \[ \sqrt{3} \csc 20^\circ - \sec 20^\circ \]
\[ = \frac{\sqrt{3}}{\sin 20^\circ} - \frac{1}{\cos 20^\circ} = \frac{\sqrt{3} \cos 20^\circ - \sin 20^\circ}{\sin 20^\circ \cos 20^\circ} \]
\[
= 4 \left[ \frac{\sqrt{3} \cos 20^\circ - \frac{1}{2} \sin 20^\circ}{2 \sin 20^\circ \cos 20^\circ} \right] \\
= 4 \left[ \frac{\sin 60^\circ \cos 20^\circ - \cos 60^\circ \sin 20^\circ}{\sin(2 \times 20^\circ)} \right] \\
= \frac{4 \sin (60^\circ - 20^\circ)}{\sin 40^\circ} = 4 \sin 40^\circ = 4
\]

7. (b) The given equation is
\[
sin x - 3 \sin 2x + sin 3x = \cos x - 3 \cos 2x + \cos 3x \\
\Rightarrow 2 \sin 2x \cos x - 3 \sin 2x = 2 \cos 2x \cos x - 3 \cos 2x \\
\Rightarrow \sin 2x (2 \cos x - 3) = \cos 2x (2 \cos x - 3) \\
\Rightarrow \sin 2x = \cos 2x \quad (\text{as } \cos x \neq 3/2) \\
\Rightarrow \tan 2x = 1 \Rightarrow 2x = n\pi + \pi/4 \Rightarrow x = \frac{n\pi + \pi}{8}
\]

8. (d) The given equation is
\[
(\cos p - 1) x^2 + (\cos p) x + \sin p = 0
\]
For this equation to have real roots, \( D \geq 0 \)
\[
\Rightarrow \cos^2 p - 4 \sin p (\cos p - 1) \geq 0 \\
\Rightarrow \cos^2 p - 4 \sin p \cos p + 4 \sin^2 p \geq 0 \\
\Rightarrow (\cos p - 2 \sin p)^2 + 4 \sin p (1 - \sin p) \geq 0
\]
For every real value of \( p \) \((\cos p - 2 \sin p)^2 \geq 0 \)
\[
\Rightarrow x = \frac{\pi}{6}, \frac{3\pi}{2} \in [0, 2\pi]
\]
But for \( x = \frac{3\pi}{2} \), given eq. is not defined,
\[
\Rightarrow \text{only 2 solutions.}
\]

9. (c) The given eq is, \( \tan x + \sec x = 2 \cos x \)
\[
\Rightarrow \frac{\sin x + 1}{\cos x} = 2 \cos x \\
\Rightarrow \sin x + 1 = 2 \cos^2 x = 2 \sin^2 x + \sin x - 1 = 0 \\
\Rightarrow (2 \sin x - 1) (\sin x + 1) = 0 \Rightarrow \sin x = \frac{1}{2}, -1
\]
\[
\Rightarrow x = \frac{\pi}{6}, \frac{5\pi}{6} \in [0, 2\pi]
\]

10. (b) \( \sec 2x - \tan 2x = \frac{1 - \sin 2x}{\cos 2x} = \frac{1 - \cos 2\left(\frac{\pi}{4} - x\right)}{\sin 2\left(\frac{\pi}{4} - x\right)} \)
\[
= \frac{2\sin^2\left(\frac{\pi}{4} - x\right)}{2\sin\left(\frac{\pi}{4} - x\right)\cos\left(\frac{\pi}{4} - x\right)} = \tan\left(\frac{\pi}{4} - x\right)
\]

11. (d) \( \sin \frac{\pi}{2n} + \cos \frac{\pi}{2n} = \frac{\sqrt{n}}{2} \)
\[
\Rightarrow \sin^2 \frac{\pi}{2n} + \cos^2 \frac{\pi}{2n} + 2 \sin \frac{\pi}{2n} \cos \frac{\pi}{2n} = \frac{n}{2} \\
\Rightarrow 1 + \sin \frac{n}{2} = \frac{n}{2} \Rightarrow \sin \frac{n}{4} = \frac{n - 4}{n} \\
\]
For \( n = 2 \) the given equation is not satisfied. Considering \( n > 1 \) and \( n \neq 2 \)
\[
0 < \sin \frac{n}{n} < 1 \Rightarrow 0 < \frac{n - 4}{4} < 1 \Rightarrow 4 < n < 8.
\]

12. (c) \( \sin \left(\omega^{10} + \omega^{23}\right) \pi - \frac{\pi}{4} = \sin \left(\omega + \omega^2\right) \pi - \frac{\pi}{4} \)
\[
= \sin \left(-\pi - \frac{\pi}{4}\right) = -\sin \left(\pi + \frac{\pi}{4}\right) = -\sin \frac{\pi}{4} = 1/\sqrt{2}
\]

13. (c) \( 3(\sin x - \cos x)^4 + 6(\sin x + \cos x)^2 + 4(\sin^6 x + \cos^6 x) = 3(1 - \sin 2x)^2 + 6(1 + \sin 2x) \\
+ 4[(\sin^2 x + \cos^2 x)^3 - 3 \sin^2 x \cos^2 x (\sin^2 x + \cos^2 x)] = 3 - 6 \sin 2x + 3 \sin^2 2x + 6 \sin 2x + 4 \left[1 - 3 \sin^2 2x\right] \\
= 13 + 3 \sin^2 2x - 3 \sin^2 2x = 13
\]

14. (d) The given equation is \( 2 \sin^2 \theta - 3 \sin \theta - 2 = 0 \)
\[
\Rightarrow (2 \sin \theta - 1)(\sin \theta - 2) = 0 \\
\Rightarrow \sin \theta = \frac{1}{2}, [\because \sin \theta = 0 \text{ is not possible}] \\
\Rightarrow \theta = n\pi + (-1)^n (-\pi/6) = n\pi + (-1)^n 7\pi/6 \\
\Rightarrow \text{Thus, } \theta = n\pi + (-1)^n 7\pi/6
\]

15. (b) We have \( \sec^2 \theta = \frac{4xy}{(x+y)^2} \)
\[
\text{But } \sec^2 \theta \geq 1 \Rightarrow \frac{4xy}{(x+y)^2} \geq 1 \\
\Rightarrow 4xy \geq x^2 + y^2 + 2xy \\
\Rightarrow x^2 + y^2 - 2xy \leq 0 \Rightarrow (x-y)^2 \leq 0 \\
\Rightarrow x = y [\text{as perfect square of real number can never be negative}] \\
\text{Also then } x \neq 0 \text{ as then } \sec^2 \theta \text{ will become indeterminate.}
\]

16. (a) Given that in \( \triangle PQR, \angle R = \pi/2 \)
\[
\Rightarrow \angle P + \angle Q = \pi/2 \Rightarrow \angle P = \frac{\angle P}{2} + \frac{\angle Q}{2} = \frac{\pi}{4}
\]
Trigonometric Functions & Equations

Also tan \( P/2 \) and tan \( Q/2 \) are roots of the equation
\[ ax^2 + bx + c = 0 \] (\( a \neq 0 \))
\[
\therefore \tan P/2 + \tan Q/2 = -\frac{b}{a} \quad \text{and} \quad \tan P/2 \tan Q/2 = \frac{c}{a}
\]
Now consider, \[ \tan \left( \frac{P + Q}{2} \right) = \frac{\tan P/2 + \tan Q/2}{1 - \tan P/2 \tan Q/2} \]
\[
\Rightarrow \tan \frac{\pi}{4} = -\frac{b}{a} \quad \Rightarrow 1 - \frac{c}{a} = \frac{-b}{a} \Rightarrow a - c = -b \Rightarrow a + b = c
\]
17. (c) \( f(\theta) = \sin \theta (\sin \theta + \sin 3\theta) \)
\[ = (\sin \theta + 3 \sin \theta - 4 \sin^3 \theta) \sin \theta \]
\[ = (4 \sin \theta - 4 \sin^3 \theta) \sin \theta = \sin^2 \theta (4 - 4 \sin^2 \theta) \]
\[ = 4 \sin^2 \theta (1 - \sin^2 \theta) \]
\[ = 4 \sin^2 \theta \cos^2 \theta = (2 \sin \theta \cos \theta)^2 = (\sin 2\theta)^2 \geq 0 \]
which is true for all \( \theta \).

18. (c) To simplify the det. Let \( \sin x = a; \cos x = b \) the equation becomes
\[
\begin{vmatrix}
  a & b & b \\
  b & a & b \\
  b & b & a \\
\end{vmatrix} = 0
\]
Operating \( C_2 \rightarrow C_1; C_3 \rightarrow C_2 \) we get
\[
\begin{vmatrix}
  a & b - a & 0 \\
  b & a - b & b - a \\
  b & a - b & a - b \\
\end{vmatrix} = 0
\]
\[
\Rightarrow a(a - b)^2 - (b - a) [b(a - b) - b(b - a)] = 0
\]
\[
\Rightarrow a(a - b)^2 - 2b(b - a)(a - b) = 0
\]
\[
\Rightarrow (a - b)^2 (a - 2b) = 0 \Rightarrow (a - b) = 0 \text{ or } a = 2b
\]
\[
\Rightarrow \frac{a}{b} = 1 \text{ or } a = 2b
\]
\[
\Rightarrow \tan x = 1 \text{ or } \tan x = 2. \text{ But we have } -\pi/4 \leq x \leq \pi/4
\]
\[
\Rightarrow \tan (-\pi/4) \leq \tan x \leq \tan (\pi/4) \Rightarrow -1 \leq \tan x \leq 1
\]
\[
\Rightarrow \tan x = 1 \Rightarrow x = \pi/4 \quad \therefore \text{Only one real root is there.}
\]
19. (a) We are given that
\[
\begin{align*}
& (\cot \alpha_1, \cot \alpha_2, \ldots, \cot \alpha_n) = 1 \\
& \Rightarrow (\cos \alpha_1, \cos \alpha_2, \ldots, \cos \alpha_n) = (\sin \alpha_1, \sin \alpha_2, \ldots, \sin \alpha_n) \\
& \quad \ldots (1)
\end{align*}
\]
Let \( y = (\cos \alpha_1, \cos \alpha_2, \ldots, \cos \alpha_n) \) (to be max.)
Squaring both sides, we get
\[
y^2 = (\cos^2 \alpha_1, \cos^2 \alpha_2, \ldots, \cos^2 \alpha_n) = \cos^2 \alpha_1 \sin \alpha_1 \cos \alpha_2 \ldots \cos \alpha_n \sin \alpha_n\quad \text{(Using (1))}
\]
\[
= \frac{1}{2^n} [\sin 2\alpha_1 \sin 2\alpha_2 \ldots \sin 2\alpha_n]
\]
As \( 0 \leq \alpha_1, \alpha_2, \ldots, \alpha_n \leq \pi/2 \)
\[
\Rightarrow 0 \leq 2\alpha_1, 2\alpha_2, \ldots, 2\alpha_n \leq \pi
\]
\[
\Rightarrow 0 \leq \sin 2\alpha_1 \sin 2\alpha_2 \ldots \sin 2\alpha_n \leq 1
\]
\[
\Rightarrow y^2 \leq \frac{1}{2^n} \Rightarrow y \leq \frac{1}{2^n}
\]
\[
\Rightarrow \text{Max. value of } y \text{ is } 1/2^n.
\]
20. (c) Given that \( \alpha + \beta = \pi/2 \Rightarrow \alpha = \pi/2 - \beta \)
\[
\Rightarrow \tan \alpha = \tan \left( \frac{\pi}{2} - \beta \right) = \cot \beta = \frac{1}{\tan \beta}
\]
\[
\Rightarrow \tan \alpha \tan \beta = 1 \Rightarrow 1 + \tan \alpha \tan \beta = 2.
\]
\[
\Rightarrow \tan (\alpha - \beta) = \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta} = \tan \gamma = \frac{\tan \alpha - \tan \beta}{2}
\]
\[
\Rightarrow 2 \tan \gamma = \tan \alpha - \tan \beta \Rightarrow \tan \alpha = 2 \tan \gamma + \tan \beta
\]
21. (b) We know that
\[
\Rightarrow -\sqrt{a^2 + b^2} \leq a \cos \theta + b \sin \theta \leq \sqrt{a^2 + b^2}
\]
NOTE THIS STEP
\[
\Rightarrow -\sqrt{74} \leq 7 \cos x + 5 \sin x \leq \sqrt{74}
\]
\[
\Rightarrow -\sqrt{74} \leq 2k + 1 \leq \sqrt{74} \Rightarrow -8.6 \leq 2k + 1 \leq 8.6
\]
\[
\Rightarrow -4.8 \leq k \leq 3.8
\]
(considering only integral values)
\[
\Rightarrow k \text{ can take 8 integral values.}
\]
22. (b) Given that \( \sin \theta = 1/2 \) and \( \cos \phi = 1/3 \) and \( \theta \) and \( \phi \) both are acute angles
\[
\Rightarrow \theta = \pi/6 \text{ and } 0 < \theta < \frac{1}{3} \quad 2
\]
or \( \cos \pi/2 < \cos \phi < \cos \pi/3 \) or \( \pi/3 < \phi < \pi/2 \)
\[
\Rightarrow \frac{\pi}{6} < \theta + \phi < \frac{\pi}{6} \quad \frac{\pi}{2} \quad \frac{\pi}{6} \quad \frac{\pi}{2} < \theta + \phi < \frac{2\pi}{3}
\]
\[
\Rightarrow \theta + \phi = \left( \frac{\pi}{6}, \frac{2\pi}{3} \right)
\]
23. (d) Given that \( \cos (\alpha - \beta) = 1 \) and \( \cos (\alpha + \beta) = 1/e \) where \( \alpha, \beta \in [-\pi, \pi] \)
Now, \( \cos (\alpha - \beta) = 1 \Rightarrow \alpha - \beta = 0 \Rightarrow \alpha = \beta \)
Now, \( \cos (\alpha + \beta) = 1/e \Rightarrow \cos 2\alpha = 1/e \)
\[
\Rightarrow 0 < 1/e < 1 \text{ and } 2\alpha \in [-2\pi, 2\pi]
\]
\[
\Rightarrow \text{There will be two values of } 2 \alpha \text{ satisfying } \cos 2\alpha = 1/e \text{ in } [0, 2\pi] \text{ and two in } [-2\pi, 0].
\]
\[
\Rightarrow \text{There will be four values of } \alpha \text{ in } [-\pi, \pi] \text{ and correspondingly four values of } \beta. \text{ Hence there are four sets of } (\alpha, \beta).
24. (a) 
\[ 2 \sin^2 \theta - 5 \sin \theta + 2 > 0 \]
\[ \Rightarrow \ (\sin \theta - 2) (2 \sin \theta - 1) > 0 \]
\[ \Rightarrow \ \sin \theta < \frac{1}{2} \quad \text{[.: -1 \leq \sin \theta \leq 1]} \]

From graph, we get 
\[ x \in \left( 0, \frac{\pi}{6} \right) \cup \left( \frac{5\pi}{6}, 2\pi \right) \]

25. (b) 
\[ \therefore \ \theta \in \left( 0, \frac{\pi}{4} \right) \Rightarrow \tan \theta < 1 \text{ and } \cot \theta > 1 \]

Let \( \tan \theta = 1 - x \) and \( \cot \theta = 1 + y \)
Where \( x, y > 0 \) and are very small, then
\[ t_1 = (1-x)^{1-x}, \ t_2 = (1-x)^{1+x}, \ t_3 = (1+y)^{1-x}, \ t_4 = (1+y)^{1+y} \]

Clearly, \( t_4 > t_3 \) and \( t_1 > t_2 \) also, \( t_3 > t_1 \) \text{NOTE THIS STEP}
Thus \( t_4 > t_3 > t_1 > t_2 \)

26. (c) 
\[ 2 \sin^2 \theta - \cos 2\theta = 0 \Rightarrow 1 - 2 \cos 2\theta = 0 \]
\[ \Rightarrow \ \cos 2\theta = \frac{1}{2} \Rightarrow 2\theta = 3\pi \cdot \frac{5\pi}{3}, \ \frac{11\pi}{3} \]
\[ \Rightarrow \ \theta = \frac{5\pi}{6}, \ \frac{7\pi}{6} \quad \text{[..]} \]

where \( \theta \in [0, 2\pi] \)

Also \( 2 \cos^2 \theta - 3 \sin \theta = 0 \)
\[ \Rightarrow 2 \sin^2 \theta + 3 \sin \theta - 2 = 0 \]
\[ \Rightarrow (2 \sin \theta - 1)(\sin \theta + 2) = 0 \Rightarrow \sin \theta = \frac{1}{2} \]
\[ \text{[.: \sin \theta \neq -2]} \]

\[ \Rightarrow \ \theta = \frac{\pi}{6}, \ \frac{5\pi}{6} \quad \text{[..]} \text{, where } \theta \in [0, 2\pi] \]

Combining (1) and (2), we get \( \theta = \frac{\pi}{6}, \ \frac{5\pi}{6} \)

\[ \therefore \text{ Two solutions are there.} \]

27. (d) 
\[ \sin x + 2 \sin 2x - \sin 3x = 3 \]
\[ \Rightarrow \ \sin x + 4 \sin x \cos x - 3 \sin x + 4 \sin^3 x = 3 \]
\[ \Rightarrow \ \sin x (-2 + 2 \cos x + 4 \sin^2 x) = 3 \]
\[ \Rightarrow \ \sin x (-2 + 2 \cos x + 4 - 4 \cos^2 x) = 3 \]
\[ \Rightarrow \ 2 + 2 \cos x - 4 \cos^2 x = \frac{3}{\sin x} \]

28. (c) 
\[ \sqrt{3} \sec x + \cosec x + 2 (\tan x - \cot x) = 0 \]
\[ \Rightarrow \ \frac{\sqrt{3}}{2} \sin x + \frac{1}{2} \cos x = \cos^2 x - \sin^2 x \]
\[ \Rightarrow \ \cos \left( x - \frac{\pi}{3} \right) = \cos 2x \Rightarrow x - \frac{\pi}{3} = 2n\pi \pm 2x \]
\[ \Rightarrow x = \frac{2n\pi}{3} + \frac{\pi}{9} \text{ or } -x = -2n\pi - \frac{\pi}{3} \]

For \( x \in S, n = 0 \Rightarrow x = \frac{\pi}{9} - \frac{\pi}{3} \)
\[ \text{Sum of all values of } x = \frac{\pi}{9} + \frac{7\pi}{9} + \frac{5\pi}{9} = 0 \]

29. (e) 
\[ \sum_{k=1}^{13} \frac{1}{\sin \left( \frac{\pi}{4} + (k-1)\frac{\pi}{6} \right) \cdot \sin \left( \frac{\pi}{4} + k\frac{\pi}{6} \right)} \]
\[ = \sum_{k=1}^{13} \frac{1}{\sin \frac{\pi}{6} \cdot \sin \left( \frac{\pi}{4} + (k-1)\frac{\pi}{6} \right) \cdot \sin \left( \frac{\pi}{4} + k\frac{\pi}{6} \right)} \]

\[ \sum_{k=1}^{13} 2 \left[ \cot \left( \frac{\pi}{4} + (k-1)\frac{\pi}{6} \right) - \cot \left( \frac{\pi}{4} + k\frac{\pi}{6} \right) \right] \]
\[ = 2 \left[ \left( \cot \frac{\pi}{4} - \cot \frac{\pi}{6} \right) + \left( \cot \frac{\pi}{4} + \cot \frac{13\pi}{6} \right) \right] \]
\[ \text{[..]} \]
\[ = 2 \left( \frac{\pi}{9} \right) \left( \frac{5\pi}{12} \right) = 2 \left( 1 - \cot 5\pi \right) \]
\[ = 2 \left( 1 - \frac{\sqrt{3} - 1}{\sqrt{3} + 1} \right) = 2 \left( \sqrt{3} - 1 \right) \]
D. MCQs with ONE or MORE THAN ONE Correct

1. (c) We have,
\[
(1 + \cos \pi/8)(1 + \cos 3\pi/8)(1 + \cos 5\pi/8)(1 + \cos 7\pi/8)
= (1 + \cos \pi/8)(1 + \cos 3\pi/8)(1 + \cos (\pi - 3\pi/8))
\]
\[
= (1 + \cos \pi/8)(1 + \cos 3\pi/8)(1 - \cos 3\pi/8)(1 - \cos \pi/8)
= (1 - \cos^2 \pi/8)(1 - \cos^2 3\pi/8) = \sin^2 \pi/8 \sin^2 3\pi/8
\]
\[
= \frac{1}{4} [2 \sin \pi/8 \sin (\pi/2 - \pi/8)]^2
\]
\[
= \frac{1}{4} [2 \sin \pi/8 \cos \pi/8]^2 = \frac{1}{4} \sin^2 \pi/8 = \frac{1}{4} \times \frac{1}{2} = \frac{1}{8}
\]
\[\therefore \text{(c) is the correct answer.}\]

2. (b) The given expression is
\[
= 3 \left[ \sin^4 \left(\frac{3\pi}{2} - \alpha\right) + \sin^4 (3\pi + \alpha) \right] - 2 \sin^6 (\pi/2 + \alpha) + \sin^6 (5\pi - \alpha)
\]
\[
= 3 \left[ \cos^4 \alpha + \sin^4 \alpha \right] - 2 \left[ \cos^6 \alpha + \sin^6 \alpha \right]
= 3 \left[ \left( \cos^2 \alpha + \sin^2 \alpha \right)^2 - 2 \sin^2 \alpha \cos^2 \alpha \right]
- 2 \left[ \cos^2 \alpha + \sin^2 \alpha \right]^3 - 3 \cos^2 \alpha \sin^2 \alpha \left( \cos^2 \alpha + \sin^2 \alpha \right)
\]
\[
= 3 \left[ 1 - 2 \sin^2 \alpha \cos^2 \alpha \right] - 2 \left[ 1 - 3 \cos^2 \alpha \sin^2 \alpha \right]
= 3 - 6 \sin^2 \alpha \cos^2 \alpha - 2 + 6 \sin^2 \alpha \cos^2 \alpha = 1
\]

3. (d) Since \(a_1 + a_2 \cos 2x + a_3 \sin^2 x = 0\) for all \(x\)
Putting \(x = 0\) and \(x = \pi/2\), we get \(a_1 + a_2 = 0\) .....(1)
and \(a_1 - a_2 + a_3 = 0\) .....(2)
\[\Rightarrow \quad a_2 = -a_1 \quad \text{and} \quad a_3 = -2a_1\]

\[\therefore \text{The given equation becomes}\]
\[a_1 \cos 2x - 2a_1 \sin^2 x = 0, \forall x\]
\[\Rightarrow \quad a_1 (1 - \cos 2x - 2 \sin^2 x) = 0, \forall x\]
\[\Rightarrow \quad a_1 (2 \sin^2 x - 2 \sin^2 x) = 0, \forall x\]
The above is satisfied for all values of \(a_1\),
Hence infinite number of triplets \((a_1, -a_1, -2a_1)\) are possible.

4. (a, c) We have
\[
\begin{vmatrix}
1 + \sin^2 \theta & \cos^2 \theta & 4 \sin 4\theta \\
\sin^2 \theta & 1 + \cos^2 \theta & 4 \sin 4\theta \\
\sin^2 \theta & \cos^2 \theta & 1 + 4 \sin 4\theta \\
\end{vmatrix} = 0
\]
Operating \(C_1 \rightarrow C_1 + C_2\)
\[
= \begin{vmatrix}
2 \cos^2 \theta & 4 \sin 4\theta \\
1 + \cos^2 \theta & 4 \sin 4\theta \\
1 \cos^2 \theta & 1 + 4 \sin 4\theta \\
\end{vmatrix} = 0
\]
Operating \(R_1 \rightarrow R_1 - R_2; R_2 \rightarrow R_2 - R_3\)
\[
\begin{vmatrix}
0 & -1 & 0 \\
1 & 1 & -1 \\
1 \cos^2 \theta & 1 + 4 \sin 4\theta & 0 \\
\end{vmatrix} = 0
\]
Expanding along \(R_1\) we get \([1 + 4 \sin 4\theta + 1] = 0\)
\[\Rightarrow \quad 2 (1 + 2 \sin 4\theta) = 0 \Rightarrow \sin 4\theta = -\frac{1}{2}\]
\[\Rightarrow \quad 4\theta = \pi + \pi/6 \quad \text{or} \quad 2\pi - \pi/6\]
\[\Rightarrow \quad 4\theta = 7\pi/6 \quad \text{or} \quad 11\pi/6\]
\[\Rightarrow \quad \theta = \pi/24 \quad \text{or} \quad 11\pi/24\]

5. (d) \(2 \sin^2 x + 3 \sin x - 2 > 0\)
\((2 \sin x - 1)(\sin x + 2) > 0\)
\[\Rightarrow \quad 2 \sin x - 1 > 0 \quad (\because -1 \leq \sin x \leq 1)\]
\[\Rightarrow \quad \sin x > 1/2 \Rightarrow x \in (\pi/6, 5\pi/6) \quad ...(1)\]
Also \(x^2 - x - 2 < 0\)
\[\Rightarrow \quad (x-2)(x+1) < 0 \Rightarrow -1 < x < 2 \quad ...(2)\]
Combining (1) and (2) \(x \in (\pi/6, 2)\).

6. (c) \(\sin \alpha + \sin \beta + \sin \gamma = 2 \sin \alpha + \beta \cos \alpha - \beta + 2 \sin \gamma \cos \gamma = 2\sin \left(\frac{\alpha + \beta}{2}\right) \cos \left(-\frac{\alpha - \beta}{2}\right) + 2 \sin \left(\frac{\gamma - \alpha + \beta}{2}\right) \cos \left(-\frac{\gamma}{2}\right)\]
\[= 2 \cos \frac{\gamma}{2} \left[ \cos \frac{\alpha - \beta}{2} + \cos \frac{\alpha + \beta}{2} \right] \cos \gamma \]
\[= 2 \cos \frac{\gamma}{2} \cos \beta / 2 \cos \gamma / 2\]
\[\therefore \text{Each} \cos \alpha / 2, \cos \beta / 2, \cos \gamma / 2 \text{lies between} -1 \text{and 1, therefore} -1 \leq \cos \alpha / 2, \cos \beta / 2, \cos \gamma / 2 \leq 1\]
\[\Rightarrow -2 \leq \cos \alpha / 2, \cos \beta / 2, \cos \gamma / 2 \leq 2\]
\[\Rightarrow -2 \leq \cos \alpha + \cos \beta + \cos \gamma \leq 2\]
\[\therefore \text{min value} = -2\]

7. (c) \(3 \sin^2 x - 7 \sin x + 2 = 0\), put \(\sin x = s\)
\[\Rightarrow \quad (s-2)(3s-1) = 0 \Rightarrow s = 1/3\]
\(s = 2\) is not possible.

Number of solutions of \(\sin x = \frac{1}{3}\) from the following graph is 6 between \([0, 5\pi]\)
8. (e) We know that $\sin 15^\circ = \frac{\sqrt{3} - 1}{2\sqrt{2}}$ (irrational)

$$\cos 15^\circ = \frac{\sqrt{3} + 1}{2\sqrt{2}}$$ (irrational)

$$\sin 15^\circ \cdot \cos 15^\circ = \frac{1}{2} (2 \sin 15^\circ \cos 15^\circ)$$

$$= \frac{1}{2} \sin 30^\circ = \frac{1}{4}$$ (rational)

$$\sin 15^\circ \cos 75^\circ = \sin 15^\circ \cos (90^\circ - 15^\circ)$$

$$= \sin 15^\circ \sin 15^\circ = \sin^2 15^\circ = \frac{1}{2} (1 + \cos 30^\circ)$$

$$= \frac{1}{2} \left(1 - \frac{\sqrt{3}}{2}\right)$$ (irrational)

9. (a, b, c, d) $E = f_0(\theta) = \frac{\sin(\theta/2)}{\cos(\theta/2)}$

$$= \left[\frac{2\cos^2(\theta/2)}{\cos \theta} \cdot \frac{2\cos^2 \theta}{\cos 20} \cdot \frac{2\cos^2 20}{\cos 40} \cdot \frac{2\cos^2 2\theta}{\cos 2n\theta}\right]$$

$$= \frac{\sin \theta}{\cos \theta} \left[\frac{2\cos^2 \theta}{\cos 2\theta} \cdot \frac{2\cos^2 2\theta}{\cos 4\theta} \cdot \frac{2\cos^2 2n\theta}{\cos 2n\theta}\right] = \tan 2^n \theta.$$

$n = 2, 0 = \frac{\pi}{16}$

$$f_2 \left(\frac{\pi}{16}\right) = \tan 4 \frac{\pi}{16} = \tan \frac{\pi}{4} = 1.$$

Similarly, $f_3 \left(\frac{\pi}{32}\right), f_4 \left(\frac{\pi}{64}\right)$ and $f_5 \left(\frac{\pi}{128}\right)$ is $\tan \frac{\pi}{4} = 1.$

10. (a, b) Given that

$$\frac{\sin^4 x + \cos^4 x}{2} = \frac{1}{5} \Rightarrow 3\sin^4 x + 2\cos^4 x = \frac{6}{5}$$

$$\Rightarrow \sin^4 x + 2[\sin^4 x + \cos^4 x] = \frac{6}{5}$$

$$\Rightarrow \sin^4 x + 2[1 - 2\sin^2 x \cos^2 x] = \frac{6}{5}$$

$$\Rightarrow \sin^4 x + 2 - 4\sin^2 x(1 - \sin^2 x) = \frac{6}{5}$$

$$\Rightarrow 5\sin^4 x - 4\sin^2 x + 2 - \frac{6}{5} = 0$$

$$\Rightarrow 25\sin^4 x - 20\sin^2 x + 4 = 0$$

$$\Rightarrow (5\sin^2 x - 2)^2 = 0 \Rightarrow \sin^2 x = \frac{2}{5}$$

$$\Rightarrow \cos^2 x = \frac{3}{5} \text{ and } \tan^2 x = \frac{2}{3}$$

Also, $\frac{\sin^8 x + \cos^8 x}{27} = \frac{2}{625} + \frac{3}{625} = \frac{5}{625} = \frac{1}{125}$

11. (c, d) We have

$$\sum_{m=1}^{6} \csc \left[\theta + \frac{(m-1)\pi}{4}\right] \csc \left[\theta + \frac{m\pi}{4}\right] = 4\sqrt{2}$$

$$\Rightarrow \sum_{m=1}^{6} \frac{\sin \frac{\pi}{4}}{\sin \left[\theta + \frac{(m-1)\pi}{4}\right] \sin \left[\theta + \frac{m\pi}{4}\right]} = 4$$

$$\Rightarrow \sum_{m=1}^{6} \frac{\sin \left[\theta + \frac{m\pi}{4}\right] - \sin \left[\theta + \frac{(m-1)\pi}{4}\right]}{\sin \left[\theta + \frac{(m-1)\pi}{4}\right] \sin \left[\theta + \frac{m\pi}{4}\right]} = 4$$

$$\Rightarrow \sum_{m=1}^{6} \frac{\sin \left[\theta + \frac{m\pi}{4}\right] \cos \left[\theta + \frac{(m-1)\pi}{4}\right]}{\cos \left[\theta + \frac{(m-1)\pi}{4}\right] \sin \left[\theta + \frac{m\pi}{4}\right]} = 4$$

$$\Rightarrow \sum_{m=1}^{6} \frac{-\cos \left[\theta + \frac{m\pi}{4}\right] \sin \left[\theta + \frac{(m-1)\pi}{4}\right]}{\sin \left[\theta + \frac{(m-1)\pi}{4}\right] \sin \left[\theta + \frac{m\pi}{4}\right]} = 4$$

$$\Rightarrow \cot \left[\theta + \frac{(m-1)\pi}{4}\right] - \cot \left[\theta + \frac{m\pi}{4}\right] = 4$$

$$\Rightarrow \cot \left(\cot \left[\theta + \frac{\pi}{4}\right] + \cot \left[\theta + \frac{\pi}{4}\right] - \cot \left[\theta + \frac{2\pi}{4}\right]\right)$$

$$+ \ldots + \left[\cot \left(\theta + \frac{5\pi}{4}\right) - \cot \left(\theta + \frac{6\pi}{4}\right)\right] = 4$$

$$\Rightarrow \cot \theta - \cot \left(\theta + \frac{3\pi}{2}\right) = 4 \Rightarrow \cot \theta + \tan \theta = 4$$

$$\Rightarrow \cos^2 \theta + \sin^2 \theta = 4 \sin \theta \cos \theta$$

$$\Rightarrow \sin 2\theta = \frac{1}{2} \Rightarrow 2\theta = \frac{\pi}{6} \text{ or } \frac{5\pi}{6} \Rightarrow \theta = \frac{\pi}{12} \text{ or } \frac{5\pi}{12}.$$
12. \((a, c, d)\)

As \(\tan(2\pi - \theta) > 0 \Rightarrow -\tan \theta > 0 \Rightarrow \tan \theta < 0\)

\[\therefore \theta \in \text{II or IV quadrant} \quad \ldots (1)\]

And \(-1 < \sin \theta < -\frac{\sqrt{3}}{2}\)

\[\Rightarrow \theta \in \text{III or IV quadrant} \quad \ldots (2)\]

Also \(\theta \in [0, 2\pi]\)

\[\Rightarrow \theta \in \text{IV quadrant and more precisely} \quad \frac{3\pi}{2} < \theta < \frac{5\pi}{3}\]

\[\therefore -1 < \sin \theta < -\frac{\sqrt{3}}{2}\]

Now,

\[2 \cos \theta (1 - \sin \phi) = \sin^2 \theta (\tan \theta/2 + \cot \theta/2) \cos \phi - 1\]

\[\Rightarrow 2 \cos \theta (1 - \sin \phi) = \sin^2 \theta \times \frac{1}{\sin \theta/2 \cos \theta/2} \cdot \cos \phi - 1\]

\[\Rightarrow 2 \cos \theta (1 - \sin \phi) = 2 \sin \theta \cos \phi - 1\]

\[\Rightarrow 2 \cos \theta + 1 = 2 \sin (\theta + \phi)\]

\[\therefore \theta \in \left[\frac{3\pi}{2}, \frac{5\pi}{3}\right] \quad \therefore 2 \cos \theta + 1 \in (1, 2)\]

\[\Rightarrow 1 < 2 \sin (\theta + \phi) < 2\]

\[\Rightarrow \frac{1}{2} < \sin (\theta + \phi) < 1 \Rightarrow \theta + \phi \in \left(\frac{\pi}{6}, \frac{5\pi}{6}\right)\]

or \(\theta + \phi \in \left(2\pi + \frac{\pi}{6}, 2\pi + \frac{5\pi}{6}\right)\) or \(\left(\frac{13\pi}{6}, \frac{17\pi}{6}\right)\)

But \(\theta \in \left[\frac{3\pi}{2}, \frac{5\pi}{3}\right] \) (as \(\theta + \phi \in [0, 4\pi]\))

\[\Rightarrow \frac{13\pi}{6} < \theta + \phi < \frac{17\pi}{6} \Rightarrow \frac{13\pi}{6} - \theta < \phi < \frac{17\pi}{6} - \theta\]

\[\Rightarrow \frac{13\pi}{6} - \theta_{\text{max}} < \phi < \frac{17\pi}{6} - \theta_{\text{min}}\]

\[\Rightarrow \frac{13\pi}{6} - \frac{5\pi}{3} < \phi < \frac{17\pi}{6} - \frac{3\pi}{2} \Rightarrow \frac{\pi}{2} < \phi < \frac{4\pi}{3}\]

13. (c)

Let \(f(x) = x^2 - x \sin x - \cos x\)

\[\Rightarrow f(x) = 2x - x \cos x = x(2 - \cos x)\]

\[\therefore f(x) \text{ is increasing on } (0, \infty) \text{ and decreasing on } (-\infty, 0)\]

Also \(\lim_{x \to -\infty} f(x) = \infty, \lim_{x \to \infty} f(x) = \infty \text{ and } f(0) = -1\)

\[\therefore y = f(x) \text{ meets x-axis twice.}\]

i.e., \(f(x) = 0 \) has two points in \((-\infty, \infty)\).

14. (b, c)

We have \(f(x) = x \sin x, x > 0\)

\[\Rightarrow f(x) = \sin x + x \cos x\]

\[\Rightarrow f(x) = 0 \Rightarrow \tan x = -x\]

\[\Rightarrow \cos (\alpha + \beta) = \frac{4}{5}\]

\[\Rightarrow \tan (\alpha + \beta) = \frac{3}{4}, 0 < \alpha, \beta < \frac{\pi}{4}\]
3. Given \( \alpha + \beta - \gamma = \pi \) and to prove that
\[
\sin^2 \alpha + \sin^2 \beta - \sin^2 \gamma = 2 \sin \alpha \sin \beta \cos \gamma
\]
L.H.S. = \( \sin^2 \alpha + \sin^2 \beta - \sin^2 \gamma \)
[Using \( \sin^2 A - \sin^2 B = \sin (A + B) \sin (A - B) \)]
\[
= \sin^2 \alpha + \sin (\beta + \gamma) \sin (\beta - \gamma)
- \sin^2 \alpha + \sin (\beta + \gamma) \sin (\beta - \gamma)
- \sin (\alpha - \beta - \gamma) \sin (\beta + \gamma)
- \sin (\alpha - \beta + \gamma) \sin (\beta + \gamma)
\]
\[
= \sin \alpha [2 \sin \beta \cos \gamma] = 2 \sin \alpha \sin \beta \cos \gamma = \text{R.H.S.}
\]

4. \( A = \left\{ x : \frac{\pi}{6} \leq x \leq \frac{\pi}{3} \right\} \)
\[
f(x) = \cos x - x (1 + x)
\]
\[
f'(x) = -\sin x - 1 - 2x < 0, \quad \forall x \in A
\]
\[
\therefore f \text{ is a decreasing function.}
\]
\[
\therefore \text{ as } \frac{\pi}{6} \leq x \leq \frac{\pi}{3} \implies f\left(\frac{\pi}{3}\right) \leq f(x) \leq f\left(\frac{\pi}{6}\right)
\]
\[
\Rightarrow \cos \frac{\pi}{3} \left( 1 + \frac{\pi}{3} \right) \leq f(x) \leq \cos \frac{\pi}{6} \left( 1 + \frac{\pi}{6} \right)
\]
\[
\therefore f(A) = \left[ \frac{1}{2} - \frac{\pi}{3} \left( 1 + \frac{\pi}{3} \right), \frac{\sqrt{3}}{2} - \frac{\pi}{6} \left( 1 + \frac{\pi}{6} \right) \right]
\]

5. We have
\[
\cos \theta + \sin \theta = \sqrt{2} \left[ \frac{1}{\sqrt{2}} \cos \theta + \frac{1}{\sqrt{2}} \sin \theta \right]
\]
\[
= \sqrt{2} \sin (\pi/4 + \theta)
\]
\[
\therefore \cos \theta + \sin \theta \leq \sqrt{2} < \pi/2 \quad \left( : \frac{\sqrt{2}}{1.414} = 1.17 \right)
\]
\[
\therefore \cos \theta + \sin \theta < \pi/2 - \sin \theta
\]
As \( \theta \in [0, \pi/2] \) in which \( \sin \theta \) increases.
\[
\therefore \text{ taking sin on both sides of eq. (1), we get}
\]
\[
\sin (\cos \theta) < \sin (\pi/2 - \sin \theta)
\]
\[
\sin (\cos \theta) < \cos (\sin \theta)
\]
\[
\Rightarrow \cos (\sin \theta) > \sin (\cos \theta) \quad \text{(1)}
\]
Hence the result.

6. L.H.S. = \( \sin 12^\circ \sin 48^\circ \sin 54^\circ = \frac{1}{2} \left[ 2 \sin 12^\circ \cos 42^\circ \right] \sin 54^\circ \)
\[
= \frac{1}{2} \sin^2 54^\circ - \frac{1}{2} \sin 54^\circ = \frac{1}{4} \left[ 2 \sin^2 54^\circ - \sin 54^\circ \right]
\]
Now we know that \( \sin 54^\circ = \frac{1 + \sqrt{5}}{4} \)
\[
\therefore \text{ we get, } \frac{1}{4} \left[ 2 \left( \frac{1 + \sqrt{5}}{4} \right)^2 - \frac{1 + \sqrt{5}}{4} \right]
\]
\[
= \frac{1}{4} \left[ 2 \left( \frac{1 + 5 + 2 \sqrt{5}}{16} \right) - \frac{1 + \sqrt{5}}{4} \right]
\]
\[
= \frac{1}{4} \times \frac{1}{8} \left[ 6 + 2 \sqrt{5} - 2 - 2 \sqrt{5} \right]
\]
\[
= \frac{1}{32} \times 4 = \frac{1}{8} = \text{R.H.S.}
\]

7. We know that,
\[
\cos A \cos 2A \cos 4A \ldots \cos 2^n A = \frac{1}{2^n + 1} \sin (2^{n+1} A)
\]
\[
\therefore 16 \cos \frac{2\pi}{15} \cos \frac{2\pi}{15} \cos \frac{2\pi}{15} \cos \frac{2\pi}{15} \cos \frac{2\pi}{15} \cos \frac{2\pi}{15}
\]
\[
= 16 \cdot \frac{\sin \frac{4\pi}{A}}{2^n A} \quad \text{(where } A = 2\pi/15)\]
\[
= 16 \cdot \frac{\sin \frac{32\pi}{15}}{16 \sin \frac{2\pi}{15}} = \frac{\sin (32\pi / 15)}{\sin (2\pi + 2\pi / 15)} = \frac{\sin (32\pi / 15)}{\sin (32\pi / 15)} = 1
\]

8. Given eq. is,
\[
4 \cos^2 x \sin x - 2 \sin^2 x = 3 \sin x
\]
\[
\Rightarrow 4 \cos^2 x \sin x - 2 \sin^2 x - 3 \sin x = 0
\]
\[
\Rightarrow 4(1 - \sin^2 x) \sin x - 2 \sin^2 x - 3 \sin x = 0
\]
\[
\Rightarrow \sin x [4 \sin^2 x + 2 \sin x - 1] = 0
\]
\[
\Rightarrow \text{ either } \sin x = 0 \text{ or } 4 \sin^2 x + 2 \sin x - 1 = 0
\]
\[
\text{If } \sin x = 0 \Rightarrow x = n\pi
\]
\[
\Rightarrow \text{ If } 4 \sin^2 x + 2 \sin x - 1 = 0 \Rightarrow \sin x = \frac{-1 \pm \sqrt{5}}{4}
\]
\[
\text{If } \sin x = \frac{-1 + \sqrt{5}}{4} = \sin 18^\circ = \sin \frac{\pi}{10}
\]
\[
\text{then } x = n\pi + (-1)^n \frac{\pi}{10}
\]
\[
\text{If } \sin x = \frac{-1 - \sqrt{5}}{4} = \sin (-54^\circ) = \sin \left( -\frac{3\pi}{10} \right)
\]
\[
\text{then } x = n\pi + (-1)^n \left( -\frac{3\pi}{10} \right)
\]
Hence, \( x = n\pi, n\pi + (-1)^n\frac{\pi}{10} \) or \( n\pi + (-1)^n\frac{-3\pi}{10} \)

where \( n \) is some integer

9. The given equation is
\[
8\left(1 + |\cos x| + |\cos^2 x| + |\cos^3 x| + \ldots\right) = 4^3
\]
\[
\Rightarrow 2^3(1 + |\cos x| + |\cos^2 x| + |\cos^3 x| + \ldots) = 2^6
\]
\[
\Rightarrow 3(1 + |\cos x| + |\cos^2 x| + |\cos^3 x| + \ldots) = 6
\]
\[
\Rightarrow 1 + |\cos x| + |\cos^2 x| + |\cos^3 x| + \ldots = 2
\]
\[
\Rightarrow \frac{1}{1 - |\cos x|} = 2 \quad \text{NOTE THIS STEP}
\]
\[
\Rightarrow 1 - \cos x = 1/2 \quad \Rightarrow |\cos x| = \frac{1}{2}
\]
\[
\Rightarrow x = \pi/3, -\pi/3, 2\pi/3, -2\pi/3, \ldots
\]
The values of \( x \in (-\pi, \pi) \) are \( \pm \pi/3, \pm 2\pi/3 \).

10. We know that \( \tan 2\alpha = \frac{2\tan \alpha}{1 - \tan^2 \alpha} \)
\[
\Rightarrow \frac{1 - \tan^2 \alpha}{\tan \alpha} = 2 \cot 2\alpha \Rightarrow \cot \alpha - \tan \alpha = 2 \cot 2\alpha
\]
Now we have to prove
\[
\tan \alpha + 2 \tan 2\alpha + 4 \tan 4\alpha + 8 \cot 8\alpha = \cot \alpha
\]
\[
\text{LHS}
\]
\[
= \tan \alpha + 2 \tan 2\alpha + 4 \tan 4\alpha + 8 \cot 8\alpha
\]
\[
= \tan \alpha + 2 \tan 2\alpha + 4 \tan 4\alpha + 8 (\cot 4\alpha - \tan 4\alpha)
\]
[Using (1)]
\[
= \tan \alpha + 2 \tan 2\alpha + 4 \tan 4\alpha + 4 \cot 4\alpha - 4 \tan 4\alpha
\]
\[
= \tan \alpha + 2 \tan 2\alpha + 2 (2 \cot 2\alpha + 2 \tan 2\alpha)
\]
\[
= \tan \alpha + 2 \tan 2\alpha + 2 (\cot \alpha - \tan 2\alpha)
\]
\[
= \tan \alpha + 2 \tan 2\alpha + 2 (2 \cot 2\alpha)
\]
[Using (1)]
\[
= \tan \alpha + 2 \cot 2\alpha
\]
\[
= \tan \alpha + (\cot \alpha - \tan \alpha)
\]
[Using (1)]
\[
= \cot \alpha = \text{RHS}.
\]

11. Given that in \( \triangle ABC \), \( A \), \( B \) and \( C \) are in A.P.
\( \therefore A + C = 2B \)
also \( A + B + C = 180^\circ \) \( \Rightarrow B + 2B = 180^\circ \) \( \Rightarrow B = 60^\circ \)
Also given that, \( \sin (2A + B) = \sin (C - A) = -\sin (B + 2C) = \frac{1}{2} \)
\[
\Rightarrow \sin (2A + 60^\circ) = \sin (C - A) = -\sin (60 + 2C) = \frac{1}{2} \quad \text{...(1)}
\]
From eq. (1), we have
\[
\sin (2A + 60^\circ) = \frac{1}{2} \Rightarrow 2A + 60^\circ = 30^\circ, 150^\circ
\]
but \( A \) cannot be \(-ve\)
\( \therefore 2A + 60^\circ = 150^\circ \) \( \Rightarrow 2A = 90^\circ \) \( \Rightarrow A = 45^\circ \)
Again from (1) \( \sin (60^\circ + 2C) = -\frac{1}{2} \)
\[\Rightarrow 60^\circ + 2C = 210^\circ \quad \text{or} \quad 330^\circ
\]
\[\Rightarrow C = 75^\circ \quad \text{or} \quad 135^\circ
\]

Also from (1) \( \sin (C - A) = \frac{1}{2} \Rightarrow C - A = 30^\circ, 150^\circ \)
For \( A = 45^\circ, C = 75^\circ \) or \( 195^\circ \) (not possible) \( \therefore C = 75^\circ \)
Hence we have \( A = 45^\circ, B = 60^\circ, C = 75^\circ \).

12. Let \( y = \exp [\sin^2 x + \sin^4 x + \sin^6 x + \ldots \infty] \ln 2 \)
\[
= e^{\ln \left(2\sin^4 x + \sin^6 x + \ldots \infty\right)}
\]
\[
= \frac{\sin^2 x}{1 - \sin^2 x}
\]
As \( y \) satisfies the eq.
\[
x^2 - 9x + 8 = 0 \quad \therefore y^2 - 9y + 8 = 0
\]
\[
\Rightarrow (y - 1)(y - 8) = 0 \Rightarrow y = 1, 8
\]
\[
\Rightarrow 2\tan^2 x = 1 \quad \text{or} \quad 2\tan^2 x = 8
\]
\[
\Rightarrow \tan^2 x = 0 \quad \text{or} \quad \tan^2 x = 3
\]
\[
\Rightarrow \tan x = 0 \quad \text{or} \quad \tan x = \pm\sqrt{3}
\]
\( \Rightarrow x = 0 \quad \text{or} \quad x = \pi/3, 2\pi/3
\]
But given that \( 0 < x < \pi/2 \) \( \Rightarrow x = \pi/3 \)
\[
\therefore \frac{\sin x}{\cos x + \sin x} = \frac{1}{1 + \tan x} = \frac{1}{1 + \sqrt{3}} = \frac{\sqrt{3} - 1}{2}
\]

13. Let \( y = \frac{\tan x}{\tan 3x} \Rightarrow y = \frac{\tan x(1 - \tan^2 x)}{3\tan x - \tan^3 x}
\]
\[
\Rightarrow 3y - 3\tan^2 x = 1 - 3\tan^2 x
\]
\[
\Rightarrow (y - 3)\tan^2 x = 3y - 1 \Rightarrow \tan^2 x = \frac{3y - 1}{y - 3}
\]
\[
\Rightarrow \frac{3y - 1}{y - 3} > 0 \quad \text{L.H.S. being a prefect square}
\]
\[
\Rightarrow (y - 3)^2 > 0 \Rightarrow (3y - 1)(y - 3) > 0
\]
\[
\Rightarrow y < \frac{1}{3} \quad \text{or} \quad y > 3
\]
Thus \( y \) never lies between \( \frac{1}{3} \) and 3.

14. Given that,
\[
\frac{\tan (x + 10^\circ)}{\tan x} = \tan (x + 50^\circ) \tan (x - 50^\circ)
\]
\[
\Rightarrow \frac{\sin (x + 10^\circ)\cos x}{\cos (x + 10^\circ)\sin x} = \frac{\sin (x + 50^\circ)\sin (x - 50^\circ)}{\cos (x + 50^\circ)\cos (x - 50^\circ)}
\]
\[
\Rightarrow \sin (2x + 100^\circ) + \sin 100^\circ = \frac{\sin (x + 100^\circ)\cos x}{\cos (x + 100^\circ)\sin x} = \frac{\cos 100^\circ - \cos 2x}{\cos (x + 100^\circ) - \sin 100^\circ} = \frac{\cos 100^\circ - \cos 2x}{\sin (x + 100^\circ) - \cos 100^\circ} = \frac{\cos 100^\circ - \cos 2x}{\sin (x + 100^\circ) - \cos 100^\circ}
\]
Applying componendo and dividendo, we get
\[ 2 \sin(2x + 100^\circ) \sin 100^\circ \]
\[ 2 \sin 2x = -2 \sin 100^\circ \cos 100^\circ \]
\[ 2 \sin 2x = -2 \sin 200^\circ \]
\[ 2 \cos(4x + 100^\circ) \cos 100^\circ = -2 \cos 20^\circ \]
\[ 2 \cos(4x + 100^\circ) = -2 \cos 20^\circ - \cos 10^\circ \]
\[ 2 \cos (4x + 100^\circ) = 2 \cos 20^\circ - \cos 80^\circ \]

\[ = -2 \cos 50^\circ \sin 30^\circ = -2 \cos 50^\circ \cdot \frac{1}{2} \sin 50^\circ = \cos 130^\circ \]
\[ 4x + 100^\circ = 130^\circ \Rightarrow x = 30^\circ \]

15. Given that \( \cos \theta = \sin \phi \)
where \( \theta = p \sin x \), \( \phi = p \cos x \)

Above is possible when both \( \theta = \phi = \frac{5\pi}{4} \) or \( \theta = \phi = \frac{5\pi}{4} \)

\[ p \sin x = \frac{\pi}{4} \quad \text{or} \quad p \sin x = \frac{5\pi}{4} \]
and \( p \cos x = \frac{\pi}{4} \quad \text{or} \quad p \cos x = \frac{5\pi}{4} \)

Squaring and adding, \( p^2 = \frac{\pi^2}{16} + 2 \cdot \frac{25\pi^2}{16} \cdot 2 \)

\[ p = \frac{\pi}{4} \quad \text{or} \quad p = \frac{\pi^2}{4} \quad \text{only for least positive value} \]

16. Given : \((1 - \tan \theta) (1 + \tan \theta) \sec^2 \theta + 2 \tan^2 \theta = 0 \)

or \( (1 - \tan^2 \theta) (1 + \tan^2 \theta) + 2 \tan^2 \theta = 0 \)

Let us put \( \tan^2 \theta = t \)
\[ (1 - t)(1 + t) + 2t = 0 \quad \text{or} \quad 1 - t^2 + 2t = 0 \]
It is clearly satisfied by \( t = 3 \).

as \(-8 + 8 = 0 \quad \therefore \quad \tan^2 \theta = 3 \)

\[ p = \pm \sqrt{3} \quad \text{in the given interval.} \]

17. Let \( y = \frac{\sin 3x \cos x}{\sin 3x \cos x} = \frac{\tan x}{\tan 3x} \)

We have \( y = \frac{\tan x}{3 \tan x - \tan^3 x} = \frac{1 - 3 \tan^2 x}{3 - \tan^2 x} \)

(the expression is not defined if \( \tan x = 0 \))
\[ 3y - (\tan^2 x) y = 1 - 3 \tan^2 x \Rightarrow 3y - y = (y - 3) \tan^2 x \]

\[ \tan^2 x = \frac{3y - 1}{y - 3} \]

Since \( \tan^2 x > 0 \), we get \( (3y - 1) (y - 3) > 0 \)
\[ \left( y - \frac{1}{3} \right) (y - 3) > 0 \Rightarrow y < \frac{1}{3} \quad \text{or} \quad y > 3 \]

This shows that \( y \) cannot lie between \( \frac{1}{3} \) and \( 3 \).

18. Expanding the sigma on putting \( k = 1, 2, 3, \ldots, n \)

\[ S = (n-1) \cos \frac{2\pi}{n} + (n-2) \cos \frac{2\pi}{n} + \ldots \]

\[ + 1. \cos \frac{2\pi}{n} \cos \frac{2\pi}{n} \ldots \ldots (1) \]

We know that \( \cos \theta = \cos (2\pi - \theta) \)
Replacing each angle \( \theta \) by \( 2\pi - \theta \) in (1), we get

\[ S = (n-1) \cos \frac{2\pi}{n} \cos \frac{2\pi}{n} + (n-2) \cos \frac{2\pi}{n} + \ldots \]

\[ + 1. \cos \frac{2\pi}{n} \cos \frac{2\pi}{n} \ldots \ldots (2) \]

Add terms in (1) and (2) having the same angle and take \( n \) common

\[ 2S = n \left[ \cos \frac{2\pi}{n} + \cos \frac{4\pi}{n} + \cos \frac{6\pi}{n} + \ldots \ldots + \cos \frac{(n-1)\frac{2\pi}{n}}{n} \right] \]

Angles are in A.P. of \( d = \frac{2\pi}{n} \)

\[ 2S = \left[ \frac{\sin(n-1)\frac{\pi}{n}}{\sin \frac{\pi}{n}} \cdot \frac{2\pi}{n} \right] \]

\[ = n \cdot \cos \pi = -n \quad \because \cos (\pi - \theta) = \cos \theta \quad \therefore \quad S = -n/2 \]

19. We have, \( A + B + C = \pi \)
\[ \Rightarrow \frac{A}{2} + \frac{B}{2} + \frac{C}{2} = \frac{\pi}{2} \Rightarrow \frac{A}{2} + \frac{B}{2} = \frac{\pi}{2} - \frac{C}{2} \]

or \( \cot \left( \frac{A}{2} + \frac{B}{2} \right) = \cot \left( \frac{\pi}{2} - \frac{C}{2} \right) \)

\[ \Rightarrow \cot \frac{A}{2} - \cot \frac{B}{2} = \tan \frac{C}{2} \]

\[ \Rightarrow \frac{A}{2} + \cot \frac{B}{2} + \cot \frac{C}{2} = \cot \frac{A}{2} + \cot \frac{B}{2} \cdot \cot \frac{C}{2} \]

20. Given that, \( 2 \sin t = \frac{1 - 2x + 5x^2}{3x^2 - 2x - 1} \), \( t \in [-\pi/2, \pi/2] \)

This can be written as
\( (6 \sin t - 5)x^2 + 2(1 - 2 \sin t)x - (1 + 2 \sin t) = 0 \)

For given equation to hold, \( x \) should be some real number, therefore above equation should have real roots i.e., \( D \geq 0 \)
\[ \Rightarrow 4(1 - 2 \sin t)^2 + 4(6 \sin t - 5)(1 + 2 \sin t) \geq 0 \]
\[ \Rightarrow 16 \sin^2 t - 8 \sin t - 4 \geq 0 \Rightarrow (4 \sin^2 t - 2 \sin t - 1) \geq 0 \]
\[ \Rightarrow 4 \left( \sin t + \frac{\sqrt{5} + 1}{4} \right) \left( \sin t + \frac{\sqrt{5} - 1}{4} \right) \geq 0 \]
Trigonometric Functions & Equations

1. If \( \frac{13\pi}{48} < \alpha < \frac{14\pi}{48} \) then \( \frac{13\pi}{16} < 3\alpha < \frac{14\pi}{16} \)

and \( \frac{13\pi}{24} < 2\alpha < \frac{14\pi}{24} \)

\( \Rightarrow 3\alpha \in \text{II} \) or \( \text{III} \) quad and \( 2\alpha \in \text{II} \) quad.

\( \Rightarrow \) Nothing can be said about the sign of \( \frac{\sin 3\alpha}{\cos 2\alpha} \)

over this interval.

If \( \alpha = \left( \frac{18\pi}{48}, \frac{23\pi}{48} \right) \) then \( \frac{18\pi}{16} < 3\alpha < \frac{23\pi}{16} \)

and \( \frac{18\pi}{24} < 2\alpha < \frac{23\pi}{24} \)

\( \Rightarrow 3\alpha \in \text{III} \) quad and \( 2\alpha \in \text{II} \) quad

\( \Rightarrow \) Nothing can be said about the sign of \( \frac{\sin 3\alpha}{\cos 2\alpha} \)

over the given interval.

1. Integer Value Correct Type

1. The given equations are

\[ xy + z \cos \theta + 2y \sin \theta = 0 \]  \hspace{1cm} (1)

\[ xy + z \cos \theta + 2y \sin \theta = 0 \]  \hspace{1cm} (2)

\( \Rightarrow \) \( \sin \theta \leq -\frac{\sqrt{5} - 1}{4} \) or \( \sin \theta \geq \frac{\sqrt{5} + 1}{4} \)

\( \Rightarrow \) \( \sin \theta \leq \sin \left( -\frac{\pi}{10} \right) \) or \( \sin \theta \geq \sin \left( \frac{3\pi}{10} \right) \)

\( \Rightarrow \) \( t \leq -\frac{\pi}{10} \) or \( t \geq \frac{3\pi}{10} \)

(Notes that \( \sin x \) is an increasing function from \( -\pi/2 \) to \( \pi/2 \))

\( \therefore \) range of \( t \) is \( [-\pi/2, -\pi/10] \cup [3\pi/10, \pi/2] \).

F. Match the Following

1. (i) If \( \frac{13\pi}{48} < \alpha < \frac{14\pi}{48} \) \( \Rightarrow \) \( \frac{13\pi}{16} < 3\alpha < \frac{14\pi}{16} \)

and \( \frac{13\pi}{24} < 2\alpha < \frac{14\pi}{24} \)

\( \Rightarrow 3\alpha \in \text{II} \) or \( \text{III} \) quad and \( 2\alpha \in \text{II} \) quad

\( \Rightarrow \) Nothing can be said about the sign of \( \frac{\sin 3\alpha}{\cos 2\alpha} \)

over this interval.

If \( \alpha = \left( \frac{14\pi}{48}, \frac{18\pi}{48} \right) \) \( \Rightarrow \) \( \frac{14\pi}{16} < 3\alpha < \frac{18\pi}{16} \)

and \( \frac{14\pi}{24} < 2\alpha < \frac{18\pi}{24} \)

\( \Rightarrow 3\alpha \in \text{II} \) and \( 2\alpha \in \text{II} \) quad

\( \Rightarrow \) Nothing can be said about the sign of \( \frac{\sin 3\alpha}{\cos 2\alpha} \)

over the given interval.

1. Integer Value Correct Type

1. (3) The given equations are

\[ xy + z \cos \theta + 2y \sin \theta = 0 \]  \hspace{1cm} (3)

\( \Rightarrow \) \( \cos \theta - 2 \sin \theta \) \( y - (\cos \theta)z = 0 \)

which is homogeneous system of linear equation. But

\( y \neq 0, z \neq 0 \)

\( \therefore \) \( \frac{\cos \theta - 2 \sin \theta}{\sin \theta} = \frac{\cos \theta}{\cos \theta} \Rightarrow \cos \theta = \sin \theta \)

\( \Rightarrow \) \( \tan \theta = 1 \Rightarrow \theta = n\pi + \frac{\pi}{4} \Rightarrow \theta = (4n + 1)\frac{\pi}{12}, n \in \mathbb{Z} \)

For \( \theta \in (0, \pi) \) \( \Rightarrow \theta = \frac{5\pi}{12}, \frac{3\pi}{4}, \frac{3\pi}{4}, \frac{3\pi}{4} \)

\( \therefore \) Three such solutions are possible.

2. (3) \( \tan \theta = \cot 5\theta, \theta \neq \frac{n\pi}{5} \)

\( \Rightarrow \cos \theta \cos 5\theta - \sin 5\theta \sin \theta = 0 \Rightarrow \cos 6\theta = 0 \)

\( \Rightarrow 6\theta = \frac{-5\pi}{2}, \frac{-3\pi}{2}, \frac{-\pi}{2}, \frac{\pi}{2}, \frac{3\pi}{2} \)

\( \Rightarrow \theta = \frac{5\pi}{12}, \frac{3\pi}{4}, \frac{3\pi}{4}, \frac{3\pi}{4}, \frac{3\pi}{4} \)

Again \( \sin 2\theta = \cos 4\theta = 1 - 2 \sin^2 \theta \)

\( \Rightarrow 2 \sin^2 2\theta + \sin 2\theta - 1 = 0 \Rightarrow \sin 2\theta = -1, \frac{1}{2} \)

\( \Rightarrow 2\theta = \frac{-\pi}{2}, \frac{\pi}{6}, \frac{5\pi}{6} \Rightarrow \theta = \frac{-\pi}{4}, \frac{\pi}{12}, \frac{\pi}{12}, \frac{\pi}{12} \)

So common solutions are \( \theta = \frac{-\pi}{4}, \frac{\pi}{12}, \frac{5\pi}{12} \)

\( \therefore \) Number of solutions are \( \theta = \frac{-\pi}{4}, \frac{\pi}{12}, \frac{5\pi}{12} \)

1. (2) Let \( f(\theta) = \frac{1}{g(\theta)} \)

where \( g(\theta) = \sin^2 \theta + 3 \sin \theta \cos \theta + 5 \cos^2 \theta \)

Clearly \( f \) is maximum when \( g \) is minimum

Now \( g(\theta) = \frac{1 - \cos 2\theta}{2} + \frac{3}{2} \sin 2\theta + \frac{5}{2} (1 + \cos 2\theta) \)

\( = 3 + 2 \cos 2\theta + \frac{3}{2} \sin 2\theta + \frac{5}{2} \geq 3 + \left( -\frac{9}{4} \right) \)

\( \therefore g_{\min} = 3 - \frac{5}{2} = -\frac{1}{2} \Rightarrow f_{\max} = 2. \)
4. (3) From figure, we get
\[ 2 \cos \frac{\pi}{k} + 2 \cos \frac{\pi}{2k} = \sqrt{3} + 1 \]
\[ \Rightarrow 2 \times 2 \cos \frac{\pi}{2k} = \sqrt{3} + 1 \]
\[ \Rightarrow 4 \cos^2 \frac{\pi}{2k} + 2 \cos \frac{\pi}{2k} - (3 + \sqrt{3}) = 0 \]
\[ \Rightarrow \cos \frac{\pi}{2k} = \frac{-2 \pm \sqrt{4 + 16 (3 + \sqrt{3})}}{8} = \frac{-1 \pm \sqrt{13 + 4 \sqrt{3}}}{4} \]
\[ = \frac{-1 \pm (2 \sqrt{3} + 1)}{4} \]
\[ = \frac{-1 \pm (2 \sqrt{3} + 1)}{4} \text{ or } \left( \frac{\sqrt{3} + 1}{2} \right) \]
As \( \frac{\pi}{2} \) is an acute angle, \( \cos \frac{\pi}{2k} = \frac{- \sqrt{3}}{2} = \cos \frac{\pi}{6} \Rightarrow k = 3 \)

5. (7) We have, \[ \frac{1}{\sin \frac{\pi}{n}} - \frac{1}{\sin \frac{3 \pi}{n}} = \frac{1}{\sin \frac{2 \pi}{n}} \]
\[ \Rightarrow \frac{\sin \frac{3 \pi}{n} \sin \frac{\pi}{n}}{\sin \frac{\pi}{n} \sin \frac{3 \pi}{n}} = \frac{1}{\sin \frac{2 \pi}{n}} \]
\[ \Rightarrow 2 \cos \frac{2 \pi}{n} \sin \frac{\pi}{n} \sin \frac{3 \pi}{n} = \frac{1}{\sin \frac{2 \pi}{n}} \]

---

**Section-B**

JEE Main/ AIEEE

1. (b) \( \sin^2 \theta = \frac{1 - \cos 2 \theta}{2} \); Period = \( \frac{2 \pi}{2} = \pi \)

2. (b) The given equation is \( \tan x + \sec x = 2 \cos x \);
\[ \Rightarrow \sin x + 1 = 2 \cos^2 x \Rightarrow \sin x + 1 = 2(1 - \sin^2 x) \]
\[ \Rightarrow 2 \sin^2 x + \sin x - 1 = 0; \]
\[ \Rightarrow (2 \sin x - 1)(\sin x + 1) = 0 \Rightarrow \sin x = \frac{1}{2}, -1. \]
\[ \Rightarrow x = 30^\circ, 150^\circ, 270^\circ. \]

3. (b) \( \cos \sqrt{x} \) is non periodic
\[ \Rightarrow \cos \sqrt{x} + \cos^2 x \) can not be periodic.

4. (d) \( \pi < \alpha - \beta < 3 \pi \)
\[ \Rightarrow \frac{\pi}{2} < \frac{\alpha - \beta}{2} < \frac{3 \pi}{2} \Rightarrow \cos \frac{\alpha - \beta}{2} < 0 \]
\[ \sin \alpha + \sin \beta = -\frac{21}{65} \]

\[ \Rightarrow 2 \sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2} = -\frac{21}{65} \] \( \ldots (1) \)

\[ \Rightarrow \cos \alpha + \cos \beta = -\frac{27}{65} \]
\[ \Rightarrow 2 \cos \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2} = -\frac{27}{65} \] \( \ldots (2) \)

Square and add (1) and (2)
\[ 4 \cos^2 \frac{\alpha - \beta}{2} = \frac{(21)^2 + (27)^2}{(65)^2} = \frac{1170}{65 \times 65} \]
\[ \Rightarrow \cos^2 \frac{\alpha - \beta}{2} = \frac{9}{130} \Rightarrow \cos \frac{\alpha - \beta}{2} = \frac{3}{\sqrt{130}} \]

5. (a) \[ u^2 = a^2 + b^2 + 2 \sqrt{(a^4 + b^4) \cos^2 \theta \sin^2 \theta + a^2 b^2 (\cos^4 \theta + \sin^4 \theta)} \ldots (1) \]
Now \((a^4 + b^4)\cos^2 \theta \sin^2 \theta + a^2 b^2 (\cos^4 \theta + \sin^4 \theta)\)
\[= (a^4 + b^4) \cos^2 \theta \sin^2 \theta + a^2 b^2 (1 - 2 \cos^2 \theta \sin^2 \theta)\]
\[= (a^4 + b^4 - 2a^2 b^2) \cos^2 \theta \sin^2 \theta + a^2 b^2\]
\[= (a^2 - b^2)^2 \frac{\sin^2 2\theta}{4} + a^2 b^2 \quad \text{...(2)}\]
\[
\therefore \quad 0 \leq \sin^2 2\theta \leq 1
\]
\[\Rightarrow 0 \leq (a^2 - b^2)^2 \frac{\sin^2 2\theta}{4} + a^2 b^2 \leq (a^2 - b^2)^2 \frac{\sin^2 2\theta}{4} + a^2 b^2 \leq \frac{1}{4} + a^2 b^2 \quad \text{...(3)}\]
\[
\therefore \quad \text{from (1), (2) and (3)}
\]
Minimum value of \(u^2 = a^2 + b^2 + 2\sqrt{a^2 b^2} = (a + b)^2\)
Maximum value of \(u^2\)
\[= a^2 + b^2 + 2\sqrt{(a^2 - b^2)^2 \frac{1}{4} + a^2 b^2}\]
\[= a^2 + b^2 + 2 \sqrt{\frac{(a^2 + b^2)^2}{4}} = 2(a^2 + b^2)\]
\[
\therefore \quad \text{Max value - Min value}
\]
\[= 2(a^2 + b^2) - (a + b)^2 = (a - b)^2\]

6. (c) The direction cosines of the line are \(\cos \theta, \cos \beta, \cos \gamma\)
\[
\therefore \quad \cos^2 \theta + \cos^2 \beta + \cos^2 \gamma = 1
\]
\[\Rightarrow 2 \cos^2 \theta = \sin^2 \beta = 3 \sin^2 \theta \quad \text{(given)}\]
\[\Rightarrow 2 \cos^2 \theta = 3 - 3 \cos^2 \theta \quad \therefore \quad \cos^2 \theta = \frac{3}{5}\]

7. (a)

\[
\begin{align*}
2 \sin^2 x + 5 \sin x - 3 &= 0 \\
\Rightarrow \quad (\sin x + 3)(2 \sin x - 1) &= 0 \\
\Rightarrow \quad \sin x &= \frac{1}{2} \quad \text{and} \quad \sin x = -3 \\
\therefore \quad \text{In } [0, 3\pi], x \text{ has 4 values.}
\end{align*}
\]

8. (c) \(\cos x + \sin x = \frac{1}{2} \quad \Rightarrow \quad 1 + \sin 2x = \frac{1}{4}\)
\[\Rightarrow \quad \sin 2x = -\frac{3}{4}, \text{ so } x \text{ is obtuse and}
\]
\[\frac{2 \tan x}{1 + \tan^2 x} = -\frac{3}{4} \quad \Rightarrow \quad 3 \tan^2 x + 8 \tan x + 3 = 0
\]
\[\therefore \quad \tan x = \frac{-8 \pm \sqrt{64 - 36}}{6} = \frac{-4 \pm \sqrt{7}}{3}
\]
as \(\tan x < 0 \quad \therefore \quad \tan x = -\frac{4 - \sqrt{7}}{3}\)

9. (b) We have
\[
\cos (\beta - \gamma) + \cos (\gamma - \alpha) + \cos (\alpha - \beta) = -\frac{3}{2}
\]
\[\Rightarrow \quad 2 [\cos (\beta - \gamma) + \cos (\gamma - \alpha) + \cos (\alpha - \beta)] + 3 = 0
\]
\[\Rightarrow \quad 2 [\cos (\beta - \gamma) + \cos (\gamma - \alpha) + \cos (\alpha - \beta)] + \sin^2 \alpha + \cos^2 \alpha + \sin^2 \beta + \cos^2 \beta + \sin^2 \gamma + \cos^2 \gamma = 0
\]
\[\Rightarrow \quad \sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma - 2 \sin \alpha \sin \beta + 2 \sin \alpha \sin \gamma + 2 \sin \beta \sin \gamma = 0
\]
\[\Rightarrow \quad \sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma = 0 \quad \text{and} \quad \cos \alpha + \cos \beta + \cos \gamma = 0
\]
\[
\therefore \quad A \text{ and } B \text{ both are true.}
\]

10. (a) \(\cos(\alpha + \beta) = \frac{4}{5} \quad \Rightarrow \quad \tan(\alpha + \beta) = \frac{3}{4}\)
\[\sin(\alpha - \beta) = \frac{5}{13} \quad \Rightarrow \quad \tan(\alpha - \beta) = \frac{5}{12}\]
\[\tan 2\alpha = \tan[(\alpha + \beta) + (\alpha - \beta)] = \frac{3 + 5}{4 - 12} = \frac{56}{33}\]

11. (d) \(A = \sin^2 x + \cos^4 x = \sin^2 x + \cos^2 x(1 - \sin^2 x)\)
\[= \sin^2 x + \cos^2 x - \frac{1}{4}(2 \sin x \cos x)^2 = 1 - \frac{1}{4} \sin^2 (2x)\]
Now \(0 \leq \sin^2 (2x) \leq 1 \quad \Rightarrow \quad 0 \geq -\frac{1}{4} \sin^2 (2x) \geq -\frac{1}{4}\)
\[\Rightarrow \quad 1 \geq 1 - \frac{1}{4} \sin^2 (2x) \geq 1 - \frac{1}{4} \quad \Rightarrow \quad 1 \geq A \geq \frac{3}{4}\]

12. (b) Given \(3 \sin P + 4 \cos Q = 6 \quad \text{...(i)}\)
\(4 \sin Q + 3 \cos P = 1 \quad \text{...(ii)}\)
Squaring and adding (i) & (ii) we get
\[9 \sin^2 P + 16 \cos^2 Q + 24 \sin P \cos Q + 16 \sin^2 Q + 9 \cos^2 P + 24 \sin Q \cos P = 36 + 1 = 37\]
\[ 9 \left( \sin^2 P + \cos^2 P \right) + 16 \left( \sin^2 Q + \cos^2 Q \right) + 24 \left( \sin P \cos Q + \cos P \sin Q \right) = 37 \]

\[ 9 + 16 + 24 \sin (P + Q) = 37 \]

\[ \sin (P + Q) = \frac{1}{2} \Rightarrow P + Q = \frac{\pi}{6} \text{ or } \frac{5\pi}{6} \]

\[ R = \frac{5\pi}{6} \text{ or } \frac{\pi}{6} \quad (\because P + Q + R = \pi) \]

If \[ R = \frac{5\pi}{6} \text{ then } 0 < P, Q < \frac{\pi}{6} \]

\[ \cos Q < 1 \text{ and } \sin P < \frac{1}{2} \]

\[ 3 \sin P + 4 \cos Q < \frac{11}{2} \text{ which is not true.} \]

So \[ R = \frac{\pi}{6} \]

13. (a) From Sine Rule

\[ \frac{AB}{\sin \theta} = \frac{\sqrt{p^2 + q^2}}{\sin(\pi - (\theta + \alpha))} \]

\[ \frac{AB}{\sin \theta \cos \alpha + \cos \theta \sin \alpha} = \frac{(p^2 + q^2) \sin \theta}{q \sin \theta + p \cos \theta} \]

\[ \therefore \cos \alpha = \frac{q}{\sqrt{p^2 + q^2}} \text{ and } \sin \alpha = \frac{p}{\sqrt{p^2 + q^2}} \]

14. (b) Given expression can be written as

\[ \frac{\sin A}{\cos A} \times \frac{\sin A}{\sin A - \cos A} + \frac{\cos A}{\cos A - \sin A} \]

\[ \left( \because \tan A = \frac{\sin A}{\cos A} \text{ and } \cot A = \frac{\cos A}{\sin A} \right) \]

\[ \Rightarrow \frac{1}{\sin A - \cos A} \left( \sin^3 A - \cos^3 A \right) \]

\[ \frac{\cos A \sin A}{\sin A \cos A} \]

\[ = \frac{\sin^2 A + \sin A \cos A + \cos^2 A}{\sin A \cos A} = 1 + \sec A \cosec A \]

15. (b) Let \( f_k(x) = \frac{1}{k}(\sin^k x + \cos^k x) \)

Consider

\[ f_4(x) - f_6(x) = \frac{1}{4} (\sin^4 x + \cos^4 x) - \frac{1}{6} (\sin^6 x + \cos^6 x) \]

\[ = \frac{1}{4} [1 - 2 \sin^2 x \cos^2 x] - \frac{1}{6} [1 - 3 \sin^2 x \cos^2 x] \]

\[ = \frac{1}{4} - \frac{1}{6} = \frac{1}{12} \]

16. (a) \( \cos x + \cos 2x + \cos 3x + \cos 4x = 0 \)

\[ \Rightarrow 2 \cos 2x \cos x + 2 \cos 3x \cos x = 0 \]

\[ \Rightarrow 2 \cos x \left( 2 \cos \frac{5x}{2} \cos \frac{x}{2} \right) = 0 \]

\[ \cos x = 0, \cos \frac{5x}{2} = 0, \cos \frac{x}{2} = 0 \]

\[ x = \pi, \frac{3\pi}{2}, \frac{3\pi}{2}, \frac{7\pi}{5}, \frac{9\pi}{5} \]

Section-B : JEE Main/ AIEEE

Section-A : JEE Advanced/ IIT-JEE

A. Fill in the Blanks

1. Let \(z = \frac{\sin x / 2 + \cos x / 2 + i \tan x}{1 + 2i \sin x / 2}\)

\[= \frac{(\sin x / 2 + \cos x / 2 + i \tan x)(1 - 2i \sin x / 2)}{(1 + 2i \sin x / 2)(1 - 2i \sin x / 2)}\]

\[= \frac{\sin x / 2 + \cos x / 2 + 2 \sin x / 2 \tan x + i(\tan x - 2 \sin^2 x / 2 - 2 \sin x / 2 \cos x / 2)}{1 + 4 \sin^2 x / 2}\]

But ATQ, \(I_n(z) = 0\) (as \(z\) is real)

\[\Rightarrow \tan x - 2 \sin x / 2 \left(\sin x / 2 + \cos x / 2\right) = 0\]

\[\Rightarrow \frac{\sin x}{\cos x} - 2 \sin^2 x / 2 - 2 \sin x / 2 \cos x / 2 = 0\]

\[\Rightarrow \frac{\sin x}{\cos x} - (1 - \cos x) - \sin x = 0\]

But ATQ, \(I_n(z) = 0\) (as \(z\) is real)

\[\Rightarrow \tan x - 2 \sin x / 2 \left(\sin x / 2 + \cos x / 2\right) = 0\]

\[\Rightarrow \frac{\sin x}{\cos x} - 2 \sin^2 x / 2 - 2 \sin x / 2 \cos x / 2 = 0\]

\[\Rightarrow \frac{\sin x}{\cos x} - (1 - \cos x) - \sin x = 0\]
\[
\sin x \left[ \frac{1}{\cos x} - 1 \right] - [1 - \cos x] = 0
\]
\[
\Rightarrow \left( 1 - \cos x \right) \frac{\sin x}{\cos x} = 0
\]
\[
\Rightarrow (1 - \cos x) \left( \frac{\sin x}{\cos x} - 1 \right) = 0
\]
\[
\Rightarrow \cos x = 1 \Rightarrow x = 2n \pi \quad \text{and} \quad \tan x = 1 \Rightarrow x = n \pi + \pi/4
\]
\[
\therefore x = 2n \pi, n \pi + \pi/4 \quad \text{Ans.}
\]

2. \[|az_1 - bz_2|^2 + |bz_1 + az_2|^2\]
\[= \left| z_1 - z_2 \right|^2 + b^2 \left| z_2 \right|^2 - 2ab \text{Re}(z_1 \overline{z_2}) + a^2 \left| z_1 \right|^2 + 2ab \text{Re}(z_1 \overline{z_2})\]
\[= (a^2 + b^2) \left( |z_1|^2 + |z_2|^2 \right)\]

3. **KEY CONCEPT**: \[|z_1 - z_2| = \text{distance between two points represented by } z_1 \text{ and } z_2.\]

As \(z_1 = a + i, \ z_2 = 1 + bi\) and \(z_3 = 0\) form an equilateral triangle, therefore \[|z_1 - z_3| = |z_2 - z_3| = |z_1 - z_2|\]
\[\Rightarrow |a + i| = |1 + bi| = |(a - 1) + i(1 - b)|\]
\[\Rightarrow a^2 + 1 = 1 + b^2 = (a - 1)^2 + (1 - b)^2\]
\[\Rightarrow a^2 - b^2 = a^2 + b^2 - 2a - 2b + 1\]
\[\Rightarrow a = b \quad \text{...(1)}\]
\[\therefore a, b > 0 \quad \therefore a \neq -b \quad \text{and} \quad 2a^2 - 2a - 2b + 1 = 0\]
or \[a^2 - 2a - 2b + 1 = 0 \quad \text{...(2)}\]
\[\Rightarrow a^2 - 2a + 1 = 0 \quad \therefore \ a = 1 \quad \text{also} \quad b = 1 - \sqrt{3}\]
\[\therefore a = 2 - \sqrt{3} \quad \text{also} \quad b = 2 - \sqrt{3}\]

4. If we see the problem as in co-ordinate geometry we have \(D = (1,1)\) and \(M = (2, -1)\)

We know that diagonals of rhombus bisect each other at 90°

\(\therefore AC \) passes through \(M\) and is \(\perp\) to \(BD\)

\(\therefore Eq. \) of \(AC\) in symmetric form can be written as
\[
\frac{x - 2}{2\sqrt{5}} = \frac{y + 1}{1/\sqrt{5}} = r
\]

Now for pt. \(A\), as
\[
AM = \frac{1}{2} DM = \frac{1}{2} \sqrt{(2 - 1)^2 + (-1 - 1)^2} = \sqrt{5}/2
\]

Putting \(r = \pm \sqrt{5}/2\) we get,

\[
x - \frac{2}{2\sqrt{5}} = \frac{y + 1}{1/\sqrt{5}} = \pm \sqrt{5}/2
\]

\[
\Rightarrow x = \pm 1 + 2, y = \pm 1/2 - 1
\]

\[
\Rightarrow x = 3 \quad \text{or} \quad y = -1/2 \quad \text{or} \quad -3/2
\]

\(\therefore\) Pt. \(A\) is \(3 - i/2\) or \(-(3/2)i\)

5. Let \(z_1, z_2, z_3\) be the vertices \(A, B\) and \(C\) respectively of equilateral \(\triangle ABC\), inscribed in a circle \(|z| = 2\), centre \((0,0)\) radius = 2

Given \(z_1 = 1 + i\sqrt{3}\)
\[
z_2 = e^{\frac{2\pi i}{3}} z_1\]
\[
= \left( \cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3} \right) (1 + i\sqrt{3})\]
\[
= \left( -1 + i\sqrt{3} \right) \left( 1 + i\sqrt{3} \right) = \frac{-1 - 2\sqrt{3} + 3}{2} = 1 - i\sqrt{3}
\]

and \(z_3 = e^{\frac{4\pi i}{3}} z_1\)
\[
= \left( \cos \frac{4\pi}{3} + i \sin \frac{4\pi}{3} \right) (1 + i\sqrt{3})\]
\[
= \left( -1 - i\sqrt{3} \right) \left( 1 + i\sqrt{3} \right) = \frac{-1 - 2\sqrt{3} + 3}{2} = -1 - i\sqrt{3}
\]

6. \(r\)th term of the given series,
\[
r\left[ (r^2 + 3r^2 + 3r) \right]
\]
\[
= \frac{1}{4} (n - 1)^2 n^2 + 3 \frac{1}{6} (n - 1) (n) (2n - 1) + 3 \frac{1}{2} (n - 1)n
\]
\[
= (n - 1) \left( \frac{1}{4} (n - 1)n + \frac{1}{2} (2n - 1) + \frac{3}{2} \right)
\]
\[
= \frac{1}{4} (n - 1) n[2n^2 - n + 4n - 2 + 6]
\]
\[
= \frac{1}{4} (n - 1) n[n^2 + 3n + 4]
\]
B. True / False

1. Let \( z = x + iy \)
   then \( 1 \cap z \Rightarrow 1 \leq x \& 0 \leq y \) (by def.)
   Consider
   \[
   \frac{1-z}{1+z} = \frac{1-(x+iy)}{1+(x+iy)} = \frac{(1-x)-iy}{1+(x)+iy} \\
   = \frac{1-x^2-y^2}{(1+x^2+y^2)} - \frac{2iy}{(1+x)^2+y^2} \\
   \]
   \[
   \frac{1-z}{1+z} \cap 0 \Rightarrow \frac{1-x^2-y^2}{(1+x^2+y^2)} \leq 0
   \]
   and \( \frac{-2y}{(1+x)^2+y^2} \leq 0 \)
   \( \Rightarrow 1-x^2-y^2 \leq 0 \) and \( -2y \leq 0 \)
   \( \Rightarrow x^2+y^2 \geq 1 \) and \( y \geq 0 \) which is true as \( x \geq 1 \) & \( y \geq 0 \).
   \( \therefore \) The given statement is true \( \forall \ x, z \in C. \)

2. As \( |z_1|=|z_2|=|z_3| \)
   \( \therefore z_1, z_2, z_3 \) are equidistant from origin. Hence O is the circumcentre of \( \triangle ABC \).
   But according to question \( \triangle ABC \) is equilateral and we know that in an equilateral \( \triangle 
   \) the circumcentre and centroid coincide.
   \( \therefore \) Centroid of \( \triangle ABC=0 \)
   \( \Rightarrow \frac{z_1+z_2+z_3}{3} = 0 \Rightarrow z_1+z_2+z_3 = 0 \)
   \( \therefore \) Statement is true.

3. If \( z_1, z_2, z_3 \) are in A.P. then, \( \frac{z_1+z_3}{2} = z_2 \)
   \( \Rightarrow z_2 \) is mid pt. of line joining \( z_1 \) and \( z_3 \).
   \( \Rightarrow z_1, z_2, z_3 \) lie on a st. line
   \( \therefore \) Given statement is false.

4. \( \therefore \) Cube roots of unity are 1, \( -\frac{1+i\sqrt{3}}{2}, \frac{-1-i\sqrt{3}}{2} \)
   \( \therefore \) Vertices of triangle are
   \[
   A(1,0), B\left(-\frac{1+\sqrt{3}}{2}, \frac{-1-i\sqrt{3}}{2}\right), C\left(-\frac{1+i\sqrt{3}}{2}\right)
   \]
   \( \Rightarrow AB = BC = CA \) \( \therefore \) \( \triangle \) is equilateral.

C. MCQs with ONE Correct Answer

1. (b) \( (x-1)^3 + 8 = 0 \)
   \( \Rightarrow (x-1)^3 = -8 = (2)^3 \)
   \( \Rightarrow x-1 = -2 \)
   \( \therefore x = -1, 1-2\omega, 1-2\omega^2 \)

2. (d) \[
\frac{1+i}{1-i} = \frac{(1+i)^2}{(1-i)(1+i)} = \frac{1-2i}{2} = i
\]
   Now \( r^2 = 1 \) \( \therefore \) the smallest positive integral value of \( n \) should be 4.

3. (a) \( \mid x+iy-5i \mid = \mid x+iy+5i \mid \)
   \( \Rightarrow |x+(y-5)i| = |x+(y+5)i| \)
   \( \Rightarrow x^2 + (y-5)^2 = x^2 + (y+5)^2 \)
   \( \Rightarrow x^2 + y^2 - 10y + 25 = x^2 + y^2 + 10y + 25 \)
   \( \Rightarrow 20y = 0 \Rightarrow y = 0 \)
   \( \therefore \) ‘a’ is the correct alternative.

4. (b) \( \left(\frac{\sqrt{3}}{2} + \frac{i}{2}\right) = i \cdot \left(\frac{-1}{2} + \frac{i\sqrt{3}}{2}\right) = i^2 \)
   \( \Rightarrow \frac{\sqrt{3}}{2} - i = i \cdot \left(\frac{-1}{2} - i\sqrt{3}/2\right) \)
   \( \therefore \) \( z = (-i\omega)^2 + (i\omega^3)^2 = -i\omega^2 + i\omega \)
   \( \Rightarrow \text{Re}(z) < 0 \) and \( \text{Im}(z) = 0 \)
   \( \therefore \) (b) is the correct choice.

5. (d) \( |z-4| < |z-2| \)
   \( \Rightarrow |(x-4)+iy| < |(x-2)+iy| \)
   \( \Rightarrow (x-4)^2 + y^2 < (x-2)^2 + y^2 \)
   \( \Rightarrow -8x + 16 < -4x + 4 \Rightarrow 4x - 12 > 0 \)
   \( \Rightarrow x > 3 \Rightarrow \text{Re}(z) > 3 \)

6. (b) \( |\omega| = 1 \Rightarrow \left|\frac{1-i\omega}{z-i}\right| = 1 \)
   \( \Rightarrow |1-i\omega| = |z-i| \)
   \( \Rightarrow |1+i(x+iy)| = |x+iy-i| \)
   \( \Rightarrow |(y+1)-i\omega| = |x+i(y-1)| \)
   \( \Rightarrow x^2 + (y+1)^2 = x^2 + (y-1)^2 \)
   \( \Rightarrow 4y = 0 \Rightarrow y = 0 \Rightarrow z \) lies on real axis

7. (b) If vertices of a parallelogram are \( z_1, z_2, z_3, z_4 \) then as diagonals bisect each other
   \( \therefore \)
   \( \frac{z_1+z_3}{2} = \frac{z_2+z_4}{2} \Rightarrow z_1+z_3 = z_2+z_4 \)
8. (b) Let $ABC$ be the $\Delta$ with vertices $a, b, c$ and $PQR$ be the $\Delta$ with vertices $u, v, w$.
Then $c = (1 - r) a + rb$

\[c - a = r(b - a) \Rightarrow \frac{c - a}{b - a} = r \quad ...(1)\]

\[w = (1 - r) u + rv \Rightarrow \frac{w - u}{v - u} = r \quad ...(2)\]

From (1) and (2) \[\frac{c - a}{b - a} = \frac{w - u}{v - u} \quad \text{and} \quad \arg \left( \frac{c - a}{b - a} \right) = \arg \left( \frac{w - u}{v - u} \right)\]

\[\Rightarrow \quad \frac{AC}{AB} = \frac{PR}{PQ} \quad \text{and} \quad \angle CAB = \angle RPQ\]

\[\Rightarrow \quad \Delta ABC \sim \Delta PQR\]

9. (b) \[(1 + \omega)^7 = A + B\omega\]

\[\Rightarrow \quad (-\omega^2)^7 = A + B\omega \quad (\because 1 + \omega + \omega^2 = 0)\]

\[\Rightarrow \quad -\omega^{14} = A + B\omega\]

\[\Rightarrow \quad -\omega^2 = A + B\omega \quad (\because \omega^3 = 1)\]

\[\Rightarrow \quad 1 + \omega = A + B\omega \Rightarrow A = 1, B = 1\]

10. (d) \[\therefore |z| = |\omega| \quad \text{and} \quad \arg z = \pi - \arg \omega\]

Let \[\omega = re^{i\theta}\]
\[\Rightarrow \quad z = re^{i(\pi - \theta)}\]

\[= (re^{-\theta}) (\cos \pi + i \sin \pi) = -r \quad (-1) = -\bar{\omega}\]

11. (c) Given that \[|z + i\bar{\omega}| = |z - i\omega|\]

\[\Rightarrow \quad |z - (i\omega)| = |z - (-i\bar{\omega})|\]

\[\Rightarrow \quad z \text{ lies on perpendicular bisector of the line segment joining } (-i\omega) \text{ and } (-i\bar{\omega}), \text{ which is real axis,}\]

\[(-i\omega) \text{ and } (-i\bar{\omega}) \text{ being mirror images of each other.}\]

\[\therefore \text{ Im}(z) = 0.\]

If $z = x$ then $|z| \leq 1 \Rightarrow x^2 \leq 1 \Rightarrow -1 \leq x \leq 1$

\[\therefore \quad (c) \text{ is the correct option.}\]

12. (d) \[(1 + i)^{n_1} + (1 + i^3)^{n_1} + (1 + i^5)^{n_2} + (1 + i^7)^{n_2}\]

\[= (1 + i)^{n_1} + (1 - i)^{n_1} + (1 + i)^{n_2} + (1 - i)^{n_2}\]

Using $1 + i = \sqrt{2} \cos \pi/4 + i \sin \pi/4$

and $1 - i = \sqrt{2} \cos \pi/4 - i \sin \pi/4$

We get the given expression as

\[= (\sqrt{2})^{n_1} \left[ \cos \frac{n_1\pi}{4} + i \sin \frac{n_1\pi}{4} \right] + (\sqrt{2})^{n_2} \left[ \cos \frac{n_2\pi}{4} + i \sin \frac{n_2\pi}{4} \right] + (\sqrt{2})^{n_2} \left[ \cos \frac{n_2\pi}{4} - i \sin \frac{n_2\pi}{4} \right]\]

\[= (\sqrt{2})^{n_1} \left[ 2 \cos \frac{n_1\pi}{4} \right] + (\sqrt{2})^{n_2} \left[ 2 \cos \frac{n_2\pi}{4} \right]\]

\[= \text{real number irrespective the values of } n_1 \text{ and } n_2\]

\[\therefore \quad (d) \text{ is the most appropriate answer.}\]

13. (c) \[E = 4 + 5(\omega)^{334} + 3(\omega)^{365} = 4 + 5\omega + 3\omega^2\]

\[= 1 + 2\omega + 3(l + \omega + \omega^2) = 1 + (-1 + i\sqrt{3}) = i\sqrt{3}\]

14. (a) \[\arg (z) < 0 \quad (\text{given}) \Rightarrow \arg (z) = -\theta\]

Now

\[\begin{align*}
\angle O\theta r &= \theta - \pi + 1 \quad (\text{as } \theta - \pi > \pi, \text{ the angle is anticlockwise}) \\
\therefore \quad \angle O\theta r &= \pi - \theta \\
\end{align*}\]

\[z = r \cos(-\theta) + i \sin(-\theta) = r[\cos(\theta) - i \sin(\theta)]\]

Again \[-z = -r[\cos(\theta) - i \sin(\theta)]\]

\[= r[\cos(\pi - \theta) + i \sin(\pi - \theta)]\]

\[\therefore \quad \arg (-z) = \pi - \theta;\]

Thus \[\arg (-z) - \arg (z) = \pi - 0 = 0 = \pi - 0 = \pi - 0 = \pi\]

\[|z_1| = |z_2| = |z_3| = 1 \quad (\text{given})\]

Now, \[|z_1|^2 = 1 \Rightarrow |z_1| = 1 \Rightarrow z_1\bar{z}_1 = 1\]

Similarly, \[z_2\bar{z}_2 = 1, \quad z_3\bar{z}_3 = 1\]

Now, \[\left| \frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3} \right| = 1 \Rightarrow |\bar{z}_1 + \bar{z}_2 + \bar{z}_3| = 1\]
16. (d) Let \( z = (1)^{1/n} = (\cos 2k\pi + i \sin 2k\pi)^{1/n} \)

\[
z = \cos \left( \frac{2k\pi}{n} \right) + i \sin \left( \frac{2k\pi}{n} \right), \quad k = 0, 1, 2, \ldots, n-1.
\]

Let \( z_1 = \cos \left( \frac{2k_1\pi}{n} \right) + i \sin \left( \frac{2k_1\pi}{n} \right) \)

and \( z_2 = \cos \left( \frac{2k_2\pi}{n} \right) + i \sin \left( \frac{2k_2\pi}{n} \right) \)

be the two values of \( z \) s.t. they subtend \( \angle \) of 90° at origin.

\[
\begin{align*}
\therefore \quad & 2k_1 \pi n - 2k_2 \pi n = \pm \pi 2 \\
\Rightarrow & 4(k_1 - k_2) = \pm n
\end{align*}
\]

As \( k_1 \) and \( k_2 \) are integers and \( k_1 \neq k_2 \),

\[
\therefore \quad n = 4k, \quad k \in 1
\]

17. (c) \[
\frac{z_1 - z_3}{z_2 - z_3} = \frac{1 - i\sqrt{3}}{2}
\]

\[
\Rightarrow \quad \arg \left( \frac{z_1 - z_3}{z_2 - z_3} \right) = \arg \left( \frac{1 - i\sqrt{3}}{2} \right)
\]

\[
\Rightarrow \quad \arg (\cos(-\pi/3) + i \sin(-\pi/3))
\]

\[
\Rightarrow \quad \text{angle between } z_1 - z_3 \text{ and } z_2 - z_3 \text{ is 60°.}
\]

and \[
\left| \frac{z_1 - z_3}{z_2 - z_3} \right| = \left| \frac{1 - i\sqrt{3}}{2} \right|
\]

\[
\Rightarrow \quad \left| \frac{z_1 - z_3}{z_2 - z_3} \right| = 1 \Rightarrow |z_1 - z_3| = |z_2 - z_3|
\]

\textbf{NOTE THIS STEP}

\( \Rightarrow \) The \( \Delta \) with vertices \( z_1, z_2 \) and \( z_3 \) is isosceles with vertical \( \angle \) of 60°. Hence rest of the two angles should also be 60° each.

\( \Rightarrow \) Req. \( \Delta \) is an equilateral \( \Delta \).

18. (b) \( |z_1| = 12 \Rightarrow z_1 \) lies on a circle with centre \((0, 0)\) and radius 12 units, and \( |z_2 - 3 - 4i| = 5 \Rightarrow z_2 \) lies on a circle with centre \((3, 4)\) and radius 5 units.

\[
\text{From fig. it is clear that } |z_1 - z_2| \text{ i.e., distance between } z_1 \text{ and } z_2 \text{ will be min when they lie at } A \text{ and } B \text{ resp. i.e., } O, C, B, A \text{ are collinear as shown. Then } z_1 - z_2 = AB = OA - OB = 12 - 2(5) = 2. \text{ As above is the min, value, we must have } |z_1 - z_2| \geq 2.
\]

19. (a) Given that \( |z| = 1 \) and \( \omega = \frac{z - 1}{z + 1} \)

\[
\text{Now we know that } z\bar{z} = |z|^2
\]

\[
\Rightarrow \quad z\bar{z} = 1 \quad \text{(for } |z| = 1) \quad \therefore \quad \omega = \frac{(z - 1)(z + 1)}{(z + 1)(z + 1)} = \frac{z\bar{z} + z - \bar{z} - 1}{z\bar{z} + z + \bar{z} + 1} = -\frac{2i}{2 + 2x}
\]

\[
[\because z\bar{z} = 1 \text{ and taking } z = x + iy \text{ so that } z + \bar{z} = 2x \text{ and } z - \bar{z} = 2iy]
\]

\[
\Rightarrow \quad \text{Re}(\omega) = 0
\]

20. (b) \( (1 + \omega^2)^n = (1 + \omega^4)^n \)

\[
\Rightarrow (-\omega)^n = (1 + \omega)^n \Rightarrow \omega^n = 1 \Rightarrow n = 3
\]

21. (a) Here we observe that.

\[
AB = AC = AD = 2
\]

\( \therefore \) \( BCD \) is an arc of a circle with centre at \( A \) and radius 2. Shaded region is outer (exterior) part of this sector \( ABCDA \).

\( \therefore \) For any pt. \( z \) on arc \( BCD \) we should have

\[
|z - (-1)| = 2
\]

and for shaded region, \( |z + 1| > 2 \) \( \cdots (i) \)

For shaded region we also have

\[
-\pi/4 < \arg (z + 1) < \pi/4
\]

or \( |\arg (z + 1)| < \pi/4 \) \( \cdots (ii) \)

Combining (i) and (ii), (a) is the correct option.

22. (b) Given that \( a, b, c \) are integers not all equal, \( \omega \) is cube root of unity \( \neq 1 \), then

\[
|a + b\omega + c\omega^2| = |a + b \left( \frac{-1 + i\sqrt{3}}{2} \right) + c \left( \frac{-1 - i\sqrt{3}}{2} \right)|
\]

\[
= \left| \frac{2a - b - c}{2} + i \left( b\sqrt{3} - c\sqrt{3} \right) \right|
\]

\[
= \frac{1}{2} \sqrt{(2a - b - c)^2 + 3(b - c)^2}
\]

\[
= \frac{1}{2} \sqrt{[(a - b)^2 + (b - c)^2 + (c - a)^2]}
\]

R.H.S. will be min. when \( a = b = c \), but we cannot take \( a = b = c \) as per question.
23. (b) Operating $R_1 + R_2 + R_3$, we get

\[
\begin{vmatrix}
3 & 0 & 0 \\
1 & -1 - \omega & \omega^2 \\
1 & \omega^2 & \omega \\
\end{vmatrix}
= 3[-\omega - 1 - \omega] = 3(\omega^2 - \omega)
\]

\[
\therefore \quad \text{Im}(z^{2m-1}) = \sin(2m-1)\theta
\]

\[
\sum_{m=1}^{15} \text{Im}(z^{2m-1}) = \sum_{m=1}^{15} \sin(2m-1)\theta
\]

\[
= \sin \theta + \sin 3\theta + \sin 5\theta + \ldots + \text{upto 15 terms}
\]

\[
\sin \left[ \sin \left( \frac{2\theta}{2} \right) \cdot \sin \left( \theta + 14 \times \theta \right) \right]
\]

\[
\Rightarrow \quad \sin \theta = \frac{\sin 15\theta \cdot \sin 15\theta}{\sin \theta} = \frac{\sin 30^\circ \cdot \sin 30^\circ}{\sin 2^\circ} = \frac{1}{4 \sin 2^\circ}
\]

24. (d) \[ \frac{w \cdot w}{1 - z} \text{ is purely real} \]

\[
\therefore \quad \frac{w \cdot w}{1 - z} = \left( \frac{w \cdot w}{1 - z} \right) \Rightarrow \frac{w \cdot w}{1 - z} = \frac{w \cdot w}{1 - z}
\]

\[
\Rightarrow \quad w - \overline{w} = (w - \overline{w}) |z|^2
\]

\[
\Rightarrow \quad |z|^2 = 1 \quad \text{ (\because w = \alpha + i\beta and \beta \neq 0)}
\]

\[
\Rightarrow \quad |z| = 1 \text{ also given } z \neq 1
\]

\[
\therefore \quad \text{The required set is } \{z : |z| = 1, z \neq 1\}
\]

\[
= 3\omega (\omega - 1)
\]

25. (d)

\[
\overline{OP} = \overline{OA} + \overline{AP}
\]

\[
= \overline{OA} + \overline{OB}
\]

\[
= 3e^{i\pi/4} + 4e^{i(\pi/2 + \pi/4)}
\]

\[
= 3e^{i\pi/4} + 4e^{i\pi/2}e^{i\pi/4}
\]

\[
= 3e^{i\pi/4} + 4e^{i\pi/4} = e^{i\pi/4}(3 + 4i).
\]

26. (d) Given \(|z| = 1\) and \(z \neq \pm 1\)

To find locus of \(w = \frac{z}{1 - z^2}\)

We have \(w = \frac{z}{1 - z^2} = \frac{z}{z \bar{z} - z^2}\)

\[
\therefore \quad |z| = 1 \Rightarrow |z|^2 = z \bar{z} = 1
\]

\[
\therefore \quad w = \frac{1}{\bar{z} - z} \text{ is purely imaginary number}
\]

\[
\therefore \quad w \text{ must lie on } y-axis.
\]

27. (d) The initial position of point is \(Z_0 = 1 + 2i\)

\[
Z_1 = (1 + 5) + (2 + 3)i = 6 + 5i
\]

Now \(Z_1\) is moved through a distance of \(\sqrt{2}\) units in the direction \(\hat{i} + \hat{j}\). (i.e. by \(1 + i\))

\[
\therefore \quad \text{It becomes } Z_1' = Z_1 + (1 + i) = 7 + 6i
\]

Now \(OZ_1'\) is rotated through an angle \(\frac{\pi}{2}\) in anticlockwise direction, therefore \(Z_2 = iZ_1' = -6 + 7i\)

\[
\Rightarrow \quad \text{Im}(z) \neq 0 \Rightarrow z \text{ is non real}
\]

\[
\text{and equation } z^2 + z + (1 - a) = 0 \text{ will have non real roots, if } D < 0
\]

\[
\Rightarrow \quad 1 - 4(1 - a) < 0 \Rightarrow 4a < 3 \Rightarrow a < \frac{3}{4}
\]

\[
\therefore \quad a \text{ can not take the value } \frac{3}{4}
\]
31. (c) As \( \alpha \) lies on the circle \((x-x_0)^2 + (y-y_0)^2 = r^2\)
\[ \therefore \quad (\alpha - z_0)(\bar{\alpha} - \bar{z}_0) = r^2 \]
\[ \Rightarrow \quad \alpha \bar{\alpha} - \alpha z_0 - \bar{\alpha} z_0 + z_0 \bar{z}_0 = r^2 \]
\[ \Rightarrow \quad |\alpha|^2 + |z_0|^2 - \bar{\alpha} z_0 - \bar{z}_0 \alpha = r^2 \] (i)

Also \( \frac{1}{\alpha} \) lies on the circle \((x-x_0)^2 + (y-y_0)^2 = 4r^2\)
\[ \therefore \quad \left| \frac{1}{\alpha} - z_0 \right|^2 = 4r^2 \Rightarrow \left( \frac{1}{\alpha} - z_0 \right) \left( \frac{1}{\alpha} - \bar{z}_0 \right) = 4r^2 \]
\[ \Rightarrow \quad \frac{1}{\alpha} - \frac{z_0}{\alpha} + \frac{\bar{z}_0}{\alpha} = 4r^2 \]
\[ \Rightarrow \quad \frac{1}{|\alpha|^2} - \frac{z_0}{|\alpha|^2} + \frac{\bar{z}_0}{|\alpha|^2} = 4r^2 \]
\[ \Rightarrow \quad 1 + |\alpha|^2 |z_0|^2 - \bar{z}_0 \alpha - \bar{z}_0 \alpha = 4r^2 |\alpha|^2 \] (ii)

Subtracting eqn (i) from (ii) we get
\[ 1 - |\alpha|^2 + |z_0|^2 (|\alpha|^2 - 1) = r^2 (4 |\alpha|^2 - 1) \]
or
\[ |\alpha|^2 - 1 |z_0|^2 - 1 = r^2 (4 |\alpha|^2 - 1) \]

Using \( |z_0|^2 = \frac{r^2 + 2}{2} \) we get
\[ (|\alpha|^2 - 1) \frac{r^2}{2} = r^2 (4 |\alpha|^2 - 1) \]
\[ \Rightarrow \quad |\alpha|^2 - 1 = 8 |\alpha|^2 - 2 \Rightarrow |\alpha| = \frac{1}{\sqrt{7}} \]

D. MCQs with ONE or MORE THAN ONE Correct

1. (a, b, c) \( z_1 = a + ib \) and \( z_2 = c + id \).
   \[ \text{ATQ} \quad |z_1|^2 = |z_2|^2 = 1 \]
   \[ \Rightarrow \quad a^2 + b^2 = 1 \quad \text{and} \quad c^2 + d^2 = 1. \] (I)
   Also \( \text{Re} \ (z_1 z_2) = 0 \Rightarrow ac + bd = 0 \)
   \[ \Rightarrow \quad \frac{a}{b} = -\frac{d}{c} = \alpha \ (\text{say}) \] (II)
   From (I) and (II), we get
   \[ b^2 \alpha^2 + b^2 = c^2 \alpha^2 + c^2 \Rightarrow b^2 = c^2, \]
   Similarly \( a^2 = d^2 \)
\[ \therefore \quad |\omega_1| = \sqrt{a^2 + c^2} = \sqrt{b^2 + d^2} = 1 \]
and \( |\omega_2| = \sqrt{b^2 + d^2} = \sqrt{a^2 + c^2} = 1 \)
   Also \( \text{Re} \ (\omega_1 \omega_2) = ab + cd = (b\alpha)c + (-c\alpha) = \alpha(b^2 - c^2) = 0 \]

2. (a, d) Let \( z_1 = a + ib, a > 0 \) and \( b \in \mathbb{R}; z_2 = c + id, d < 0, c \in \mathbb{R} \)
then \( |z_1| = |z_2| \Rightarrow a_2 + b_2 = c_2 + d_2 \)
\[ \Rightarrow \quad a^2 - c^2 = d^2 - b^2 \] ... (I)

Now, \( z_1 + z_2 = \frac{(a + c) + i(b + d)}{(a - c) + i(b - d)} \)
\[ = \frac{[(a^2 - c^2) + (b^2 - d^2)] + i[(a(c + d) - (a + c)(b - d)]}{(a - c)^2 + (b - d)^2} \]
\[ = \frac{i[(a + c)(b - d) - (a - c)(b + d)]}{(a - c)^2 + (b - d)^2} \]
\[ = \frac{[(a^2 - c^2) + (b^2 - d^2)]}{(a - c)^2 + (b - d)^2} \]
\[ = \text{purely imaginary number or zero in case } a + c = b + d = 0. \]

3. (c) Let \( z_1 = \eta (\cos \theta_1 + i \sin \theta_1) \)
and \( z_2 = r_2 \) (cos \( \theta_2 + i \sin \theta_2 \))
where \( \eta = |z_1|, r_2 = |z_2|, \theta_1 = \text{arg} (z_1), \theta_2 = \text{arg} (z_2) \)
\[ \therefore \quad z_1 + z_2 = \eta (\cos \theta_1 + i \sin \theta_1) + r_2 \) (cos \( \theta_2 + i \sin \theta_2 \))
\[ = \eta \cos \theta_1 + r_2 \cos \theta_2 + i(\eta \sin \theta_1 + r_2 \sin \theta_2) \]
\[ = \eta^2 \sin^2 \theta_1 \cos^2 \theta_2 + 2\eta \cos \theta_1 \cos \theta_2 \sin \theta_1 \sin \theta_2 + r_2^2 \sin^2 \theta_2 \]
\[ = \eta^2 + r_2^2 + 2\eta r_2 \cos (\theta_1 - \theta_2) \]
and \( |z_1| + |z_2| = \eta + r_2 \)
Since \( |z_1 + z_2|^2 = |z_1|^2 + |z_2|^2 + 2 |z_1| |z_2| \) \( \text{(given)} \)
\[ \Rightarrow \quad \eta^2 + r_2^2 + 2 \eta r_2 \cos (\theta_1 - \theta_2) = \eta^2 + r_2^2 + 2 \eta r_2 \]
\[ \Rightarrow \quad \cos (\theta_1 - \theta_2) = 1 \Rightarrow \theta_1 - \theta_2 = 0 \]
\[ \Rightarrow \quad \text{Arg} (z_1) = \text{Arg} (z_2) \]

4. (d) Let \( z = \cos \frac{2\pi}{7} + i \sin \frac{2\pi}{7} \)
Then by DeMoivre’s theorem, we have
\( z^k = \cos \frac{2\pi k}{7} + i \sin \frac{2\pi k}{7} \)
\[ \text{Now, } \sum_{k=1}^{6} \left( \sin \frac{2\pi k}{7} - i \cos \frac{2\pi k}{7} \right) \]
\[ = \sum_{k=1}^{6} (-i) \left( \cos \frac{2\pi k}{7} + i \sin \frac{2\pi k}{7} \right) \]
\[ = (-i) \sum_{k=1}^{6} z^k = -i \frac{z(1 - z^6)}{1 - z} = -i \left( \frac{z - z^7}{1 - z} \right) \]
\[ (-i) \left( \frac{z-1}{1-z} \right) = [\text{Using } z^7 = \cos 2\pi + i\sin 2\pi = 1] \]
\[ = i \left( \frac{1-z}{1-z} \right) = i \]

5. (d) We have \((1 + \omega + \omega^2)^7 = (-\omega^2 - \omega^2)^7\)
\((-2)^7 (\omega^2)^7 = -1280i^{14} = -1280\omega^2\)

6. (b) \[ \sum_{i=1}^{13} (i^n + i^{n+1}) = \sum_{i=1}^{13} i^n (1+i) = (1+i) \sum_{i=1}^{13} i^n \]
This forms a GP.
Sum of GP = \(i (1+i) \frac{(1-i^{13})}{1-i} = i - 1 \) as \(i^{13} = i\)

7. (d) Taking \(-3i\) common from \(C_2\), we get
\[ \begin{vmatrix} 6i & 1 & 1 \\ 4 & -i & 1 \\ 20 & i & i \end{vmatrix} = 0 \quad (\therefore \ C_2 = C_3) \]
\[ \Rightarrow x = 0, \ y = 0 \]

8. (a,c,d) Given that \(z = (1-t) z_1 + t z_2\) where \(0 < t < 1\)
\[ \Rightarrow z = \frac{(1-t)z_1 + tz_2}{1-t} + t \]
\[ \Rightarrow z \text{ divides the join of } z_1 \text{ and } z_2 \text{internally in the ratio} \]
\[ t: (1-t). \]
\[ \therefore \ z_1, z \text{ and } z_2 \text{ are collinear} \]
\[ \Rightarrow \frac{t}{z_1} = \frac{1-t}{z_2} \]
Also \(z = (1-t)z_1 + t z_2\)
\[ \Rightarrow \frac{z - z_1}{z_2 - z_1} = t \text{ is purely real number} \]
\[ \therefore \text{arg} \left( \frac{z - z_1}{z_2 - z_1} \right) = 0 \Rightarrow \text{arg}(z - z_1) = \text{arg}(z_2 - z_1) \]
Also \(\frac{z - z_1}{z_2 - z_1} = t \Rightarrow \frac{\overline{z} - \overline{z_1}}{\overline{z_2} - \overline{z_1}} = t \)
\[ \Rightarrow \frac{z - z_1}{z_2 - z_1} = \frac{\overline{z} - \overline{z_1}}{\overline{z_2} - \overline{z_1}} \]
\[ \Rightarrow (z - z_1)(\overline{z_2} - \overline{z_1}) = (\overline{z} - \overline{z_1})(z_2 - z_1) \]
\[ \Rightarrow \begin{vmatrix} z_2 - z_1 & \overline{z} - \overline{z_1} \\ z_1 - z_2 & \overline{z_1} - z_1 \end{vmatrix} = 0 \]

9. (c, d) \(w = \frac{\sqrt{3} + i}{2} = \cos \frac{\pi}{3} + i \sin \frac{\pi}{6}\)
and \(w^n = \cos \frac{n\pi}{6} + i \sin \frac{n\pi}{6}\)
\[ \therefore \text{ P contains all those points which lie on unit circle} \]
and have arguments \(\frac{\pi}{3}, \frac{2\pi}{3}, \frac{3\pi}{6}, \frac{8\pi}{6}, \text{ and so on.} \)
As \(z_1 \in \text{ P } \cap \text{ H}_1 \) and \(z_2 \in \text{ P } \cap \text{ H}_2 \), therefore \(z_1 \) and \(z_2 \) can have possible positions as shown in the figure.

\[ \therefore \angle z_1Oz_2 \text{ can be } \frac{2\pi}{3} \text{ or } \frac{5\pi}{6}. \]

10. (a, c, d) \(z = \frac{1}{a + ibt} = x + iy\)
\[ \Rightarrow x + iy = \frac{a - ibt}{a^2 + b^2 t^2} \]
\[ \Rightarrow x = \frac{a}{a^2 + b^2 t^2}, \ y = \frac{-bt}{a^2 + b^2 t^2} \]
\[ \Rightarrow x^2 + y^2 = \frac{1}{a^2 + b^2 t^2} = \frac{x}{a} \]
\[ \Rightarrow x^2 + y^2 - \frac{x}{a} = 0 \]
\[ \therefore \text{ Locus of } z \text{ is a circle with centre } \left( \frac{1}{2a}, 0 \right) \text{ and radius} \]
\[ = \frac{1}{2|a|} \] irrespective of ‘a’ +ve or –ve
Also for \(b = 0, a \neq 0, \) we get, \(y = 0\)
\[ \therefore \text{ locus is x-axis} \]
and for \(a = 0, b \neq 0 \) we get \(x = 0\)
\[ \therefore \text{ locus is y-axis.} \]
\[ \therefore \ a, c, d \text{ are the correct options.} \]
E. Subjective Problems

1. 
\[
\frac{1}{1 - \cos \theta + 2i \sin \theta} = \frac{1}{2 \sin^2 \theta/2 + 4i \sin \theta/2 \cos \theta/2} = \frac{1}{2 \sin \theta/2} \left[ \frac{\sin \theta/2 - 2i \cos \theta/2}{(\sin \theta/2 + 2i \cos \theta/2)(\sin \theta/2 - 2i \cos \theta/2)} \right] = \frac{1}{2 \sin \theta/2} \left[ \frac{-2 \cot \theta/2}{5 + 3 \cos \theta} \right] i
\]

which is of the form \(X + iY\).

2. As \(\beta\) and \(\gamma\) are the complex cube roots of unity therefore, let \(\beta = \omega\) and \(\gamma = \omega^2\) so that \(\omega + \omega^2 + 1 = 0\) and \(\omega^3 = 1\). Then \(\beta \gamma = (a + b)(\omega a^2 + b\omega) = (a + b)(\omega^2 a^2 + ab\omega^2 + b^2\omega) = (a + b)(\omega a^2 + ab\omega + b^2\omega)(\text{using } \omega^3 = 1) = (a + b)(\omega^3 a^3 + ab\omega^3 + b^3\omega^3) = (a + b)(\omega^3 + ab + b^3)(\text{using } \omega^3 = 1) = a^3 + b^3\). Hence proved.

3. Given \(x + iy = \frac{c + ib}{c + id}\)

\[\Rightarrow (x + iy)^2 = \frac{a + ib}{c + id}\] ... (1)

Taking conjugate on both sides, we get

\[\frac{a - ib}{c - id}\] ... (2)

Multiply (1) and (2), we get

\[(x^2 + y^2)^2 = \frac{a^2 + b^2}{c^2 + d^2}\]

4. 
\[
\frac{(1 + i)x - 2i}{3 + i} + \frac{(2 - 3i)y + i}{3 - i} = i
\]

\[\Rightarrow (4 + 2i)x - 6i - 2 + (9 - 7i)y + 3i - 1 = 10i\]
\[\Rightarrow (4x + 9y - 3) + (2x - 7y - 3)i = 10i\]
\[\Rightarrow 4x + 9y - 3 = 0 \text{ and } 2x - 7y - 3 = 10\]

On solving these two, we get \(x = 3, y = -1\)

5. Let us consider the equilateral \(\Delta\) with each side of length \(2a\) and having two of its vertices namely \(A(-a,0)\) and \(B(a,0)\), then third vertex \(C\) will clearly lie on y-axis s.t. \(OC = 2a\sin 60^\circ = a\sqrt{3}\) \(\therefore C\) has the co-ordinates \((0, a\sqrt{3})\).

Now in the form of complex numbers if \(A, B\) and \(C\) are represented by \(z_1, z_2, z_3\) then \(z_1 = a; z_2 = a^\ast; z_3 = a\sqrt{3}i\)

As in an equilateral \(\Delta\), centroid and circumcentre coincide, we get

Circumcentre, \(z_0 = \frac{z_1 + z_2 + z_3}{3}\)

\[\Rightarrow z_0 = \frac{-a + a + a\sqrt{3}i}{3} = \frac{ia}{\sqrt{3}}\]

Now, \(z_1^2 + z_2^2 + z_3^2 = a^2 + a^2 - 3a^2 = -a^2\)

and \(3z_0^2 = (ia)^2 = -a^2 \therefore\) Clearly \(3z_0^2 = z_1^2 + z_2^2 + z_3^2\)

6. We know that if \(z_1, z_2, z_3\) are vertices of an equilateral \(\Delta\) then

\[\frac{z_1 - z_2}{z_3 - z_1} = \frac{z_3 - z_1}{z_2 - z_1}\]

Here \(z_3 = 0\),

We get

\[\frac{z_1 - z_2}{z_2 - z_1} = \frac{-z_1}{z_2 - z_1} \Rightarrow -(z_1 - z_2)^2 = z_1z_2\]

\[\Rightarrow -z_1^2 - z_2^2 + 2z_1z_2 = z_1z_2 \Rightarrow z_1^2 + z_2^2 - z_1z_2 = 0.\]

7. \(1, a, a^2, \ldots, a^{n-1}\) are the \(n\) roots of unity. Clearly above \(n\) values are roots of eq. \(x^n - 1 = 0\)

Therefore we must have (by factor theorem)

\[x^n - 1 = (x - 1)(x - a)(x - a^2) \ldots (x - a^{n-1})\] ... (1)

\[\Rightarrow \frac{x^n - 1}{x - 1} = (x - a)(x - a^2) \ldots (x - a^{n-1})\] ... (2)

Differentiating both sides of eq. (1), we get

\[nx^{n-1} = (x - a_1)(x - a_2) \ldots (x - a_{n-1}) + (x - 1)(x - a_2) \ldots (x - a_{n-2})\]

\[\ldots (x - a_{n-1}) + a_1(a_1 - a_2) \ldots (a_1 - a_{n-1})\]

For \(x = 1\), we get \(n = (1 - a_1)(1 - a_2) \ldots (1 - a_{n-1})\)

[All the terms except first contain \((x - 1)\) and hence become zero for \(x = 1\)].

Proved.
8. Let $A = z = x + iy$, $B = iz = -y + ix$, $C = z + iz = (x - y) + i(x + y)$

Now, area of $\Delta ABC = \frac{1}{2} \begin{vmatrix} x & y & 1 \\ -y & x & 1 \\ x - y & x + y & 1 \end{vmatrix}$

Operating $R_2 - R_1, R_3 - R_1$, we get

\[ \Delta = \frac{1}{2} \begin{vmatrix} x & y & 1 \\ -y - x & x - y & 0 \\ -y & x & 0 \end{vmatrix} \]

\[ = \frac{1}{2} |x(-y - x) + y(x - y)| \]

\[ = \frac{1}{2} |-xy - x^2 + xy - y^2| = \frac{1}{2} |-x^2 - y^2| \]

\[ = \frac{1}{2} |x^2 + y^2| = \frac{1}{2} |z|^2 \text{ Hence Proved.} \]

9. We are given that $z_1 = 10 + 6i$ and $z_2 = 4 + 6i$

Also $\arg \left( \frac{z - z_1}{z - z_2} \right) = \frac{\pi}{4}$

$\Rightarrow \arg (z - z_1) = \arg (z - z_2) = \frac{\pi}{4}$ **NOTE THIS STEP**

10. Dividing throughout by $i$ and knowing that $\frac{1}{i} = -i$, we get

\[ z^3 - iz^2 + iz + 1 = 0 \]

or \[ z^2(z - i) + i(z - i) = 0 \text{ as } 1 = -i^2 \]

or \[ (z - i)(z^2 + i) = 0 \]

\[ \therefore \ |z| = |i| = 1 \text{ or } |z|^2 = |z| = 1 \Rightarrow |z| = 1 \]

Hence in either case $|z| = 1$

11. Let $Z = \eta \cos \theta_1 + i \sin \theta_1$

and $W = r_2 \cos \theta_2 + i \sin \theta_2$

We have $|Z| = r_1, |W| = r_2$, Arg $Z = \theta_1$ and Arg $W = \theta_2$

Since $|Z| \leq 1, |W| \leq 1$, it follows that $\eta \leq \text{ and } r_2 \leq 1$.

We have $Z - W = (\eta \cos \theta_1 - r_2 \cos \theta_2) + i(\eta \sin \theta_1 - r_2 \sin \theta_2)$

\[ |Z - W|^2 = (\eta \cos \theta_1 - r_2 \cos \theta_2)^2 + (\eta \sin \theta_1 - r_2 \sin \theta_2)^2 \]

\[ = r_1^2 \cos^2 \theta_1 + r_2^2 \cos^2 \theta_2 - 2 \eta r_2 \cos \theta_1 \cos \theta_2 + r_1^2 \sin^2 \theta_1 + r_2^2 \sin^2 \theta_2 + 2 \eta r_2 \sin \theta_1 \sin \theta_2 \]

\[ = r_1^2 (\cos^2 \theta_1 + \sin^2 \theta_1) + r_2^2 (\cos^2 \theta_2 + \sin^2 \theta_2) - 2 \eta r_2 \sin \theta_1 \sin \theta_2 \]

\[ = r_1^2 + r_2^2 - 2 \eta r_2 \cos (\theta_1 - \theta_2) \]

\[ = (\eta - r_2)^2 + 2 \eta r_2 [1 - \cos (\theta_1 - \theta_2)] \]

\[ = (\eta - r_2)^2 + 4 \eta r_2 \sin^2 \left( \frac{\theta_1 - \theta_2}{2} \right) \]

\[ \leq |\eta - r_2|^2 + 4 \left| \sin \left( \frac{\theta_1 - \theta_2}{2} \right) \right|^2 \]

\[ \therefore |\eta - r_2|^2 + 4 \left| \sin \left( \frac{\theta_1 - \theta_2}{2} \right) \right|^2 \]

But $|\sin \theta| \leq |\theta| \quad \forall \theta \in \mathbb{R}$ **NOTE THIS STEP**

Therefore,

\[ |Z - W|^2 \leq |\eta - r_2|^2 + 4 \left| \frac{\theta_1 - \theta_2}{2} \right|^2 \leq |\eta - r_2|^2 + |\theta_1 - \theta_2|^2 \]

Thus $|Z - W|^2 \leq (|Z| - |W|)^2 + (\text{Arg} \ Z - \text{Arg} \ W)^2$

12. Let $z = x + iy$ then $\overline{z} = x - iy$

$\Rightarrow x - iy = i(x^2 - y^2 + 2xy)$

$\Rightarrow x - iy = i(x^2 - y^2) - 2xy$
**Complex Numbers**

\[ x (1 + 2y) = 0; \quad x^2 - y^2 + y = 0 \]

\[ x = 0 \text{ or } y = -\frac{1}{2} \Rightarrow x = 0, \quad y = 0, \quad 1 \]

or \[ y = -\frac{1}{2}; \quad x = \pm \sqrt{\frac{3}{2}} \]

For non-zero complex number \( z \)

\[ x = 0, \quad y = 1; \quad x = \frac{\sqrt{3}}{2}, \quad y = -\frac{1}{2}; \quad x = -\frac{\sqrt{3}}{2}, \quad y = -\frac{1}{2} \]

\[ z = i, \quad \frac{\sqrt{3}}{2} - \frac{i}{2}, \quad -\frac{\sqrt{3}}{2} - \frac{i}{2} \]

13. \( z^2 + pz + q = 0 \)

\[ z_1 + z_2 = -p, \quad z_1 z_2 = q \]

By rotation through \( \alpha \) in anticlockwise direction

\[ z_2 = z_1 e^{i\alpha} \quad \ldots(1) \]

\[ \frac{z_2}{z_1} = \frac{e^{i\alpha}}{1} \]

Add 1 in both sides to get \( z_1 + z_2 = -p \)

\[ z_1 + z_2 = \frac{1 + \cos \alpha + i \sin \alpha}{1} = 2 \cos \frac{\alpha}{2} \left[ \frac{\cos \frac{\alpha}{2} + i \sin \frac{\alpha}{2}}{2} \right] \]

or \[ (z_2 + z_1) / z_1 = 2 \cos \frac{\alpha}{2} e^{i\alpha/2} \]

On squaring \( (z_2 + z_1)^2 = 4 \cos^2 (\alpha / 2) z_1 \)

\[ = 4 \cos^2 \frac{\alpha}{2} \frac{z_2}{z_1} = 4 \cos^2 \frac{\alpha}{2} z_1 z_2 \]

or \[ p^2 = 4q \cos^2 \frac{\alpha}{2} \]

14. Given that \( z \) and \( w \) are two complex numbers.

To prove \( |z|^2 w - |w|^2 z = z - w \) \( \Leftrightarrow z = w \) or \( \bar{z} = w \)

First let us consider

\[ |z|^2 w - |w|^2 z = z - w \]

\[ \Rightarrow z (1 + |w|^2) w = |w|^2 (1 + |z|^2 w) \]

\[ \Rightarrow \frac{z}{w} = \frac{1 + |z|^2}{1 + |w|^2} = \frac{z}{w} = \text{a real number} \]

\[ \Rightarrow \left( \frac{z}{w} \right) = \frac{z}{w} \Rightarrow \frac{z}{w} = \frac{z}{w} \]

\[ \bar{z} w = z \bar{w} \]

Again from equation (1),

\[ \bar{z} w - w \bar{z} = z - w \]

\[ z (\bar{z} w - 1) - w (\bar{z} w - 1) = 0 \]

\[ z (\bar{z} w - 1) - w (\bar{z} w - 1) = 0 \quad \text{(Using equation (2))} \]

\[ \Rightarrow (\bar{z} w - 1) (z - w) = 0 \Rightarrow \bar{z} w - 1 = 0 \text{ or } z = w \]

Conversely if \( z = w \) then

L.H.S. of (1) \( = |w|^2 w - |w|^2 w = 0 \)

R.H.S. of (1) \( = w - w = 0 \)

\[ \therefore (1) \text{ holds} \]

Also if \( z \bar{w} = 1 \) then

L.H.S. of (1) \( = z \bar{w} w - w \bar{w} z \)

\[ = z \bar{w} w - w \bar{w} z = z - w = R.H.S. \]

Hence proved.

15. The given equation can be written as

\[ (z^p - 1) (z^q - 1) = 0 \]

\[ \therefore z = (1)^{1/p} \text{ or } (1)^{1/q} \quad \ldots(1) \]

where \( p \) and \( q \) are distinct prime numbers.

Hence both the equations will have distinct roots and as \( z \neq 1 \), both will not be simultaneously zero for any value of \( z \) given by equations in (1)

**NOTE THIS STEP**

Also \( 1 + \alpha + \alpha^2 + \ldots + \alpha^{p-1} = \frac{1 - \alpha^p}{1 - \alpha} = 0 \) (\( \neq 1 \))

or \( 1 + \alpha + \alpha^2 + \ldots + \alpha^q = \frac{1 - \alpha^q}{1 - \alpha} = 0 \) (\( \neq 1 \))

Because of (1) either \( \alpha^p = 1 \) and if \( \alpha^q = 1 \) but not both simultaneously as \( p \) and \( q \) are distinct primes.

16. Given that \( |z| < 1 < |z|_2 \)

Then \( \left| \frac{1 - z}{z_2} \right| < 1 \) is true

if \( |1 - z_1 \bar{z}_2| < |z_1 - z_2| \) is true

if \( |1 - z_1 \bar{z}_2|^2 < |z_1 - z_2|^2 \) is true

if \( (1 - z_1 \bar{z}_2) (1 - z_1 \bar{z}_2) < (z_1 - z_2) (z_1 - z_2) \) is true

if \( (1 - z_1 \bar{z}_2) (1 - z_1 \bar{z}_2) < (z_1 - z_2) (z_1 - z_2) \) is true

if \( 1 - z_1 \bar{z}_2 - z_1 z_2 + z_1 \bar{z}_2 \bar{z}_2 - z_1 \bar{z}_2 \bar{z}_2 = z_1 \bar{z}_2 \)

\[ = \bar{z}_1 z_2 + z_1 \bar{z}_2 \]

is true

if \( 1 - |z_1|^2 \bar{z}_2 |z_2|^2 < |z_1|^2 |z_2|^2 < |z_1|^2 + |z_2|^2 \) is true

if \( (1 - |z_1|^2) (1 - |z_2|^2) < 0 \) is true

which is obviously true

as \( |z| < 1 < |z| \)

\[ \Rightarrow |z|^2 < 1 < |z|^2 \]

\[ \Rightarrow |1 - |z|^2| > 0 \text{ and } (1 - |z|^2) < 0 \quad \text{Hence proved.} \]

17. Let us consider, \( \sum_{r=1}^{n} a_r z_r = 1 \) where \( |a_r| < 2 \)

\[ a_1 z + a_2 z^2 + a_3 z^3 + \ldots + a_n z^n = 1 \]

\[ |a_1 z + a_2 z^2 + a_3 z^3 + \ldots + a_n z^n| = 1 \quad \ldots(1) \]

But we know that \( |z_1 + z_2| \leq |z_1| + |z_2| \)

\[ \therefore \text{ Using its generalised form, we get} \]

\[ |a_1 z + a_2 z^2 + a_3 z^3 + \ldots + a_n z^n| \leq |a_1 z| + |a_2 z^2| + \ldots + |a_n z^n| \]
\[
1 \leq |a_1||z| + |a_2||z|^2 + |a_3||z|^3 + \ldots + |a_n||z^n|
\]
(Using eq^a(1))

But given that \( |a_r| < 2 \forall \ r = 1(1)^n \)
\[
\Rightarrow \quad 1 < 2 \left[ |z| + |z|^2 + |z|^3 + \ldots + |z|^n \right]
\]
(Using \( |z|^n = |z|^n \))
\[
\Rightarrow \quad 1 < 2 \left[ \frac{|z|}{1 - |z|} \right] \quad \Rightarrow \quad 2 \left[ \frac{|z|}{1 - |z|} \right] > 1
\]
\[
\Rightarrow \quad 2 \left[ |z| - |z|^n+1 \right] > 1 - |z| \quad (\because \quad 1 - |z| > 0 \text{ as } |z| < 1/3)
\]
\[
\Rightarrow \quad \left| |z| - |z|^n+1 \right| > \frac{1}{2} \quad \Rightarrow \quad \frac{3}{2} |z| > \frac{1}{2} + |z|^n+1
\]
\[
\Rightarrow \quad |z| > \frac{1}{3} + \frac{2}{3} |z|^n+1 \Rightarrow \quad |z| > \frac{1}{3}
\]
which is a contradiction as given that \( |z| < \frac{1}{3} \)
\[
\therefore \quad \text{There exist no such complex number.}
\]

18. We are given that
\[
\left| \frac{z - \alpha}{z - \beta} \right| = k \quad \Rightarrow \quad |z - \alpha| = k |z - \beta|
\]

Let pt. A represents complex number \( \alpha \) and B that of \( \beta \), and P represents z. then \( |z - \alpha| = k |z - \beta| \)
\( \Rightarrow \quad z \) is the complex number whose distance from A is k times its distance from B.
\( \therefore \quad PA = k \ PB \)
\( \Rightarrow \quad P \) divides AB in the ratio k: 1 internally or externally (at P).

Then
\[
\therefore \quad P \left( \frac{k\beta + \alpha}{k + 1} \right) \quad \text{and} \quad P ' \left( \frac{k\beta - \alpha}{k - 1} \right)
\]

Now through PP' there can pass a number of circles, but with given data we can find radius and centre of that circle for which PP' is diameter.
And hence then centre = mid. point of PP'
\[
\therefore \quad \left( \frac{k\beta + \alpha + k\beta - \alpha}{k + 1 - k - 1} \right) = \frac{k^2\beta + k\alpha - k\beta - \alpha + k^2\beta - k\alpha + k\beta - \alpha}{2(k^2 - 1)}
\]
\[
= \frac{k^2\beta - \alpha}{k^2 - 1} = \frac{\alpha - k^2\beta}{1 - k^2}
\]

Also radius
\[
\frac{1}{2} |PP'| = \frac{1}{2} \left| k\beta + \alpha - k\beta - \alpha \right| \quad \Rightarrow \quad \frac{1}{2} \left| k\beta + \alpha - k\beta - \alpha \right| = k |\alpha - \beta| |1 - k^2|
\]

19. The given circle is
\( |z - 1| = \sqrt{2} \) where \( z_0 = 1 \) is
the centre and \( \sqrt{2} \) is
the radius of circle. \( z_1 \) is one of
the vertex of square inscribed in the given
circle.
Clearly \( z_2 \) can be obtained by rotating \( z_1 \) by an \( \pm 90^\circ \) in
anticlockwise sense, about centre \( z_0 \)
Thus, \( z_2 = (z_1 - z_0)e^{\pm i} \)
or \( \quad z_2 - 1 = (2 + i\sqrt{3} - 1) i \Rightarrow \quad z_2 = i - \sqrt{3} + 1 \)
\( \quad z_2 = (1 - \sqrt{3}) + i \)
Again rotating \( z_2 \) by \( 90^\circ \) about \( z_0 \) we get
\( \quad z_3 - z_0 = (z_2 - z_0) i \)
\( \Rightarrow \quad z_3 - 1 = [(1 - \sqrt{3}) + i] i = - \sqrt{3} i - 1 \Rightarrow \quad z_3 = \sqrt{3} i - 1 \)
and similarly \( i(\sqrt{3} i - 1) = \sqrt{3} i - i \)
\( \Rightarrow \quad z_4 = (\sqrt{3} i + 1) - i \)
Thus the remaining vertices are
\( \quad (1 - \sqrt{3}) + i, -i\sqrt{3}, (\sqrt{3} + 1) - i \)

F. Match the Following
1. \( z \neq 0 \) Let \( z = a + ib \)
Re \( (z) = 0 \Rightarrow z = ib \Rightarrow z^2 = -b^2 \)
\( \therefore \quad Im \ (z)^2 = 0 \)
\( \therefore \quad (A) \) corresponds to (q)

Arg \( z = \frac{\pi}{4} \Rightarrow a = b \Rightarrow z = a + ia \)
\( z^2 = a^2 - a^2 + 2ia^2; \quad z^2 = 2ia^2 \Rightarrow \text{Re} \ (z) = 0 \)
\( \therefore \quad (B) \) corresponds to (p).

2. \( (A) \rightarrow (q, r) |z - i| = |z + i| \)
\( \Rightarrow \quad z \) is equidistant from two points \((0, |z|)\) and \((0, -|z|)\) which lie on imaginary axis.
\( \therefore \quad z \) must lie on real axis \( \Rightarrow \quad \text{Im} \ (z) = 0 \) also \( |m(z)| \leq 1 \)
(B) \rightarrow p
Sum of distances of \( z \) from two fixed points \((4, 0)\) and \((4, 0)\) is 10 which is greater than 8.
\( \therefore \quad z \) traces an ellipse with \( 2a = 10 \) and \( 2ae = 8 \)
\( \Rightarrow \quad e = \frac{4}{5} \)
Complex Numbers

(C) → (p, s, t)

Let \( \omega = 2(\cos \theta + i \sin \theta) \)

then \( z = \omega - \frac{1}{\omega} = 2(\cos \theta + i \sin \theta) - \frac{1}{2}(\cos \theta - i \sin \theta) \)

\[ x + iy = \frac{3}{2} \cos \theta + i \frac{5}{2} \sin \theta \]

Here \( |z| = \sqrt{\left(\frac{9 + 25}{4}\right)} = \sqrt{\frac{34}{4}} \leq 3 \) and \( |R(x)| \leq 2 \)

Also \( x = \frac{3}{2} \cos \theta, y = \frac{5}{2} \sin \theta \Rightarrow \frac{4x^2}{9} + \frac{4y^2}{25} = 1 \)

Which is an ellipse with \( e = \sqrt{1 - \frac{9}{25}} = \frac{4}{5} \)

(D) → (q, r, s, t)

Let \( \omega = \cos \theta + i \sin \theta \) then \( z = 2 \cos \theta \Rightarrow \text{Im} z = 0 \)

Also \( |z| \leq 3 \) and \( |\text{Im}(z)| \leq 1, |R(x)| \leq 2 \)

3. \( (c) \rightarrow (1): \ z_k = \cos \frac{2k\pi}{10} + i \sin \frac{2k\pi}{10}, k = 1 \text{ to } 9 \)

\[ \therefore z_k = e^{i\frac{2k\pi}{10}} \]

Now \( z_k \cdot z_j = 1 \Rightarrow z_j = \frac{1}{z_k} = e^{-i\frac{2k\pi}{10}} = \overline{z_k} \)

We know if \( z_k \) is 10\(^{th}\) root of unity so will be \( \overline{z_k} \).

\( \therefore \) For every \( z_k \), there exist \( z_i = \overline{z_k} \)

Such that \( z_k \cdot z_j = z_k \cdot \overline{z_k} = 1 \)

Hence the statement is true.

(Q) → (2) \( z_1 = z_k \Rightarrow z = \frac{z_k}{z_1} \) for \( z_1 \neq 0 \)

\( \therefore \) We can always find a solution to \( z_1 \cdot z = z_k \)

Hence the statement is false.

(R) → (3): We know \( z^{10} - 1 = (z - 1)(z - z_1)(z - z_2) \ldots (z - z_9) \)

\[ \Rightarrow (z - z_1)(z - z_2) \ldots (z - z_9) = \frac{z^{10} - 1}{z - 1} = 1 + z + z^2 + \ldots z^9 \]

For \( z = 1 \) we get

\[ (1 - z_1)(1 - z_2) \ldots (1 - z_9) = 10 \]

\[ \therefore |z_1 - z_2| |1 - z_2| \ldots |1 - z_9| = 1 \]

\( S \rightarrow (4): 1, Z_1, Z_2, \ldots Z_9 \) are 10th roots of unity.

\( \therefore Z^{10} - 1 = 0 \)

From equation \( 1 + Z_1 + Z_2 + \ldots + Z_9 = 0 \)

\( \Rightarrow \text{Re}(1 + \text{Re}(Z_1) + \text{Re}(Z_2) + \ldots + \text{Re}(Z_9)) = 0 \)

\( \Rightarrow \text{Re}(Z_1) + \text{Re}(Z_2) + \ldots + \text{Re}(Z_9) = -1 \)

\[ \Rightarrow \sum_{k=1}^{9} \cos \frac{2k\pi}{10} = -1 \Rightarrow 1 - \sum_{k=1}^{9} \cos \frac{2k\pi}{10} = 2 \]

Hence (c) is the correct option.

G. Comprehension Based Questions

For (Q. 1 - 3)

We have \( A = \{ z : \text{Im}(z) \geq 1 \} = \{(x, y) : y \geq 1 \} \)

Clearly \( A \) is the set of all points lying on or above the line \( y = 1 \) in cartesian plane.

\( B = \{ z : |z - 2 - i| = 3 \} = \{(x, y) : (x - 2)^2 + (y - 1)^2 = 9 \} \)

\( \Rightarrow B \) is the set of all points lying on the boundary of the circle with centre \((2, 1)\) and radius 3.

\( C = \{ z : \text{Re}(z) = \sqrt{2} \} = \{(x, y) : x + y = \sqrt{2} \} \)

\( \Rightarrow C \) is the set of all points lying on the straight line represented by \( x + y = \sqrt{2} \).

Graphically, the three sets are represented as shown below:

![Diagram of sets A, B, and C]

1. (b) From graph \( A \cap B \cap C \) consists of only one point \( P \) [the common point of the region \( y \geq 1, (x - 2)^2 + (y - 1)^2 = 9 \) and \( x + y = \sqrt{2} \)]

\( \therefore n(A \cap B \cap C) = 1 \)

2. (c) As \( z \) is a point of \( A \cap B \cap C \) \( z \) represents the point \( P \)

\( \therefore |z - 1 - i|^2 + |z - 5 - i|^2 \Rightarrow |z - (1 + i)|^2 + |z - (5 + i)|^2 \Rightarrow PQ^2 + PR^2 = QR^2 = 6^2 = 36 \)

which lies between 35 and 39

\( \therefore \) (c) is correct option.

3. (d) Given that \( |w - 2 - i| < 3 \)

\( \Rightarrow \) Distance between \( w \) and \( 2 + i \) i.e. \( S \) is smaller than 3.

\( \Rightarrow w \) is a point lying inside the circle with centre \( S \) and radius 3.

\( \Rightarrow \) Distance between \( z \) (i.e. the point \( P \)) and \( w \) should
be smaller than 6 (the diameter of the circle) 
\[ |z - w| < 6 \]

But we know that \( |z - w| < |z - w| \)
\[ \Rightarrow |z - w| < 6 \Rightarrow -6 < |z - w| < 6 \]
\[ -3 < |z - w| + 3 < 9 \]

For (Q. 4 & 5)
\[ S_1 : x^2 + y^2 < 16 \]
\[ S_2 : \text{Im} \left[ \frac{(x - 1) + i(y + \sqrt{3})}{1 - i\sqrt{3}} \right] > 0 \]
\[ \Rightarrow \sqrt{3}(x - 1) + (y + \sqrt{3}) > 0 \Rightarrow y + \sqrt{3}x > 0 \]
\[ S_3 : x > 0 \]
Then \( S = S_1 \cap S_2 \cap S_3 \) is as shown in the figure given below.

4. (b) Area of shaded region
\[ = \pi \times 4^2 + \pi \times \frac{4^2 \times 60^\circ}{360^\circ} = 4\pi + \frac{8\pi}{3} = \frac{20\pi}{3} \]

5. (c) \( \min_{z \in z} |1 - 3i - z| = \min \) distance between \( z \) and \( (1, -3) \)
Clearly (from figure) minimum distance between \( z \in z \)
and \( (1, -3) \) from line \( y + x\sqrt{3} = 0 \) i.e.
\[ \frac{\sqrt{3} - 3}{\sqrt{3} + 1} = \frac{3 - \sqrt{3}}{2} \]

I. Integer Value Correct Type

1. (5)
Given \( |z - 3 - 2i| \leq 2 \)
which represents a circular region with centre \((3, 2)\)
and radius 2.

Now \( |2z - 6 + 5i| = 2|z - \left(3 - \frac{5}{2}i\right)| \)
\[ = 2 \times \text{distance of } z \text{ from } P \]
(where \( Z \) lies in or on the circle)
Also \( \min \) distance of \( z \) from \( P = \frac{5}{2} \)
\[ \therefore \text{Minimum value of } |2z - 6 + 5i| = 5 \]

2. (3)
The expression may not attain integral value for all \( a, b, c \).
If we consider \( a = b = c \) then
\[ x = 3a, y = a(1 + \omega + \omega^2) = a(1 + i\sqrt{3}) \]
\[ Z = a(1 + \omega^2 + \omega) = a(1 + i\sqrt{3}) \]
\[ \Rightarrow \left| x \right|^2 + \left| y \right|^2 + \left| z \right|^2 = 9 |a|^2 + 4 |a|^2 + 4 |a|^2 = 17 |a|^2 \]
\[ \Rightarrow \left| a \right|^2 + \left| b \right|^2 + \left| c \right|^2 = \frac{17}{3} \] (which is not an integer)

Note: However if \( \omega = e^{i\frac{2\pi}{3}} \), then the value of expression
\[ (a + b + c)(\overline{a} + \overline{b} + \overline{c}) + (a + b\omega + c\omega^2)(\overline{a} + \overline{b} \omega + \overline{c} \omega^2) + \]
\[ = (a + b\omega + c\omega^2)(\overline{a} + \overline{b} \omega + \overline{c} \omega^2) \]
\[ = 3 \left| a \right|^2 + \left| b \right|^2 + \left| c \right|^2 \]
\[ = 3 \quad (\because 1 + \omega + \omega^2 = 0) \]

3. (4) \( \alpha_k = \cos \frac{k\pi}{7} + i\sin \frac{k\pi}{7} = e^{\frac{ink}{7}} \)
\[ \alpha_{k+1} - \alpha_k = e^{\frac{ink}{7}} - e^{\frac{ink}{7}} = e^{\frac{ink}{7}} (e^{\frac{ink}{7}} - 1) \]
\[ \Rightarrow \sum_{k=1}^{12} |\alpha_{k+1} - \alpha_k| = 12 |e^{\frac{ink}{7}} - 1| \]
Similarly \( \sum_{k=1}^{3} |\alpha_{4k+1} - \alpha_{4k-1}| = 3 |e^{\frac{ink}{7}} - 1| \)
\[ \therefore \frac{\sum_{k=1}^{12} |\alpha_{k+1} - \alpha_k|}{\sum_{k=1}^{3} |\alpha_{4k+1} - \alpha_{4k-1}|} = 4 \]
1. (b) \[ |z| = |\omega| = r \Rightarrow \omega = re^{i\phi} \text{ where } 0 + \phi = \pi. \]

   \[ \therefore z = re^{i(\pi - \phi)} = re^{-i\phi} = \bar{\omega} \text{ [for } \omega = re^{i\phi}] \]

2. (c) Given \[ |z - 4| < |z - 2| \text{ Let } z = x + iy \]

   \[ \Rightarrow |(x - 4) + iy| < |(x - 2) + iy| \]

   \[ \Rightarrow (x - 4)^2 + y^2 < (x - 2)^2 + y^2 \]

   \[ \Rightarrow x^2 - 8x + 16 < x^2 - 4x + 4 \]

   \[ \Rightarrow x > 3 \Rightarrow \text{ Re}(z) > 3 \]

3. (b) Let the circle be \[ |z - z_0| = r. \] Then according to given conditions \[ |z_0 - z_1| = r + a \text{ and } |z_0 - z_2| = r - b. \]

   Eliminating \( r, \) we get \[ |z_0 - z_1| - |z_0 - z_2| = a - b. \]

   \[ \therefore \text{ Locus of centre } z_0 \text{ is } |z - z_1| - |z - z_2| = a - b, \] which represents a hyperbola.

4. (a) \[ |\bar{z}| \omega = |\bar{z} ||\omega| = |z| \omega = |z\omega| = 1 \]

   \[ \text{Arg}(\bar{z})\omega = \text{Arg}(\bar{z}) + \text{Arg}(\omega) = -\text{Arg}(z) + \text{Arg} \omega \]

   \[ = -\frac{\pi}{2} \therefore \bar{z}\omega = -1 \]

5. (d) \[ z^2 + az + b = 0; \quad z_1 + z_2 = -a \quad \& \quad z_1z_2 = b \]

   \[ 0, z_1, z_2 \text{ form an equilateral } \Delta \]

   \[ \therefore 0^2 + z_1^2 + z_2^2 = 0, z_1 + z_2 = z_2 = 0 \]

   (for an equilateral triangle, \[ z_1^2 + z_2^2 + z_3^2 = z_1z_2 + z_2z_3 + z_3z_1 \]

   \[ \Rightarrow z_1^2 + z_2^2 = z_1z_2 \Rightarrow (z_1 + z_2)^2 = 3z_1z_2 \therefore a^2 = 3b \]

6. (b) \[ \left( \frac{1 + i}{1 - i} \right)^x = 1 \Rightarrow \left[ \frac{(1 + i)^2}{1 - i^2} \right]^x = 1 \]

   \[ \left( \frac{1 + i^2 + 2i}{1 + 1} \right)^x = 1 \Rightarrow (i)^x = 1; \therefore x = 4n; \quad n \in \mathbb{Z}^+ \]

7. (c) \[ \arg z \omega = \pi \Rightarrow \arg z + \arg \omega = \pi ... (1) \]

   \[ \bar{z} + i\omega = 0 \Rightarrow \bar{z} = -i\omega \]

   \[ \therefore z = i\omega \Rightarrow \arg z = \frac{\pi}{2} + \arg \omega \]

   \[ \therefore \arg z = \frac{\pi}{2} + \arg \omega \]

   \[ \Rightarrow \arg z = \frac{\pi}{2} + \arg z (\text{from(1)}); \therefore \arg z = \frac{3\pi}{4} \]

8. (a) \[ z = p + iq \Rightarrow z = p^3 + (iq)^3 + 3p(iq)(p + iq) \]

   \[ \Rightarrow x - iy = p^3 - 3pq^2 + i(3p^2q - q^3) \]

   \[ \therefore x = p^3 - 3pq^2 \Rightarrow \frac{x}{p} = p^2 - 3q^2 \]

   \[ y = q^3 - 3p^2q \Rightarrow \frac{y}{q} = q^2 - 3p^2 \]

   \[ \therefore \frac{x}{p} + \frac{y}{q} = -2p^2 - 2q^2 \Rightarrow \left( \frac{x}{p} + \frac{y}{q} \right) / (p^2 + q^2) = -2 \]

9. (b) \[ |z^2 - 1| = |z|^2 + 1 \Rightarrow |z^2 - 1|^2 = (z\bar{z} + 1)^2 \]

   \[ \Rightarrow (z^2 - 1)(\bar{z}^2 - 1) = (z\bar{z} + 1)^2 \]

   \[ \Rightarrow z^2\bar{z}^2 - z^2 - \bar{z}^2 + 1 = z^2\bar{z}^2 + 2z\bar{z} + 1 \]

   \[ \Rightarrow z^2 + 2z\bar{z} + \bar{z}^2 = 0 \Rightarrow (z + \bar{z})^2 = 0 \Rightarrow z = -\bar{z} \]

   \[ \therefore z \text{ is purely imaginary} \]

10. (c) \[ (x - 1)^3 + 8 = 0 \Rightarrow (x - 1) = (-2)(1/3) \]

    \[ \Rightarrow x - 1 = -2 \text{ or } -2x \text{ or } -2x^2 \]

    \[ \text{or } x = -1 \text{ or } 1 - 2x \text{ or } 1 - 2x^2. \]

11. (c) \[ |z_1 + z_2| = |z_1| + |z_2| \Rightarrow z_1 \text{ and } z_2 \text{ are collinear and are to the same side of origin}; \]

    \[ \therefore \arg z_1 - \arg z_2 = 0. \]

12. (c) \[ \text{As given } w = \frac{z}{z - \frac{1}{3}} \Rightarrow |w| = \frac{|z|}{|z - \frac{1}{3}|} = 1 \]

    \[ \Rightarrow |z| = \left| z - \frac{1}{3} \right| \]

    \[ \Rightarrow \text{distance of } z \text{ from origin and point } \left( 0, \frac{1}{3} \right) \text{ is same hence } z \text{ lies on bisector of the line joining points } (0, 0) \text{ and } (0, 1/3). \]

    \[ \text{Hence } z \text{ lies on a straight line.} \]

13. (d) \[ \sum_{k=1}^{10} \left( \sin \frac{2k\pi}{11} + i\cos \frac{2k\pi}{11} \right) = i \sum_{k=1}^{10} \left( \cos \frac{2k\pi}{11} - i\sin \frac{2k\pi}{11} \right) \]

    \[ = i \sum_{k=0}^{10} \left( \frac{2k\pi}{11} \right) = i \sum_{k=0}^{10} \left( -e^{\frac{2k\pi i}{11}} \right) \]

    \[ = i \left[ \frac{2k\pi i}{11} + \frac{2\pi i}{11} + ... \right. \text{11 terms} \left. \right] = -i \]

    \[ = i \left[ 1 - e^{-\frac{2\pi i}{11}} \right] = -i \]

14. (d) \[ z^2 + z + 1 = 0 \Rightarrow z = \omega \text{ or } \omega^2 \]

    \[ \text{So, } z + \frac{1}{z} = \omega + \omega^2 = -1 \]

    \[ z^2 + \frac{1}{z^2} = \omega^2 + \omega^2 = -1, \quad z^3 + \frac{1}{z^3} = \omega^3 + \omega^3 = 2 \]
15. (a) \( z \) lies on or inside the circle with centre \((-4, 0)\) and radius 3 units.

\[ z^4 + \frac{1}{z^4} = -1 \]
\[ z^5 + \frac{1}{z^5} = -1 \]
\[ z^6 + \frac{1}{z^6} = 2 \]

\( \Rightarrow \) The given sum \( = 1 + 4 + 1 + 4 = 12 \)

22. (c) Given \( |z| = 1 \), \( \arg z = 0 \)

As we know, \( \frac{1}{z} = \frac{\bar{z}}{1} \)

\( \therefore \) \( \arg \left( \frac{1+z}{1+\bar{z}} \right) = \arg \left( \frac{1+z}{1+\bar{z}} \right) = \arg (z) = 0 \).

23. (b) We know minimum value of \(|Z_1 + Z_2|\) is \(||Z_1| - |Z_2||\)

Thus minimum value of \(|Z + \frac{1}{2}|\) is \(|Z - \frac{1}{2}|\)

\[ \leq |Z + \frac{1}{2}| < |Z + \frac{1}{2}| < 2 + \frac{1}{2} \]

\[ \Rightarrow \frac{3}{2} < |Z + \frac{1}{2}| < 5 \]

24. (a) \[ \frac{|z_1 - 2z_2|}{2 - z_1\bar{z}_2} = 1 \Rightarrow |z_1 - 2z_2|^2 = |2 - z_1\bar{z}_2|^2 \]

\[ \Rightarrow (z_1 - 2z_2)(\bar{z}_1 - 2\bar{z}_2) = (2 - z_1\bar{z}_2)(2 - \bar{z}_1\bar{z}_2) \]

\[ \Rightarrow (z_1\bar{z}_1) - 2z_1\bar{z}_2 - 2\bar{z}_1z_2 + 4z_2\bar{z}_2 = 4 - 2z_1\bar{z}_2 - 2\bar{z}_1z_2 + 4z_2\bar{z}_2 \]

\[ \Rightarrow |z_1|^2 + 4|z_2|^2 - 4 - |z_1|^2 - |z_2|^2 = 0 \]

\[ \Rightarrow (|z_1|^2 - 4)(1 - |z_2|^2) = 0 \]

\[ \Rightarrow |z_2| = 1 \Rightarrow |z_1|^2 = 4 \Rightarrow |z_1| = 2 \]

\( \Rightarrow \) Point \( z_1 \) lies on circle of radius 2.

25. (b) Rationalizing the given expression

\( (2 + 3i\sin \theta)(1 + 2i\sin \theta) \)

\[ 1 + 4\sin^2 \theta \]

For the given expression to be purely imaginary, real part of the above expression should be equal to zero.

\[ \Rightarrow 2 - 6\sin^2 \theta = 0 \Rightarrow \sin^2 \theta = \frac{1}{3} \Rightarrow \sin \theta = \pm \frac{1}{\sqrt{3}} \]

### Section-A : JEE Advanced/ IIT-JEE

#### A. Fill in the Blanks

1. Given polynomial:
   
   $(x - 1)(x - 2)(x - 3) \ldots (x - 100)$
   
   $= x^{100} - (1 + 2 + 3 + \ldots + 100)x^{99} + (\ldots) x^{98} + \ldots$

   Here coeff. of $x^{99} = -(1 + 2 + 3 + \ldots + 100)$
   
   $= \frac{-100 \times 101}{2} = -5050$.

2. As $p$ and $q$ are real; and one root is $2 + i \sqrt{3}$, other should be $2 - i \sqrt{3}$.

3. The given equation is $x^2 - 3kx + 2e^{2lnk} - 1 = 0$.

   Or $x^2 - 3kx + (2k^2 - 1) = 0$

   Here product of roots $= 2k^2 - 1$. 

$\therefore 2k^2 - 1 = 7 \Rightarrow k^2 = 4 \Rightarrow k = 2, -2$

Now for real roots we must have $D \geq 0$

$\Rightarrow 9k^2 - 4(2k^2 - 1) \geq 0 \Rightarrow k^2 + 4 \geq 0$

Which is true for all $k$. Thus $k = 2, -2$

But for $k = 2$, $ln k$ is not defined

$\therefore$ Rejecting $k = 2$, we get $k = 2$

4. $x = 1$ reduces both the equations to $1 + a + b = 0$

$\therefore 1$ is the common root. For $a + b = -1$

$\therefore$ Numerical value of $a + b = 1$

5. $\log_7 \log_5 \left( \sqrt{x + 5} + \sqrt{x} \right) = 0$

$\Rightarrow \log_5 \left( \sqrt{x + 5} + \sqrt{x} \right) = 1 \quad \text{NOTE THIS STEP}$

$\Rightarrow \sqrt{x + 5} + \sqrt{x} = 5 \Rightarrow x + 5 = 25 + 10\sqrt{x}$

$\Rightarrow 2 = \sqrt{x} \Rightarrow x = 4$ which satisfies the given equation.

6. Given $x < 0, y < 0$

$x + y = \frac{1}{2}$ and $(x + y) \frac{x}{y} = -\frac{1}{2}$

Let $x + y = a$ and $\frac{x}{y} = b$ .... (1)

$\therefore$ We get $a + b = \frac{1}{2}$ and $ab = -\frac{1}{2}$

Solving these two, we get $a + \left( -\frac{1}{2a} \right) = \frac{1}{2}$

$\Rightarrow 2a^2 - a - 1 = 0 \Rightarrow a = 1, -1/2 \Rightarrow b = -1/2, 1$

$\therefore$ (1) $x + y = 1$ and $\frac{x}{y} = -\frac{1}{2}$

or $x + y = -\frac{1}{2}$ and $\frac{x}{y} = 1$

But $x, y < 0$

$\therefore x + y < 0 \Rightarrow x + y = -\frac{1}{2}$ and $\frac{x}{y} = 1$

On solving, we get $x = -1/4$ and $y = -1/4$.

7. We have $x_1 + x_2 + \ldots + x_k = n$ .... (1)

where $x_1 \geq x_2 \geq x_3 \geq \ldots \ldots \geq x_k \geq k$; all integers

Let $y_1 = x_1 - 1, y_2 = x_2 - 2, \ldots \ldots , y_k = x_k - k$

so that $y_1, y_2, \ldots \ldots , y_k \geq 0$

Substituting the values of $x_1, x_2, \ldots \ldots , x_k$ in equation .... (1)

We get $y_1 + y_2 + \ldots + y_k = n -(1 + 2 + 3 + \ldots + k)$

$= n - \frac{k(k+1)}{2}$ .... (2)

8. $|x - 2|^2 + |x - 3|^2 - 2 = 0$

Case 1. $x \geq 2$

$\Rightarrow (x - 2)^2 + (x - 2) - 2 = 0$

$\Rightarrow x^2 - 3x = 0 \Rightarrow x \in (0, 3)$

$\Rightarrow x = 0$ (rejected as $x \geq 2$)

$\Rightarrow x = 3$ .... (1)

Case 2. $x < 2$

$\Rightarrow (x-2)^2 - (x-2) - 2 = 0$

$\Rightarrow x^2 - 4x = 0 \Rightarrow (x-1)(x-4) = 0$

$\Rightarrow x = 1, 4$ (rejected as $x < 2$)

$\Rightarrow x = 1$ .... (2)

Therefore, the sum of the roots is $3 + 1 = 4$.

B. True/False

1. Consider $n$ numbers, namely $1, 2, 3, 4, \ldots , n$.

KEY CONCEPT: Now using A.M. > G.M. for distinct numbers, we get

$\frac{1 + 2 + 3 + 4 + \ldots + n}{n} > (1 \cdot 2 \cdot 3 \cdot 4 \cdot n)^{1/n}$

$\Rightarrow \frac{n(n+1)}{2n} > (n!)^{1/n} \Rightarrow (n!)^{1/n} < \frac{n+1}{2} \therefore : \text{True}$

2. $2x^2 + 3x + 1 = 0 \Rightarrow x = -1, -1/2$ both are rational

$\therefore$ Statement is FALSE.
Quadratic Equation and Inequalities

3. \( f(x) = (x-a)(x-c) + 2(x-b)(x-d) \)
   \[ f(a) = +ve; f(b) = -ve; f(c) = -ve; f(d) = +ve \]
   \( \therefore \) There exists two real and distinct roots one in the interval \((a, b)\) and other in \((c, d)\). Hence, (True).

4. Consider \( N = n_1 + n_2 + n_3 + \ldots + n_p \), where \( N \) is an even number.
   Let \( k \) numbers among these \( p \) numbers be odd, then \( p - k \) are even numbers. Now sum of \((p - k)\) even numbers is even and for \( N \) to be an even number, sum of \( k \) odd numbers must be even which is possible only when \( k \) is even.
   \( \therefore \) The given statement is false.

5. \( P(x), Q(x) = (ax^2 + bx + c)(-ax^2 + bx + c) \)
   \( \Rightarrow D_1 = b^2 - 4ac \) and \( D_2 = b^2 + 4ac \)
   Clearly, \( D_1 + D_2 = 2b^2 \geq 0 \)
   \( \therefore \) atleast one of \( D_1 \) and \( D_2 \) is (+ ve). Hence, atleast two real roots.
   Thus, (True)

6. As \( x \) and \( y \) are positive real numbers and \( m \) and \( n \) are positive integers
   \[ \frac{1 + x^{2n}}{2} \geq (1 \times x^{2n})^{1/2} \quad \text{and} \quad \frac{1 + y^{2m}}{2} \geq (1 \times y^{2m})^{1/2} \]
   \{For two +ve numbers A.M. \geq G.M.\}
   \[ \Rightarrow \left( \frac{1 + x^{2n}}{2} \right)^{1/2} \geq x^n \quad \ldots(1) \]
   and \[ \left( \frac{1 + y^{2m}}{2} \right)^{1/2} \geq y^m \quad \ldots(2) \]
   Multiplying (1) and (2), we get
   \[ \left( \frac{1 + x^{2n}}{4} \right) \left( \frac{1 + y^{2m}}{4} \right) \geq x^n y^m \]
   \[ \Rightarrow \frac{1}{4} \geq \frac{x^n y^m}{(1 + x^{2n})(1 + y^{2m})} \]
   Hence the statement is false.

C. MCQs with ONE Correct Answer

1. (c) \( \ell, m, n \) are real, \( \ell \neq m \)
   Given equation is
   \[ (\ell - m)x^2 - 5(\ell + m)x - 2(\ell - m) = 0 \]
   \[ D = 25(\ell + m)^2 + 8(\ell - m)^2 > 0, \ell, m \in R \]
   \( \therefore \) Roots are real and unequal.

2. (d) The given equations are
   \[ x + 2y + 2z = 1 \quad \ldots(1) \]
   \[ 2x + 4y + 4z = 9 \quad \ldots(2) \]
   Subtracting (1) \times 2 \) from (2), we get 0 = 7 (not possible)
   \( \therefore \) No solution.

3. (a) \( u = x^2 + 4y^2 + 9z^2 - 6xy - 3xz - 2xy \)
   \[ = \frac{1}{2} [2x^2 + 8y^2 + 18z^2 - 12yz - 6xz - 4xy] \]
   \[ = \frac{1}{2} [(x^2 - 4xy + 4y^2) + (4y^2 + 9z^2 - 12yz) \]
   \( + (x^2 + 9z^2 - 6xz)] \]
   \[ = \frac{1}{2} [(x - 2y)^2 + (2y - 3z)^2 + (3z - x)^2] \]
   \[ \geq 0 \]
   \( \therefore \) \( u \) is always non-negative.

4. (c) As \( a, b, c > 0, a, b, c \) should be real (note that order relation is not defined in the set of complex numbers)
   \( \therefore \) Roots of equation are either real or complex conjugate.
   Let \( \alpha, \beta \) be the roots of \( ax^2 + bx + c = 0 \), then
   \[ \alpha + \beta = -\frac{b}{a} = -ve, \quad \alpha \beta = \frac{c}{a} = +ve \]
   \( \therefore \) Either both \( \alpha, \beta \) are -ve (if roots are real) or both \( \alpha, \beta \)
   have -ve real parts (if roots are complex conjugate)

5. (b) The given equation is
   \[ (x - b)(x - c) + (x - a)(x - c) + (x - a)(x - b) = 0 \]
   \[ 3x^2 - 2(a + b + c)x + (ab + bc + ca) = 0 \]
   Discriminant \( = 4(a + b + c)^2 - 12(ab + bc + ca) \)
   \[ = 4[a^2 + b^2 + c^2 - ab - bc - ca] \]
   \[ = 2[(a-b)^2 + (b-c)^2 + (c-a)^2] \geq 0 \quad \forall a, b, c \]
   \( \therefore \) Roots of given equation are always real.

6. (b) Let \( y = 2 \log_{10} x - \log_{10} 0.01 \)
   \[ = 2 \log_{10} x - \frac{\log_{10} 0.01}{\log_{10} x} = 2 \log_{10} x + \frac{2}{\log_{10} x} \]
   \[ = 2 \left[ \log_{10} x \left( \frac{1}{\log_{10} x} \right) \right] \]
   \[ = 2 \left[ \log_{10} x + \frac{2}{\log_{10} x} \right] \]
   \[ \geq 2 \times 2 = y \geq 4, \quad \therefore \] Least value of \( y \) is 4.

(c) As \( (x^2 + px + 1) \) is a factor of \( ax^3 + bx + c \), we can assume that zeros of \( x^2 + px + 1 \) are \( \alpha, \beta \) and that of \( ax^3 + bx + c \) be \( \alpha, \beta, \gamma \) so that
   \[ \alpha + \beta = -p \quad \ldots(i) \]
   \[ \alpha \beta = 1 \quad \ldots(ii) \]
   and \( \alpha + \beta + \gamma = 0 \quad \ldots(iii) \)
   \[ \alpha \beta \gamma = \frac{b}{a} \quad \ldots(iv) \]
   \[ \alpha \beta \gamma = -\frac{c}{a} \quad \ldots(v) \]
   Solving (ii) and (v) we get \( \gamma = -c / a \).
   Also from (i) and (iii) we get \( \gamma = p \)
   \[ \Rightarrow p = \gamma = -c / a \]
   Using equations (i), (ii) and (iv) we get
   \[ 1 + \gamma (-p) = \frac{b}{a} \]
   \[ \Rightarrow 1 + \left[ \left( -\frac{c}{a} \right) \left( -\frac{c}{a} \right) \right] = \frac{b}{a} \quad \text{(using } \gamma = -c / a) \]
   \[ \Rightarrow \frac{1 - c^2}{a^2} = \frac{b}{a} \Rightarrow a^2 - c^2 = ab \]
   \( \therefore \) (c) is the correct answer.
8. (a) \[ |x|^2 - 3 |x| + 2 = 0 \]

Case I: \( x < 0 \) then \(|x| = -x\)
\[ x^2 + 3x + 2 = 0 \]
\[ (x+1) (x+2) = 0 \]
\[ x = -1, -2 \text{ (both acceptable as} < 0) \]

Case II: \( x > 0 \) then \(|x| = x\)
\[ x^2 - 3x + 2 = 0 \]
\[ (x-1)(x-2) = 0 \]
\[ x = 1, 2 \text{ (both acceptable as} > 0) \]

.: There are 4 real solutions.

9. (c) Let the distance of school from \( A = x \)

.: The distance of the school form \( B = 60 - x \)
Total distance covered by 200 students
\[ = 2[150 x + 50(60 - x)] = 2[100 x + 3000] \]
This is min., when \( x = 0 \)

.: school should be built at town \( A \).

10. (b) if \( p = 5, q = 3, r = 2 \)
\[ \text{max}(p, q) = 5; \quad \text{max}(p, q, r) = 5 \]
\[ \Rightarrow \text{max}(p, q) = \text{max}(p, q, r) \]

.: (a) is not true. Similarly we can show that (c) is not true.

Also \( \min(p, q) = \frac{1}{2}(p+q-|p-q|) \)

Let \( p < q \) then LHS = \( p \)

and R.H.S. = \( \frac{1}{2}(p+q+q-p) = p \)

Similarly, we can prove that (b) is true for \( q < p \) too.

11. (d) Given expression \( x^{12} - x^9 + x^4 - x + 1 = f(x) \) (say)
For \( x < 0 \) put \( x = -y \) where \( y > 0 \)
then we get \( f(x) = y^{12} - y^9 + y^4 + 1 > 0 \) for \( y > 0 \)

For \( 0 < x < 1 \), \( x^9 < x^4 \Rightarrow -x^9 + x^4 > 0 \)

Also \( 1-x > 0 \) and \( x^2 > 0 \)
\[ \Rightarrow x^{12} - x^9 + x^4 - x + 1 = 0 \]
\[ \Rightarrow f(x) > 0 \]

For \( x > 1 \)
\[ f(x) = x(x^3 - 1)(x^2 + 1) > 0 \]
So \( f(x) > 0 \) for \( x > 0 \).

12. (a) Given equation is \( x - 2 \frac{x}{x-1} = 1 - \frac{2}{x-1} \)

Clearly \( x \neq 1 \) for the given eq. to be defined. If \( x = 1 \neq 0 \), we can cancel the common term \( \frac{2}{x-1} \) on both sides to get \( x = 1 \), but it is not possible. So given eq. has no roots.

.: (a) is the correct answer.

13. (c) Given that \( a^2 + b^2 + c^2 = 1 \)

We know \( (a + b + c)^2 \geq 0 \)
\[ \Rightarrow a^2 + b^2 + c^2 + 2ab + 2bc + 2ca \geq 0 \]
\[ \Rightarrow 2(a^2 + b^2 + c^2 + 2ab + 2bc + 2ca) \geq 2 \text{ [Using (1)]} \]
\[ \Rightarrow ab + bc + ca \geq -1/2 \text{ [Using (1)]} \]
Also we know that

14. (a) First of all for \( \log(x-1) \) to be defined, \( x-1 > 0 \)
\[ \Rightarrow x > 1 \text{ [Using (1)]} \]

Now, \( \log_{0.3}(x-1) < \log_{0.9}(x-1) \)
\[ \Rightarrow \log_{0.3}(x-1) < \log_{0.3}(x-1) \]
\[ \Rightarrow \frac{1}{2} \log_{0.3}(x-1) < \log_{0.3}(x-1) \]
\[ \Rightarrow 2 \log_{0.3}(x-1) < \log_{0.3}(x-1) \]
\[ \Rightarrow \log_{0.3}(x-1)^2 < \log_{0.3}(x-1) \]
\[ \Rightarrow (x-1)^2 > (x-1) \text{ NOTE THIS STEP} \]
[The inequality is reversed since base lies between 0 and 1]
\[ \Rightarrow (x-1)^2 - (x-1) > 0 \Rightarrow (x-1)(x-2) \geq 0 \text{ [Using (2)]} \]
Combining (1) and (2) we get \( x > 2 \)

.: \( x \in (2, \infty) \)

15. (d) From the first method,
\[ q = \alpha \beta, r = \alpha^4 + \beta^4 \]

Product of the roots of the equation
\[ x^2 - 4qx + (2\alpha^2 - \alpha^2) = 0 \]
\[ = 2q^2 - r = 2\alpha^2 \beta^2 - \alpha^4 - \beta^4 = -\alpha^2 - \beta^2 \]
[From (3)]
\[ = -\text{ (positive quantity)} = -\text{ ve quantity} \]
\[ \Rightarrow \text{ root one is positive and other is negative.} \]

16. (d) KEY CONCEPT: If \( f(\alpha) \) and \( f(\beta) \) are of opposite signs then there must lie a value \( \gamma \) between \( \alpha \) and \( \beta \) such that \( f(\gamma) = 0 \).

\[ a, b, c \text{ are real numbers and} \quad a \neq 0. \]

As \( \alpha \) is a root of \( a^2 x^2 + bx + c = 0 \)
\[ \Rightarrow a^2 \alpha^2 + b \alpha + c = 0 \text{ [Using eq. (1)]} \]

Also \( \beta \) is a root of \( a^2 \beta^2 - b \beta - c = 0 \) \[ \Rightarrow \]
\[ a^2 \beta^2 - b \beta - c = 0 \text{ [Using eq. (2)]} \]
\[ = a^2 \beta^2 + 2(b \beta + c) \]
\[ = a^2 \beta^2 + 2(b \beta + c) \text{ [Using eq. (2)]} \]
\[ = 3a^2 \beta^2 > 0. \]

Since \( f(\alpha) \) and \( f(\beta) \) are of opposite signs and \( \gamma \) is a root of equation \( f(x) = 0 \)

Thus \( \gamma < \beta. \text{ [Answer] (d) is the correct option.} \)

17. (a) The given eq. is \( \sin(e^x) = 5^x + 5^{-x} \)
We know \( 5^x \) and \( 5^{-x} \) both are +ve real numbers using
\[ AM \geq GM \text{ [Answer] } \Rightarrow 5^x + 5^{-x} \geq 2 \Rightarrow 5^x + 5^{-x} \geq 2 \]
Quadratic Equation and Inequalities

.: R.H.S. of given eq. ≥ 2

While sin ex ∈ [-1, 1], i.e. L.H.S ∈ [-1, 1]

.: The equation is not possible for any real value of x. Hence (a) is the correct answer.

18. (c) α, β are roots of the equation (x - a) (x - b) = c, c ≠ 0

.: (x - a)(x - b) - c = (x - α)(x - β)

⇒ (x - α)(x - β) + c = (x - a)(x - b)

⇒ roots of (x - α)(x - β) + c = 0 are α and β.

.: (c) is the correct option.

19. (a) We have

\[ y = 5x^2 + 2x + 3 = 5\left(x + \frac{1}{5}\right)^2 + \frac{14}{5} ≥ 2, \forall x ∈ R \]

while \( y = 2 \sin x ≤ 2, \forall x ∈ R \)

⇒ The two curves do not meet at all.

20. (b) For real roots \( q^2 - 4pr ≥ 0 \)

\[ \left(\frac{p+r}{2}\right)^2 - 4pr ≥ 0 \quad (\because p, q, r \text{ are in A.P.}) \]

\[ p^2 + r^2 - 14pr ≥ 0 \quad \Rightarrow \frac{p^2}{r^2} - 14\frac{p}{r} + 1 ≥ 0 \]

\[ \frac{p}{r} - 7 ≥ 4\sqrt{3} \]

21. (c) For the equation \( px^2 + qx + 1 = 0 \) to have real roots

\[ D ≥ 0 \quad \Rightarrow q^2 ≥ 4p \]

If \( p = 1 \) then \( q^2 ≥ 4 \quad \Rightarrow q = 2, 3, 4 \)

If \( p = 2 \) then \( q^2 ≥ 8 \quad \Rightarrow q = 3, 4 \)

If \( p = 3 \) then \( q^2 ≥ 12 \quad \Rightarrow q = 4 \)

If \( p = 4 \) then \( q^2 ≥ 16 \quad \Rightarrow q = 4 \)

.: No. of eq. equations = 7.

22. (a) KEY CONCEPT: If both roots of a quadratic equation \( ax^2 + bx + c = 0 \) are less than k then \( a(k)^2 > 0, D ≥ 0, α < β < 2k \).

\[ f(x) = x^2 - 2ax + a^2 + a - 3 = 0 \]

\[ f(3) > 0, α + β = 6, D ≥ 0, \quad \Rightarrow a^2 - 5a + 6 > 0, a < 3, -a + 12 ≥ 0 \]

\[ a < 2 \text{ or } a > 3, a < 3 \quad \Rightarrow a < 2. \]

23. (b) Given \( c < 0 < b \) and \( α + β = -b \quad ...\( \text{(1)} \)

\[ αβ = c \quad ...\( \text{(2)} \)

From (2), \( c < 0 \quad \Rightarrow αβ < 0 \quad \Rightarrow \) either \( α \) is -ve or \( β \) is -ve and second quantity is positive. from (1), \( b > 0 \quad \Rightarrow -b < 0 \quad \Rightarrow α + β < 0 \quad \Rightarrow \) the sum is negative

\[ \Rightarrow \text{modulus of negative quantity is } > \text{modulus of positive quantity but } α < β \text{ is given. Therefore, it is clear that } α \text{ is negative and } β \text{ is positive and modulus of } α \text{ is greater than modulus of } β \quad \Rightarrow α < 0 < β < |α| \]

24. (a) As A.M. ≥ G.M. for positive real numbers, we get

\[ \frac{(a+b)+(c+d)}{2} ≥ \sqrt{(a+b)(c+d)} \quad \Rightarrow M ≤ 1 \]

(Putting values)

Also \( a(b+c+d) > 0 \quad \Rightarrow \text{ a,b,c,d > 0 } \)

\[ \Rightarrow 0 ≤ M ≤ 1 \]

25. (d) The given equation is \((x-a)(x-b)-1=0, b>a \)

or \( x^2 -(a+b)x + ab-1 = 0 \)

Let \( f(x) = x^2 -(a+b)x + ab-1 \)

Since coeff. of \( x^2 \) i.e. \( 1 > 0 \), it represents upward parabola, intersecting x-axis at two points. (corresponding to two real roots, \( D \) being +ve). Also \( f(a) = f(b) = -1 \quad \Rightarrow \) curve is below x-axis at \( a \) and \( b \)

\( \Rightarrow a \text{ and } b \text{ both lie between the roots.} \)

Thus the graph of given eqn is as shown.

![Graph](image)

from graph it is clear that one root of the equation lies in \((a, b, c)\) and other in \((b, c, d)\).

26. (c) Let \( α, \alpha^2 \) be the roots of \( 3x^2 + px + 3 = 0 \)

\[ \Rightarrow α + α^2 = -\frac{p}{3} \text{ and } α^3 = 1 \]

\[ \Rightarrow α(α^2 + α + 1) = 0 \quad \Rightarrow α = 1 \text{ or } α^2 + α = -1 \]

If \( α = 1, p = -6 \) which is not possible as \( p > 0 \)

If \( α^2 + α = -1 \quad \Rightarrow -p = -6 \quad \Rightarrow p = 3 \).

27. (a) We have

\[ \frac{(a_1 + a_2 + ... + a_n - 1 + 2a_n)}{n} ≥ (a_1 a_2 ... a_n - 1/2 a_n)^n \]

[Using A.M. ≥ G.M.]

\[ \Rightarrow a_1 + a_2 + a_3 + ... + a_{n-1} + 2a_n ≥ n(2c)^{1/n} \]

28. (b) For \( x < -2 \), \( |x + 2| = -(x + 2) \) and the inequality becomes

\[ x^2 + x + 2 + x > 0 \quad ⇒ x^2 + 2x > 0 \quad \Rightarrow x > \sqrt{2} \text{ or } x < -\sqrt{2} \]

which is valid \( \forall \ x \in R \) but \( x < -2 \)

\[ \Rightarrow x \in (-\infty, -2) \quad \ldots(1) \]

For \( x ≥ 2 \), \( |x + 2| = x + 2 \) and the inequality becomes

\[ x^2 - x - 2 + x > 0 \quad ⇒ x^2 > 2 \quad ⇒ x > \sqrt{2} \text{ or } x < -\sqrt{2} \]

i.e., \( x \in (-\infty, -\sqrt{2}) \cup (\sqrt{2}, \infty) \)

but \( x ≥ 2 \quad ⇒ x \in [-2, -\sqrt{2}) \cup (\sqrt{2}, \infty) \quad \ldots(2) \)

From (1) and (2)

\[ x \in (-\infty, -\sqrt{2}) \cup (\sqrt{2}, \infty) \]

29. (a) Let \( a = \sqrt{x^2 + x} \) and \( b = \frac{\tan^2 α}{\sqrt{x^2 + x}} \)
then using AM ≥ GM, we get $\frac{a+b}{2} ≥ \sqrt{ab}$

$$⇒ a + b ≥ 2\sqrt{ab}$$
$$⇒ \sqrt{x^2 + x + \frac{\tan^2 \alpha}{\sqrt{x^2 + x}}} ≥ 2 \sqrt{\tan^2 \alpha} = 2 \tan \alpha$$

[:: \alpha \in (0, \pi/2)]

30. (b) **KEY CONCEPT**: $f(x) = ax^2 + bx + c$ has same sign as that of $a$ if $D < 0$.

$$x^2 + 2ax + 10 - 3a > 0 \forall x$$

$$⇒ D < 0 ⇒ 4a^2 - 4(10 - 3a) < 0 ⇒ a^2 + 3a - 10 < 0$$

$$(a + 5)(a - 2) < 0 ⇒ a \in (-5, 2)$$

31. (a) $x^2 + px + q = 0$

Let roots be $\alpha$ and $\beta$.

$$⇒ \alpha + \beta = -p, \alpha \beta = q ⇒ \alpha = q^{1/3}$$

:. $$(q^{1/3})^3 + (q^{1/3})^2 = -p$$

Taking cube of both sides, we get

$$q + q^2 + 3q(q^{1/3} + q^{2/3}) = -p^3$$

$$⇒ q + q^2 - 3pq = -p^3 \Rightarrow p^3 + q^2 - q(3p - 1) = 0$$

32. (a) $\therefore a, b, c$ are sides of a triangle and $a ≠ b ≠ c$

$$|a - b| < |c| ⇒ a^2 + b^2 - 2ab < c^2$$

Similarly, we have

$$b^2 + c^2 - 2bc < a^2 ; c^2 + a^2 - 2ca < b^2$$

On adding, we get

$$a^2 + b^2 + c^2 < 2(ab + bc + ca)$$

$$⇒ \frac{a^2 + b^2 + c^2}{ab + bc + ca} < 2$$

:. Roots of the given equation are real

$$⇒ (a + b + c)^2 = 3(\alpha + \beta + \gamma) \geq 0$$

$$⇒ \frac{a^2 + b^2 + c^2}{ab + bc + ca} ≥ 3\lambda - 2$$

From (1) and (2), we get $3\lambda - 2 < 2 ⇒ \lambda < \frac{4}{3}$.

33. (d) As $\alpha, \beta$ are the roots of $x^2 - px + r = 0$

$$⇒ \alpha + \beta = p$$ \hspace{1cm} (1)

and $\alpha \beta = r$ \hspace{1cm} (2)

Also $\frac{\alpha}{2}, 2\beta$ are the roots of $x^2 - qx + r = 0$

$$⇒ \frac{\alpha}{2} + 2\beta = q \hspace{1cm} \text{or} \hspace{1cm} \alpha + 4\beta = 2q$$ \hspace{1cm} (3)

Solving (1) and (3) for $\alpha$ and $\beta$, we get

$$\beta = \frac{1}{3}(2q - p) \hspace{1cm} \text{and} \hspace{1cm} \alpha = \frac{2}{3}(2q - p)$$

Substituting values of $\alpha$ and $\beta$, in equation (2), we get

$$\frac{2}{9}(2p - q)(2q - p) = r.$$ 

34. (b) $\therefore \alpha + \beta = -p$ and $\alpha^3 + \beta^3 = q$

$$⇒ (\alpha + \beta)^3 = 3\alpha\beta (\alpha + \beta) = q$$

$$⇒ -p^3 - 3\alpha\beta (-p) = q ⇒ \alpha\beta = \frac{p^3 + q}{3p}$$

Now for required quadratic equation,

sum of roots $= \frac{\alpha + \beta}{\alpha \beta} = \frac{\alpha^2 + \beta^2}{\alpha\beta}$

$$= \frac{(\alpha + \beta)^2 - 2\alpha\beta}{\alpha\beta} = \frac{p^2 - 2\left(\frac{p^3 + q}{3p}\right)}{\frac{p^3 + q}{3p}}$$

$$= \frac{3p^3 - 2p^3 - 2q}{p^3 + q} \cdot \frac{p^3 + q}{3p}$$

and product of roots $= \frac{\alpha}{\beta} \cdot \frac{\beta}{\alpha} = 1$

$$⇒ \frac{p^3 - 2q}{p^3 + q} = \frac{p^3 - 2q}{p^3 + q}$$

:. Required equation is $x^2 - \left(\frac{p^3 - 2q}{p^3 + q}\right)x + 1 = 0$

or $(p^3 + q)x^2 - (p^3 - 2q)x + (p^3 + q) = 0$

35. (c) We have $(2x)^{n_2} = (3y)^{n_3}$

$$⇒ \ell n 2 \cdot \ell n 2x = \ell n 3 \cdot \ell n 3y$$

$$⇒ \ell n 2 \cdot \ell n 2x = \ell n 3 \cdot (\ell n 3 + \ell n y) \hspace{1cm} \text{...(1)}$$

Also given $3^{\ell n x} = 2^{\ell n y}$

$$⇒ \ell n x \cdot \ell n 3 = \ell n y \Rightarrow \ell n y = \frac{\ell n x \cdot \ell n 3}{\ell n 2}$$

Substituting this value of $\ell n y$ in equation (1), we get

$$\ell n 2 \cdot \ell n 2x = \ell n 3 \left[\ell n 3 + \frac{\ell n x \cdot \ell n 3}{\ell n 2}\right]$$

$$⇒ (\ell n 2^2 \cdot \ell n 2x = (\ell n 3)^2 \ell n 2^2 \cdot \ell n x + (\ell n 3)^2 \ell n x)$$

$$⇒ (\ell n 2^2 \cdot \ell n 2x = (\ell n 3)^2 \ell n 2 + \ell n x)$$

$$⇒ (\ell n 2^2 \cdot \ell n 2x = (\ell n 3)^2 \ell n 2^2) \Rightarrow \ell n 2^2 \cdot \ell n 2x = 0 \Rightarrow \ell n 2x = 0$$

$$⇒ 2x = 1 \hspace{1cm} \text{or} \hspace{1cm} x = \frac{1}{2}$$

36. (c) $\therefore \alpha, \beta$ are the roots of $x^2 - 6x - 2 = 0$

$$⇒ \alpha^2 - 6\alpha - 2 = 0$$

$$⇒ \alpha^{10} - 6\alpha^9 - 2\alpha^8 = 0$$

$$⇒ \alpha^{10} - 2\alpha^8 = 6\alpha^9$$ \hspace{1cm} (1)

Similarly $\beta^{10} - 2\beta^8 = 6\beta^9$ \hspace{1cm} (2)

From equation (1) and (2),

$$\alpha^{10} - \beta^{10} - 2(\alpha^8 - \beta^8) = 6(\alpha^9 - \beta^9)$$

$$⇒ a_{10} - 2a_8 = 6a_9 \Rightarrow \frac{a_{10} - 2a_8}{2a_9} = 3$$
Quadratic Equation and Inequations (Inequalities)

37. (b) Let \( \alpha \) be the common root of given equations, then
\[
\alpha^2 + b\alpha - 1 = 0 \quad \cdots (1)
\]
and \( \alpha^2 + a\alpha + b = 0 \quad \cdots (2)
\]
Subtracting (2) from (1), we get
\[
(b - 1)\alpha - (b + 1) = 0
\]
\[
\alpha = \frac{b + 1}{b - 1}
\]
Substituting this value of \( \alpha \) in equation (1), we get
\[
\left( \frac{b + 1}{b - 1} \right)^2 + b\left( \frac{b + 1}{b - 1} \right) - 1 = 0 \quad \text{or} \quad b^2 + 3b = 0
\]
\[
\Rightarrow b = 0, i\sqrt{3}, -i\sqrt{3}
\]
38. (d) Quadratic equation with real coefficients and purely imaginary roots can be considered as
\[
p(x) = x^2 + ax = 0 \quad \text{where} \quad a > 0 \quad \text{and} \quad a \in R
\]
The polynomial \( p[p(x)] = 0 \Rightarrow (x^2 + a)^2 + a = 0
\]
\[
\Rightarrow x^4 + 2ax^2 + (a^2 + a) = 0
\]
\[
\Rightarrow x^2 = \frac{-2a \pm \sqrt{4a^2 - 4a^2 - 4a}}{2}
\]
\[
\Rightarrow x^2 = -a \pm i\sqrt{a}
\]
\[
\Rightarrow x = \sqrt{-a} \pm i \beta \quad \text{where} \quad \alpha, \beta \neq 0
\]
\[
\therefore p[p(x)] = 0 \quad \text{has complex roots which are neither purely real nor purely imaginary.}
\]
39. (c) \( x^2 - 2x \sec \theta + 1 = 0 \Rightarrow x = \sec \theta \pm \tan \theta \)
and \( x^2 + 2x \tan \theta - 1 = 0 \Rightarrow x = -\tan \theta \pm \sec \theta \)
\[
\therefore -\frac{\pi}{6} < \theta < \frac{\pi}{12}
\]
\[
\Rightarrow \sec \frac{\pi}{6} > \sec \theta > \sec \frac{\pi}{12}
\]
and \( -\tan \frac{\pi}{6} < \tan \theta < -\tan \frac{\pi}{12} \)
also \( \tan \frac{\pi}{12} < -\tan \theta < \tan \frac{\pi}{12} \)
\[
\alpha_1, \beta_1 \text{ are roots of } x^2 - 2x \sec \theta + 1 = 0
\]
and \( \alpha_1 > \beta_1 \)
\[
\therefore \alpha_1 = \sec \theta - \tan \theta \quad \text{and} \beta_1 = \sec \theta + \tan \theta
\]
\[
\alpha_2, \beta_2 \text{ are roots of } x^2 + 2x \tan \theta - 1 = 0 \quad \text{and} \quad \alpha_2 > \beta_2
\]
\[
\therefore \alpha_2 = -\tan \theta + \sec \theta, \beta_2 = -\tan \theta - \sec \theta
\]
\[
\therefore \alpha_1 + \beta_2 = \sec \theta - \tan \theta - \tan \theta - \sec \theta = -2\tan \theta
\]

D. MCQs with ONE or MORE THAN ONE Correct

1. (c,d) Let \( y = \frac{(x-a)(x-b)}{(x-c)} \)
\[
\Rightarrow (x-c)y = x^2 - (a+b)x + ab
\]
\[
\Rightarrow x^2 - (a+b+y)x + ab + cy = 0
\]
Here, \( \Delta = (a+b+y)^2 - 4(ab+cy) \)
\[
= y^2 + 2y(a+b-2c) + (a-b)^2
\]
Since \( x \) is real and \( y \) assumes all real values.
\[
\therefore \Delta \geq 0 \quad \text{for all real values of} \ y
\]
\[
\Rightarrow y^2 + 2y(a+b-2c) + (a-b)^2 \geq 0
\]
Now we know that the sign of a quad is same as of coeff of \( y^2 \)
\[
\text{provided its discriminant } B^2 - 4AC < 0
\]
This will be so i.e., \( 4(a+b-2c)^2 - 4(a-b)^2 < 0 \)
or \( 4(a+b-2c+a-b)(a+b-2c-a+b) < 0 \)
\[
\Rightarrow 16(c-a)(c-b) < 0
\]
\[
\Rightarrow 16(c-a)(c-b) < 0 \quad \cdots (1)
\]

Now,
If \( a < b \) then from inequation (1), we get \( c \in (a, b) \)
\[
\Rightarrow a < c < b
\]
or If \( a > b \) then from inequation (1) we get, \( c \in (b, a) \)
\[
\Rightarrow b < c < a \quad \text{or} \quad a < c < b
\]
Thus, we observe that both (c) and (d) are the correct answer.

2. (a,d) KEY CONCEPT : Wavy curve method:
Let \( f(x) = (x-\alpha_1)(x-\alpha_2)\ldots(x-\alpha_n) \)
To find sign of \( f(x) \), plot \( \alpha_1, \alpha_2,\ldots, \alpha_n \) on number line in ascending order of magnitude. Starting from right extreme put + ve, -ve signs alternately. For \( f(x) \) positive in the intervals having +ve sign and negative in the intervals having -ve sign.
We have,
\[
f(x) = \frac{2x-1}{2x^3 + 3x^2 + x} = \frac{2x-1}{x(2x+1)(x+1)}
\]

NOTE THIS STEP : Critical points are \( x = 1/2, 0, -1/2, -1 \)
On number line by wavy method, we have
\[
\begin{align*}
\text{For } f(x) > 0, & \quad \text{when } x \in (-\infty, -1) \cup (-1/2, 0) \cup (1/2, \infty) \\
\text{Clearly } S & \text{ contains } (-\infty, -3/2) \text{ and } (1/2, 3)
\end{align*}
\]

3. (b) Given that \( a, b, c \) are distinct +ve numbers. The expression whose sign is to be checked is \( (b + c - a)(c + a - b)(a + b - c) - abc \).
As this expression is symmetric in \( a, b, c \), without loss of generality, we can assume that \( a < b < c \).
Then \( c - a = +ve \) and \( c - b = +ve \)
\[
\therefore \quad b + c - a = +ve \quad \text{and} \quad c + a - b = +ve
\]
But \( a + b - c \) may be +ve or -ve.
Case 1 : If \( a + b - c = +ve \) then we can say that \( a, b, c \), are such that sum \( \\Sigma \) of any two is greater than the 3rd. Consider \( x = a + b - c, \quad y = b + c - a, \quad z = c + a - b \)
then \( x, y, z \) all are +ve.

and then \( a = \frac{x+z}{2}, b = \frac{y+x}{2}, c = \frac{z+y}{2} \)
\[
\therefore \frac{x+y+z}{2} > \sqrt[3]{xyz}, \frac{y+z+x}{2} > \sqrt[3]{xyz}, \frac{z+x+y}{2} > \sqrt[3]{xyz}
\]
\[ \Rightarrow \left( \frac{x+y}{2} \right) \left( \frac{y+z}{2} \right) \left( \frac{z+x}{2} \right) > xyz \]
\[ \Rightarrow \quad abc > (a+b-c)(b+c-a)(c+a-b) \]
\[ \Rightarrow \quad (b+c-a)(c+a-b)(a+b-c) - abc < 0 \]

Case II: If \( a + b - c = -ve \) then
\[ (b+c-a)(c+a-b)(a+b-c) - abc \]
\[ = (+ve)(+ve)(-ve) - (+ve) \]
\[ = (-ve) - (+ve) = (-ve) \]
\[ \Rightarrow (b+c-a)(c+a-b)(a+b-c) < abc \]

Hence in either case given expression is \(-ve\).

4. (b) Given that \( a, b, c, d, p \) are real and distinct numbers such that
\[ (a^2 + b^2 + c^2)p^2 - 2(ab + bc + cd)p + (b^2 + c^2 + d^2) \leq 0 \]
\[ \Rightarrow (a^2p^2 + b^2p^2 + c^2p^2) - (2abp + 2bcp + 2cdp) \]
\[ + (b^2 + c^2 + d^2) \leq 0 \]
\[ \Rightarrow (ap-b)^2 + (bp-c)^2 + (cp-d)^2 \leq 0 \]
Being sum of perfect squares, LHS can never be \(-ve\), therefore the only possibility is
\[ (ap-b)^2 + (bp-c)^2 + (cp-d)^2 = 0 \]
Which is possible only when each term is zero individually i.e.
\[ ap-b = 0; \quad bp-c = 0; \quad cp-d = 0 \]
\[ \Rightarrow \quad \frac{b}{a} = \frac{c}{b} = \frac{d}{c} = \frac{p}{d} \]
\[ \Rightarrow \quad a, b, c, d \text{ are in G.P.} \]

5. (a, b, c) The given equation is,
\[ \frac{3}{4}(\log_2 x)^2 + \log_2 x - \frac{5}{4} = \sqrt{2} \]
For \( x > 0 \), taking log on both sides to the base \( x \), we get
\[ \frac{3}{4} \log_2 x = y, \text{ then we get, } \quad \frac{3}{4}y^2 + y - \frac{5}{4} = \frac{1}{2} \log_2 x \]
Let \( \log_2 x = y \), then we get,
\[ 3y^2 + 4y^2 - 5y - 2 = 0 \]
\[ \Rightarrow (y-1)(y+2)(3y+1) = 0 \Rightarrow y = 1, -2, -1/3 \]
\[ \log_2 x = 1, -2, -1/3 \Rightarrow x = 2, 2^{-2}, 2^{-1/3} \]
\[ \Rightarrow \quad x = 2, \frac{1}{4}, \sqrt[3]{2} \quad \text{(All accepted as } > 0) \]
\[ \therefore \text{ There are three real solution in which one is irrational.} \]

6. (d) Let \( x_1, x_2, \ldots, x_n \) be the \( n \) \(+ve\) numbers
According to the question,
\[ x_1x_2x_3\ldots x_n = 1 \]
\[ \quad \ldots \text{(I)} \]

We know for \(+ve\) no.'s A.M. \( \geq \) G.M.
\[ \Rightarrow \quad \frac{x_1 + x_2 + \ldots + x_n}{n} \geq \sqrt[n]{x_1x_2x_3\ldots x_n} \]
\[ \Rightarrow \quad \frac{x_1 + x_2 + \ldots + x_n}{n} \geq 1 \quad \quad \text{(Using eq. (1))} \]
\[ \Rightarrow \quad x_1 + x_2 + \ldots + x_n \geq n. \]

Out of these divisors just 4 divisors viz., 2, 6, 10, 30 are of the form \( 4n+2 \).

7. (a) We have \( 240 = 2^4 \cdot 3 \cdot 5 \).
Divisors of 240 are
\[ 1, 2, 4, 8, 16 \]
\[ 3, 6, 12, 24, 48 \]
\[ 5, 10, 20, 40, 80 \]
\[ 15, 30, 60, 120, 240 \]

8. (a, b, c)
\[ 3^x = 4^{x-1} \Rightarrow \log_3 3 = 2(x-1) \log_2 \]
\[ \Rightarrow \quad x = \frac{2 \log 2}{2 \log 2 - \log 3} \quad \Rightarrow \quad x = \frac{2 \log 3}{2 \log 3 - 2} = \frac{2}{2 - \log 3} \]
Also, \( x = \frac{1}{2} \log_2 2 \cdot \log_4 3 \]
9. (a, d) \( \alpha x^2 - x + \alpha = 0 \) has distinct real roots.
\[ \therefore \quad D > 0 \Rightarrow -4 \alpha^2 > 0 \]
\[ \Rightarrow \quad \alpha \in \left( -\frac{1}{2}, \frac{1}{2} \right) \quad \ldots (i) \]
Also, \( |x_1 - x_2| < 1 \)
\[ \Rightarrow (x_1 - x_2)^2 < 1 \Rightarrow (x_1 + x_2)^2 - 4x_1x_2 < 1 \]
\[ \Rightarrow \frac{1}{\alpha^2} - 4 < 1 \Rightarrow \frac{1}{\alpha^2} < 5 \text{ or } \alpha^2 > \frac{1}{5} \]
\[ \Rightarrow \quad \alpha \in \left( -\infty, -\frac{1}{\sqrt{5}} \right) \cup \left( \frac{1}{\sqrt{5}}, \infty \right) \quad \ldots (ii) \]
Combining (i) and (ii)
\[ S = \left( -\frac{1}{2}, -\frac{1}{\sqrt{5}} \right) \cup \left( \frac{1}{\sqrt{5}}, \frac{1}{2} \right) \]
\[ \therefore \quad \text{ Subsets of } S \text{ can be } \left( -\frac{1}{2}, -\frac{1}{\sqrt{5}} \right) \text{ and } \left( \frac{1}{\sqrt{5}}, \frac{1}{2} \right). \]

E. Subjective Problems

1. \[ 4^x - 3^{x-1/2} = 3^{x+1/2} - \left( \frac{2}{2} \right)^x \]
\[ \Rightarrow \quad 4^x - \frac{3^x}{\sqrt{3}} = 3^x \sqrt{3} - \frac{4}{2} \]
\[ \Rightarrow \quad \frac{3}{2} \cdot 4^x = 3^x \left( \sqrt{3} + \frac{1}{\sqrt{3}} \right) \]
\[ \Rightarrow \quad \frac{3}{2} \cdot 4^x = 3^x \frac{4}{\sqrt{3}} \]
\[ \Rightarrow \quad \frac{4^{x-1}}{4^{1/2}} = \frac{3^{x-1}}{\sqrt{3}} \Rightarrow 4^{x-3/2} = 3^{x-3/2} \]
Quadratic Equation and Inequations (Inequalities)

2. RHS = \((m-1, n+1) + x^{m-n-1}(m-1, n)\)
   \[
   = \frac{(1-x^{m-1})(1-x^{m-2}) \ldots (1-x^{m-n-1})}{(1-x)(1-x^2) \ldots (1-x^{n+1})} + x^{m-n-1} \left[ \frac{(1-x^{m-1})(1-x^{m-2}) \ldots (1-x^{m-n})}{(1-x)(1-x^2) \ldots (1-x^n)} \right]
   \]
   \[
   = \frac{(1-x^{m-1})(1-x^{m-2}) \ldots (1-x^{m-n})}{(1-x)(1-x^2) \ldots (1-x^n)} \left[ \frac{1-x^{m-n-1}}{1-x^{n+1}} + x^{m-n-1} \right]
   \]
   \[
   = \frac{(1-x^m)(1-x^{m-1}) \ldots (1-x^{m-n})}{(1-x)(1-x^2) \ldots (1-x^n)(1-x^{n+1})}
   \]
   Hence L.H.S. = \(m, n+1\)

3. \(\sqrt{x+1} = 1 + \sqrt{x-1}\)
   Squaring both sides, we get
   \[x + 1 = 1 + x - 1 + 2\sqrt{x-1} \Rightarrow 1 = 2\sqrt{x-1}.
   \]
   \[
   \Rightarrow 1 = 4(x-1)
   \]
   \[
   \Rightarrow x = 5/4
   \]

4. Given \(a > 0\), so we have to consider two cases:
   a \(\neq 1\) and \(a = 1\). Also it is clear that \(x > 0\) and \(x \neq 1\).
   Case I: If \(a > 0, \neq 1\)
   then given equation can be simplified as
   \[
   \frac{2}{\log_a x} + \frac{1}{1 + \log_a x} + \frac{3}{2 + \log_a x} = 0
   \]
   Putting \(\log_a x = y\), we get
   \[
   2(1 + y)(2 + y) + y(2 + y) + 3y(1 + y) = 0
   \]
   \[
   \Rightarrow 6y^2 + 11y + 4 = 0 \Rightarrow y = -4/3 \text{ and } -1/2
   \]
   \[
   \Rightarrow \log_a x = -4/3 \text{ and } \log_a x = -1/2
   \]
   \[
   \Rightarrow x = a^{-4/3} \text{ and } x = a^{-1/2}
   \]
   Case II: If \(a = 1\) then equation becomes
   \[
   2 \log_x 1 + 1 + \log_x 1 + 3 \log_x 1 = 6 \log_x 1 = 0
   \]
   which is true \(\forall x > 0, \neq 1\)
   Hence solution is if \(a = 1, x > 0, \neq 1\)
   if \(a > 0, \neq 1; x = a^{-1/2}, a^{-4/3}\)

5. Let \(x = \frac{\sqrt{26-15\sqrt{3}}}{5\sqrt{2}-\sqrt{38+5\sqrt{3}}}\)

6. \(x^2 + y^2 - 2x \geq 0 \Rightarrow x^2 - 2x + 1 + y^2 \geq 1\)
   \[
   \Rightarrow (x - 1)^2 + y^2 \geq 1 \text{ which represents the boundary and}
   \]
   \[
   \text{exterior region of the circle with centre at (1,0) and radius as 1.}
   \]
   For \(3x - y \leq 12\), the corresponding equation is \(3x - y = 12\);
   any two points on it can be taken as \((4, 0), (2, -6)\). Also putting \((0, 0)\) in given inequation, we get \(0 \leq 12\) which is true.
   \[
   \therefore \text{ given inequation represents that half plane region of}
   \]
   \[
   \text{line } 3x - y = 12 \text{ which contains origin.}
   \]
   For \(y \leq x\), the corresponding equation \(y = x\) has any two points on it as \((0, 0)\) and \((1, 1)\). Also putting \((2, 1)\) in the
   given inequation, we get \(1 \leq 2\) which is true, so \(y \leq x\)
   represents that half plane which contains the points \((2, 1)\).
   \(y \geq 0\) represents upper half cartesian plane.
   Combining all we find the solution set as the shaded region in the graph.

7. There are two parts of this question
   \((5x - 1) < (x + 1)^2\) and \((x + 1)^2 > (7x - 3)\)
   Taking first part
   \[
   (5x - 1) < (x + 1)^2 \Rightarrow 5x - 1 < x^2 + 2x + 1
   \]
   \[
   \Rightarrow x^2 - 3x + 2 > 0 \Rightarrow (x - 1)(x - 2) > 0
   \]
   \[
   \Rightarrow x < 1 \text{ or } x > 2 \text{ ....(1)}
   \]
   Taking second part
\[(x+1)^2 < (7x-3) \Rightarrow x^2 - 5x + 4 < 0\]
\[
\Rightarrow (x - 1)(x - 4) < 0
\]
\[
\begin{array}{c}
\begin{array}{c}
+ \\
- \\
+ \\
- \\
+\infty
\end{array}
\end{array}
\quad \text{using wavy method}
\Rightarrow 1 < x < 4 \quad \ldots (2)
\]

Combining (1) and (2) [taking common solution], we get
\[2 < x < 4\] but \(x\) is an integer therefore \(x = 3\).

8. \(\alpha, \beta\) are the roots of \(x^2 + px + q = 0\)
\[\alpha + \beta = -p, \quad \alpha\beta = q\]
\[\gamma, \delta\] are the roots of \(x^2 + px + q = 0\)
\[\gamma + \delta = -r, \gamma\delta = s\]

Now, \((\alpha - \gamma)(\alpha - \delta)(\beta - \gamma)(\beta - \delta)\)
\[= [\alpha^2 - (\gamma + \delta)\alpha + \gamma\delta][\beta^2 - (\gamma + \delta)\beta + \gamma\delta]\]
\[= [\alpha^2 + r\alpha + s][\beta^2 + r\beta + s]\]
\[\because \alpha, \beta\] are roots of \(x^2 + px + q = 0\),
\[
\alpha + \beta = -p \quad \text{and} \quad \alpha\beta = q = 0
\]
\[= [(r - p)\alpha + (s - q)][(r - p)\beta + (s - q)]
\]
\[= (r - p)^2 \alpha\beta - (r - p)(s - q)(\alpha + \beta) + (s - q)^2
\]
\[= q(r - p)^2 - (r - p)(s - q)\]
Now if the equations \(x^2 + px + q = 0\) and \(x^2 + px + q = 0\) have a common root say \(\alpha\), then \(\alpha^2 + p\alpha + q = 0\) and
\[\alpha^2 + r\alpha + s = 0
\]
\[\Rightarrow \frac{\alpha^2}{ps - qr} = \frac{\alpha}{q - s} = \frac{1}{r - p}
\]
\[\Rightarrow \alpha^2 = \frac{ps - qr}{r - p} \quad \text{and} \quad \alpha = \frac{q - s}{r - p}
\]
\[\Rightarrow (q - s)^2 = (r - p)(ps - qr)\] which is the required condition.

9. Given that \(n^4 < 10^n\) for a fixed +ve integer \(n \geq 2\).
To prove that \((n + 1)^4 < 10^{n+1}\)
Proof: Since \(n^4 < 10^n \Rightarrow 10n^4 < 10^{n+1}\) \ldots (1)
So it is sufficient to prove that \((n + 1)^4 < 10n^4\)
Now \(\frac{(n + 1)^4}{n^4} = \left(1 + \frac{1}{n}\right)^4 \leq \left(1 + \frac{1}{2}\right)^4 \quad \because n \geq 2\)
\[= \frac{81}{16} < 10\]
\[\Rightarrow (n + 1)^4 < 10n^4 \quad \ldots (2)
\]
From (1) and (2), \((n + 1)^4 < 10^{n+1}\)

10. \[y = \sqrt{(x + 1)(x - 3)\over (x - 2)}\]
\[y \text{ will take all real values if} \left({(x + 1)(x - 3)\over (x - 2)} \geq 0\right)
\]

By wavy method
\[x \in (-1, 2) \cup [3, \infty)\]
\[2 \text{ is not included as it makes denominator zero, and hence} y \quad \text{an undefined number.} \]

11. The given equations are \(3x + my - m = 0\) and \(2x - 5y - 20 = 0\)
Solving these equations by cross product method, we get
\[\frac{x}{-20m - 5m} = \frac{y}{-2m + 60} = \frac{1}{-15 - 2m}
\]
\[\text{NOTE THIS STEP} \]
\[\Rightarrow x = \frac{25m}{2m + 15}, y = \frac{2m - 60}{2m + 15}
\]
For \(x > 0 \Rightarrow \frac{25m}{2m + 15} > 0
\]
\[\Rightarrow m < -\frac{15}{2} \quad \text{or} \quad m > 0 \quad \ldots \ (1)
\]
For \(y > 0 \Rightarrow \frac{2(m - 30)}{2m + 15} > 0
\]
\[\Rightarrow m < -\frac{15}{2} \quad \text{or} \quad m > 30 \quad \ldots \ (2)
\]
Combining (1) and (2), we get the common values of \(m\) as follows:
\[m < -\frac{15}{2} \quad \text{or} \quad m > 30 \quad \because m \in \left(-\infty, -\frac{15}{2}\right) \cup \left(30, \infty\right)
\]

12. The given system is
\[x + 2y + z = 1 \quad \ldots (1)
\]
\[2x - 3y - \omega = 2 \quad \ldots (2)
\]
where \(x, y, z, \omega \geq 0\)
Multiplying eqn. (1) by 2 and subtracting from (2), we get
\[7y + 2z + \omega = 0 \Rightarrow \omega = -(7y + 2z)
\]
Now if \(y, z > 0, \omega < 0\) (not possible)
If \(y = 0, z = 0\) then \(x = 1\) and \(\omega = 0\).
\[\therefore \quad \text{The only solution is} \quad x = 1, y = 0, z = 0, \omega = 0.
\]

13. \(e^{\sin x} - e^{-\sin x} - 4 = 0\)
Let \(e^{\sin x} = y\) then \(e^{-\sin x} = \frac{1}{y}\)
\[\because \quad \text{Equation becomes,} \quad y - \frac{1}{y} = 4 \quad 0
\]
\[\Rightarrow y^2 - 4y - 1 = 0 \Rightarrow y = 2 + \sqrt{5}, 2 - \sqrt{5}
\]
But \(y\) is real +ve number,
\[\therefore \quad y = 2 + \sqrt{5} \Rightarrow y = 2 + \sqrt{5}
\]
\[\Rightarrow e^{\sin x} = 2 + \sqrt{5} \Rightarrow \sin x = \log e(2 + \sqrt{5})
\]
But \(2 + \sqrt{5} > e \Rightarrow \log e(2 + \sqrt{5}) > \log e \)
Quadratic Equation and Inequations (Inequalities)

\[ \Rightarrow \log_e(2 + \sqrt{5}) > 1 \quad \text{Hence, } x > 1 \]

Which is not possible.

\[ \therefore \quad \text{Given equation has no real solution.} \]

14. For any square there can be at most 4, neighbouring squares.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>( q )</td>
<td></td>
<td></td>
</tr>
<tr>
<td>( P )</td>
<td>( d )</td>
<td>( r )</td>
</tr>
<tr>
<td>( s )</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Let for a square having largest number \( d', p, q, r, s \) be written then

According to the question,

\[ p + q + r + s = 4d \]

\[ \Rightarrow \quad (d - p) + (d - q) + (d - r) + (d - s) = 0 \]

Sum of four +ve numbers can be zero only if these are zero individually

\[ \therefore \quad d - p = 0 = d - q = d - r = d - s \]

\[ \Rightarrow \quad p = q = r = s = d \]

\[ \Rightarrow \quad \text{all the numbers written are same.} \]

Hence Proved.

15. Let \( \alpha, \beta \) be the roots of eq. \( ax^2 + bx + c = 0 \)

According to the question, \( \beta = \alpha^a \)

Also \( \alpha + \beta = -\frac{b}{a} ; \quad \alpha \beta = \frac{c}{a} \)

\[ \alpha \beta = \frac{c}{a} \Rightarrow \alpha \alpha^a = \frac{c}{a} \Rightarrow \alpha = \left(\frac{c}{a}\right)^\frac{1}{n+1} \]

then \( \alpha + \beta = -\frac{b}{a} \Rightarrow \alpha + \alpha^a = -\frac{b}{a} \)

\[ \text{or} \quad \left(\frac{c}{a}\right)^\frac{1}{n+1} + \left(\frac{c}{a}\right)^n = -\frac{b}{a} \]

\[ \Rightarrow \quad a\left(\frac{c}{a}\right)^\frac{1}{n+1} + a\left(\frac{c}{a}\right)^n = -\frac{b}{a} = 0 \]

\[ \Rightarrow \quad \frac{n}{a^{n+1}}c^{n+1} + \frac{1}{a}^{n+1}c^n + b = 0 \]

\[ \Rightarrow \quad (a^n)c + (ac)^{n+1} + b = 0 \]

Hence Proved.

16. \( x^2 - 3x + 2 > 0, \quad x^2 - 3x - 4 \leq 0 \)

\[ \Rightarrow \quad (x - 1)(x - 2) > 0 \quad \text{and} \quad (x - 4)(x + 1) < 0 \]

\[ \Rightarrow \quad x \in (-\infty, 1) \cup (2, \infty) \quad \text{and} \quad x \in [-1, 4] \]

\[ \therefore \quad \text{Common solution is } [-1, 1) \cup (2, 4] \]

17. The given equation is

\[ (5 + 2\sqrt{6})x^2 - 3 + (5 - 2\sqrt{6})x^2 - 3 = 10 \quad \ldots (1) \]

Let \( (5 + 2\sqrt{6})x^2 - 3 = y \quad \ldots (2) \)

\[ \therefore \quad (5 - 2\sqrt{6})x^2 - 3 = \left( \frac{(5 - 2\sqrt{6})(5 + 2\sqrt{6})}{5 + 2\sqrt{6}} \right) \]

\[ = \left( \frac{25 - 24}{5 + 2\sqrt{6}} \right)x^2 - 3 = \left( \frac{1}{5 + 2\sqrt{6}} \right)x^2 - 3 = \frac{1}{y} \quad \text{(Using (2))} \]

\[ \therefore \quad \text{The given equation (1) becomes} \quad y + \frac{1}{y} = 10 \]

\[ \Rightarrow \quad y^2 - 10y + 1 = 0 \Rightarrow \quad y = \frac{10 \pm \sqrt{100 - 4}}{2} = \frac{10 \pm 4\sqrt{6}}{2} \]

\[ \Rightarrow \quad y = 5 + 2\sqrt{6} \quad \text{or} \quad 5 - 2\sqrt{6} \]

Consider, \( y = 5 + 2\sqrt{6} \)

\[ \Rightarrow \quad (5 + 2\sqrt{6})x^2 - 3 = (5 + 2\sqrt{6}) \]

\[ \Rightarrow \quad x^2 - 3 = 1 \Rightarrow \quad x^2 = 4 \Rightarrow \quad x = \pm 2 \]

Again consider

\[ y = 5 - 2\sqrt{6} = \frac{1}{5 + 2\sqrt{6}} = (5 - 2\sqrt{6})^{-1} \]

\[ \Rightarrow \quad (5 + 2\sqrt{6})x^2 - 3 = (5 + 2\sqrt{6})^{-1} \Rightarrow \quad x^2 - 3 = -1 \]

\[ \Rightarrow \quad x^2 = 2 \Rightarrow \quad x = \pm \sqrt{2} \]

Hence the solutions are \( 2, -2, \sqrt{2}, -\sqrt{2} \).

18. The given equation is,

\[ x^2 - 2a |x - a| - 3a^2 = 0 \]

Here two cases are possible.

**Case I**: \( x - a > 0 \) then \( |x - a| = x - a \)

\[ \therefore \quad \text{Eq. becomes} \quad \Rightarrow \quad x^2 - 2a(x - a) - 3a^2 = 0 \]

\[ \Rightarrow \quad x = a \pm a\sqrt{2} \]

**Case II**: \( x - a < 0 \) then \( |x - a| = -(x - a) \)

\[ \therefore \quad \text{Eq. becomes} \quad \Rightarrow \quad x^2 + 2a(x - a) - 3a^2 = 0 \]

\[ \Rightarrow \quad x = a \pm \sqrt{2} \]

**Case II**: \( x - a < 0 \) then \( |x - a| = -(x - a) \)

\[ \therefore \quad \text{Eq. becomes} \quad \Rightarrow \quad x^2 + 2a(x - a) - 3a^2 = 0 \]

\[ \Rightarrow \quad x = a \pm \sqrt{2} \]
21. Given that for $a, b, c \in R$, $ax^2 + bx + c = 0$ has two real roots $\alpha$ and $\beta$, where $\alpha < -1$ and $\beta > 1$. There may be two cases depending upon value of $a$, as shown below.

In each of cases (i) and (ii) $af(-1) < 0$ and $af(1) < 0$

\[ y=ax^2+bx+c \]

\[ (i) \ a > 0 \]

\[ (ii) \ a < 0 \]

\[ a(a-b+c) < 0 \] and $a(a+b+c) < 0$

Dividing by $a^2 (> 0)$, we get

\[ 1 + \frac{b}{a} + \frac{c}{a} < 0 \]

and

\[ 1 + \frac{b}{a} + \frac{c}{a} < 0 \]

\[ ... (1) \]

Combining (1) and (2) we get

\[ 1 + \frac{b}{a} + \frac{c}{a} < 0 \text{ or } \frac{1}{a} + \frac{c}{a} + \frac{b}{a} < 0 \text{ Hence Proved.} \]

22. $a^2 = p^2 + q^2$, $b^2 = (1-p)^2 + q^2$

\[ c^2 = (1-q)^2 + (1-r)^2, \] \[ d^2 = p^2 + (1-s)^2 \]

\[ a^2 + b^2 + c^2 + d^2 = \{p^2 + (1-p)^2\} + \{q^2 - (1-q)^2\} \]

\[ + \{r^2 + (1-r)^2\} + \{s^2 + (1-s)^2\} \]

where $p, q, r, s$ all vary in the interval $[0, 1]$.

Now consider the function

\[ y^2 = x^2 + (1-x)^2, \text{ } 0 \leq x \leq 1, \]

\[ 2y \frac{dy}{dx} = 2x - 2(1-x) = 0 \]

\[ \Rightarrow x = \frac{1}{2} \text{ which } \frac{dy}{dx} = 4 \text{ i.e. positive} \]

Hence $y$ is minimum at $x = \frac{1}{2}$ and its minimum value is $\frac{1}{4} + \frac{1}{4} = \frac{1}{2}$.

Clearly value is maximum at the end pts which is 1.

\[ \therefore \text{ Minimum value of } a^2 + b^2 + c^2 + d^2 = \frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} = 2 \]

and maximum value is $1 + 1 + 1 = 4$. Hence proved.

23. We know that,

\[ (\alpha - \beta)^2 = [(\alpha + \delta) - (\beta + \delta)]^2 \]
Quadratic Equation and Inequations (Inequalities)

\[ \Rightarrow (a + b)^2 - 4ab = (a + \delta + b + \delta)^2 - 4(\alpha + \delta)(\beta + \delta) \]
\[ \Rightarrow \frac{b^2 - 4c}{a^2 - A} = \frac{B^2 - 4C}{A^2} \Rightarrow \frac{4ac - b^2}{a^2} = \frac{4AC - B^2}{A^2} \]

[Here \( \alpha + \beta = \frac{a}{b}, \alpha \beta = \frac{c}{a} \)]

\[ (\alpha + \delta)(\beta + \delta) = \frac{B}{A} \text{ and } (\alpha + \delta)(\beta + \delta) = \frac{C}{A} \]

Hence proved.

24. Divide the equation by \( a^3 \), we get

\[ x^2 + \frac{b}{a} x + \left(\frac{c}{a}\right)^3 = 0 \]

\[ \Rightarrow x^2 - (\alpha + \beta) x + (\alpha \beta)^3 = 0 \]
\[ \Rightarrow x^2 - \alpha^2 \beta x - \alpha \beta^2 x + (\alpha \beta)^3 = 0 \]
\[ \Rightarrow x(x - \alpha \beta^2) - \alpha \beta^2 (x - \alpha^2 \beta) = 0 \]
\[ \Rightarrow (x - \alpha \beta^2) (x - \alpha^2 \beta) = 0 \]
\[ \Rightarrow x = \alpha^2 \beta, \alpha \beta^2 \text{ which is the required answer.} \]

25. The given equation is,

\[ x^2 + (a - b) x + (1 - a - b) = 0, a, b \in R \]

For this eqn to have unequal real roots \( \forall b \)

\[ D > 0 \]
\[ \Rightarrow (a - b)^2 - 4(1 - a - b) > 0 \]
\[ \Rightarrow a^2 + b^2 - 2ab - 4a + 4b > 0 \]
\[ \Rightarrow b^2 + b(4 - 2a) + a^2 - 4a + 4 > 0 \]
Which is a quadratic expression in \( b \), and it will be true \( \forall b \in R \) if discriminant of above eqn less than zero.

i.e., \( (4 - 2a)^2 - 4(a^2 + 4a - 4) < 0 \)
\[ \Rightarrow (2 - a)^2 - (a^2 + 4a - 4) < 0 \]
\[ \Rightarrow 4 - 4a + a^2 - a^2 - 4a + 4 < 0 \]
\[ \Rightarrow -8a + 8 < 0 \]
\[ \Rightarrow a > 1 \]

26. Given that \( a, b, c \) are positive real numbers. To prove that

\( (a + 1)^7 (b + 1)^7 (c + 1)^7 > 7^7 a^b b^c c^a \)

Consider L.H.S. = \( (1 + a)^7 (1 + b)^7 (1 + c)^7 \)
\[ = [(1 + a)(1 + b)(1 + c)]^7 \]
\[ [1 + a + b + c + ab + bc + ca + abc]^7 \]
\[ > [a + b + c + ab + bc + ca + abc]^7 \]
\[ > [a + b + c + ab + bc + ca + abc]^7 \]

Now we know that AM ≥ GM using it for +ve no's \( a, b, c, \)
\( ab, bc, ca \) and \( abc \), we get

\[ \frac{a + b + c + ab + bc + ca + abc}{7} \geq \frac{(a^b b^c c^a)^7}{7} \]

From (1) and (2), we get

\[ [(1 + a)(1 + b)(1 + c)]^7 > 7^7 a^b b^c c^a \]
Hence Proved.

27. Roots of \( x^2 - 10ax - 11b = 0 \) are \( a \) and \( b \)
\[ \Rightarrow a + b = 10c \text{ and } ab = -11d \]

Similarly \( c \) and \( d \) are the roots of \( x^2 - 10ax - 11b = 0 \)
\[ \Rightarrow c + d = 10a \text{ and } cd = -11b \]

\[ \Rightarrow a + b + c + d = 10(a + c) \text{ and } abcd = 121 bd \]
\[ \Rightarrow b + d = 9(a + c) \text{ and } ac = 121 \]

Also we have \( a^2 - 10ac - 11d = 0 \) and \( c^2 - 10ac - 11b = 0 \)
\[ \Rightarrow a^2 + c^2 - 20ac - 11d = 0 \]
\[ \Rightarrow (a + c)^2 - 22 \times 121 - 99(a + c) = 0 \]
\[ \Rightarrow a + c = 121 \text{ or } -22 \]
For \( a + c = -22 \), we get \( a = c \)
\[ \therefore \text{ rejecting this value we have } a + c = 121 \]
\[ \therefore a + b + c + d = 10(a + c) = 1210 \]

H. Assertion & Reason Type Questions

1. (b) As \( a, b, c, p, q, \in R \) and the two given equations have exactly one common root
\[ \Rightarrow \text{Either both equations have real roots} \]
or both equations have imaginary roots
\[ \Rightarrow \text{Either } \Delta_1 \geq 0 \text{ and } \Delta_2 \geq 0 \text{ or } \Delta_1 \leq 0 \text{ and } \Delta_2 \leq 0 \]
\[ \Rightarrow p^2 - q \geq 0 \text{ and } b^2 - ac \geq 0 \]
or \( p^2 - q \leq 0 \) and \( b^2 - ac \leq 0 \)
\[ \Rightarrow (p^2 - q)(b^2 - ac) \geq 0 \]
\[ \therefore \text{Statement 1 is true.} \]

Also we have \( \alpha \beta = q \) and \( \frac{a}{b} = \frac{c}{a} \)
\[ \therefore \frac{\alpha \beta}{\alpha / \beta} = \frac{q}{c} \times a \Rightarrow \beta^2 = \frac{qa}{c} \]

As \( \beta \neq 1 \) or \(-1 \Rightarrow \beta^2 \neq 1 \Rightarrow \frac{qa}{c} \neq 1 \) or \( c \neq q a \)

Again, as exactly one root \( \alpha \) is common, and \( \beta \neq 1 \)
\[ \therefore \alpha + \beta = \alpha + \frac{1}{\beta} \Rightarrow \frac{-2b}{a} \neq -2p \Rightarrow b \neq ap \]
\[ \therefore \text{Statement 2 is correct.} \]

1. Integer Value Correct Type

1. (7) The given system of equations is
\[ 3x - y - z = 0 \]
\[ -3x + z = 0 \]
\[ -3x + 2y + z = 0 \]
Let \( x = p \) where \( p \) is an integer, then \( y = 0 \) and \( z = 3p \)

But \( x^2 + y^2 + z^2 \leq 100 \Rightarrow p^2 + 9p^2 \leq 100 \)
\[ \Rightarrow p^2 \leq 10 \Rightarrow p = 0, \pm 1, \pm 2 \pm 3 \]
\[ \text{i.e. } p \text{ can take 7 different values.} \]
\[ \therefore \text{ Number of points } (x, y, z) \text{ are 7.} \]

2. (2) The given equation is
\[ x^2 - 8kx + 16(k^2 - k + 1) = 0 \]
\[ \therefore \text{ Both the roots are real and distinct} \]
\[ \therefore D > 0 \Rightarrow (8k)^2 - 4 \times 16(k^2 - k + 1) > 0 \]
\[ \Rightarrow k > 1 \]
\[ \therefore (i) \]
Both the roots are greater than or equal to 4
\[ \Rightarrow \alpha + \beta > 8 \quad \text{and} \quad f(4) \geq 0 \]
\[ \Rightarrow k > 1 \quad \text{(ii)} \]
and
\[ 16 - 32k + 16(k^2 - k + 1) \geq 0 \]
\[ \Rightarrow k^2 - 3k + 2 \geq 0 \quad \Rightarrow (k - 1)(k - 2) \geq 0 \]
\[ \Rightarrow k \in (-\infty, 1) \cup [2, \infty) \quad \text{(iii)} \]
Combining (i), (ii) and (iii), we get \( k \geq 2 \) or the smallest value of \( k = 2 \).

3. (8) \( \because a > 0, \therefore a^2, a^4, 3a^3, 1, a^8, a^{10} > 0 \)
Using AM \( \geq \) GM for positive real numbers we get
\[ \frac{1}{a^5} + \frac{1}{a^4} + \frac{1}{a^3} + \frac{1}{a^2} + \frac{1}{a} + 1 + a^8 + a^{10} \geq \frac{1}{8} \left( \frac{1}{a^5} + \frac{1}{a^4} + \frac{1}{a^3} + \frac{1}{a^2} + \frac{1}{a} + 1 + a^8 + a^{10} \right)^8 \]
\[ \Rightarrow \frac{1}{a^5} + \frac{1}{a^4} + \frac{3}{a^3} + \frac{3}{a^2} + \frac{1}{a} + 1 + a^8 + a^{10} \geq 8(1)^8 \]

4. (2) We have \( x^4 - 4x^3 + 12x^2 + x - 1 = 0 \)
\[ \Rightarrow x^4 - 4x^3 + 6x^2 - 4x + 1 + 2x^2 + 5x - 2 = 0 \]
\[ \Rightarrow (x - 1)^4 + 3x^2 + 5x - 2 = 0 \]

\[ \text{JEE Main/ AIEEE} \]

1. (a) We have \( \alpha^2 = 5\alpha - 3 \) and \( \beta^2 = 5\beta - 3 \);
\[ \Rightarrow \alpha \& \beta \text{ are roots of equation, } x^2 = 5x - 3 \]
or \( x^2 - 5x + 3 = 0 \)
\[ \therefore \alpha + \beta = 5 \text{ and } \alpha \beta = 3 \]
Thus, the equation having \( \alpha \beta \) as its roots is
\[ x^2 - x \left( \frac{\alpha + \beta}{\alpha} \right) + \frac{\alpha \beta}{\alpha} = 0 \]
\[ \Rightarrow x^2 - x \left( \frac{\alpha^2 + \beta^2}{\alpha \beta} \right) + 1 = 0 \text{ or } 3x^2 - 19x + 3 = 0 \]

2. (a) Let \( \alpha, \beta \) and \( \gamma, \delta \) be the roots of the equations \( x^2 + ax + b = 0 \) and \( x^2 + bx + a = 0 \) respectively.
\[ \therefore \alpha + \beta = -a, \alpha \beta = b \text{ and } \gamma + \delta = -b, \gamma \delta = a. \]
Given \( |\alpha - \beta| = |\gamma - \delta| \)
\[ \Rightarrow (\alpha - \beta)^2 = (\gamma - \delta)^2 \]
\[ \Rightarrow (\alpha + \beta)^2 - 4\alpha \beta = (\gamma + \delta)^2 - 4\gamma \delta \]
\[ \Rightarrow a^2 - 4b = b^2 - 4a \Rightarrow a^2 - b^2 = 4(a - b) = 0 \]
\[ \Rightarrow a + b + 4 = 0 \quad (\therefore a \neq b) \]

3. (a) Product of real roots = \( \frac{9}{t^2} > 0 \), \( \forall t \in R \)
\[ \therefore \text{Product of real roots is always positive.} \]

4. (a) \( p + q = -p \) and \( pq = q \)
\[ \Rightarrow q = 0 \text{ or } p = 1 \]
If \( q = 0 \), then \( p = 0 \). i.e., \( p = q \)
\[ \therefore p = 1 \text{ and } q = -2. \]

5. (a) \( \because (a - b)^2 + (b - c)^2 + (c - a)^2 > 0 \)
\[ \Rightarrow 2(a^2 + b^2 + c^2 - ab - bc - ca) > 0 \]
\[ \Rightarrow 2 > 2(ab + bc + ca) \Rightarrow ab + bc + ca < 1 \]

6. (d) \( ax^2 + bx + c = 0, \alpha + \beta = \frac{-b}{a}, \alpha \beta = \frac{c}{a} \)
As for given condition, \( \alpha + \beta = \frac{1}{a^2} + \frac{1}{b^2} \)
\[ \alpha + \beta = \frac{a^2 + b^2}{a^2 b^2} - \frac{b^2 - 2c}{a^2 b^2} \]
\[ \alpha + \beta = \frac{2a^2 - 2c}{a^2 b^2} \]
On simplification \( 2a^2 c = ab^2 + bc^2 \)
\[ \Rightarrow \frac{2a}{b} = \frac{c}{a} \quad \Rightarrow \frac{c}{a}, \frac{b}{a}, \frac{c}{b} \text{ are in A.P.} \]
\[ \therefore \frac{a}{c}, \frac{b}{a}, \frac{c}{b} \text{ are in H.P.} \]

7. (b) Let the roots of given equation be \( \alpha \) and \( 2\alpha \) then
\[ \alpha + 2\alpha = 3\alpha = \frac{1 - 3a}{a^2 - 5a + 3} \]
\[ \& 2\alpha^2 = \frac{2}{a^2 - 5a + 3} \Rightarrow \alpha = \frac{1 - 3a}{3(a^2 - 5a + 3)} \]
Quadratic Equation and Inequations (Inequalities)

\[ \therefore \frac{2}{9} \left( \frac{(1-3a)^2}{a^2-5a+3} \right) = \frac{2}{a^2-5a+3} \]

\[ \frac{(1-3a)^2}{a^2-5a+3} = 9 \text{ or } 9a^2-6a+1 = 9a^2-45a+27 \]

or \[ 39a = 26 \text{ or } a = \frac{2}{3} \]

8. (c) \[ x^2 - 3|x| + 2 = 0 \Rightarrow |x|^2 - 3|x| + 2 = 0 \]

\[ (|x|-2)(|x|-1) = 0 \]

\[ |x| = 1, 2 \text{ or } x = \pm 1, \pm 2. \quad \therefore \text{No. of solution} = 4 \]

9. (c) \[ y = x + \frac{1}{x} \quad \text{or} \quad \frac{dy}{dx} = 1 - \frac{1}{x^2} \]

For max. or min., \[ 1 - \frac{1}{x^2} = 0 \Rightarrow x = \pm 1 \]

\[ \frac{d^2y}{dx^2} = \frac{2}{x^3} \Rightarrow \left( \frac{d^2y}{dx^2} \right)_{x=2} = 2 \text{ (+ve minimum)} \therefore x = 1 \]

10. (b) Let two numbers be \( a \) and \( b \) then \[ \frac{a+b}{2} = 9 \text{ and } \sqrt{ab} = 4 \]

\[ . \therefore \text{Equation with roots } a \text{ and } b \text{ is} \]

\[ x^2 - (a+b)x + ab = 0 \Rightarrow x^2 - 18x + 16 = 0 \]

11. (c) Let the second root be \( \alpha \).

Then \( \alpha + (1-p) = -p \Rightarrow \alpha = -1 \)

Also \( \alpha(1-p) = 1-p \)

\[ \Rightarrow (\alpha-1)(1-p) = 0 \Rightarrow p = 1: \alpha = -1 \]

\[ . \therefore \text{Roots are } \alpha = -1 \text{ and } p = 1 = 0 \]

12. (d) 4 is a root of \( x^2 + px + q = 0 \)

\[ \Rightarrow 16 + 4p + 12 = 0 \]

\[ \Rightarrow p = -7 \]

Now, the equation \( x^2 + px + q = 0 \)
has equal roots.

\[ \therefore p^2 - 4q = 0 \Rightarrow q = \frac{p^2}{4} = \frac{49}{4} \]

13. (b) \[ \tan \left( \frac{P}{2} \right), \tan \left( \frac{Q}{2} \right) \text{ are the roots of } \alpha x^2 + bx + c = 0 \]

\[ \tan \left( \frac{P}{2} \right) + \tan \left( \frac{Q}{2} \right) = -\frac{b}{a}, \quad \tan \left( \frac{P}{2} \right) \cdot \tan \left( \frac{Q}{2} \right) = \frac{c}{a} \]

\[ \frac{\tan \left( \frac{P}{2} \right) + \tan \left( \frac{Q}{2} \right)}{1 - \tan \left( \frac{P}{2} \right) \tan \left( \frac{Q}{2} \right)} = \tan \left( \frac{P + Q}{2} \right) = 1 \]

14. (c)

\[ \therefore \frac{-b}{a-c} = 1 \Rightarrow -b = a - c \]

\[ \Rightarrow b = a - c \text{ or } c = a + b. \]

both roots are less than 5

then (i) Discriminant \( \geq 0 \)

(ii) \( p(5) > 0 \)

(iii) \[ \text{Sum of roots} \leq 5 \]

Hence \( 4k^2 - 4(k^2 + k - 5) \geq 0 \)

\[ 4k^2 - 4k^2 - 4k + 20 \geq 0 \]

\( 4k \leq 20 \Rightarrow k \leq 5 \)

(ii) \[ f(5) > 0 ; 25 - 10k + k^2 + k - 5 > 0 \]

or \( k^2 - 9k + 20 > 0 \)

or \( k(k-4) - 5(k-4) > 0 \)

or \( (k-5)(k-4) > 0 \)

\[ \Rightarrow k \in (-\infty, 4) \cup (5, \infty) \]

(iii) \[ \text{Sum of roots} = \frac{-b}{2a} = \frac{2k}{2} < 5 \]

The intersection of (i), (ii) & (iii) gives \( k \in (-\infty, 4) \).

15. (b) \[ x^2 + px + q = 0 \]

\[ \text{Sum of roots} = \tan 30^o + \tan 15^o = -p \]

\[ \text{Product of roots} = \tan 30^o \cdot \tan 15^o = q \]

\[ \tan 45^o = \frac{\tan 30^o + \tan 15^o}{1 - \tan 30^o \cdot \tan 15^o} = \frac{-p}{1-q} = 1 \]

\[ \Rightarrow -p = 1-q \Rightarrow q = p = 1 \therefore 2q - p = 3 \]

16. (c) \[ \text{Equation } x^2 - 2mx + m^2 - 1 = 0 \]

\[ (x-m)^2 - 1 = 0 \text{ or } (x-m+1)(x-m-1) = 0 \]

\[ x = m - 1, m + 1 \]

\[ m - 1 > -2 \text{ and } m + 1 < 4 \]

\[ \Rightarrow m > -1 \text{ and } m < 3 \text{ or, } -1 < m < 3 \]

17. (b) \[ y = \frac{3x^2 + 9x + 17}{3x^2 + 9x + 7} \]

\[ 3x^2(y-1) + 9x(y-1) + 7y - 17 = 0 \]

\[ D \geq 0 \quad \therefore x \text{ is real} \]

\[ 8(4y-1)^2 - 4 \cdot 3(4y-1)(7y-17) \geq 0 \]

\[ \Rightarrow (y-1)(y-41) \leq 0 \Rightarrow 1 \leq y \leq 41 \]

\[ . \therefore \text{Max value of } y \text{ is } 41 \]

18. (c) Let \( \alpha \) and \( \beta \) are roots of the equation \( x^2 + ax + 1 = 0 \) So, \( \alpha + \beta = -a \) and \( \alpha \beta = 1 \)

given \( |\alpha - \beta| < \sqrt{5} \Rightarrow \sqrt{(\alpha + \beta)^2 - 4\alpha \beta} < \sqrt{5} \)

\[ . \therefore (\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha \beta \]
\[ \sqrt{a^2 - 4} < \sqrt{5} \Rightarrow a^2 - 4 < 5 \]
\[ a^2 - 9 < 0 \Rightarrow a^2 < 9 \Rightarrow -3 < a < 3 \Rightarrow a \in (-3, 3) \]

19. (b) Statement 2 is \( \sqrt{n(n+1)} < n + 1, n \geq 2 \)

\[ \Rightarrow \sqrt{n} < \sqrt{n + 1}, n \geq 2 \text{ which is true} \]
\[ \Rightarrow \sqrt{2} < \sqrt{3} < \sqrt{4} < \sqrt{5} < \ldots \ldots \ldots \\ldots \\sqrt{n} \]

Now \( \sqrt{2} < \sqrt{n} \Rightarrow \frac{1}{\sqrt{2}} > \frac{1}{\sqrt{n}} \)
\[ \sqrt{3} < \sqrt{n} \Rightarrow \frac{1}{\sqrt{3}} > \frac{1}{\sqrt{n}} \quad ; \quad \sqrt{n} \leq \sqrt{3} \Rightarrow \frac{1}{\sqrt{n}} \geq \frac{1}{\sqrt{3}} \]

Also \( \frac{1}{\sqrt{1}} > \frac{1}{\sqrt{n}} \) \quad \therefore Adding all, we get
\[ \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} + \ldots \ldots \ldots + \frac{1}{\sqrt{n}} = \sqrt{n} \]

Hence both the statements are correct and statement 2 is a correct explanation of statement-1.

20. (d) Let the roots of equation \( x^2 - 6x + a = 0 \) be \( \alpha \) and \( 3 \beta \).

Then \[ \alpha + 3 \beta = 6 \; ; \quad 4 \alpha \beta = a \]
and \[ \alpha + 3 \beta = 6 \; ; \quad 3 \alpha \beta = 6 \]

\[ \Rightarrow \alpha = 8 \]

\[ \therefore \quad \text{The equation becomes} \quad x^2 - 6x + 8 = 0 \]
\[ \Rightarrow \quad (x - 2)(x - 4) = 0 \quad \Rightarrow \text{roots are 2 and 4} \]
\[ \Rightarrow \quad \alpha = 2, \beta = 1 \quad \therefore \quad \text{Common root is 2.} \]

21. (b) Given that roots of the equation
\[ bx^2 + cx + a = 0 \]
are imaginary
\[ \therefore \quad c^2 - 4ab < 0 \]

Let \( y = 3b^2x^2 + 6bx + 2c^2 \)
\[ \Rightarrow \quad 3b^2x^2 + 6bx + 2c^2 - y = 0 \]

As \( x \) is real, \( D \geq 0 \)
\[ \Rightarrow \quad 36b^2 - 12b^2(2c^2 - y) \geq 0 \]
\[ \Rightarrow \quad 12b^2(3c^2 - 2c^2 + y) \geq 0 \]
\[ \Rightarrow \quad c^2 + y \geq 0 \]

But from eqn. (i), \( c^2 < 4ab \) or \(-c^2 > -4ab\)
\[ \therefore \quad y \geq -c^2 \]
\[ \Rightarrow \quad y > -4ab \]

22. (a) Given that \( |z - \frac{4}{z}| = 2 \)

Now \[ |z| = \left| z - \frac{4}{z} \right| + \frac{4}{|z|} \]
\[ \Rightarrow \quad |z| \leq 2 + \frac{4}{|z|} \quad \Rightarrow \quad |z|^2 - 2|z| - 4 \leq 0 \]
\[ \Rightarrow \quad \left( |z| - \frac{2 + \sqrt{20}}{2} \right) \left( |z| - \frac{2 - \sqrt{20}}{2} \right) \leq 0 \]
\[ \Rightarrow \quad \left( |z| - (1 + \sqrt{5}) \right) \left( |z| - (1 - \sqrt{5}) \right) \leq 0 \]

23. (b) \( x^2 - x + 1 = 0 \Rightarrow x = \frac{1 + \sqrt{1 - 4}}{2} \)
\[ x = \frac{1 + \sqrt{3}i}{2} \]
\[ \alpha = \frac{1 + i \sqrt{3}}{2} = -\omega^2 \quad \beta = \frac{1 - i \sqrt{3}}{2} = \omega \]
\[ \alpha^{2009} + \beta^{2009} = (-\omega^2)^{2009} + (-\omega)^{2009} = -\omega^2 - \omega = 1 \]

24. (b) Given equation is \( e^{i\sin x} - e^{-i\sin x} = 4 \)

Put \( e^{i\sin x} = t \) in the given equation, we get
\[ t^2 - 4t - 1 = 0 \]
\[ \Rightarrow \quad t = \frac{4 \pm \sqrt{16 + 4}}{2} = \frac{4 \pm \sqrt{20}}{2} = \frac{4 \pm 2\sqrt{5}}{2} = 2 \pm \sqrt{5} \]
\[ \Rightarrow \quad e^{i\sin x} = 2 \pm \sqrt{5} \quad \therefore \quad t = e^{i\sin x} \]
\[ \Rightarrow \quad e^{i\sin x} = 2 - \sqrt{5} \quad \text{and} \quad e^{i\sin x} = 2 + \sqrt{5} \]
\[ \Rightarrow \quad e^{i\sin x} = 2 - \sqrt{5} < 0 \quad \text{and} \quad \sin x = \ln(2 + \sqrt{5}) > 1 \]
So rejected

Hence given equation has no solution.
\[ \therefore \quad \text{The equation has no real roots.} \]

25. (d) \( f(x) = 2x^2 + 3x + k \)
\[ f(x) = 6x^2 + 3 > 0 \quad \forall x \in R \quad (\therefore \quad x^2 > 0) \]
\[ \Rightarrow \quad f(x) \text{ is strictly increasing function} \]
\[ \Rightarrow \quad f(x) = 0 \text{ has only one real root, so two roots are not possible.} \]

26. (b) From the given system, we have
\[ k + 1 \quad \text{(} \therefore \text{System has no solution)} \]
\[ \frac{k + 1}{k} = \frac{-8}{3k - 1} \]
\[ \Rightarrow k^2 + 4k + 3 = 8k \]
\[ \Rightarrow k = 1, 3 \]

If \( k = 1 \) then \( \frac{8}{1 + 3} \neq \frac{4}{2} \) which is false

And if \( k = 3 \)
then \( \frac{8}{6} \neq \frac{4.3}{9 - 1} \) which is true, therefore \( k = 3 \)

Hence for only one value of \( k \). System has no solution.

27. (a) Given equations are
\[ x^2 + 2x + 3 = 0 \quad \ldots \ldots \ldots \ldots (i) \]
\[ ax^2 + bx + c = 0 \quad \ldots \ldots \ldots \ldots (ii) \]

Roots of equation (i) are imaginary roots.

According to the question (ii) will also have both roots same as (i). Thus
\[ a = b = c = \lambda \quad \text{(say)} \quad \Rightarrow a = \lambda, b = 2\lambda, c = 3\lambda \]

Hence, required ratio is \( 1 : 2 : 3 \)

28. (c) Consider \(-3(x-[x])^2 + 2[x-[x]] + 2a^2 = 0 \)
\[ 3|x|^2 - 2|x| - a^2 = 0 \quad (\because \quad x-[x] = |x|) \]
Quadratic Equation and Inequalities (Inequalities)

\[ 3 \left( \{x\}^2 - \frac{2}{3} \{x\} \right) = a^2, \ a \neq 0 \]
\[ a^2 = 3\{x\} \left( \{x\} - \frac{2}{3} \right) \]

Now, \( \{x\} \in (0,1) \) and \( \frac{-2}{3} \leq a^2 < 1 \) (by graph)
Since \( x \) is not an integer
\[ \therefore \ a \in (-1,1) - \{0\} \Rightarrow a \in (-1,0) \cup (0,1) \]

29. (b) Let \( p, q, r \) are in AP
\[ 2q = p + r \quad \text{... (i)} \]
Given \( \frac{1}{\alpha} + \frac{1}{\beta} = 4 \Rightarrow \frac{\alpha + \beta}{\alpha\beta} = 4 \]
We have \( \alpha + \beta = -\frac{q}{p} \) and \( \alpha\beta = \frac{r}{p} \)
\[ \Rightarrow \frac{-q}{r} = 4 \Rightarrow q = -4r \]
From (i), we have
\[ 2(-4r) = p + r \Rightarrow p = -9r \quad q = -4r \]

\[ a_{10} - 2a_8 \]
\[ = \frac{(3 + \sqrt{11})^{10} - (3 - \sqrt{11})^{10} - 2(3 + \sqrt{11})^8 + 2(3 - \sqrt{11})^8}{2[(3 + \sqrt{11})^9 - (3 - \sqrt{11})^9]} \]
\[ = \frac{(3 + \sqrt{11})^8 \left( 3 + \sqrt{11} \right)^2 - 2 \left( 3 - \sqrt{11} \right)^8 \left( 2 - (3 - \sqrt{11})^2 \right)}{2 \left( 3 + \sqrt{11} \right)^9 - 3 - \sqrt{11})^9} \]
\[ = \frac{(3 + \sqrt{11})^8 \left( 9 + 11 + 6\sqrt{11} - 2 \right) + (3 - \sqrt{11})^8 \left( 2 - 9 - 11 + 6\sqrt{11} \right)}{2 \left( 3 + \sqrt{11} \right)^9 - 3 - \sqrt{11})^9} \]
\[ = \frac{6(3 + \sqrt{11})^9 - 6(3 - \sqrt{11})^9}{2 \left( 3 + \sqrt{11} \right)^9 - 3 + \sqrt{11})^9} \]
\[ = \frac{6}{2} = 3 \]

31. (c) \( (x^2 - 5x + 5)x^2 + 4x - 60 = 1 \)

Case I
\( x^2 - 5x + 5 = 1 \) and \( x^2 + 4x - 60 \) can be any real number
\[ \Rightarrow x = 1, 4 \]

Case II
\( x^2 - 5x + 5 = -1 \) and \( x^2 + 4x - 60 \) has to be an even number
\[ \Rightarrow x = 2, 3 \]
where 3 is rejected because for \( x = 3 \), \( x^2 + 4x - 60 \) is odd.

Case III
\( x^2 - 5x + 5 \) can be any real number and \( x^2 + 4x - 60 = 0 \)
\[ \Rightarrow x = -10, 6 \]
\[ \Rightarrow \text{Sum of all values of } x = -10 + 6 + 2 + 1 + 4 = 3 \]
# Permutations and Combinations

## Section-A: JEE Advanced/ IIT-JEE

### A. Fill in the Blanks

1. Number of students who gave wrong answers to exactly one question = \( a_1 - a_2 \). Two questions = \( a_2 - a_3 \). Three questions = \( a_3 - a_4 \), k-1 question = \( a_{k-1} - a_k \), kth question = \( a_k \).

   ∴ Total number of wrong answers
   = \( 1 \times (a_1 - a_2) + 2 \times (a_2 - a_3) + 3 \times (a_3 - a_4) + \ldots + (k-1) \times (a_{k-1} - a_k) + k \times a_k \)
   = \( a_1 + a_2 + a_3 + \ldots + a_k \)

2. We have total 3 + 4 + 5 = 12 points out of which 3 fall on one line, 4 on other line and 5 on still other line. So number of \( \Delta \)'s that can be formed using 12 such points are
   = \( \binom{12}{3} \binom{9}{3} \binom{6}{3} \)
   = \( \frac{12 \times 11 \times 10}{6} \times \frac{9 \times 8 \times 7}{3 \times 2 \times 1} \times \frac{6 \times 5 \times 4}{2 \times 1} \)
   = 220 - 15 = 205

3. '+' signs can be put in a row in 1 way, creating 7 ticked places to keep '-' sign so that no two '-' signs occur together

   √+√+√+√+√+√+√

   Out of these 7 places 4 can be chosen in \( \binom{7}{4} \) ways.
   ∴ Required no. of arrangements are
   = \( \binom{7}{4} \times 3 \times 2 \times 1 \times \frac{1}{n!} \)

### B. True/False

1. Consider \( \frac{(n+1)(n+2)\ldots(n+r)}{r!} \)
   = \( \frac{1 \times 2 \times 3 \times \ldots \times (n-1) \times n \times (n+1) \times (n+2)\ldots(n+r)}{1 \times 2 \times 3 \times \ldots \times r} \)
   = \( \frac{1 \times 2 \times 3 \times \ldots \times (n-1) \times n \times (n+1) \times (n+2)\ldots(n+r)}{1 \times 2 \times 3 \times \ldots \times r} \)

---

### Key Concept

We know that number of rearrangements of \( n \) objects

= \( n! \left[ \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \ldots + \frac{1}{n!} \right] \)

∴ No. of ways of putting all the 4 balls into boxes of different colour

= \( 4! \left[ \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} \right] = 4! \left( \frac{1}{2} \times \frac{1}{6} + \frac{1}{24} \right) \)

= \( \frac{24}{12 - 4 + 1} = 9 \)
5. (a) KEY CONCEPT: We know that a number is divisible by 3 if the sum of its digits is divisible by 3.

Now out of 0, 1, 2, 3, 4, 5 if we take 1, 2, 3, 4, 5 or 0, 1, 2, 4, 5 then the 5 digit numbers will be divisible by 3.

Case I: Number of 5 digit numbers formed using the digits 1, 2, 3, 4, 5 = 5! = 120

Case II: Taking 0, 1, 2, 4, 5 if we make 5 digit number then
I place can be filled in = 4 ways (0 can not come at 1 place)
II place can be filled in = 4 ways
III place can be filled in = 3 ways
IV place can be filled in = 2 ways
V place can be filled in = 1 way

Total numbers are = 4 × 4! = 96

Thus total numbers divisible by 3 are = 120 + 96 = 216

6. (c) \(X - X - X - X - X\) The four digits 3, 3, 5, 5 can be arranged at (-) places in \(\frac{4!}{2!2!}\) = 6 ways.

The five digits 2, 2, 8, 8, 8 can be arranged at

\((\lambda)\) places in \(\frac{5!}{2!3!}\) = 10 ways.

Total no. of arrangements = \(6 × 10 = 60\) ways.

7. (b) \(\therefore T_n = \binom{n}{3}; T_{n+1} = \binom{n+1}{3}\)

As per question,

\[T_{n+1} - T_n = 21 \Rightarrow \binom{n+1}{3} - \binom{n}{3} = 21\]

\[\Rightarrow \frac{(n+1)(n)(n-1)}{3.2.1} - \frac{n(n-1)(n-2)}{3.2.1} = 21\]

\[\Rightarrow n(n-1)(n+1-2) = 126\]

\[\Rightarrow n(n-1) = 42 \Rightarrow n(n-1) = 7 \times 6 \Rightarrow n = 7.\]

8. (a) Total number of ways of arranging the letters of the word BANANA is \(\frac{6!}{2!3!} = 60\). Number of words in which 2 N’s come together is \(\frac{5!}{3!} = 20\).

Hence the required number = \(60 - 20 = 40\)

9. (c)

If we see the blocks in terms of lines then there are 2m vertical lines and 2n horizontal lines. To form the
required rectangle we must select two horizontal lines, one even numbered (out of 2, 4, .... 2n) and one odd numbered (out of 1, 3, .... 2n–1) and similarly two vertical lines. The number of rectangles is \( ^mC_1 \times ^mC_1 \times ^mC_1 = m^2n^2 \)

10. (c) \( \therefore \) r, s, t are prime numbers.

\( \therefore \) Section of (p, q) can be done as follows

<table>
<thead>
<tr>
<th>p</th>
<th>q</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>r</td>
</tr>
<tr>
<td>r</td>
<td>r</td>
</tr>
</tbody>
</table>

Similarly s and t can be selected in 9 and 5 ways respectively.

\( \therefore \) Total ways = 5 \times 9 \times 5 = 225

11. (c) The letter of word COCHIN in alphabetic order are C, C, H, I, N, O.

Fixing first letter C and keeping C at second place, rest 4 can be arranged in 4! ways.

Similarly the words starting with CH, CI, CN are 4! in each case.

Then fixing first two letters as CO next four places when filled in alphabetic order give the word COCHIN.

\( \therefore \) Numbers of words coming before COCHIN are \( 4 \times 4! = 4 \times 24 = 96 \)

12. (c) We have to form 7 digit numbers, using the digits 1, 2 and 3 only, such that the sum of the digits in a number = 10.

This can be done by taking 2, 2, 2, 1, 1, 1, 1, or by taking 2, 3, 1, 1, 1, 1, 1.

\( \therefore \) Number of ways = \( \frac{7!}{3!4!} + \frac{7!}{5!} = 77. \)

13. (b) \( \therefore \) Each person gets at least one ball.

\( \therefore \) 3 Persons can have 5 balls in the following systems

<table>
<thead>
<tr>
<th>Person</th>
<th>I</th>
<th>II</th>
<th>III</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. of balls</td>
<td>1</td>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

or

<table>
<thead>
<tr>
<th>Person</th>
<th>I</th>
<th>II</th>
<th>III</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. of balls</td>
<td>1</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

The number of ways to distribute the balls in first system

\( = ^5C_1 \times ^4C_1 \times ^3C_3 \)

Also 3, persons having 1, 1 and 3 balls can be arranged in \( \frac{3!}{2!} \) ways.

\( \therefore \) No. of ways to distribute 1, 1, 3 balls to the three persons

\( = ^5C_1 \times ^4C_1 \times ^3C_3 \times \frac{3!}{2!} = 60 \)

**Topic-wise Solved Papers - MATHEMATICS**

Similarly the total no. of ways to distribute 1, 2, 2 balls to the three persons \( = ^5C_1 \times ^4C_2 \times ^2C_2 \times \frac{3!}{2!} = 90 \)

\( \therefore \) The required number of ways = 60 + 90 = 150

14. (e) \( \therefore \) Card numbered 1 is always placed in envelope numbered 2, we can consider two cases.

Case I: Card numbered 2 is placed in envelope numbered 1. Then it is rearrangement of 4 objects, which can be done in \( 4! \left( \frac{1}{1!} + \frac{1}{1!} + \frac{1}{1!} + \frac{1}{1!} \right) = 9 \) ways

Case II: Card numbered 2 is not placed in envelope numbered 1. Then it is rearrangement of 5 objects, which can be done in \( 5! \left( \frac{1}{1!} + \frac{1}{1!} + \frac{1}{1!} + \frac{1}{3!} + \frac{1}{4!} \right) = 44 \) ways

\( \therefore \) Total ways = 44 + 9 = 53

15. (a) Either one boy will be selected or no boy will be selected. Also out of four members one captain is to be selected.

\( \therefore \) Required number of ways = \( (4 \times 6 \times 6 \times C_3) \times 4 \times C_1 \)

\( = (80 + 15) \times 4 = 380 \)

**D. MCQs with ONE or MORE THAN ONE Correct**

1. (b) Distinct n digit numbers which can be formed using digits 2, 5 and 8 are 3^n.

We have to find n so that 3^n \( \geq \) 900 \( \Rightarrow \) 3^n \( \geq \) 100

\( \Rightarrow \) n – 2 \( \geq \) 5 \( \Rightarrow \) n \( \geq \) 7. So the least value of n is 7.

**E. Subjective Problems**

1. As all the X's are identical, the question is of selection of 6 squares from 8 squares, so that no row remains empty. Here \( R_1 \) has 2 squares, \( R_2 \) has 4 squares and \( R_3 \) has 2 squares.

The selection scheme is as follows:

<table>
<thead>
<tr>
<th>( R_1 )</th>
<th>( R_2 )</th>
<th>( R_3 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>or</td>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>or</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>or</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

\( \therefore \) Number of selections are

\( 2^2 \times C_1 \times C_4 \times C_2 + 2^1 \times C_1 \times C_3 \times C_2 \)

\( + 2^1 \times C_1 \times C_3 \times C_2 \times C_2 \times C_2 \times C_2 \times C_2 \)

\( = 4 + 8 + 6 = 26 \)
2. The various possibilities to put 5 different balls in 3 different size boxes, when no box remains empty: The balls can be 1, 1 and 3 in different boxes or 2, 2, 1.

\textbf{Case I:} To put 1, 1 and 3 balls in different boxes. Selection of 1, 1 and 3 balls out of 5 balls can be done in $\binom{5}{1} \times \binom{4}{1} \times \binom{3}{3}$ ways and then 1, 1, 3 can permute (as different size boxes) in 3! ways.

\[
\text{No. of ways} = \binom{5}{1} \times \binom{4}{1} \times \binom{3}{3} \times 3! = 5 \times 4 \times 1 \times 6 = 120
\]

\textbf{Case II:} To put 2, 2 and 1 ball in different boxes. Selection of 2, 2 and 1 balls out of 5 balls can be done in $\binom{5}{2} \times \binom{3}{2} \times \binom{1}{1}$ ways and then 2, 2, 1 can permute (different boxes) in 3! ways.

\[
\text{No. of ways} = \binom{5}{2} \times \binom{3}{2} \times \binom{1}{1} \times 3! = 10 \times 3 \times 1 \times 6 = 180
\]

Combining case I and II, total number of required ways are 
\[
120 + 180 = 300.
\]

3. m men can be seated in $m!$ ways creating $(m+1)$ places for ladies to sit.

n ladies out of $(m+1)$ places (as $n < m$) can be seated in $\frac{(m+1)!}{(m+1-n)!}$ ways

\[
\text{Total ways} = m! \times \frac{(m+1)!}{(m+1-n)!} = \frac{(m+1)!m!}{(m-n+1)!}
\]

4. There are four possibilities:

(i) 3 ladies from husband’s side and 3 gentlemen from wife’s side.

No. of ways in this case = $\binom{4}{3} \times \binom{4}{3} = 4 \times 4 = 16$

(ii) 3 gentlemen from husband’s side and 3 ladies from wife’s side.

No. of ways in this case = $\binom{3}{3} \times \binom{3}{3} = 3 \times 3 = 1 = 1$

(iii) 2 ladies and one gentleman from husband’s side and one lady and 2 gentlemen from wife’s side.

No. of ways in this case = $\binom{6}{2} \times \binom{4}{4} = 6 \times 3 \times 3 \times 6 = 324$

(iv) One lady and 2 gentlemen from husband’s side and 2 ladies and one gentleman from wife’s side.

No. of ways in this case = $\binom{4}{1} \times \binom{3}{2} \times \binom{6}{4} \times \binom{4}{1} = 4 \times 3 \times 3 \times 4 = 144$

Hence the total no. of ways are 
\[
16 + 1 + 324 + 144 = 485
\]

5. Number of ways of drawing at least one black ball = 1 black and 2 other or 2 black and 1 other or 3 black

$= \binom{3}{1} \times \binom{6}{2} = \binom{4}{2} \times \binom{5}{3} = \binom{6}{3} \times 5 = 3 \times 15 + 3 \times 6 + 1 = 45 + 18 + 1 = 64$

6. Out of 18 guests half i.e. 9 to be seated on side A and rest 9 on side B. Now out of 18 guests, 4 particular guests desire to sit on one particular side say side A and other 3 on other side B. Out of rest 18 - 4 - 3 = 11 guests we can select 5 more for side A and rest 6 can be seated on side B. Selection of 5 out of 11 can be done in $\binom{11}{5}$ ways and 9 guests on each sides of table can be seated in $9! \times 9!$ ways. Thus there are total $\binom{11}{5} \times 9! \times 9!$ arrangements.

7. Given that there are 9 women and 8 men. A committee of 12 is to be formed including at least 5 women.

This can be done in the following ways.

\[
\begin{align*}
5W \text{ and } 7M & \quad \text{or} \quad 6W \text{ and } 6M \\
& \quad \text{or} \quad 7W \text{ and } 5M \\
& \quad \text{or} \quad 8W \text{ and } 4M \\
& \quad \text{or} \quad 9W \text{ and } 3M
\end{align*}
\]

No. of ways of forming committee is

\[
\begin{align*}
&= \binom{9}{5} \times \binom{8}{7} + \binom{9}{6} \times \binom{8}{6} + \binom{9}{7} \times \binom{8}{5} + \binom{9}{8} \times \binom{8}{4} + \binom{9}{9} \times \binom{8}{3} \\
&= \begin{array}{c}
\frac{9 \times 8 \times 7 \times 6 \times 5}{4 \times 3 \times 2 \times 1} + \frac{9 \times 8 \times 7 \times 6}{4 \times 3 \times 2 \\
+ \frac{9 \times 8 \times 7}{4 \times 3 \times 2} \times \frac{9 \times 8}{4 \times 3 \times 2} + \frac{9 \times 8}{4 \times 3 \times 2} \times \frac{9}{4 \times 3 \times 2}
\end{array} \\
&= 126 \times 8 + 84 \times 28 + 36 \times 56 + 9 \times 70 + 56 = 6062 \text{ ways}
\end{align*}
\]

(a) The women are in majority in 2016 + 630 + 56 = 2702 ways.

(b) The men are in majority in 1008 ways.

8. Let there be n sets of different objects each set containing n objects each set containing $n$ identical objects [e.g. (1, 1, 1, ..., 1 (n times)), (2, 2, 2, ..., 2 (n times)), .....

\[n \times n = n^2 \text{ objects can be arranged in a row} = \frac{(n^2)!}{n! \times n!} = \frac{(n^2)!}{(n!)^n}\]

But these number of ways should be a natural number.

Hence $\frac{(n^2)!}{(n!)^n}$ is an integer. ($n \in \mathbb{N}^*$)

9. Given that

runs scored in kth match = $k \times 2^{n+1-k}$, $1 \leq k \leq n$

and runs scored in n matches = $\frac{n+1}{4} (2^{n+1} - n - 2)$

\[
\begin{align*}
\sum_{k=1}^{n} k \times 2^{n+1-k} &= \frac{n+1}{4} (2^{n+1} - n - 2) \\
2^{n+1} \left[ \sum_{k=1}^{n} \frac{k}{2^k} \right] &= \frac{n+1}{4} (2^{n+1} - n - 2) \\
2^{n+1} \left[ \frac{1}{2^2} + \frac{2}{2^3} + \frac{3}{2^4} + \ldots + \frac{n}{2^n} \right] &= \frac{n+1}{4} (2^{n+1} - n - 2) \\
2^{n+1} \left[ \frac{1}{2} + \frac{2}{3} + \frac{3}{4} + \ldots + \frac{n}{2^n} \right] &= \frac{n+1}{4} (2^{n+1} - n - 2) \quad \ldots(i)
\end{align*}
\]

Let \[S = \frac{1}{2} + \frac{2}{3} + \frac{3}{4} + \ldots + \frac{n}{2^n}\]

\[
\frac{1}{2} S = \frac{1}{2^2} + \frac{2}{2^3} + \frac{3}{2^4} + \ldots + \frac{n-1}{2^n} + \frac{n}{2^{n+1}}
\]

Subtracting the above two, we get

\[
\frac{1}{2} S = \frac{1}{2^2} + \frac{1}{2^3} + \frac{1}{2^4} + \ldots + \frac{1}{2^{n+1}} - \frac{n}{2^{n+1}}
\]
\[
\begin{align*}
\Rightarrow \quad \frac{1}{2} S &= \frac{1}{2} \left(1 - \frac{1}{2^n}\right) - \frac{n}{2^{n+1}} \Rightarrow S = 2 \left[1 - \frac{1}{2^n} - \frac{n}{2^{n+1}}\right] \\
\therefore \quad \text{Equation (i) becomes} \\
2.2^{n+1} \left[1 - \frac{1}{2^n} - \frac{n}{2^{n+1}}\right] &= \frac{n+1}{4} \left[2^{n+1} - n - 2\right] \\
\Rightarrow \quad 2 \left[2^{n+1} - 2 - n\right] &= \frac{n+1}{4} \left[2^{n+1} - 2 - n\right] \\
\Rightarrow \quad \frac{n+1}{4} &= 2 \Rightarrow n = 7
\end{align*}
\]

**F. Match the Following**

1. (A)-p; (B)-q; (C)-r; (D)-q

(A) For the permutations containing the word ENDEA we consider 'ENDEA' as single letter. Then we have total ENDEA, N, O, E, i.e. 5 letters which can be arranged in 5! ways.

\[\therefore (A) \rightarrow (p)\]

(B) If E occupies the first and last position, the middle 7 positions can be filled by N, D, E, A, N, O, L.

These can be arranged in \(\frac{7!}{2!}\) = 21 × 5! ways.

\[\therefore (B) \rightarrow (q)\]

(C) If none of the letters D, L, N occur in the last five positions then we should arrange D, D, L, N at first four positions and rest five i.e. E, E, E, A, O at last five positions. This can be done in

\[\frac{4! \times 5!}{2! \times 3!}\]

ways. (C) \rightarrow (q)

(D) As per question A, E, E, E, O can be arranged at 1st, 3rd, 5th, 7th and 9th positions and rest N, D, N, L at rest 4 positions. This can be done in

\[\frac{5! \times 4!}{3! \times 2!}\]

ways = 2 × 5! ways (D) \rightarrow (q)

**G. Comprehension Based Questions**

1. (b) \[\therefore a_n = \text{number of all } n \text{ digit +ve integers formed by the digits 0, 1 or both such that no consecutive digits in them are 0} \]

and \(b_n = \text{number of such } n \text{ digit integers ending with 1}\)

\(c_n = \text{number of such } n \text{ digit integers ending with 0}\)

Clearly, \(a_n = b_n + c_n\) (\(\therefore a_n\) can end with 0 or 1)

Also \(b_n = a_{n-1}\)

and \(c_n = a_{n-2}\) (\(\therefore\) if last digit is 0, second last has to be 1)

\[\therefore\] We get \(a_n = a_{n-1} + a_{n-2} \quad n \geq 3\)

Also \(a_1 = 1, a_2 = 2\),

By this recurring formula

\[a_3 = a_2 + a_1 = 3\]
\[a_4 = a_3 + a_2 = 3 + 2 = 5\]
\[a_5 = a_4 + a_3 = 5 + 3 = 8\]

2. (a) By recurring formula, \(a_{17} = a_{16} + a_{15}\) is correct

Also \(c_{17} \neq c_{16} + c_{15}\)

\[\Rightarrow a_{15} \neq a_{14} + a_{13}\]

\(\because c_n = a_{n-2}\)

\[\therefore\] Incorrect

Similarly, other parts are also incorrect.

### I. Integer Value Correct Type

1. (5) Given 8 vectors are

(1, 1, 1), (−1, −1, −1); (1, −1, 1), (−1, 1, −1); (1, −1, 1), (−1, 1, 1)

These are 4 diagonals of a cube and their opposites.

For 3 non coplanar vectors we select 3 groups of diagonals and their opposite in \(4C_3\) ways. Then one vector from each group can be selected in \(2 \times 2 \times 2\) ways.

\[\therefore \text{Total ways } = 4C_3 \times 2 \times 2 \times 2 = 32 = 2^5 \therefore p = 5\]

2. (7) \[\therefore n_1, n_2, n_3, n_4 \text{ and } n_5 \text{ are positive integers such that } 1 \leq n_1 < n_2 < n_3 < n_4 < n_5\]

Then for \(n_1 + n_2 + n_3 + n_4 + n_5 = 20\)

If \(n_1, n_2, n_3, n_4\) take minimum values 1, 2, 3, 4 respectively then \(n_5\) will be maximum 10.

\[\therefore\] Corresponding to \(n_5 = 10\), there is only one solution

\(n_1 = 1, n_2 = 2, n_3 = 3, n_4 = 4\).

Corresponding to \(n_5 = 9\), we can have, only solution

\(n_1 = 1, n_2 = 2, n_3 = 3, n_4 = 5\) i.e., one solution

Corresponding to \(n_5 = 8\), we can have, only solution

\(n_1 = 1, n_2 = 2, n_3 = 4, n_4 = 4\)

i.e., 2 solution

For \(n_5 = 7\), we can have

\(n_1 = 1, n_2 = 1, n_3 = 4, n_4 = 6\)

or \(n_1 = 1, n_2 = 2, n_3 = 4, n_4 = 4\)

\(\therefore 2\) solutions

For \(n_5 = 6\), we can have

\(n_1 = 2, n_2 = 3, n_3 = 4, n_4 = 5\)

\(\therefore\) i.e., one solution

Thus there can be 7 solutions.

3. (5) Number of adjacent lines = \(n\)

Number of non adjacent lines = \(nC_2 - n\)

\[\therefore nC_2 - n = n \Rightarrow \frac{n(n-1)}{2} - 2n = 0\]

\[\Rightarrow n^2 - 5n = 0 \Rightarrow n = 0 \text{ or } 5\]

But \(n \geq 2 \Rightarrow n = 5\)

4. (5) \(n = 5! \times 6!\)

For second arrangement,

5 boys can be made to stand in a row in 5! ways, creating 6 alternate space for girls. A group of 4 girls can be selected in \(5C_4\) ways. A group of 4 and single girl can be arranged at 2 places out of 6 in \(6P_2\) ways. Also 4 girls can arrange themselves in 4! ways.

\[\therefore m = 5! \times 6P_2 \times 5C_4 \times 4!\]

\[\frac{m}{n} = \frac{5! \times 6 \times 5 \times 5 \times 4!}{5! \times 6!} = 5\]
1. (d) Required number of numbers
   \[ = 5 \times 6 \times 6 \times 4 = 36 \times 20 = 720. \]
2. (e) Required number of numbers
   \[ = 3 \times 5 \times 5 \times 5 = 375 \]
3. (d) We know that a number is divisible by 3 only when the sum of the digits is divisible by 3. The given digits are 0, 1, 2, 3, 4, 5.

   Here the possible number of combinations of 5 digits out of 6 are \( ^5C_4 = 5 \), which are as follows-
   \[ \begin{align*}
   1 + 2 + 3 + 4 + 5 &= 15 = 3 \times 5 \\
   0 + 2 + 3 + 4 + 5 &= 14 \text{ (not divisible by 3)} \\
   0 + 1 + 3 + 4 + 5 &= 13 \text{ (not divisible by 3)} \\
   0 + 1 + 2 + 4 + 5 &= 12 = 3 \times 4 \\
   0 + 1 + 2 + 3 + 5 &= 11 \text{ (not divisible by 3)} \\
   0 + 1 + 2 + 3 + 4 &= 10 \text{ (not divisible by 3)}
   \end{align*} \]

   Thus the number should contain the digits 1, 2, 3, 4, 5 or the digits 0, 1, 2, 4, 5.

   Taking 1, 2, 3, 4, 5, the 5 digit numbers are \( = 5! = 120 \)

   Taking 0, 1, 2, 4, 5, the 5 digit numbers are \( = 5! - 4! = 96 \)

   \[ \therefore \text{ Total number of numbers} = 120 + 96 = 216 \]
4. (b) Required sum
   \[ = (2 + 4 + 6 + \ldots + 100) + (5 + 10 + 15 + \ldots + 100) \\
   = (10 + 20 + \ldots + 100) \\
   = 2550 + 1050 - 530 = 3050. \]
5. (c) \[ ^nC_r + ^nC_{r-1} + \binom{n}{r-1} = \binom{n}{r} + \binom{n}{r-1} + \binom{n+1}{r+1} \]
6. (c) As for given question two cases are possible.
   (i) Selecting 4 out of first five question and 6 out of remaining 8 question \( = ^5C_4 \times ^8C_6 = 140 \) choices.
   (ii) Selecting 5 out of first five question and 5 out of remaining 8 questions \( = ^5C_5 \times ^8C_5 = 56 \) choices.

   \[ \therefore \text{ total number of choices} = 140 + 56 = 196. \]
7. (a) No. of ways in which 6 men can be arranged at a round table \( = (6 - 1)! = 5! \)

   Now women can be arranged in \( ^6P_3 = 6! \) Ways.

   Total Number of ways \( = 6! \times 5! \)
8. (e) Total number of arrangements of letters in the word GARDEN = 6! = 720 there are two vowels A and E, in half of the arrangements A precedes E and other half A follows E.

   So, vowels in alphabetical order in \( \frac{1}{2} \times 720 = 360 \)
9. (b) We know that the number of ways of distributing \( n \) identical items among \( r \) persons, when each one of them receives at least one item is \( ^{n-1}C_{r-1} \)

   \[ \therefore \text{ The required number of ways} \]
   \[ = ^{8-1}C_{3-1} = 7C_2 = \frac{7!}{2!15!} = \frac{7 \times 6}{2 \times 1} = 21 \]
10. (a) Alphabetical order is

    A, C, H, I, N, S

    No. of words starting with A – 5!

    No. of words starting with C – 5!

    No. of words starting with H – 5!

    No. of words starting with I – 5!

    No. of words starting with N – 5!

    SACHIN–1

    \[ \therefore \text{ sachin appears at serial no 601} \]
11. (c) \[ ^{10}C_1 + ^{10}C_2 + ^{10}C_3 + ^{10}C_4 \]

   \[ = 10 + 45 + 120 + 210 = 385 \]
12. (a) Set \( S = \{1, 2, 3, \ldots, 12\} \)

    \[ A \cup B \cup C = S, A \cap B = B \cap C = A \cap C = \emptyset \]

    \[ \therefore \text{ The number of ways to partition} \]
   \[ = ^{12}C_4 \times ^8C_4 \times ^4C_4 = \frac{12!}{4!8!4!} \times \frac{8!}{4!4!} = \frac{12!}{(4!)^3} \]
13. (a) The given situation in statement 1 is equivalent to find the non negative integral solutions of the equation \( x_1 + x_2 + x_3 + x_4 + x_5 = 6 \)

    which is coeff. of \( x^6 \) in the expansion of \( (1 + x + x^2 + x^3 + \ldots \infty)^5 = \text{coeff. of } x^6 \text{ in } (1-x)^{-5} \)

    \[ = \text{ coeff. of } x^6 \text{ in } 1 + 5x + \frac{5.6}{2!} x^2 \ldots \ldots \]

    \[ = \frac{5 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \cdot 10}{6!} = \frac{10!}{6!4!} = \frac{10C_6}{6!} \]

    \[ \therefore \text{ Statement 1 is wrong.} \]

    Number of ways of arranging 6A's and 4B's in a row

    \[ = \frac{10!}{6!4!} = 10C_6 \text{ which is same as the number of ways the child can buy six icecreams}. \]

    \[ \therefore \text{ Statement 2 is true.} \]
14. (d) First let us arrange M, I, I, I, I, P, P

    Which can be done in \( \frac{7!}{4!2!} \) ways

    \[ \sqrt{M \sqrt{I \sqrt{I \sqrt{I \sqrt{I \sqrt{P \sqrt{P}}}}}}} \]
Now 4 S can be kept at any of the ticked places in \(8C_4\) ways so that no two S are adjacent.
Total required ways
\[
\frac{7!}{4!2!} \times 8C_4 = \frac{7!}{4!2!} \times 6C_4 \times 8C_4
\]
15. (c) 4 novels, out of 6 novels and 1 dictionary out of 3 can be selected in \(6C_4 \times 3C_1\) ways
Then 4 novels with one dictionary in the middle can be arranged in 4! ways.
\[
\therefore \text{Total ways of arrangement } = 6C_4 \times 3C_1 \times 4! = 1080
\]
16. (c) Total number of ways = \(3C_2 \times 9C_2\)
\[
= 3 \times \frac{9 \times 8}{2} = 3 \times 36 = 108
\]
17. (d) The number of ways of distributing 10 identical balls in 4 distinct boxes such that no box empty is same as the number of ways of selecting \((r-1)\) places out of \((n-1)\) different places, that is \(n^{r-1}C_{r-1}\).
Hence required number of ways = \(10^{r-1}C_{4-1} = 9C_3\)
\[
\therefore \text{Both statements are correct and second statement is a correct explanation of statement } -1.
\]
18. (a) Number of required triangles = \(10C_3 - 6C_3\)
\[
= \frac{10 \times 9 \times 8}{6} - \frac{6 \times 5 \times 4}{6} = 120 - 20 = 100
\]
19. (d) Number of white balls = 10
Number of green balls = 9

**Topic-wise Solved Papers - MATHEMATICS**

and Number of black balls = 7
\[
\therefore \text{Required probability } = \frac{(10 + 1)(9 + 1)(7 + 1)}{-1} = 11.10.8 -1 = 879
\]
\[
\text{[Note: The total number of ways of selecting one or more items from } p \text{ identical items of one kind, } q \text{ identical items of second kind; } r \text{ identical items of third kind is } (p+1)(q+1)(r+1)-1]\]
20. (b) We know,
\[
T_n = nC_3, \ T_{n+1} = n^{n+1}C_3
\]
ATQ, \(T_{n+1} - T_n = n^{n+1}C_3 - nC_3 = 10\)
\[
\Rightarrow nC_2 = 10
\]
\[
\Rightarrow n = 5.
\]
21. (d) Four digits number can be arranged in \(3 \times 4!\) ways.

Five digits number can be arranged in \(5!\) ways.
Number of integers = \(3 \times 4! + 5! = 192\).
22. (b) ALLMS
No. of words starting with
A : \(A \_ \_ \_ \frac{4!}{2!} = 12\)
L : \(L \_ \_ \_ \_ \_ \frac{4!}{2!} = 24\)
M : \(M \_ \_ \_ \_ \_ \_ \frac{4!}{2!} = 12\)
S : \(S \_ \_ \_ \_ \_ \_ \_ \frac{3!}{2!} = 3\)
SMALL \(\rightarrow 58^{th}\) word
Mathematical Induction and Binomial Theorem

Section-A : JEE Advanced/ IIT-JEE

Section-B : JEE Main/ AIEEE

A. Fill in the Blanks

1. Consider \((101)^{50} - (99)^{50} + (100)^{50}\)
   \[= (100 + 1)^{50} - (100 - 1)^{50} - (100)^{50}\]
   \[= (100)^{50} [1 + 0.01]^50 - [1 - 0.01]^{50} - 1\]
   \[= (100)^{50} [2C_1(0.01) + 50C_3(0.01)^3 + \ldots] - 1\]
   \[= (100)^{50} [2C_1(0.01)^3 + \ldots] > 0\]

   \((101)^{50} > (99)^{50} + (100)^{50}\)

2. If we put \(x = 1\) in the expansion of \((1 + x - 3x^2)^{2163} = A_0 + A_1x + A_2x^2 + \ldots\)
   we will get the sum of coefficients of given polynomial, which clearly comes to be -1.

3. \((1 + ax)^n = 1 + 8x + 24x^2 + \ldots\)

   \[\Rightarrow (1 + ax)^n = 1 + nx + \frac{n(n-1)}{2}a^2x^2 + \ldots\]

   \[= 1 + 8x + 24x^2 + \ldots\]

   Comparing like powers of \(x\) we get
   \[nax = 8 \Rightarrow na = 8 \quad \ldots(1)\]

   \[\frac{n(n-1)a^2}{2} = 24 \Rightarrow n(n-1)a^2 = 48 \quad \ldots(2)\]

   Solving (1) and (2), \(n = 4, a = 2\)

4. We know that for \(a + ve\) integer \(n\)
   \[(1+x)^n = \binom{n}{0}C_0x^0 + \binom{n}{1}C_1x + \binom{n}{2}C_2x^2 + \ldots + \binom{n}{n}C_nx^n\]

   ATQ coefficients of \(3^{rd}\) and \(5^{th}\) terms are in A.P.
   \[\Rightarrow \binom{n}{1}C_1 = \binom{n}{2}C_2\]

   \[\Rightarrow 2 \times \frac{n(n-1)}{2} = \frac{n}{6} + \frac{n(n-1)(n-2)}{3!}\]

   \[\Rightarrow n-1 = 1 + \frac{n^2 - 3n + 2}{6} \Rightarrow n^2 - 9n + 14 = 0\]

   \[\Rightarrow (n-7)(n-2) = 0 \Rightarrow n = 7 \text{ or } 2\]

   But for the existence of \(4^{th}\) term, \(n = 7\).

5. Let \(T_{r+1}\) be the general term in the expansion of
   \[\left(\sqrt{2} + 3^{1/5}\right)^{10}\]

   \[\Rightarrow T_{r+1} = 10C_r \left(\sqrt{2}\right)^{10-r} \cdot 3^{1/5}r \cdot (0 \leq r \leq 10)\]

   \[= \frac{10!}{r!(10-r)!} \cdot 2^{5-r}/3^{r/5}\]

   Let \(T_{r+1}\) will be rational if \(2^{5-r}\) and \(3^{r/5}\) are rational numbers.

   \[\Rightarrow 5 - \frac{r}{2} \text{ and } \frac{r}{5} \text{ are integers.}\]

   \[r = 0 \text{ or } 10 \Rightarrow T_1 \text{ and } T_{11} \text{ are rational terms.}\]

   \[\sum \text{ of } T_1 \text{ and } T_{11} = 10C_02^{10} - 9^{10} + 10C_{10}2^{5} - 5^{3} = 132.1 + 1.9 = 32 + 9 = 41\]

C. MCQs with ONE Correct Answer

1. (a) Given that \(r \text{ and } n\) are \(+ve\) integers such that \(r > 1, n > 2\)

   Also in the expansion of \((1 + x)^{2n}\)

   coeff. of \((3r)^{th}\) term = coeff. of \((r + 2)^{th}\) term

   \[\Rightarrow 2nC_{3r-1} = 2nC_{r+1}\]

   \[\Rightarrow 3r - 1 = r + 1 \text{ or } 3r - 1 + r + 1 = 2n\]

   \[\Rightarrow r = 1 \text{ or } 2r = n\]

   But \(r > 1 \Rightarrow n = 2r\)

2. (a) General term in the expansion \[\left(\frac{x}{2} - \frac{3}{x^2}\right)^{10}\]

   \[T_{r+1} = 10C_r \left(\frac{x}{2}\right)^{10-r} \cdot \left(-\frac{3}{x^2}\right)^r = 10C_r x^{10-3r} \cdot \left(-\frac{1}{x^2}\right)^r\]

   \[= \frac{10!}{r!(10-r)!} \cdot 2^{5-r}/3^{r/5}\]
For coeff. of \( x^4 \), we should have
\[
10 - 3r = 4 \implies r = 2
\]
\[
\therefore \text{ Coeff. of } x^4 = 10C_2 \left( \frac{-1}{3} \right) \left( \frac{2}{3} \right)^2 = \frac{405}{256}
\]
3. (c) The given expression is
\[
(x + \sqrt{x^3 - 1})^5 + (x - \sqrt{x^3 - 1})^5
\]
We know by binomial theorem, that
\[
(x + a)^n + (x - a)^n = 2 \left[ \binom{n}{0} x^n a^0 + \binom{n}{1} x^{n-1} a + ... + \binom{n}{n} x^0 a^n \right]
\]
\[
\therefore \text{ The given expression is equal to}
2 \left[ 5C_2 x^5 + 5C_2 x^3(x^3 - 1) + 5C_2 x(x^3 - 1)^2 \right]
\]
Max. power of \( x \) involved here is 7, also only +ve integral powers of \( x \) are involved, therefore given expression is a polynomial of degree 7.
4. (c) We have \((1 + x)^m (1 - x)^n\)
\[
\left[ 1 + mx + \frac{m(m-1)}{2!} x^2 + ... \right] \left[ 1 - nx + \frac{n(n-1)}{2!} x^2 + ... \right]
\]
\[
= 1 + (m - n) x + \frac{m(m-1)}{2} + \frac{n(n-1)}{2} - mn \right] x^2 + ...
\]
Given, \( m - n = 3 \) ... (1)
and \( \frac{1}{2} m(m-1) + \frac{1}{2} n(n-1) - mn = -6 \)
\[
\therefore m^2 + n^2 - 2mn = (m + n) = -12
\]
\[
\therefore m + n = 9 + 12 = 21 \quad \text{... (2)}
\]
From (1) and (2), we get \( m = 12 \)
5. (d) \[
\binom{n}{r} 2 \left( \binom{n}{r-1} + \binom{n}{r-2} \right)
\]
\[
= \left[ \binom{n}{r} + \binom{n}{r-1} \right] + \left[ \binom{n}{r-1} + \binom{n}{r-2} \right]
\]
\[
\therefore nC_r + nC_{r-1} = n+1C_r
\]
NOTE THIS STEP: \[
\binom{n}{r} + \binom{n+1}{r} = \binom{n+1}{r+1}
\]
6. (b) \((a - b)^n, n \geq 5\)
In binomial expansion of above \( T_4 + T_6 = 0 \)
\[
\therefore nC_4 a^{n-4} b^4 + nC_5 a^{n-5} b^5 = 0
\]
\[
\therefore \frac{nC_4}{nC_5} a = 1 \implies \frac{a}{b} = \frac{n-4}{n-5} \implies a = \frac{n-4}{n-5}
\]
7. (c) \[
\sum_{i=0}^{m} 10C_i 20C_{m-i} = 10C_0 20C_m + 10C_1 20C_{m-1} + 10C_2 20C_{m-2} + ... + 10C_m 20C_0
\]
= Coeff. of \( x^m \) in the expansion of \((1+x)^{10} (1+x)^{20} \)
= Coeff. of \( x^m \) in the expansion of \((1+x)^{30} \)
= \(30C_m\)
To get max. value of given sum, \(30C_m\) should be max. which is so when \( m = 30/2 = 15 \).

**Topic-wise Solved Papers - MATHEMATICS**

8. (d) \((1 + \sqrt{2})^2 (1 + \sqrt{3})^2 (1 + \sqrt{2})^2 (1 + \sqrt{3})^2 \)
\[
= (1 + \sqrt{2})^2 (1 + \sqrt{3})^2 (1 + \sqrt{2})^2 (1 + \sqrt{3})^2
\]
\[
\therefore \text{ Coefficient of } x^{24} = 1 \times \text{ Coefficient of } x^{24} \text{ in } (1 + \sqrt{2})^2 + 1 \times \text{ Coefficient of } x^{12} \text{ in } (1 + \sqrt{2})^2 + 1 \times \text{ constant term in } (1 + \sqrt{2})^2
\]
\[
= 12C_2 + 12C_6 + 12C_0 = 1 + 12C_6 + 1 = 12C_6 + 2
\]
9. (d) \( n^{-1}C_r = n^{-1}C_{r+1}(k^2 - 3) \implies k^2 - 3 = \frac{n^{-1}C_r}{n} = \frac{r + 1}{n} \)
Since \( 0 \leq r \leq n - 1 \)
\[
\therefore 1 \leq r + 1 \leq n \implies \frac{r + 1}{n} \leq \frac{n}{n} \leq 1 \implies \frac{1}{n} \leq k^2 - 3 \leq 1
\]
\[
\implies 3 + \frac{1}{n} \leq k^2 \leq 4 \implies \sqrt{3 + \frac{1}{n}} \leq k \leq 2
\]
as \( n \to \infty \), \( \sqrt{3} \leq k \leq 2 \implies k \in [\sqrt{3}, 2] \)
10. (a) To find \( 30C_1 30C_0 30C_10 - 30C_1 30C_11 + 30C_2 30C_12 - 30C_2 30C_13 + ... + 30C_2 30C_30 \)
We know that \( (1 + x)^{30} = 30C_0 + 30C_1x + 30C_2x^2 + ... + 30C_30x^{30} \)
\( (x-1)^{30} = 30C_0x^{30} - 30C_1x^{29} + 30C_2x^{28} - ... + 30C_{30}x^0 \) ... (1)
\( (x-1)^{30} = 30C_1x^{29} + 30C_2x^{28} + ... + 30C_{30}x^0 \) ... (2)
Multiplying eq (1) and (2), we get \((x^2 - 1)^{30} = (\cdot) \times (\cdot) \)
Equating the coefficients of \( x^{20} \) on both sides, we get
\[
30C_10 = 30C_0 30C_10 - 30C_1 30C_{11} + 30C_2 30C_{12} - ... + 30C_30 30C_{30}
\]
\[
\therefore \text{ Req. value is } 30C_{10}
\]
11. (d) Clearly \( A_r = 10C_r, B_r = 20C_r, C_r = 30C_r \)
Now \( \sum_{r=1}^{10} 10C_r (20C_{10} - 20C_r - 30C_{10} 10C_r) \)
\[
= 20C_{10} \sum_{r=1}^{10} 10C_r 20C_r - 30C_{10} \sum_{r=1}^{10} 10C_r 10C_r \times 10C_r
\]
\[
= 30C_{10} \left( 10C_1 20C_1 + 10C_2 20C_2 + ... + 10C_{10} 20C_{10} \right)
\]
\[
- 30C_{10} \left( 10C_{10} 10C_1 + 10C_{10} 10C_2 + ... + 10C_{10} 10C_{10} \right) \) ... (1)
Now expanding \((1 + x)^{10} \text{ and } (1 + x)^{20} \) by binomial theorem and comparing the coefficients of \( x^{20} \) in their product, on both sides, we get
\[
10C_0 20C_0 + 10C_1 20C_1 + 10C_2 20C_2 + ... + 10C_{10} 20C_{10}
\]
\[
= \text{ coeff of } x^{20} \text{ in } (1 + x)^{30} = 30C_{20} = 30C_{10}
\]
\[
\therefore 10C_1 20C_1 + 10C_2 20C_2 + ... + 10C_{10} 20C_{10} = 30C_{10} - 1
\]
Again expanding \((1 + x)^{10} \text{ and } (x + 1)^{10} \) by binomial theorem and comparing the coefficients of \( x^{10} \) in their...

Hence by the principle of mathematical induction
\( P(n) \) is true \( \forall \ n \in \mathbb{Z} \).

3. \( S = \sum \sum C_i C_j \)
\( 0 \leq i < j \leq n \)

NOTE THIS STEP
\[
S = C_0 (C_1 + C_2 + C_3 + \ldots + C_n) + C_1 (C_2 + C_3 + \ldots + C_n) + C_2 (C_3 + \ldots + C_n) + C_3 + \ldots + C_{n-1}(C_n) \\
= C_0 (2^n - C_0) + C_1 (2^n - C_0 - C_1) + C_2 (2^n - C_0 - C_1 - C_2) + \ldots + C_{n-1}(2^n - C_0 - C_1 - \ldots - C_{n-1}) \\
= 2^n (C_0 + C_1 + C_2 + \ldots + C_{n-1} + C_n) - \left(C_0^2 + C_1^2 + C_2^2 + \ldots + C_{n-1}^2 \right) - S \\
\Rightarrow 2S = 2^n - \frac{2n!}{(n!)^2} = 2^n - \frac{2n!}{(n!)^2} \]
\[
\Rightarrow S = 2^{n-1} - \frac{2n!}{(n!)^2} \]

4. \( P(n) : n \ (n^2 - 1) \) is divisible by 24 for \( n \) odd +ve integer.  
For \( n = 2m - 1 \), it can be restated as 
\( P(m) : (2m - 1)(4m^2 - 4m) = 4m (m - 1)(2m - 1) \) 
is divisible by \( 24 \ \forall \ m \in N \\
\Rightarrow P(m) : m (m - 1)(2m - 1) \) is divisible by \( 6 \ \forall \ m \in N \\
Here \( P(1) = 0 \), divisible by 6.
\begin{align*}
& \therefore \ P(1) \text{ is true.}
& \text{Let it be true for } m = k, \text{i.e.,} \\
& k (k-1)(2k-1) = 6p \quad \ldots \ldots(1)
& \text{Consider } P(k + 1) : (k + 1) (2k + 1) = 2k^3 + 3k^2 + k \\
& = 6p + 3k^2 + k \quad \text{(Using (1))}
& \therefore P(k + 1) \text{ is divisible by 6.}
& \therefore \ P(k + 1) \text{ is also true.}
\end{align*}

Hence \( P(m) \) is true \( \forall \ m \in N \).

5. \( P(n) : P^{n+1} + (p+1)^{2n-1} \) is divisible by \( p^2 + p + 1 \). 
For \( n = 1 \), \( P(1) : p^2 + p + 1 \) which is divisible by \( p^2 + p + 1 \).
\begin{align*}
& \therefore \ P(1) \text{ is true.}
& \text{Let } P(k) \text{ be true, i.e.,}
& p^{k+1} + (p+1)^{2k-1} \text{ is divisible by } p^2 + p + 1 \\
& \Rightarrow (p+1)^{2k-1} = (p^2 + p + 1) m \quad \ldots \ldots(1)
& \text{Consider } P(k + 1) : p^{k+2} + (p+1)^{2k+1} \\
& = p \cdot p^{k+1} + (p+1) \cdot (p+1)^{2k-1} \quad \text{(Here, } p \text{ is a integer value)}
& = p \cdot p^{k+1} + (p+1) \cdot (p+1)^{2k-1} \quad \text{(Using Induction hypothesis (1))}
& \therefore \ p^{k+2} + (p+1)^{2k+1} \text{ is divisible by } p^2 + p + 1 \\
& \therefore \ P(k + 1) \text{ is also true.}
\end{align*}

Hence by principle of mathematical induction \( P(n) \) is true \( \forall n \in N \).

6. We have \( S_n = \frac{1-q^{n+1}}{1-q} \ldots \ldots(1) \)
\begin{align*}
\text{and } S_n &= \frac{1 - \left(\frac{q+1}{2}\right)^{n+1}}{1 - \left(\frac{q+1}{2}\right)} = \frac{2^{n+1} - (q+1)^{n+1}}{2^n (1-q)} \ldots \ldots(2)
\end{align*}

7. Let \( A_n = 2^{2m + 3.5n - 5} \)
Then \( A_1 = 2^{7.5 - 5} = 14 + 15 - 5 = 24 \).
Hence \( A_1 \) is divisible by 24.
Now assume that \( A_m \) is divisible by 24 so that we may write
\( A_m = 2^{2m + 3.5m - 5} = 24k, \ k \in N \) \ldots \ldots(1)
Then \( A_{m+1} - A_m = 2^{2(m+1) + 3.5(m+1) - 5} - 2^{2m + 3.5m - 5} = 2^{7m - 7} + 3.5m (5m - 5) = 12.7m + 5m \)
Since \( 7m \) and \( 5m \) are odd integers \( \forall \ m \in N \), their sum must be an even integer, say \( 7m + 5m = 2p, \ p \in N \).
Hence \( A_{m+1} - A_m = 2^{12.2p} \) or \( A_{m+1} = A_m + 2^{12.2p} = 24k + 24p \) \quad \text{(by (1))}
Hence \( A_{m+1} \) is divisible by 24.
It follows by mathematical induction that \( A_n \) is divisible by 24 for all \( n \in N \).

8. Let \( P(n) : \frac{(2n)!}{2^{2n} (n!)^2} \leq \frac{1}{(3n+1)^{1/2}} \)
For \( n = 1 \), \( P(1) : \frac{2!}{2^2 (1!)^2} = \frac{1}{4} \leq \frac{1}{4} = \frac{1}{2} \)
\begin{align*}
& \therefore 1 \leq \frac{1}{2} \text{ which is true for } n = 1
& \text{Assume that } P(k) \text{ is true, then}
& P(k) : \frac{(2k)!}{2^{2k} (k!)^2} \leq \frac{1}{(3k+1)^{1/2}} \quad \ldots \ldots(1)
& \text{For } n = k + 1,
& \frac{(2(k+1))!}{2^{2(k+1)} ((k+1)!)^2} \leq \frac{1}{(3(k+1))^{1/2}}
& \left(2k + 2\right) (2k + 1) (2k)! \\
& = \frac{4.2k (k+1)^2 (k!)^2}{(3k+1)^{1/2}}
& \leq \frac{1}{(2k + 2) (2k + 1) \quad \ldots \ldots(2)}
& \text{[Using Induction hypothesis (1)]}
& \left(2k + 1\right)
& \frac{(2(k+1))!}{2^{2(k+1)} ((k+1)!)^2} \leq \frac{(2k + 1)}{2(k+1) (3k+1)^{1/2}} \quad \ldots \ldots(2)
In order to prove \( P(k + 1) \), it is sufficient to prove that
\[
\frac{(2k + 1)\sqrt{2}}{2(3k + 1)^{1/2}} \leq \frac{1}{(3k + 4)^{1/2}} \quad \text{...(3)}
\]
Squaring eq. (3), we get
\[
\frac{(2k + 1)^2}{4(k + 1)^2} \leq \frac{1}{3k + 4}
\]
\[
\Rightarrow (2k + 1)^2(3k + 4) - 4(k + 1)^2(3k + 1) \leq 0
\]
\[
\Rightarrow (4k^2 + 4k + 1) (3k + 4) - 4(k^2 + 2k + 1)(3k + 1) \leq 0
\]
\[
\Rightarrow (12k^3 + 28k^2 + 19k + 4) - (12k^3 + 28k^2 + 20k + 4) \leq 0
\]
\[
\Rightarrow -k \leq 0
\]
which is true.
Hence from (2) and (3), we get
\[
\frac{(2k + 2)^2}{4k^2 + 8k + 4} \leq \frac{1}{3k + 4}
\]
Hence the above inequation is true for \( n = k + 1 \) and by the principle of induction it is true for all \( n \in N \).

9. We have \( 5\sqrt{5} - 11 = 4 \)
\[\frac{4}{5\sqrt{5} + 11} < 1\]
Therefore \( 0 < 5\sqrt{5} - 11 < 1 \)
This gives us \( 0 < (5\sqrt{5} - 11)^{2n+1} < 1 \) for every positive integer \( n \).
Also \( (5\sqrt{5} + 11)^{2n+1} - (5\sqrt{5} - 11)^{2n+1} = 2(\sqrt{5})^{2n+1}C_1(5) + 2(\sqrt{5})^{2n+1}C_3(5)^3 + \ldots \)
\[= 2^{2n+1}C_1(125)^n + 2^{2n+1}C_3(125)^3n + \ldots \]
\[= 2k \quad \text{...(1)} \]
where \( k \) is some positive integer.
Let \( F = (5\sqrt{5} - 11)^{2n+1} \)
Then equation (1) becomes
\[R - F = 2k \]
\[\Rightarrow [R] + [R] - F = 2k \Rightarrow [R] + f - F = 2k \]
\[\Rightarrow f - F = 2k - [R] \Rightarrow f - F \text{ is an integer.} \]
But \( 0 \leq f < 1 \) and \( 0 < F < 1 \) Therefore \(-1 < f - F < 1 \)
Since \( f - F \) is an integer, we must have \( f - F = 0 \)
\[\Rightarrow f = F. \]
Now, \( RF = RF = (5\sqrt{5} + 11)^{2n+1}(5\sqrt{5} - 11)^{-2n+1} \)
\[= [(5\sqrt{5})^2 - 12]^2n+1 = 4^{2n+1} \]
10. Let the given statement be
\[P(m, n): mC_0^nC_k + mC_1^nC_{k-1} + \ldots + mC_k^nC_0 = m+nC_k \]
where \( m, n, k \in N \) and \( P_C_q = 0 \) for \( p < q \).
As \( k \) is a positive integer and \( P_C_q = 0 \) for \( p < q \).
\[\therefore \text{ } k \text{ must be a positive integer less than or equal to the smaller of } m \text{ and } n, \]
We have \( k = 1, \text{ when } n = n = 1 \)
\[\therefore P(1, 1) \text{ is } 1C_0C_1 + 1C_1C_0 = 2C_1 \Rightarrow 1+1 = 2. \]
Thus \( P(1, 1) \) is true.
Now let us assume that \( P(m, n) \) holds good for any fixed value of \( m \) and \( n \) i.e.
\[mC_0^nC_k + mC_1^nC_{k-1} + \ldots + mC_k^nC_0 = m+nC_k \quad \text{...(1)} \]
Then \( P(m + 1, n + 1) \) will be
\[mC_0^{n+1}C_k + mC_1^{n+1}C_{k-1} + \ldots + mC_k^{n+1}C_0
\]
\[= m+n+2C_k \quad \text{...(2)} \]
Consider LHS
\[= mC_0^{n+1}C_k + mC_1^{n+1}C_{k-1} + \ldots + mC_k^{n+1}C_0
\]
\[= 1, (nC_k-1 + nC_k) + (mC_0 + mC_1)(nC_k-2 + nC_k-1)
\]
\[+ (mC_1 + mC_2)(nC_k-3 + nC_k-2) + \ldots + (mC_k-1 + mC_k).1
\]
\[= (nC_k-1 + mC_0^nC_k-2 + mC_2^nC_k-3 + \ldots + mC_k-1^nC_0)
\]
\[+ (mC_k + mC_1^nC_k-1 + mC_2^nC_k-2 + \ldots + mC_k-1^nC_1 + mC_k)
\]
\[+ (mC_0^nC_k-2 + mC_1^nC_k-3 + \ldots + mC_k-2^nC_0)
\]
\[+ (mC_0^nC_k-1 + mC_1^nC_k-2 + mC_2^nC_k-3 + \ldots + mC_k-2^nC_1 + mC_k-1)
\]
\[= m+nC_k \quad \text{[Using (1)]}
\]
\[= m+nC_k + m+nC_k = m+n+2C_k \]
Hence the theorem holds for the next integers \( m + 1 \) and \( n + 1 \). Then by mathematical induction the statement \( P(m, n) \)
holds for all positive integral values of \( m \) and \( n \).

11. We know that
\[(1-x)^n = C_0^nC_nx + C_2^nC_nx^2 - C_3^nC_nx^3 + \ldots + (-1)^nC_nx^n \]
Multiplying both sides by \( x \), we get
\[x(1-x)^n = C_0^nC_nx^2 + C_2^nC_nx^3 - C_3^nC_nx^4 + \ldots + (-1)^nC_nx^{n+1} \]
Differentiating both sides w.r. to \( x \), we get
\[(1-x)^n - nx(1-x)^{n-1} = C_0^nC_nx + 3C_2^nC_nx^2 - 4C_3^nC_nx^3 + \ldots + (-1)^n(n+1)C_nx^n \]
Again multiplying both sides by \( x \), we get
\[x(1-x)^n - nx^2(1-x)^{n-1} = C_0^nC_nx^2 + 3C_2^nC_nx^3 - 4C_3^nC_nx^4 + \ldots + (-1)^n(n+1)C_nx^{n+1} \]
Differentiating above with respect to \( x \), we get
\[(1-x)^n - n(1-x)^{n-1} - 2nx(1-x)^{n-2} + n^2x^2(n-1)(1-x)^{n-2} = C_0^n2C_1^nC_nx + 3C_2^nC_nx^2 - 4C_3^nC_nx^3 + \ldots + (-1)^n(n+1)^2C_nx^n \]
Substituting \( x = 1 \), in above, we get
\[0 = C_0^n2C_1^nC_n + 3C_2^nC_nx^2 - 4C_3^nC_nx^3 + \ldots + (-1)^n(n+1)^2C_n \]
\[\text{Hence Proved.} \]

12. We have
\[P(n): \frac{n^7}{7} + \frac{n^5}{5} + \frac{2n^3}{3} - \frac{n}{105} \text{ is an integer, } \forall n \in N \]
\[P(1): \frac{1}{7} + \frac{1}{5} + \frac{2}{3} - \frac{1}{105} = \frac{1}{105} \text{ an integer} \]
\[= \frac{15 + 21 + 70 - 1}{105} = \frac{105}{105} \text{ an integer} \]
\[ P(1) \text{ is true} \]

Let \( P(k) \) be true i.e.

\[
\frac{k^7 + k^5 + 2k^3}{7} + \frac{k}{3} - \frac{k}{105} \text{ is an integer}
\]

\[
\Rightarrow \frac{k^7 + k^5 + 2k^3}{7} + \frac{k}{3} - \frac{k}{105} = m, \text{ (say)}
\]

\( m \in \mathbb{N} \) \hfill \ldots(1)

Consider \( P(k + 1) \):

\[
\frac{(k + 1)^7 + (k + 1)^5 + 2(k + 1)^3}{7} + \frac{(k + 1)}{3} - \frac{(k + 1)}{105}
\]

\[
= \left( \frac{k^7 + 7k^6 + 21k^5 + 35k^4 + 35k^3 + 21k^2 + 7k + 1}{7} \right)
\]

\[
+ \left( \frac{k^5 + 5k^4 + 10k^3 + 10k^2 + 5k + 1}{5} \right)
\]

\[
+ 2 \left( \frac{k^3 + 3k^2 + 3k + 1}{3} \right) - \left( \frac{(k + 1)}{105} \right)
\]

\[
= \left( \frac{k^7 + k^5 + 2k^3}{7} + \frac{k}{3} - \frac{k}{105} \right)
\]

\[
+ \left[ \frac{k^6 + 3k^5 + 5k^4 + 5k^3 + 3k^2 + k + 4}{7} \right]
\]

\[
+ \frac{2k^3 + 2k^2 + 2k^2 + 2k + \left( \frac{1}{7} \cdot \frac{1}{5} + \frac{2}{3} - \frac{1}{105} \right)}{}
\]

\( = m + \text{some integer value} + 1 \)

\( = \text{some integral value} \)

\( \therefore P(k + 1) \text{ is also true}. \)

Hence \( P(n) \) is true \( \forall n \in \mathbb{N} \), (by the Principle of Mathematical Induction).

13. Let \( P(k) = \sum_{m=0}^{k} \frac{(n - m)(r + m)!}{m!} = \frac{(r + k + 1)!}{k!} \left[ \frac{n}{r + 1} - \frac{k}{r + 2} \right] \)

For \( k = 1 \), we will have two terms, on LHS, in sigma for \( m = 0 \) and \( m = 1 \), so that

\[ \text{LHS} = (n - 0) \frac{r!}{0!} + (n - 1) \frac{(r + 1)!}{1!} \]

and \[ \text{RHS} = \frac{(r + 2)!}{1!} \left[ \frac{n}{r + 1} - \frac{1}{r + 2} \right] \]

Hence LHS = RHS for \( k = 1 \).

Now let the formula holds for \( k = s \), that is let

\[
\sum_{m=0}^{s} \frac{(n - m)(r + m)!}{m!} = \frac{(r + s + 1)!}{s!} \left[ \frac{n}{r + 1} - \frac{s}{r + 2} \right] \ldots(1)
\]

Let us add next term corresponding to \( m = s + 1 \) i.e.

\[
\text{adding} \quad \frac{(n - s - 1)(r + s + 1)!}{(s + 1)!} \quad \text{to both sides, we get}
\]

\[
\sum_{m=0}^{s+1} \frac{(n - m)(r + m)!}{m!} = \frac{(r + s + 1)!}{s!} \left[ \frac{n}{r + 1} - \frac{s}{r + 2} \right] \]

\[
+ \frac{(n - s - 1)(r + s + 1)!}{(s + 1)!}
\]

14. Given that

\[
\sum_{r=0}^{2n} a_r (x - 2)^r = \sum_{r=0}^{2n} b_r (x - 3)^r \quad \ldots(1)
\]

and \( a_k = 1, \forall k \geq n \)

To prove \( b_n = 2^{n+1} C_{n+1} \)

In the given equation (1) let us put \( x - 3 = y \) so that \( x - 2 = y + 1 \) and we get

\[
\sum_{r=0}^{2n} a_r (1 + y)^r = \sum_{r=0}^{2n} b_r (y)^r \quad \ldots(1)
\]

\[
\Rightarrow a_0 + a_1 (1 + y) + \ldots a_{n-1} + (1 + y)^n (1 + y) \quad + (1 + y)^{n+1} + \ldots + (1 + y)^{2n}
\]

\[
= \sum_{r=0}^{2n} b_r y^r \quad \text{[Using } a_k = 1, \forall k \geq n \text{]} \]

Equating the coefficients of \( y^n \) on both sides we get

\[
\Rightarrow nC_n + n+1 C_{n+1} + n+2 C_{n+2} + \ldots + 2n C_n = b_n \quad \ldots(1)
\]

\[
\Rightarrow n+1 C_{n+1} + n+2 C_{n+2} + \ldots + 2n C_n = b_n \quad \ldots(1)
\]

[Using \( nC_n + n+1 C_{n+1} = n+1 \) and \( n+1 C_{n+1} + n+2 C_{n+2} = n+2 \) \( C_n \)]

\[
\Rightarrow b_n = n+2 C_{n+1} + n+3 C_{n+2} + \ldots + 2n C_n \quad \ldots(1)
\]

[Using \( nC_n + n+1 C_{n+1} = n+1 \) and \( n+1 C_{n+1} + n+2 C_{n+2} = n+2 \) \( C_n \)]

Combining the terms in similar way, we get

\[
\Rightarrow b_n = 2^{n+1} C_{n+1} + 2^{n+1} C_{n+2} \ldots + 2^n C_n \quad \ldots(1)
\]

\[
\Rightarrow b_n = 2^{n+1} C_{n+1} + 2^n C_n \quad \ldots(1)
\]

\[
\text{Hence Proved}
\]

15. Since \( \alpha, \beta \) are the roots of \( x^2 - (p + 1)x + 1 = 0 \)

\( \Rightarrow \alpha + \beta = p + 1; \alpha \beta = 1 \)

Here \( p \geq 3 \) and \( p \in \mathbb{Z} \)

(1) To prove that \( \alpha^p + \beta^p \) is an integer.

Let us consider the statement, \( \"\alpha^p + \beta^p \" \) is an integer."

Then for \( n = 1, \alpha + \beta = p + 1 \) which is an integer, \( p \) being an integer.

\( \Rightarrow \) Statement is true for \( n = 1 \)

Let the statement be true for \( n \leq k, \) i.e., \( \alpha^k + \beta^k \) is an integer

Then,

\[
\alpha^{k+1} + \beta^{k+1} = \alpha^k \cdot \alpha^1 + \beta^k \cdot \beta^1
\]

\[
= \alpha (\alpha^k + \beta^k) + \beta (\alpha^k + \beta^k) - \alpha \beta^k - \alpha^k \beta
\]

\[
= (\alpha + \beta)(\alpha^k + \beta^k) - \alpha \beta (\alpha^{k-1} + \beta^{k-1})
\]

\[
= (\alpha + \beta)(\alpha^k + \beta^k) - (\alpha^{k-1} + \beta^{k-1}) \quad \text{[as } \alpha \beta = 1 \text{]}
\]

\[
= \text{difference of two integers } = \text{some integral value}
\]

\( \Rightarrow \) Statement is true for \( n = k + 1 \).

\( \Rightarrow \) By the principle of mathematical induction the given statement is true for \( \forall n \in \mathbb{N} \).
(ii) Let \( R_1 \) be the remainder of \( \alpha^n + \beta^n \) when divided by \( p \) where \( 0 \leq R_n \leq p - 1 \)

Since \( \alpha + \beta = p + 1 \) \( \therefore \) \( R_1 = 1 \)

Also \( \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2 \alpha \beta = (p + 1)^2 - 2 \)
\[ = p^2 + 2p - 1 - p (p + 1) + p - 1 \]
\[ = p - 1 \]
\[ = R_2 \]

Also from equation (1) of previous part (i), we have

\[ \alpha^{n+1} + \beta^{n+1} = (p + 1)(\alpha^n + \beta^n) - (\alpha^{n-1} + \beta^{n-1}) \]
\[ \Rightarrow R_{n+1} \text{ is the remainder of } R_n - R_{n-1} \text{ when divided by } p \]
\[ \Rightarrow \quad \text{We observe that } R_2 - R_1 = p - 1 \]
\[ \Rightarrow \quad R_3 = p - 2 \]
Similarly, \( R_4 = p - 2 \)

where
\[ R_3 - R_2 = p - 2 - p + 1 = -1 = p + (p - 1) \quad \therefore \quad R_4 = p - 1 \]
\[ R_4 - R_3 = p - 1 - p + 1 = 0 \quad \therefore \quad R_5 = 1 \]
\[ R_5 - R_4 = 1 - p + 1 = - p + 2 \quad \therefore \quad R_6 = p - 2 \]

It is evident for above that the remainder is either 1 or \( p - 1 \) or \( p - 2 \).

Since \( p \geq 3 \), so none is divisible by \( p \).

16. To prove

\[ P(n): \tan^{-1} \left( \frac{1}{3} \right) + \tan^{-1} \left( \frac{1}{7} \right) + \ldots + \tan^{-1} \left( \frac{1}{n^2 + n + 1} \right) = \tan^{-1} \left( \frac{n}{n^2 + 1} \right) \]

For \( n = 1 \), LHS = \( \tan^{-1} \left( \frac{1}{3} \right) \)

RHS = \( \tan^{-1} \left( \frac{1}{3} \right) \) \( \Rightarrow \) LHS = RHS.

\[ \therefore \quad P(1) \text{ is true.} \]

Let \( P(k) \) be true, i.e.

\[ \tan^{-1} \left( \frac{1}{3} \right) + \tan^{-1} \left( \frac{1}{7} \right) + \ldots + \tan^{-1} \left( \frac{1}{k^2 + k + 1} \right) = \tan^{-1} \left( \frac{k}{k + 2} \right) \]

Consider \( P(k+1) \)

\[ \tan^{-1} \left( \frac{1}{3} \right) + \tan^{-1} \left( \frac{1}{7} \right) + \ldots + \tan^{-1} \left( \frac{1}{k^2 + k + 1} \right) + \tan^{-1} \left( \frac{1}{(k+1)^2 + (k+1) + 1} \right) \]
\[ = \tan^{-1} \left[ \frac{k + 1}{(k+1) + 2} \right] \]

LHS = \( \tan^{-1} \left[ \frac{k}{k + 2} \right] + \tan^{-1} \left[ \frac{1}{k^2 + 3k + 3} \right] \)

[Using equation (1)]

\[ \Rightarrow \quad \tan^{-1} \left[ \frac{(k + 1)(k^2 + 2k + 2)}{(k + 3)(k^2 + 2k + 2)} \right] = \tan^{-1} \left( \frac{k+1}{k+3} \right) = \text{RHS} \]

\[ \therefore \quad P(k+1) \text{ is also true.} \]

Hence by the principle of mathematical induction \( P(n) \) is true for every natural number.

17. To evaluate \( \sum_{r=1}^{k} (-3)^{r-1} 3^n C_{2r-1} \) where \( k = \frac{3m}{2} \) and \( n \) is +ve even integer.

Let \( n = 2m \), where \( m \in z^+ \) \( \therefore \quad k = \frac{3(2m)}{2} = 3m \)

\[ \therefore \quad \sum_{r=1}^{k} (-3)^{r-1} 3^n C_{2r-1} = \sum_{r=1}^{3m} (-3)^{r-1} 6m C_{2r-1} \]
\[ = 6m C_1 - 3.6m C_3 + 2^2 6m C_5 - 
\]

(1)

Now we know that
\[ (1 + a)^{6m} - (1 - a)^{6m} = 2^{6m} C_0 a + 6m C_1 a^3 + 6m C_3 a^5 + 
\]

(2)

Keeping in mind the form of RHS in equation (1) and in equation (2)

We put \( a = i\sqrt{3} \) in equation (2) to get

\[ (1 + i\sqrt{3})^{6m} - (1 - i\sqrt{3})^{6m} \]
\[ = 2^{6m} C_0 i\sqrt{3} - 6m C_3 i\sqrt{3} + 6m C_5 (2\sqrt{3}....) \]
\[ \Rightarrow \quad (1 + i\sqrt{3})^{6m} - (1 - i\sqrt{3})^{6m} \]
\[ = 2\sqrt{3} i \left[ 6m C_1 - 3.6m C_3 + 2^2 6m C_5 
\]

(3)

But \( 1 + i\sqrt{3} = 2(\cos \pi/3 + i \sin \pi/3) \)
\[ \therefore \quad (1 + i\sqrt{3})^{6m} = 2^{6m} (\cos \pi/3 + i \sin \pi/3)^3 \]

**NOTE THIS STEP**

\[ = 2^{6m} \left[ \cos \left( \frac{6m \pi}{3} + i \sin \left( \frac{6m \pi}{3} \right) \right) \right] \] [Using D’Moivre’s thm.]

Similarly,
\[ (1 - i\sqrt{3})^{6m} = 2^{6m} \left[ \cos \left( -i \frac{6m \pi}{3} - i \sin \left( -\frac{6m \pi}{3} \right) \right) \right] \]
\[ \therefore \quad (1 + i\sqrt{3})^{6m} - (1 - i\sqrt{3})^{6m} = 2^{6m} 2i \sin 2m \pi = 0 \]

Substituting the above in equation (3) we get
\[ 6m C_1 - 3.6m C_3 + 2^2 6m C_5 - 
\]
\[ \Rightarrow \quad \sum_{r=1}^{k} (-3)^{r-1} 3^n C_{2r-1} = 0. \]

**Hence Proved**

18. Let \( P(n): \cos x + \cos 2x + \ldots + \cos nx \)
\[ = \cos \frac{n+1}{2} x \sin \frac{nx}{2} \cos \frac{x}{2} \]
[...(1)]

where \( x \) is not an integral multiple of 2 \( \pi \).

For \( n = 1 \) \( P(1): \text{L.H.S.} = \cos x \)

\[ R.H.S. = \cos \frac{1+1}{2} x \sin \frac{x}{2} \cos \frac{x}{2} = \cos x \]
\[ \text{L.H.S.} = \text{R.H.S.} \]
\[ \Rightarrow \quad P(1) \text{ is true.} \]
Let $P(k)$ be true i.e.
\[
\cos x + \cos 2x + \ldots + \cos kx
\]
\[
= \cos \left( \frac{k+1}{2} \right) x \sin \frac{kx}{2} \sec \frac{x}{2} \quad \ldots (2)
\]
Consider $P(k+1)$:
\[
\cos x + \cos 2x + \ldots + \cos kx + \cos (k+1)x
\]
\[
= \cos \left( \frac{k+2}{2} \right) x \sin \frac{(k+1)x}{2} \sec \frac{x}{2} \quad \ldots (2)
\]
L.H.S. [\[
\cos x + \cos 2x + \ldots + \cos kx + \cos (k+1)x
\]
\[
= \cos \left( \frac{k+1}{2} \right) x \sin \sec \frac{kx}{2} \sec \frac{x}{2} + \cos (k+1)x
\]
[Using (2)]
\[
= \left[ \cos \left( \frac{k+1}{2} \right) x \sin \frac{kx}{2} + \cos (k+1)x \sin \frac{x}{2} \right] \sec \frac{x}{2}
\]
\[
= \left[ \cos \left( \frac{k+1}{2} \right) x \sin \frac{kx}{2} + \cos \left( \frac{k+1}{2} \right) x \sin \frac{x}{2} \right] \sec \frac{x}{2}
\]
\[
= \frac{1}{2} \left[ \cos \left( \frac{2k+1}{2} \right) x \sin \frac{x}{2} - \sin \left( \frac{kx + 3x}{2} \right) \cos \frac{x}{2} \right]
\]
\[
= \frac{1}{2} \left[ \sin \left( \frac{kx + 3x}{2} \right) - \sin \frac{x}{2} \right] \cos \frac{x}{2}
\]
\[
= \frac{1}{2} \left[ \sin \left( \frac{(k+1)x}{2} \right) \cos \frac{x}{2} \right]
\]
\[
= \frac{1}{2} \left[ \cos \left( \frac{k+1}{2} \right) x \sin \frac{(k+1)x}{2} \cos \frac{x}{2} \right]
\]
\[
= \cos \left( \frac{k+1}{2} \right) x \sin \frac{(k+1)x}{2} \cos \frac{x}{2} = R.H.S.
\]
\[
\therefore P(k+1) \text{ is also true.}
\]
Hence by the principle of mathematical induction, $P(n)$ is true \(\forall n \in N\).

19. Given that,
\[
(1 + x + x^2 + \ldots + x^{2n}) = (a_0 + a_1x + a_2x^2 + \ldots + a_{2n}x^{2n}) \quad \ldots (1)
\]
where $n$ is a positive integer.
Replacing $x$ by $\frac{-1}{x}$ in eqn (1), we get
\[
\left( \frac{1}{x} - 1 + \frac{1}{x^2} \right)^n = a_0 - \frac{a_1}{x} + \frac{a_2}{x^2} - \frac{a_3}{x^3} + \ldots + \frac{a_{2n}}{x^{2n}} \quad \ldots (2)
\]
Multiplying eq.’s (1) and (2):
\[
(1 + x + x^2 + \ldots + x^{2n})^n (x^2 - x + 1)^n
\]
\[
= (a_0 + a_1x + \ldots + a_{2n}x^{2n}) (a_0 - \frac{a_1}{x} + \frac{a_2}{x^2} + \ldots + \frac{a_{2n}}{x^{2n}}) \quad \ldots (2)
\]
Equating the constant terms on both sides we get
\[
a_0^2 - a_1^2 + a_2^2 - a_3^2 + \ldots + a_{2n}^2 = \text{constant term in the expansion of} \frac{(1 + x^2 + x^4)^n}{x^{2n}}
\]
But replacing $x$ by $x^2$ in eqn’s (1), we have
\[
(1 + x^2 + x^4)^n = a_0 + a_1x + a_2x^2 + \ldots + a_{2n}x^{2n}
\]
\[
\therefore \text{Coeff. of } x^{2n} = a_n
\]
Hence we obtain,
\[
a_0^2 - a_1^2 + a_2^2 - a_3^2 + \ldots + a_{2n}^2 = a_n
\]

20. For $n = 1, 3^{2^n} - 1 = 3^{2^1} - 1 = 9 - 1 = 8$ which is divisible by $2^{n+2} = 2^3 = 8$ but not divisible by $2^{n+3} = 2^4 = 16$
Therefore, the result is true for $n = 1$.
Assume that the result is true for $n = k$. That is, assume that
\[
3^{2^k} - 1 \text{ is divisible by } 2^{k+2} \text{ but is not divisible by } 2^{k+3},
\]
Since $3^{2^k} - 1$ is divisible by $2^{k+2}$ but not by $2^{k+3}$, we can write
\[
3^{2^k} - 1 = (m) 2^{k+2}
\]
where $m$ must be an odd positive integer, for otherwise $3^{2^k} - 1$ will become divisible by $2^{k+3}$.

For $n = k + 1$, we have
\[
3^{2^{k+1}} - 1 = 3^{2^k \cdot 2} - 1 = (3^{2^k})^2 - 1
\]
\[
= (m 2^{k+2})^2 + 1 - 1
\]
\[
= m^2 2^{2k+4} + m 2^{k+3} = 2^{k+3}(m 2^{k+1} + m)
\]
\[
\Rightarrow 3^{2^k} - 1 \text{ is divisible by } 2^{k+3}.
\]
But $3^{2^k} - 1$ is not divisible by $2^{k+4}$ for otherwise we must have $2$ divides $m^2, 2^{k+1} + m$. But this is not possible as $m$ is odd.
Thus, the result is true for $n = k + 1$.

21. For $n = 1$, the inequality becomes
\[
sin A_1 \leq \sin A_1 \text{, which is clearly true.}
\]
Assume that the inequality holds for $n = k$ where $k$ is some positive integer. That is, assume that
\[
sin A_1 + \sin A_2 + \ldots + \sin A_k \leq k \sin \left( \frac{A_1 + A_2 + \ldots + A_k}{k} \right) \quad \ldots (1)
\]
for some positive integer $k$.
We shall now show that the result holds for $n = k + 1$ that is, we show that
\[
sin A_1 + \sin A_2 + \ldots + \sin A_k + \sin A_{k+1}
\]
\[
\leq (k+1) \sin \left( \frac{A_1 + A_2 + \ldots + A_{k+1}}{k+1} \right) \quad \ldots (2)
\]
L.H.S. of (2)
\[
= \sin A_1 + \sin A_2 + \ldots + \sin A_k + \sin A_{k+1}
\]
\[
\leq k \sin \frac{A_1 + A_2 + \ldots + A_k}{k} + \sin A_{k+1}
\]
[Induction assumption]
\[
= (k+1) \sin \left[ A_1 + A_2 + \ldots + A_{k+1} \right],
\]
where $\alpha + A_1 + A_2 + \ldots + A_{k+1}$
\[
\therefore \text{L.H.S. of (2) } \leq (k+1) \left[ \sin \alpha + \frac{1}{k+1} \sin A_{k+1} \right]
\]
[Using the fact $p \sin x + (1-p) y \sin y \leq \sin \left[ px + (1-p) y \right]$ for $0 \leq p \leq 1, 0 \leq x, y \leq \pi$]
Mathematical Induction and Binomial Theorem

\[(k + 1) \sin \left( \frac{k}{k+1} \left( \frac{A_1 + A_2 + \ldots + A_k}{k} \right) + \frac{1}{k+1} A_{k+1} \right) \]

\[(k + 1) \sin \left( \frac{A_1 + A_2 + \ldots + A_{k+1}}{k+1} \right) \]

Thus, the inequality holds for \( n = k + 1 \). Hence, by the principle of mathematical induction the inequality holds for all \( n \in \mathbb{N} \).

22. We know that \( \frac{n}{r} C_r = \frac{n}{r} \binom{n-1}{r-1} \).

\[\therefore \frac{m}{r} C_r = \frac{m}{r} \binom{m-1}{r-1} \]

Now, L.H.S is an integer \( \Rightarrow \) R.H.S must be an integer
But \( p \) and \( r \) are coprime (given)
\[\therefore \text{ } r \text{ must divide } m \cdot \frac{m-1}{r-1} \]

or \( \frac{m}{r} \binom{m-1}{r-1} \) is an integer.

\[\Rightarrow \frac{m}{r} C_r \text{ is an integer or } \frac{mp}{r} C_r \text{ is divisible by } p.\]

23. Let \( P(m) = \sum_{k=0}^{m} \binom{2k}{n} \binom{n}{2k} 2^n = \binom{n}{m} \binom{2n}{n} \]

\[\text{For } m=0, \text{ L.H.S} = \binom{n}{0} \binom{2n}{0} = \frac{2^n}{n}, \]

\[\text{R.H.S} = \binom{n}{0} \cdot \frac{1}{n} = \frac{2^n}{n}, \text{ L.H.S} \]

\[\therefore \text{ } m=0 \Rightarrow k=0 \]

\[\therefore P(0) \text{ holds true. Now assuming } P(m) \]

\[\text{L.H.S of } P(m+1) = \text{L.H.S of } P(m) + \binom{m+1}{n} \frac{2^n}{n} \]

\[= \frac{n!}{m!} \binom{n-1}{m-1} \frac{2^n}{n} \]

\[= \frac{n!(n-1)!}{m!(2n-2m)!} 2^{n-2m} \]

\[+ \frac{n!(n-1)!(2n-4m-3)!}{(m+1)!(2n-2m-2)!(2n-2m-1)!} 2^{n-2m-2} \]

\[= \frac{n!(n-1)!2^{n-2m-2}}{(m+1)!(2n-2m-1)!} \]

\[\times \left( \frac{(n-m)4(m+1)}{(2n-2m)} + (2n-4m-3) \right) \]

\[= \frac{n!(n-1)!2^{n-2m-2}}{(m+1)!(2n-2m-1)!} \]

\[= \frac{n!(n-1)!2^{n-2m-2}}{(m+1)!(2n-2m-2)!} = \frac{n}{m+1} 2^{n-2m} \]

\[= \text{R.H.S of } P(m+1) \]

Hence by mathematical induction, result follows for all \( 0 \leq m \leq n \).

24. Given that for positive integers \( m \) and \( n \) such that \( n \geq m \),
then to prove that
\[\sum_{k=0}^{m} \binom{2k}{n} \binom{n}{2k} 2^n = \binom{n}{m} \binom{2n}{n} \]

\[\text{L.H.S. } \sum_{k=0}^{m} \binom{2k}{n} \binom{n}{2k} 2^n = \binom{n}{m} \binom{2n}{n} \]

\[= \binom{n}{m} \binom{2n}{n} \]

\[= \left( \frac{n}{m+1} 2^{n-2m} \right) \]

Combining these we get
\[\binom{n}{m} \binom{2n}{n} = \text{R.H.S.} \]

Again we have to prove
\[\binom{n}{m} + \sum_{k=0}^{m} \binom{2k}{n} \binom{n}{2k} 2^n = \binom{n}{m} + \binom{2n}{n} \]

\[= \binom{n}{m} + \sum_{k=0}^{m} \binom{2k}{n} \binom{n}{2k} 2^n \]

\[= \binom{n}{m} + \binom{2n}{n} \]

\[= \binom{n}{m} + \binom{2n}{n} \]

\[= \text{R.H.S.} \]

25. For \( n > 0, \sqrt{4n+1} > 0, \sqrt{n} + \sqrt{n+1} > 0 \) and \( \sqrt{4n+2} > 0 \)

Now, \( \sqrt{4n+1} < \sqrt{n} + \sqrt{n+1} < \sqrt{4n+2} \) to be proved.

I. To prove \( \sqrt{4n+1} < \sqrt{n} + \sqrt{n+1} \)

Squaring both sides in \( \sqrt{4n+1} < \sqrt{n} + \sqrt{n+1} \)
\[\Rightarrow 4n+1 < n + n + 1 + 2\sqrt{n(n+1)} \]
\[\Rightarrow 2n < 2\sqrt{n(n+1)} \Rightarrow n < \sqrt{n(n+1)} \text{ which is true.} \]

II. To prove \( \sqrt{n} + \sqrt{n+1} < \sqrt{4n+2} \)

Squaring both sides,
\[n + n + 1 + 2\sqrt{n(n+1)} < 4n+2 \]
\[\Rightarrow 2\sqrt{n(n+1)} < 2n+1 \text{ Squaring again} \]
\[4n < 4n^2 + 1 + 4n \text{ or } 0 < 1 \text{ which is true} \]

Hence \( \sqrt{4n+1} < \sqrt{n} + \sqrt{n+1} < \sqrt{4n+2} \)

Further to prove \( [\sqrt{n} + \sqrt{n+1}] = [\sqrt{4n+1}] \), we have to prove that there is no positive integer which lies between \( \sqrt{4n+1} + 1 \) and \( \sqrt{4n+2} \) or \( [\sqrt{4n+1}] = [\sqrt{4n+2}] \). Using Mathematical induction.

We have to check \( [\sqrt{4n+1}] = [\sqrt{4n+2}] \) for \( n = 1 \)

\[
[\sqrt{5}] = [\sqrt{6}] \Rightarrow 2 = 2, \text{ which is true}
\]
Assume for \( n = k \) (arbitrary)
i.e., \( [\sqrt{4k+1}] = [\sqrt{4k+2}] \) To prove for \( n = k+1 \)
To check \( [\sqrt{4k+5}] = [\sqrt{4k+6}] \) since \( k \geq 0 \)
Here \( 4k+5 \) is an odd number and \( 4k+6 \) is an even number.
Their greatest integer will be different iff \( 4k+6 \) is a perfect square that is \( 4k+6 = r^2 \)

\[
\Rightarrow \quad k = \frac{r^2 - 6}{4} \quad \text{is not integer. But } k \text{ has to be integer.}
\]
So \( 4k+6 \) cannot be perfect square.

\[
[\sqrt{4k+5}] = [\sqrt{4k+6}]
\]
By Sandwich theorem

\[
[\sqrt{n} + \sqrt{n+1}] = [\sqrt{4n+1}]
\]

26. We have \( a, b, c \) the +ve real number s.t. \( b^2 - 4ac > 0; \alpha = c \).

\[
P(n): \alpha_{n+1} = \frac{a \alpha_n^2}{b^2 - 2a (\alpha_1 + \alpha_2 + ... \alpha_n)}
\]
is well defined and \( \alpha_{n+1} < \frac{\alpha_n}{c}, \forall n = 1, 2, ... \)

For \( n = 1 \), \( \alpha_2 = \frac{a \alpha_1^2}{b^2 - 2a \alpha_1} = \frac{2ac}{b^2 - 2ac} \)

Now, \( b^2 - 4ac > 0 \Rightarrow b^2 - 2ac > 2ac > 0 \)

\[
\Rightarrow \quad \alpha_2 \text{ is well defined (as denomination is not zero)}
\]
Also

\[
\frac{1}{b^2 - 2ac} > \frac{1}{2ac} \Rightarrow \frac{\alpha_2}{c} < \frac{1}{2} \Rightarrow \frac{\alpha_2}{\alpha_1} < \frac{1}{2}
\]

\[
P(n) \text{ is true for } n = 1.
\]
Let the statement be true for \( 1 \leq n \leq k \) i.e.,

\[
\alpha_{k+1} = \frac{a \alpha_k^2}{b^2 - 2a (\alpha_1 + \alpha_2 + ... \alpha_k)}
\]
is well defined and \( \alpha_{k+1} < \frac{\alpha_k}{2} \)

Now, we will prove that \( P(k+1) \) is also true

i.e., \( \alpha_{k+2} = \frac{a \alpha_{k+1}^2}{b^2 - 2a (\alpha_1 + \alpha_2 + ... \alpha_k + \alpha_{k+1})} \)

Next, we'll prove that \( P(k+1) \) is true

\[
\alpha_1 = c, \alpha_2 = \frac{c}{2}, \alpha_3 = \frac{\alpha_2}{2}, \alpha_4 = \frac{\alpha_3}{2}, \alpha_5 = \frac{\alpha_4}{2}, ... \quad \text{(by IH)}
\]

Now, \( \alpha_{n+1} + \alpha_{n+2} + ... \alpha_{k+1} + \alpha_{k+2} < \frac{c}{2} + \frac{c}{2} + ... + \frac{c}{2} \)

\[
c \left( 1 - \frac{1}{2^{k+1}} \right) = 2c \left( 1 - \frac{1}{2^{k+1}} \right) < 2c
\]

\[
\alpha_1 + \alpha_2 + ... + \alpha_{k+1} < 2c
\]

\[
\Rightarrow -2a (\alpha_1 + \alpha_2 + ... + \alpha_{k+1}) > -4ac
\]

\[
b^2 - 2a (\alpha_1 + \alpha_2 + ... + \alpha_{k+1}) > b^2 - 4ac > 0
\]

\[
\Rightarrow \quad \alpha_{k+2} \text{ is well defined. Again by IH we have}
\]

\[
\alpha_{k+1} < \frac{\alpha_k}{2} \Rightarrow 2 \alpha_{k+1} < \alpha_k
\]

\[
\Rightarrow \quad 4 \alpha_{k+1}^2 < \alpha_k^2 \quad [\text{As by def. } \alpha_{k+1}, \alpha_k \text{ are +ve}]
\]

\[
4 \alpha_{k+1}^2 < \alpha_{k+1}
\]

\[
4 \alpha_{k+1}^2 < \frac{b^2 - 2a (\alpha_1 + \alpha_2 + ... + \alpha_k)}{a}
\]

\[
4 \alpha_{k+1}^2 < b^2 - 2a (\alpha_1 + \alpha_2 + ... + \alpha_k)
\]

\[
2a \alpha_{k+1} < b^2 - 2a (\alpha_1 + \alpha_2 + ... + \alpha_k + \alpha_{k+1})
\]

\[
\alpha_{k+1} < \frac{b^2 - 2a (\alpha_1 + \alpha_2 + ... + \alpha_{k+1})}{2}
\]

\[
\Rightarrow \quad P(k+1) \text{ is also true.}
\]
Thus by the Principle of Mathematical Induction the Statement \( P(n) \) is true \( \forall n \in N \).

27. Let \( P(n): (25)^{n+1} - 24n + 5735 \)

For \( n = 1 \),
\( P(1): 625 - 24 + 5735 = 6336 = (24)^2 \times 11 \), which is divisible by \( 24^2 \). Hence \( P(1) \) is true

Let \( P(k) \) be true, where \( k \geq 1 \)

\[
\Rightarrow (25)^{k+1} - 24k + 5735 = (24)^2 \lambda \text{ where } \lambda \in N
\]

For \( n = k+1 \), \( (25)^{k+2} - 24(k+1) + 5735 = 25 \left[ (25)^{k+1} - 24k + 5735 \right] 
\]

\[
= 25 \times 24 \lambda = (24)^2 k - (24)^2 \times 24 = 24 \times (24)^2 \lambda
\]

\[
= (24)^3 \lambda
\]

Hence, by the method of mathematical induction result is true \( \forall n \in N \).

28. To prove that

\[
2^k n C_0^n C_k - 2^{k-1} n C_1^n C_{k-1} + 2^{k-2} n C_2^n C_{k-2} - ... + (-1)^k n C_k^n C_0 = n C_k
\]
Mathematical Induction and Binomial Theorem

LHS of above equation can be written as

\[ \sum_{r=0}^{k} (-1)^r 2^{k-r} nC_r n^{-r} C_{k-r} \]

\[ = \sum_{r=0}^{k} (-1)^r 2^{k-r} \frac{n!}{r!(n-r)!(k-r)!(n-k)!} \]

\[ = \sum_{r=0}^{k} (-1)^r 2^{k-r} \frac{n!}{r!k!(n-k)!(k-r)!} \]

\[ = \sum_{r=0}^{k} (-1)^r 2^{k-r} \frac{n!}{r!k!(n-k)!} \]

\[ = 2^k \sum_{r=0}^{k} nC_k \frac{k!}{r!(k-r)!} \]

\[ = 2^k nC_k \frac{1}{2^k} = nC_k = \text{R.H.S. Hence Proved} \]

29. We have \( \alpha + \beta = 1 - p \) and \( \alpha \beta = -p(1-p) \)
For \( n = 1, p_n = p_1 = 1 \)

Also, \( A\alpha^n + B\beta^n = A\alpha + B\beta = \frac{(p^2 + \beta - 1)\alpha}{\alpha - \alpha^2} \)

\[ + \frac{(p^2 + \alpha - 1)\beta}{\alpha - \beta} \]

\[ = \frac{p^2 + \beta - 1 - p^2 - \alpha + 1}{\beta - \alpha} = 1 \]

For \( n = 2, p_2 = 1 - p^2 \)

Also, \( A\alpha^n + B\beta^n = A\alpha^2 + B\beta^2 \)

\[ = \frac{(p^2 + \beta - 1)\alpha^2}{\alpha \beta - \alpha^2} + \frac{(p^2 + \alpha - 1)\beta^2}{\alpha \beta - \alpha^2} \]

which is true for \( n = 2 \)

Now let result is true for \( k < n \) where \( n \geq 3 \).

\[ P_n = (1-p)P_{n-1} + p(1-p)P_{n-2} \]

\[ = (1-p)(A\alpha^{n-1} + B\beta^{n-1}) + p(1-p)(A\alpha^{n-2} + B\beta^{n-2}) \]

\[ = A\alpha^{n-2}(1-p) + A\alpha^{n-2}(1-p) \]

\[ = A\alpha^{n-2}((1-p) + p(1-p)) + B\beta^{n-2}((1-p) + p(1-p)) \]

\[ = A\alpha^{n-2}((1-p) + p(1-p)) + B\beta^{n-2}((1-p) + p(1-p)) \]

by (1)

\[ = A\alpha^{n-2}((1-p) + p(1-p)) + B\beta^{n-2}((1-p) + p(1-p)) \]

This is true for \( n \). Hence by principle of mathematical induction, the result holds good for all \( n \in N \).

1. **Integer Value Correct Type**

1. (6) Let the coefficients of three consecutive terms of \((1+x)^n\) be \( n^+ C_{r-1}, n^+ C_r, n^+ C_{r+1} \), then we have \( n^+ C_{r-1} : n^+ C_r : n^+ C_{r+1} = 5 : 10 : 14 \)

\[ \frac{n^+ C_{r-1}}{n^+ C_r} = \frac{5}{10} \Rightarrow \frac{r}{n-6-r} = \frac{1}{2} \]

\[ n-3r+6 = 0 \quad \text{(1)} \]

Also \( \frac{n^+ C_{r+1}}{n^+ C_r} = \frac{10}{14} \Rightarrow \frac{r+1}{n-r+5} = \frac{5}{7} \)

or \( 5n-12r+18=0 \quad \text{(2)} \)

Solving (1) and (2) we get \( n = 6 \).

2. (5) \((1+x)^x = (1+x)^2 + (1+x)^3 + \ldots + (1+x)^49 + (1+mx)^{50} \)

\[ = (1+x)^2 + (1+x)^3 + \ldots + (1+x)^49 + (1+mx)^{50} \]

\[ = (1+x)^2 \cdot (1+x)^{49} + (1+mx)^{50} \]

\[ = \frac{1}{x}[(1+x)^{50} - (1+x)^2] + (1+mx)^{50} \]

Coeff. of \( x^2 \) in the above expansion

\[ = \text{Coeff. of } x^2 \text{ in } (1+x)^{50} + \text{Coeff. of } x^2 \text{ in } (1+mx)^{50} \]

\[ = 50 C_3 + 50 C_3 m^2 \]

\[ \Rightarrow (3n+1) = \frac{50 C_3 + 50 C_2 m^2}{51 C_3} \]

\[ \Rightarrow 3n + 1 = \frac{16}{17} + \frac{1}{17} m^2 \Rightarrow n = \frac{m^2 - 1}{51} \]

Least positive integer \( m \) for which \( n \) is an integer is \( m = 16 \) and then \( n = 5 \).
1. (a) We have \( t_{q+1}^{(p+q)} = \binom{p+q}{p} x^p y^q \) and \( t_{q+1}^{(p+q)} = \binom{p+q}{q} x^q y^p \)
\[ \binom{p+q}{p} = \binom{p+q}{q} [ \text{ Remember } n^C_r = \binom{n}{r} ] \]

2. (c) We have \( n^2 = 4096 = 2^{12} \Rightarrow n = 12 \); the greatest coeff = coeff of middle term. So middle term
\[ t_7; t_7 = t_{6+1} \Rightarrow \text{ coeff of } t_7 = \binom{12}{6} = \frac{12!}{6!6!} = 924. \]

3. (d) \( (1+0.0001)^{10000} = \left( 1 + \frac{1}{n} \right)^n, n = 10000 \)
\[ = 1 + \frac{\binom{n}{1}}{1^n} + \frac{\binom{n}{2}}{2!} + \frac{\binom{n}{3}}{3!} + \cdots \]
\[ = 1 + \frac{1}{n} + \frac{1}{2n(n-1)} + \frac{1}{6n(n-1)(n-2)} + \cdots \]
\[ = 1 + \frac{1}{n} + \frac{1}{2n} + \frac{1}{3n(n-1)} + \cdots + \frac{1}{9999n(n-1)(n-2)(n-3)} \]
\[ = 1 + \frac{1}{n} + \frac{1}{2n} + \frac{1}{3n(n-1)} + \cdots = e < 3 \]

4. (c) \( t_{r+2} = \binom{2n}{r+1} x^{r+1} y^r \)
Given \( \binom{2n}{r+1} = 2^n \binom{2n-1}{r} \)
\[ \Rightarrow 2^n \binom{2n-1}{r+1} = 2^n \binom{2n-1}{r} \]
\[ \Rightarrow 2n - r - 1 = 3r - 1 \Rightarrow 2n = 4r \Rightarrow n = 2r \]

5. (b) \( a_1 = \sqrt{7} < 7. \) Let \( a_m < 7 \)
Then \( a_{m+1} = \sqrt{7 + a_m} \Rightarrow a_{m+1} = 7 + a_m < 7 + 7 < 14. \)
\[ \Rightarrow a_{m+1} < \sqrt{14} < 7 \; \text{So by the principle of mathematical induction } a_n < 7 \forall n. \]

6. (d) \( T_{r+1} = \frac{n(n-1)(n-2) \cdots (n-r+1)(x)^r}{r!} \)
For first negative term, \( n-r+1 < 0 \Rightarrow r > n+1 \)
\[ \Rightarrow r > 32 \; \therefore r = 7. \; (\because n = 27) \]
Therefore, first negative term is \( T_8. \)

7. (c) \( T_{r+1} = 2^{56} C_r (\sqrt{3})^{256-r} (\sqrt{8})^r = 2^{56} C_r (3)^{256-r} (2)^{r/8} \)
Terms will be integral if \( \frac{256-r}{2} \) & \( \frac{r}{8} \) both are +ve integer, which is so if \( r \) is an integral multiple of 8. As \( 0 \leq r \leq 256 \)
\[ \therefore r = 0, 8, 16, 24, \ldots \ldots, 256, \text{ total 33 values.} \]

8. (b) \( S(k) = 1 + 3 + 5 + \cdots + (2k-1) = 3 + k^2 \)
\( S(1) = 1 + 3 + 1, \) which is not true
\[ \therefore S(1) \text{ is not true.} \]

-- P.M.I cannot be applied
Let \( S(k) \) is true, i.e.
\[ 1 + 3 + 5 + \cdots + (2k-1) = 3 + k^2 \]
\[ \Rightarrow 1 + 3 + 5 + \cdots + (2k-1) + 2k + 1 \]
\[ = 3 + k^2 + 2k + 1 = 3 + (k+1)^2 \]
\[ \therefore S(k) \Rightarrow S(k+1) \]

9. (c) The middle term in the expansion of \( (1 + \alpha x)^4 = T_3 = 4 C_2 (\alpha x)^2 = 6\alpha^2 x^2 \)
The middle term in the expansion of \( (1 - \alpha x)^6 = T_4 = 6 C_3 (-\alpha x)^3 = -20\alpha^3 x^3 \)
According to the question
\[ 6\alpha^2 = -20\alpha^3 \Rightarrow \alpha = -\frac{3}{10} \]

10. (b) Coefficient of \( x^n \) in \( (1+x)(1-x)^n \)
\[ = \text{ Coefficient of } x^n \text{ in } (1-x)^n + \text{ Coefficient of } x^{n-1} \text{ in } (1-x)^n \]
\[ = (-1)^n n C_n + (-1)^{n-1} n C_{n-1} = (-1)^n 1 + (-1)^{n-1} n \]
\[ = (-1)^n \left[ 1 - n \right] \]

11. (d) \( 50 C_4 + \sum_{r=1}^{6} 56-r C_3 \)
\[ \Rightarrow 50 C_4 + \left[ 55 C_3 + 54 C_3 + 53 C_3 + 52 C_3 \right] + 51 C_3 + 50 C_3 \]
We know \( \binom{n}{r} C_r + \binom{n}{r-1} C_{r-1} = \binom{n+1}{r} C_r \)
\[ \Rightarrow (50 C_4 + 50 C_3) \]
\[ + 51 C_3 + 52 C_3 + 53 C_3 + 54 C_3 + 55 C_3 \]
\[ \Rightarrow (51 C_4 + 51 C_3) + 52 C_3 + 53 C_3 + 54 C_3 + 55 C_3 \]
Proceeding in the same way, we get
\[ \Rightarrow 55 C_4 + 55 C_3 = 56 C_4. \]

12. (a) We observe that
\[ A^2 = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}, A^3 = \begin{bmatrix} 1 & 0 \\ 3 & 1 \end{bmatrix} \]
and we can prove by induction that \( A^n = \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix} \)
13. (d) \( T_{r+1} \) in the expansion
\[
\left[ ax^2 + \frac{1}{bx} \right]^{11} = 11C_r (ax^2)^{11-r} \left( \frac{1}{bx} \right)^r
\]
\[= 11C_r (a)^{11-r} (b)^{-r} (x)^{22-2r-r} \]
For the Coefficient of \( x^7 \), we have
\[22 - 3r = 7 \Rightarrow r = 5 \]
\[ \therefore \text{Coefficient of } x^7 = 11 \cdot C_5 (a)^6 (b)^{-5} \quad \ldots(1) \]
Again \( T_{r+1} \) in the expansion
\[
\left[ ax - \frac{1}{bx^2} \right]^{11} = 11C_r (ax^2)^{11-r} \left( -\frac{1}{bx^2} \right)^r
\]
\[= 11C_r (a)^{11-r} (-1)^r (b)^{-r} (x)^{-2r} (x)^{11-r} \]
For the Coefficient of \( x^{-7} \), we have
\[11 - 3r = -7 \Rightarrow 3r = 18 \Rightarrow r = 6 \]
\[ \therefore \text{Coefficient of } x^{-7} = 11C_6 (a)^{5} \times 1 \times (b)^{-6} \]
\[ \therefore \text{Coefficient of } x^7 = \text{Coefficient of } x^{-7} \]
\[ \Rightarrow 11C_5 (a)^6 (b)^{-5} = 11C_6 (a)^5 \times (b)^{-6} \Rightarrow ab = 1. \]

14. (c) \( x^3 \) and higher powers of \( x \) may be neglected
\[
\frac{(1+x)^3}{2} - \frac{(1+x)^2}{2} \]
\[= (1-x)^{-1} \left[ \left( 1 + 3 + \frac{3}{2} + \frac{1}{2!} x^2 \right) - \left( 1 + 3x + 3 \cdot \frac{x^2}{2} + \frac{3}{4} \cdot \frac{x^2}{2!} \right) \right]
\[= \left[ 1 + \frac{3}{2} + \frac{1}{2!} x^2 \right] - \left[ 1 + 3x + \frac{3}{2} \cdot 3 \cdot \frac{x^2}{2} \cdot \frac{1}{4} \right]
\[= \frac{1}{2} + \frac{3}{2} \cdot \frac{x^2}{2} - \frac{3}{8} x^2 \]
\[= \frac{3}{8} x^2 \]
(as \( x^3 \) and higher powers of \( x \) can be neglected)

15. (d) \( (1-ax)^{-1}(1-bx)^{-1} \)
\[= (1+ax+a^2 x^2 + \ldots)(1+bx+b^2 x^2 + \ldots) \]
\[ \therefore \text{Coefficient of } x^n \]
\[x^n = b^n + ab^{n-1} + a^2 b^{n-2} + \ldots + a^{n-1} b + a^n \]
\{which is a G.P. with \( r = \frac{a}{b} \)}
\[\therefore \text{Its sum is } \frac{b^n \left[ 1 - \left( \frac{a}{b} \right)^{n+1} \right]}{1 - \frac{a}{b}} = \frac{b^{n+1} - a^{n+1}}{b-a} \]
\[\therefore a_n = \frac{b^{n+1} - a^{n+1}}{b-a} \]

16. (d) \( (1-y)^m (1+y)^n \)
\[= [1 - mC_1 y + mC_2 y^2 - \ldots] \cdot [1 + nC_1 y + nC_2 y^2 + \ldots] \]
\[= 1 + (m-n) + \left[ \frac{m(m-1)}{2} + \frac{n(n-1)}{2} - mn \right] y^2 + \ldots \]
\[\therefore a_1 = n - m = 10 \]
\[a_2 = \frac{m^2 + n^2 - m - n - 2mn}{2} = 10 \]
So, \( n - m = 10 \) and \( (m-n)^2 - (m+n) = 20 \)
\[\Rightarrow m+n = 80 \]
\[\Rightarrow m = 35, n = 45 \]

17. (b) \( T_{r+1} = \left( -y \right)^r \cdot C_r (a-y)^{-r}. \)
\( (b)^r \) is an expansion of \( (a-b)^n \)
\[5 \text{th term } t_5 = t_{5+1} \]
\[= (-1)^{n+1} \cdot C_4 (a)^{n-4} (b)^4 = nC_4 \cdot a^{-4} \cdot b^4 \]
\[6 \text{th term } t_6 = t_{6+1} \]
\[= (-1)^{n} \cdot C_5 (a)^{n-5} (b)^5 \]
\[\text{Given } t_5 + t_6 = 0 \]
\[\Rightarrow \frac{n!}{4!(n-4)!} \cdot a^{-4} \cdot b^4 + \frac{n!}{5!(n-5)!} \cdot a^{-5} \cdot b^5 = 0 \]
\[\Rightarrow \frac{n!a^{-4}b^4}{4!(n-4)!} + \frac{n!a^{-5}b^5}{5!(n-5)!} \cdot \frac{1}{5a} = 0 \]
\[\Rightarrow \frac{n!a^{-5}b^4}{4!(n-5)!} \cdot a^{-4} = 0 \]
or,
\[\frac{1}{n-4} - \frac{b}{5a} = 0 \Rightarrow a = \frac{n-4}{5} \]

18. (d) We know that, \( (1+x)^{20} = 20C_0 + 20C_1 x + 20C_2 x^2 + \ldots \)
\[20C_{10} x^{10} + \ldots + 20C_0 x^{20} \]
Put \( x = -1, \) \( (0) = 20C_0 - 20C_1 + 20C_2 - 20C_3 + \ldots + 20C_{10} - 20C_{11} + \ldots + 20C_0 \)
\[= 0 \]
\[\Rightarrow 20C_{10} = 2^{20C_0} - 2^{20C_1} + 2^{20C_2} - 2^{20C_3} + \ldots + 2^{20C_9} + 2^{20C_{10}} \]
\[\Rightarrow 20C_{10} = 2^{20C_0} - 2^{20C_1} + 2^{20C_2} - 2^{20C_3} + \ldots + 2^{20C_9} + 2^{20C_{10}} \]
\[= 20C_{10} = \frac{1}{2} \cdot 20C_{10} \]

19. (b) We have
\[
\sum_{r=0}^{n} (r+1)^n C_r x^r = \sum_{r=0}^{n} r \cdot C_r x^r + \sum_{r=0}^{n} C_r x^r
\]
\[
\sum_{r=1}^{n} \frac{n}{r} \cdot n^{r-1} C_{r-1} x^{r} + (1 + x)^n \\
= n \sum_{r=1}^{n} n^{r-1} C_{r-1} x^{r-1} + (1 + x)^n \\
= n (1 + x)^n + (1 + x)^n = \text{RHS}
\]
\text{\therefore Statement 2 is correct.}
Putting \(x = 1\), we get
\[
\sum_{r=0}^{n} (r+1)^n C_r = n \cdot 2^{n-1} + 2^n = (n+2) \cdot 2^{n-1} .
\]
\text{\therefore Statement 1 is also true and statement 2 is a correct explanation for statement 1.}

20. (a) \((8)^{2n} - (62)^{2n+1}\)
\[
= (64)^n - (62)^{2n+1} = (63 + 1)^n - (63 - 1)^{2n+1}
\]
\[
= \left[ nC_0 (63)^n + nC_1 (63)^{n-1} + nC_2 (63)^{n-2} + \ldots \ldots + nC_n \right] \\
+ \left[ \frac{2^{n+1} C_0 (63)^{2n+1} - 2n+1 C_1 (63)^{2n} + 2n+1 C_2 (63)^{2n-1}}{2} \right] \\
- \left[ \frac{-1 \cdot 2^{n+1} C_1 (63)^{2n+1}}{2} \right] \\
= 63 \left[ \frac{nC_0 (63)^{n-1} + nC_1 (63)^{n-2} + nC_2 (63)^{n-3}}{2} + \ldots \right] + 1
\]
\[
= 63 \times (8^n - (62)^{2n+1}) \text{ when divided by 9 leaves 2 as the remainder.}
\]

21. (b) \(S_2 = \sum_{j=1}^{10} \frac{j}{10} C_j = \sum_{j=1}^{10} 10^9 C_{j-1}\)
\[
= 10 \left[ nC_0 + nC_1 + nC_2 + \ldots + nC_9 \right] = 10 \cdot 2^9
\]

22. (b) \((1 - x - x^2 + x^3)^6 = [(1 - x) - x^2 (1 - x)]^6\)
\[
= (1 - x)^6 (1 - x^2)^6
\]
\[
= (1 - 6x + 15x^2 - 20x^3 + 15x^4 - 6x^5 + x^6)
\times (1 - 6x^2 + 15x^4 - 20x^6 + 15x^8 - 6x^{10} + x^{12})
\]
Coefficient of \(x^7 = (-6)(-20) + (-20)(15) + (-6)(-6) = -144
\]

23. (a) \((\sqrt{3} + 1)^{2n} - (\sqrt{3} - 1)^{2n}\)
\[
= \left[ (\sqrt{3} + 1)^2 \right]^n - \left[ (\sqrt{3} - 1)^2 \right]^n
\]
\[
= (4 + 2\sqrt{3})^n - (4 - 2\sqrt{3})^n
\]
\[
= 2^n \left[ (2 + \sqrt{3})^n - (2 - \sqrt{3})^n \right]
\]

24. (c) \(\left(\frac{x^{1/3} + 1}{\sqrt{x}}\right)^{10} - \left(\frac{\sqrt{x} + 1}{x^{1/3}}\right)^{10}\)
\[
= \left(\frac{x^{1/3} + 1}{\sqrt{x}}\right)^{10} - \left(\frac{\sqrt{x} + 1}{x^{1/3}}\right)^{10}
\]
Given expression can be written as
\[
= 10 C_r \cdot (-1)^{10-r} \cdot \frac{x^{-r}}{2}
\]
Term will be independent of \(x\) when \(10 - r - \frac{r}{2} = 0\)
\[
\Rightarrow r = 4
\]
So, required term = \(T_5 = 10 C_4 \cdot 210 = 2100\)

25. (b) \((1 + ax + bx^2)^{10} = (1 + ax + bx^2)^{10} (1 - 2x)^{18}\)
\[
= (1 + ax + bx^2)^{10} (18 C_0 - 18 C_1 (2x) + 18 C_2 (2x)^2 - 18 C_3 (2x)^3 + 18 C_4 (2x)^4 - \ldots)
\]
Coefficient of \(x^3 = 18 C_4 (-3^2) + a (-2)^2, 18 C_2 + b (-2), 18 C_1 = 0\)
Coefficient of \(x^3 = -18 C_3, 8 + a \times 4, 18 C_2 - 2b \times 18 = 0\)
\[
= \frac{18 \times 16 \times 16 - 8 + 4a + 18 \times 17}{2} - 36b = 0
\]
\[
= -51 \times 16 \times 8 + a \times 36 \times 17 - 36b = 0
\]
\[
= -34 \times 16 + 51a - 3b = 0
\]
\[
= 51a - 3b = 34 \times 16 = 544
\]
\[
= 54a - 3b = 544 \quad \ldots (i)
\]
Only option number (b) satisfies the equation number (i)

26. (c) \((1 - 2\sqrt{x})^{50} = 50 C_0 - 50 C_1 2\sqrt{x} + 50 C_2 (2\sqrt{x})^2 - \ldots\) ... (1)
\[
(1 + 2\sqrt{x})^{50} = 50 C_0 + 50 C_1 2\sqrt{x} - 50 C_2 (2\sqrt{x})^2 + \ldots \) ... (2)
Adding equation (1) and (2)
\[
(1 - 2\sqrt{x})^{50} + (1 + 2\sqrt{x})^{50}
= 2 \left[ 50 C_0 + 50 C_2 2^2 x + 50 C_4 2^3 x^2 + \ldots \right]
\]
Putting \(x = 1\), we get above as \(\frac{3^{50} - 1}{2}
\]

27. (b) Total number of terms = \(n+2\) \(C_2 = 28\)
\[(n + 2) (n + 1) = 56\]
x = 6
Sum of coefficients = \(1 - 2 + 4)^n = 3^6 = 729\)

## Section-B : JEE Main/ AIEEE

### A. Fill in the Blanks

1. The sum of integers from 1 to 100 that are divisible by 2 or 3 = sum of integers from 1 to 100 divisible by 2 + sum of integers from 1 to 100 divisible by 3 - sum of integers from 1 to 100 divisible by 6

\[
\begin{align*}
&= (2+4+6+\ldots+100) + (5+10+15+\ldots+100) \\
&\quad - (10+20+\ldots+100) \\
&= \frac{50}{2} [2\times2+49\times2] + \frac{20}{2} [2\times5+19\times5] \\
&\quad - \frac{10}{2} [2\times10+9\times10] = 2550 + 1050 - 550 = 3050 \\
\end{align*}
\]

2. The given equation is

\[
\log_5 \log_5 (\sqrt{x} + 5 + \sqrt{x}) = 0 \\
\Rightarrow \log_5 (\sqrt{x} + 5 + \sqrt{x}) = 1 \\
\Rightarrow \sqrt{x} + 5 + \sqrt{x} = 5 \\
\Rightarrow x + 5 = 25 - 10\sqrt{x} + x \Rightarrow 10\sqrt{x} = 20 \\
\Rightarrow \sqrt{x} = 2 \Rightarrow x = 4
\]

3. When \(n\) is odd, let \(n = 2m + 1\)

\[
\begin{align*}
\text{The req. sum} & = 1^2 + 2^2 + 3^2 + 3^2 + \ldots + 2(2m)^2 + (2m+1)^2 \\
& = \Sigma (2m+1)^2 + 4 [1^2 + 2^2 + 3^2 + \ldots + m^2] \\
& = (2m+1)(2m+2) (4m+2+1)\frac{4m}{6} + (2m+1)(2m+1)\frac{6}{6} \\
& = \frac{(2m+1)(2m+2)}{6} [2(4m+3)+4m] \\
& = \frac{(2m+1)(2m+2)(6m+3)}{6} = \frac{(2m+1)^2(2m+2)}{2} \\
& = \frac{n^2(n+1)}{2} [\because 2m+1 = n]
\end{align*}
\]

Squaring both sides

\[
\Rightarrow x + 5 = 25 - 10\sqrt{x} + x \Rightarrow 10\sqrt{x} = 20 \\
\Rightarrow \sqrt{x} = 2 \Rightarrow x = 4
\]

When \(n\) is odd, let \(n = 2m + 1\)

\[
\begin{align*}
\text{The req. sum} & = 1^2 + 2^2 + 3^2 + 3^2 + \ldots + 2(2m)^2 + (2m+1)^2 \\
& = \Sigma (2m+1)^2 + 4 [1^2 + 2^2 + 3^2 + \ldots + m^2] \\
& = (2m+1)(2m+2) (4m+2+1)\frac{4m}{6} + (2m+1)(2m+1)\frac{6}{6} \\
& = \frac{(2m+1)(2m+2)}{6} [2(4m+3)+4m] \\
& = \frac{(2m+1)(2m+2)(6m+3)}{6} = \frac{(2m+1)^2(2m+2)}{2} \\
& = \frac{n^2(n+1)}{2} [\because 2m+1 = n]
\end{align*}
\]

Squaring both sides

\[
\Rightarrow x + 5 = 25 - 10\sqrt{x} + x \Rightarrow 10\sqrt{x} = 20 \\
\Rightarrow \sqrt{x} = 2 \Rightarrow x = 4
\]
4. Let \(a\) and \(b\) be two positive numbers.

Then, \(H.M. = \frac{2ab}{a+b}\) and \(G.M. = \sqrt{ab}\)

ATQ \(\frac{2ab}{a+b} = 4\)

\[
\frac{2\sqrt{ab}}{a+b} = \frac{4}{5}
\]

\[
\Rightarrow \frac{2\sqrt{a+b}}{a+b} = \frac{4}{5} \Rightarrow a+b + 2\sqrt{ab} = \frac{5+4}{5} \Rightarrow a+b - 2\sqrt{ab} = \frac{5-4}{5}
\]

\[
\Rightarrow \frac{(\sqrt{a} + \sqrt{b})^2}{(\sqrt{a} - \sqrt{b})^2} = \frac{9}{1} \Rightarrow \frac{\sqrt{a} + \sqrt{b}}{\sqrt{a} - \sqrt{b}} = 3, -3
\]

\[
\Rightarrow \frac{2\sqrt{a}}{2\sqrt{b}} = \frac{3+1}{3-1} \Rightarrow \frac{\sqrt{a}}{\sqrt{b}} = \frac{2+1}{2} \Rightarrow \frac{a}{b} = \frac{4}{4} \Rightarrow a:b = 4:1 \text{ or } 1:4
\]

5. Since \(n\) is an odd integer, \((-1)^{n-1} = 1\) and \(n - 1, n - 3, n - 5, \ldots\) are even integers.

We have

\[
n^3 - (n-1)^3 + (n-2)^3 - (n-3)^3 + \ldots + (-1)^{n-1} 1^3
\]

\[
= n^3 + (n-1)^3 + (n-2)^3 + \ldots + (n-3)^3 + \ldots + 1^3 - 2 \left[ (n-1)^3 + (n-3)^3 + \ldots + 1^3 \right]
\]

\[
-2 \times 2^3 \left[ \left( \frac{n-1}{2} \right)^3 + \left( \frac{n-3}{2} \right)^3 + \ldots + 1^3 \right]
\]

\[
\left[ \because n-1, n-3, \ldots \ldots \text{are even integers} \right]
\]

Here the first square bracket contain the sum of cubes of 1st \(n\) natural numbers. Whereas the second square bracket contains the sum of the cubes of natural numbers from 1 to \(\left( \frac{n-1}{2} \right)\), where \(n-1, n-3, \ldots\) are even integers. Using the formula for sum of cubes of 1st \(n\) natural numbers we get the summation

\[
= \left[ \frac{n(n+1)}{2} \right]^2 - 16 \left[ \frac{1}{2} \left( \frac{n-1}{2} \right)^2 \left( \frac{n-1}{2} + 1 \right)^2 \right]
\]

\[
= \frac{1}{4} n^2 (n+1)^2 - 16 \left( n-1 \right)^2 \left( n+1 \right)^2 \times \frac{1}{16} \times 4
\]

\[
= \frac{1}{4} (n+1)^2 [n^2 - (n-1)^2] = \frac{1}{4} (n+1)^2 (2n-1)
\]

6. It is given

\[
p + q = 2, \quad p = q = a
\]

and \(r + s = 18, \quad rs = B\)

and it is given that \(p, q, r\) are in A.P.

Therefore, \(p = a - 3s, \quad q = a - d, \quad r = a + d\) and \(s = a + 3d\).

As \(p < q < r < s\), we have \(a > 0\).

Now, \(2 = p + q = a - 3d + a - d = 2a - 4d\)

\[
\Rightarrow a - 2d = 1 \quad \ldots \ldots (1)
\]

Again \(18 = r + s = a + d + a + 3d\)

\[
\Rightarrow 18 = 2a + 4d \Rightarrow 9 = a + 2d. \quad \ldots \ldots \ldots (2)
\]

Subtracting (1) from (2)

\[
\Rightarrow 8 = 4d \quad \Rightarrow d = 2 \quad \text{Putting in (2) we obtain } a = 5
\]

\[
\therefore p = a - 3d = 5 - 6 = -1, \quad q = a - d = 5 - 2 = 3
\]

\[
r = a + d = 5 + 5 = 7, \quad s = a + 3d = 5 + 6 = 11
\]

Therefore, \(A = pq = -3\) and \(B = rs = 77\).
5. (e) Let \( S = \frac{1}{2} + \frac{3}{4} + \frac{7}{8} + \frac{15}{16} + \ldots n \text{ terms} \)

\[ = \left( 1 - \frac{1}{2} \right) + \left( 1 - \frac{1}{4} \right) + \left( 1 - \frac{1}{8} \right) + \left( 1 - \frac{1}{16} \right) + \ldots n \text{ terms} \]

\[ = (1 + 1 + 1 + \ldots n \text{ terms}) - \left( \frac{\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \ldots + \frac{1}{2^n}}{1 - \frac{1}{2}} \right) \]

\[ = n - \left[ \frac{1}{2} \left( \frac{1}{1 - \frac{1}{2^n}} \right) \right] = n - 1 + 2^{-n} \]

6. (c) We know that \( \log_2 4 = 2 \) and \( \log_2 8 = 3 \)

\[ \therefore \log_2 7 \text{ lies between 2 and 3} \]

\[ \therefore \log_2 7 \text{ is either rational or irrational but not integer or prime number.} \]

If possible let \( \log_2 7 = \frac{p}{q} \) (a rational number)

\[ \Rightarrow 2^{\frac{p}{q}} = 7 \Rightarrow 2^p = 7^q \]

\[ \Rightarrow \text{even number} = \text{odd number} \]

\[ \therefore \text{We get a contradiction, so assumption is wrong.} \]

Hence \( \log_2 7 \) must be an irrational number.

7. (d) In \( (a + c), (a - c), (a - 2b + c) \) are in A.P.

\[ \Rightarrow a + c, a - c, a - 2b + c \text{ are in G.P.} \]

\[ \Rightarrow (c - a)^2 = (a - c) + (a - 2b + c) \]

\[ \Rightarrow 2b + (a + c) = (a + c)^2 - (a - c)^2 \]

\[ \Rightarrow 2b (a + c) = 4ac \Rightarrow b = \frac{2ac}{a + c} \]

\[ \therefore a, b, c \text{ are in H.P.} \]

8. (d) \( a_1 = h_1 = 2, a_{10} = h_{10} = 3 \)

\[ 3 = a_9 = 2 + 9d \Rightarrow d = 1/9 \]

\[ \therefore a_4 = 2 + 3d = 7/3 \]

\[ h_{10} = \frac{1}{2} + \frac{7D}{18} \; D = \frac{-1}{54} \]

\[ \frac{1}{h_7} = \frac{1}{2} + \frac{6D}{18} = \frac{1}{2} - \frac{7}{18} \; a_4 h_7 = \frac{7}{3} \times \frac{18}{7} = 6. \]

9. (b) \[ H = \frac{1}{2} \left( \frac{\alpha + \beta}{\alpha - \beta} \right) = \frac{\alpha + \beta}{2\alpha \beta} \left( \frac{5 + 2\sqrt{2}}{5 - 2\sqrt{2}} \right) \]

\[ = \frac{1}{2} \left( \frac{\alpha}{\alpha - \beta} \right) = \frac{1}{2} H = 4. \]

10. (d) Sum = 4 and second term = 3/4, it is given that first term is a and common ratio \( r \)

\[ \Rightarrow \frac{a}{1 - r} = 4 \text{ and } ar = 3/4 \Rightarrow r = \frac{3}{4a} \]

Therefore, \[ \frac{a}{1 - r} = 4 \Rightarrow 4a^2 = 4a - 3 \]

\[ \therefore a^2 - 4a + 3 = 0 \Rightarrow (a - 1) (a - 3) = 0 \]

\[ \Rightarrow a = 1 \text{ or } 3 \]

When \( a = 1, r = 3/4 \) and when \( a = 3, r = 1/4 \)

11. (a) \( \alpha, \beta \) are the roots of \( x^2 - x + p = 0 \)

\[ \therefore \alpha + \beta = 1 \quad \text{....(1)} \]

\[ \alpha \beta = p \quad \text{....(2)} \]

\[ \gamma, \delta \text{ are the roots of } x^2 - 4x + q = 0 \]

\[ \therefore \gamma + \delta = 4 \quad \text{....(3)} \]

\[ \gamma \delta = q \quad \text{....(4)} \]

\[ \alpha, \beta, \gamma, \delta \text{ are in G.P.} \]

\[ \therefore \text{Let } \alpha = a, \beta = ar, \gamma = ar^2, \delta = ar^3. \]

Substituting these values in equations (1), (2), (3) and (4), we get

\[ a + ar = 1 \quad \text{....(5)} \]

\[ a^2 r^2 = p \quad \text{....(6)} \]

\[ ar^2 + ar^3 = 4 \quad \text{....(7)} \]

\[ a^2 r^3 = q \quad \text{....(8)} \]

Dividing (7) by (5) we get

\[ a^2 r (1 + r) = 4 \]

\[ a (1 + r) = 1 \quad \Rightarrow r^2 = 4 \quad \Rightarrow r = 2, -2 \]

As \( p \) is an integer (given), \( r \) is also an integer (2 or -2).

\[ \therefore (6) \Rightarrow a \neq \frac{1}{3}. \]

\[ \therefore a = \frac{1}{4}, r = 2 \text{ or } -2. \]

\[ \Rightarrow p = (-1)^2 (1 + r) = 2 \]

\[ \Rightarrow q = (-1)^2 (1 - r^2) = -32 \]

12. (d) \( a, b, c, d \) are in A.P.

\[ \therefore \frac{d}{c} = \frac{d}{b} = \frac{d}{a} \]

\[ \Rightarrow \frac{a}{b} = \frac{b}{c} = \frac{c}{d} \]

\[ \Rightarrow \frac{a}{b} \text{ and } \frac{b}{c} \text{ are in A.P.} \]

\[ \Rightarrow \frac{1}{abc} \text{ and } \frac{1}{abcd} \text{ are in A.P.} \]

\[ \Rightarrow \frac{1}{abc} \text{ and } \frac{1}{abcd} \text{ are in A.P.} \]

13. (e) ATQ \( 2 + 5 + 8 + \ldots n \text{ terms } = 57 + 59 + 61 + \ldots n \text{ terms} \)

\[ \Rightarrow \frac{2n}{2} [4 + (2n - 1) 3] = \frac{n}{2} [114 + (n - 1) 2] \]

\[ \Rightarrow 6n + 1 = n + 56 \Rightarrow 5n = 55 \Rightarrow n = 11 \]

14. (d) Given that \( a, b, c \) are in A.P.

\[ \Rightarrow 2b = a + c \]

\[ \Rightarrow \text{but given } a + b + c = 3/2 \Rightarrow 3b = 3/2 \]

\[ \Rightarrow b = 1/2 \text{ and then } a + c = 1 \]

Again \( a^2, b^2, c^2 \) are in G.P. \( b^4 = a^2 c^2 \)

\[ \Rightarrow b^2 = \pm ac \Rightarrow ac = \frac{1}{4} \text{ or } -\frac{1}{4} \]

and \( a + c = 1 \)

Considering \( a + c = 1 \) and \( ac = 1/4 \)

\[ \Rightarrow (a - c)^2 = 1 - 1 = 0 \Rightarrow a = c \]

but \( a + c = 1 \) as given that \( a < b < c \)

\[ \therefore \text{We consider } a + c = 1 \text{ and } ac = -1/4 \]

\[ \Rightarrow (a - c)^2 = 1 + 1 = 2 \Rightarrow a - c = \pm \sqrt{2} \]

but \( a < c \Rightarrow a - c = -\sqrt{2} \)

\[ \therefore \text{Solving (1) and (2) we get } a = \frac{1}{2} - \frac{1}{\sqrt{2}} \]
15. (c) \[ \frac{x}{1-r} = 5 \implies r = 1 - \frac{x}{5} \]
Since G.P. contains infinite terms
\[ \therefore -1 < r < 1 \]
\[ \implies -1 < \frac{x}{5} < 1 \implies -2 < x < 0 \]
\[ \implies -10 < x < 0 \implies 0 < \frac{x}{5} < 2 \]
\[ \implies 0 < x < 10 \]
16. (c) In the quadratic equation \[ ax^2 + bx + c = 0 \]
\[ \Delta = b^2 - 4ac \] and \[ \alpha + \beta = -\frac{b}{a}, \alpha \beta = \frac{c}{a} \]
\[ \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha \beta \]
\[ \frac{b^2}{a^2} = \frac{2c}{a} = \frac{b^2 - 2ac}{a^2} \]
\[ \text{and} \quad \alpha^3 + \beta^3 = \frac{3c}{a} \left( \frac{b^3}{a^3} - \frac{b}{a} \right) = \left( \frac{b^3 - 3abc}{a^3} \right) \]
Given \[ \alpha + \beta, \alpha^2 + \beta^2, \alpha^3 + \beta^3 \] are in G.P.
\[ \implies \frac{b}{a}, \frac{b^2 - 2ac}{a^2}, \frac{(b^3 - 3abc)}{a^3} \text{ are in G.P.} \]
\[ \implies \left( \frac{b^2 - 2ac}{a^2} \right)^2 = \frac{b}{a} \left( \frac{b^3 - 3abc}{a^3} \right) \]
\[ \implies b^4 + 4a^2c^2 - 4ab^2c = b^3 - 3ab^2c \]
\[ = 4a^2c^2 - ab^2c = 0 \implies ac \Delta = 0 \]
\[ \implies c \Delta = 0 \quad (\because \text{In quadratic } a \neq 0) \]
17. (e) Given that for an A.P., \[ S_n = cn^2 \]
Then \[ T_n = S_n - S_{n-1} = cn^2 - c(n-1)^2 \]
\[ = (2n-1)c \]
\[ \sum \text{Sum of squares of n terms of this A.P.} \]
\[ = \sum n^2 = \frac{n(n+1)(2n+1)}{6} \]
\[ = c^2 \left[ 4 \sum n^2 - 4 \sum n + n \right] \]
\[ = c^2 \left[ 4 \frac{n(n+1)(2n+1)}{6} - 4n + n + 1 \right] \]
\[ = c^2 \left[ 2(n^2 + 3n + 1) - 6n + 1 \right] \]
\[ = c^2 \left[ 3n^2 + 6n + 1 \right] = \frac{n(4n^2 - 1)c^2}{3} \]
18. (d) \[ a_1, a_2, a_3, \ldots \ldots \ldots \text{ are in H.P.} \]
\[ \therefore \frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \ldots \ldots \text{ are in A.P.} \]
\[ \therefore \frac{1}{a_1} = \frac{1}{5} \quad \text{and} \quad \frac{1}{a_20} = \frac{1}{25} \]
\[ \frac{1}{a_1} + 19d = \frac{1}{a_{20}} \implies \frac{1}{5} + 19d = \frac{1}{25} \implies d = \frac{4}{475} \]

**Topic-wise Solved Papers - MATHEMATICS**

Now \[ \frac{1}{a_n} = \frac{1}{5} + (n-1) \left( \frac{-4}{475} \right) \]
Clearly \( a_n < 0 \) if \[ \frac{1}{a_n} < 0 \implies \frac{1}{5} - \frac{4n}{475} + \frac{4}{475} < 0 \]
\[ \implies -4n < -99 \quad \text{or} \quad n > \frac{99}{4} = 24 \frac{3}{4} \quad \therefore n \geq 25 \]
Hence least value of \( n \) is 25.

19. (b) \[ \log b_1, \log b_2, \ldots, \log b_{101} \] are in A.P.
\[ \Rightarrow b_1, b_2, \ldots, b_{101} \text{ are in G.P.} \]
Also \( a_1, a_2, \ldots, a_{101} \) are in A.P.
where \( a_i = b_i \), \( a_{11} = b_{11} \).
\[ \therefore b_2, b_3, \ldots, b_{100} \text{ and GM's and } a_2, a_3, \ldots, a_{100} \text{ are AM's} \]
\[ \therefore GM < AM \implies b_2 < a_2, b_3 < a_3, \ldots, b_{100} < a_{100} \]
\[ \therefore b_1 + b_2 + \ldots + b_{100} < a_1 + a_2 + \ldots + a_{100} \]
\[ \therefore t < s \]
Also \( a_1, a_{11}, a_{101} \) are in A.P.
\[ \implies a_1 = b_1 \text{ and } a_{11} = b_{11} \]
\[ \therefore b_{101} > a_{101} \]

**D. MCQs with ONE or MORE THAN ONE Correct**

1. (a,b,d) Let \( x \) be the first term and \( y \) the \( (2n-1) \)th terms of AP, GP and HP whose nth terms are \( a, b, c \) respectively.
For AP, \( y = x + (2n-2) \)
\[ \Rightarrow d = \frac{y-x}{2(n-1)} \]
\[ \therefore a = x + (n-1) \quad d = x + \frac{1}{2} \quad (y-x) = \frac{1}{2} (x+y) \quad \ldots (1) \]
For GP, \( y = xr^{2n-2} \)
\[ \Rightarrow r = \left( \frac{y}{x} \right)^{2n-2} \]
\[ \therefore b = xr^{n-1} = x \left( \frac{y}{x} \right)^{1/2} = \sqrt{xy} \quad \ldots (2) \]
For HP, \[ \frac{1}{y} = \frac{1}{x} + (2n-2)d_1 \]
\[ \Rightarrow d_1 = \frac{x-y}{2xy(n-1)} \]
\[ \frac{1}{c} = \frac{1}{x} + (n-1)d_1 = \frac{x-y}{xy} \]
\[ \therefore \frac{1}{c} = \frac{x+y}{2xy} \quad \therefore c = \frac{2xy}{x+y} \quad \ldots (3) \]
Thus from (1), (2) and (3), \( a, b, c \) are A.M., G.M. and H.M. respectively of \( x \) and \( y \).

2. (b, c) We have for \( 0 < \phi < \frac{\pi}{2} \)
\[ x = \sum_{n=0}^{\infty} \cos^n \phi = 1 + \cos^2 \phi + \cos^4 \phi + \ldots \infty \]
\[ \frac{1}{1 - \cos^2 \phi} = \frac{1}{\sin^2 \phi} \quad \ldots (1) \]
Sequences and Series

[Using sum of infinite G.P. \( \cos^2 \alpha \text{ being } < 1 \)]

\[
y = \sum_{n=0}^{\infty} \sin^2 n = 1 + \sin^2 \phi + \sin^4 \phi + \ldots \infty
\]

\[
y = \frac{1}{1 - \sin^2 \phi} = \frac{1}{\cos^2 \phi}
\]

\[
(2)
\]

\[
z = \sum_{n=0}^{\infty} \cos^2 n = 1 + \cos^2 \phi + \cos^4 \phi + \ldots \infty
\]

\[
z = \frac{1}{1 - \cos^2 \phi} = \frac{1}{\sin^2 \phi}
\]

(3)

Substituting the values of \( \cos^2 \phi \) and \( \sin^2 \phi \) in (3), from (1) and (2), we get

\[
z = \frac{1}{1 - \frac{1}{x y}} \implies nz = \frac{xy}{xy - 1} \implies xz - z = xy \implies xz = xy + z.
\]

Also, \( x + y + z = \frac{1}{\cos^2 \phi} + \frac{1}{\sin^2 \phi} + \frac{1}{1 - \cos^2 \phi \sin^2 \phi} \)

\[
[\sin^2 \phi (1 - \cos^2 \phi \sin^2 \phi) + \cos^2 \phi (1 - \cos^2 \phi \sin^2 \phi) + \cos^2 \phi \sin^2 \phi] \cos^2 \phi \sin^2 \phi (1 - \cos^2 \phi \sin^2 \phi)
\]

\[
= \frac{1}{\cos^2 \phi \sin^2 \phi (1 - \cos^2 \phi \sin^2 \phi)} = \frac{1}{z}
\]

Thus (b) and (c) both are correct.

3. (b) Putting \( \theta = 0 \), we get \( b_0 = 0 \)

\[
\therefore \quad \sin n\theta = \sum_{r=1}^{n} b_r \sin^r \theta \implies \frac{\sin n\theta}{\sin \theta} = \sum_{r=1}^{n} \frac{b_r (\sin \theta)^{r-1}}{
\]

\[
= b_1 + b_2 \sin \theta + b_3 \sin^2 \theta + \ldots + b_n \sin^{n-1} \theta
\]

Taking limit as \( \theta \to 0 \), we obtain

\[
\lim_{\theta \to 0} \frac{\sin n\theta}{\sin \theta} = b_1 \implies b_1 = n.
\]

4. (c) \( T_m = a + (m - 1)d = \frac{1}{n} \) and \( t_n = a + (n - 1)d = \frac{1}{m} \)

\[
\therefore \quad (m - n) \frac{1}{n} = (1/n - 1/m) \implies d = \frac{1}{mn}
\]

\[
\therefore \quad t_{mn} = a + (mn - 1)d = \frac{1}{mn} + (mn - 1) \frac{1}{mn}
\]

\[
= \frac{1}{mn} + 1 - \frac{1}{mn} = 1
\]

5. (b) If \( x, y, z \) are in G.P. \( (x, y, z > 1) \); \( \log x, \log y, \log z \) will be in A.P.

\[
\because \quad 1 + \log x, 1 + \log y, 1 + \log z \text{ will also be in A.P.}
\]

\[
\because \quad 1 + \log x + \log y + \log z \text{ will be in H.P.}
\]

6. (a, d) We have

\[
a(n) = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \ldots + \frac{1}{2^n - 1}
\]

\[
= 1 + \left( \frac{1}{2} \right) + \left( \frac{1}{2} \right) + \left( \frac{1}{4} \right) + \left( \frac{1}{4} \right) + \left( \frac{1}{8} \right) + \left( \frac{1}{8} \right) + \ldots
\]

\[
< 1 + \frac{2}{2^1} + \frac{4}{2^2} + \frac{8}{2^3} + \ldots + \frac{2^{n-1}}{2^n} = 1 + 1 + \ldots + 1 = n
\]

Thus, \( a(100) < 100 \)

Also

\[
a(n) = 1 + \frac{1}{2} + \left( \frac{1}{3 + \frac{1}{4}} \right) + \left( \frac{1}{5 + \frac{1}{6}} \right) + \left( \frac{1}{8 + \frac{1}{7}} \right) + \ldots +
\]

\[
< 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \ldots + \frac{1}{2^{n-1}} = 1 + \frac{1}{2^{n-1}}
\]

\[
= 1 + \frac{1}{2} + \frac{2}{4} + \frac{4}{8} + \ldots + \frac{2^{n-1}}{2^n} = 1 + \frac{1}{2^{n-1}}
\]

\[
= 1 + \frac{n}{2^{n-1}} + \frac{1}{2^n}
\]

\[
= 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \ldots + \frac{1}{2^n}
\]

\[
= 1 + \frac{1}{2} + \frac{2}{4} + \frac{4}{8} + \ldots + \frac{2^{n-1}}{2^n} = 1
\]

Thus, \( a(200) > \left( 1 - \frac{1}{2^{200}} \right) + \frac{200}{2} > 100 \),

i.e. \( a(200) > 100 \).

7. (b, d)

We know by geometry \( PS \times ST = QS \times SR \) \((1)\)

\[
\because \quad S \text{ is not the centre of circumcircle,}
\]
Putting \( ab = 27 - (a+b) \) in eqn. (1), we get
\[
\frac{54 - 2(a+b)}{a+b} = 4 \Rightarrow a+b = 9 \Rightarrow ab = 27 - 9 = 18
\]

Solving the two we get \( a = 6, b = 3 \) or \( a = 3, b = 6 \), which are the required numbers.

2. Let there be \( n \) sides in the polygon.
   Then by geometry, sum of all \( n \) interior angles of polygon
   \[ S = (n-2) \times 180^\circ \]
   Also the angles are in A.P. with the smallest angle = 120°,
   common difference = 5°
   \[ \therefore \text{Sum of all interior angles of polygon} \]
   \[ = \frac{n}{2} [2 \times 120 + (n-1) \times 5] \]
   Thus we should have
   \[ \frac{n}{2} [2 \times 120 + (n-1) \times 5] = (n-2) \times 180 \]
   \[ \Rightarrow \frac{5n^2 + 235}{2} = (n-2) \times 180 \]
   \[ \Rightarrow 5n^2 + 235n = 360n - 720 \]
   \[ \Rightarrow 5n^2 - 125n + 720 = 0 \Rightarrow n^2 - 25n + 144 = 0 \]
   \[ \Rightarrow (n-16)(n-9) = 0 \Rightarrow n = 16, 9 \]
   Also if \( n = 16 \) then 16th angle = 120° + 15° = 195° > 180°
   \( \therefore \) not possible. Hence \( n = 9 \).

3. If possible let for a G.P.
   \[ T_7 = 27 = aR^6 \] \hfill (1)
   \[ T_9 = 8 = aR^8 \] \hfill (2)
   \[ \therefore T_9 = \frac{8}{27} \Rightarrow R^2 = \frac{2}{3} \] \hfill (3)
   From (1) and (2)
   \[ R^{p-q} = \frac{27}{8} \Rightarrow R^{p-q} = (\frac{3}{2})^3 \] \hfill (4)
   From (2) and (3):
   \[ R^{q-r} = \frac{8}{12} \Rightarrow R^{q-r} = (\frac{3}{2})^{-1} \] \hfill (5)
   From (4) and (5):
   \[ R = 3/2; p-q = 3; \quad q-r = -1 \]
   \[ p-2q+r = 4; \quad p, q, r \in N \] \hfill (6)
   As there can be infinite natural numbers for \( p, q \) and \( r \) to satisfy equation (6)
   \( \therefore \) There can be infinite G.P.’s
   \( 2 < a, b, c < 25, a + b + c = 25 \) \hfill (1)
   \[ 2, a, b \text{ are in AP} \Rightarrow 2a = b+2 \]
   \[ \Rightarrow 2a - b = 2 \] \hfill (2)
   \[ b, c \text{ are in GP} \Rightarrow c^2 = 18b \] \hfill (3)
   From (2) \( a = b = \frac{2}{2} \)

4. We know for \( + \text{ve numbers A.M.} \geq \text{G.M.} \)
   \( \therefore \) For \( + \text{ve numbers} a, b, c \) we get
   \[ \frac{a+b+c}{3} \geq \sqrt[3]{abc} \] \hfill (1)
Sequences and Series

Also for +ve numbers \(\frac{1}{a} + \frac{1}{b} + \frac{1}{c}\), we get
\[
\frac{1}{a} + \frac{1}{b} + \frac{1}{c} \geq \frac{1}{abc} \sqrt[3]{abc} \quad \text{...(2)}
\]

Multiplying in eqs (1) and (2) we get
\[
\left(\frac{a+b+c}{3}\right)\left(\frac{\frac{1}{a} + \frac{1}{b} + \frac{1}{c}}{3}\right) \geq \frac{1}{abc} \sqrt[3]{abc} \quad \text{...(2)}
\]

\[\Rightarrow (a+b+c)\left(\frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right) \geq 9 \quad \text{Proved.}\]

6. Given that \(n = p_1^{a_1} \cdot p_2^{a_2} \cdot p_3^{a_3} \ldots p_k^{a_k}\) \(\ldots\)(1)

Where \(n \in N^+\) and \(p_1, p_2, p_3, \ldots, p_k\) are distinct prime numbers.

Taking log on both sides of eq. (1), we get
\[\log n = \log p_1 + \log p_2 + \ldots + \log p_k \quad \text{...(2)}\]

Since every prime number is such that
\[p_i \geq 2 \quad \forall \quad i = (1 \leq k)\]

\[\Rightarrow \quad \log p_i \geq \log_{e} 2 \quad \text{...(3)}\]

Using (2) and (3) we get
\[\log n \geq \log (\alpha_1 + \alpha_2 \log 2 + \ldots + \alpha_k \log 2) \Rightarrow \log n \geq (\alpha_1 + \alpha_2 \ldots + \alpha_k) \log 2 \Rightarrow \log n \geq \log 2 \quad \text{Proved.}\]

7. The given series is
\[
\sum_{r=0}^{n} (-1)^r C_r \left[\frac{1}{2^r} + \frac{3}{2^{2r}} + \frac{7}{2^{3r}} + \ldots \text{up to m terms}\right]
\]

\[\sum_{r=0}^{n} (-1)^r C_r \left[\frac{1}{2} \right]^{1} + \left[\frac{3}{4} \right]^{r} + \left[\frac{7}{8} \right]^{r} + \left[\frac{15}{16} \right]^{r} + \ldots \text{to m terms}\right]

Now, \(\sum_{r=0}^{n} (-1)^r C_r \left[\frac{1}{2} \right]^{r} = 1 - \frac{n}{2} \quad \text{C_1, C_2, C_3, C_4, \ldots}\]

\[= \left(\frac{1 - \frac{1}{2}}{2^n}\right) = \frac{1 - 3}{4^n}\]

Similarly, \(\sum_{r=0}^{n} (-1)^r C_r \left[\frac{3}{4} \right]^{r} = \left(1 - \frac{3}{4}\right)^n = \frac{1}{4^n}\) etc.

Hence the given series is,
\[
\frac{1}{2^n} + \frac{1}{4^n} + \frac{1}{8^n} + \frac{1}{16^n} + \ldots \text{to m terms}
\]

\[= \frac{1}{2^n} \left(1 - \left(\frac{1}{2^n}\right)^m\right) \quad \text{[Summing the GP.]}\]

8. The given equation is
\[
\log \left(\frac{2x+3}{3x+7}\right) = 4 - \log \left(\frac{3x+7}{3x+7}\right) + \log \left(\frac{3x+7}{3x+7}\right) + \log \left(\frac{3x+7}{3x+7}\right) = 4
\]

\[\Rightarrow \log \left(\frac{2x+3}{3x+7}\right) = 2 \quad \text{(x+3)} + \log \left(\frac{3x+7}{3x+7}\right) = 4
\]

\[\Rightarrow \log \left(\frac{2x+3}{3x+7}\right) = 4 \quad \text{(2x+3)} + \log \left(\frac{3x+7}{3x+7}\right) = 4
\]

\[\Rightarrow \log \left(\frac{2x+3}{3x+7}\right) = 3 \quad \text{(2x+3)} + \log \left(\frac{3x+7}{3x+7}\right) = 3
\]

Let \(\log \left(\frac{2x+3}{3x+7}\right) = y \quad \text{...(1)}\)

\[\Rightarrow y = \frac{2}{y} \Rightarrow y^2 = 3 \Rightarrow y = - \frac{3}{2} \quad \text{or} \quad y = 1, 2\]

Substituting the values of \(y\) in (1), we get
\[\log \left(\frac{2x+3}{3x+7}\right) = 1 \quad \Rightarrow \quad \log \left(\frac{2x+3}{3x+7}\right) = 2 \quad \Rightarrow \quad \log \left(\frac{2x+3}{3x+7}\right) = 0\]

\[\Rightarrow \quad x = - \frac{3}{2} \quad \text{and} \quad \log \left(\frac{3x+7}{3x+7}\right) = \Rightarrow \quad x = - \frac{3}{2} \quad \text{and} \quad \log \left(\frac{3x+7}{3x+7}\right) = 0\]

\[\Rightarrow \quad x = - \frac{3}{2} \quad \text{and} \quad x = - \frac{3}{2} \quad \text{and} \quad x = - \frac{3}{2}\]

As \(\log \frac{a}{x}\) is defined for \(x > 0\) and \(a > 0 (a \neq 1)\), the possible value of \(x\) should satisfy all of the following inequalities:
\[\Rightarrow \quad 2x + 3 > 0 \quad \text{and} \quad 3x + 7 > 0\]

Also \(2x + 3 \neq 1 \quad \text{and} \quad 3x + 7 \neq 1\)

Out of \(x = - \frac{3}{2}, x = - \frac{3}{2} \text{ and } x = - \frac{3}{2}\)

satisfies the above inequalities.

So only solution is \(x = - \frac{3}{2}\).

9. Given that \(\log_2 2^x = \log_3 (2^x - 5) = \log_5 (2^x - 7/2)\) are in A.P.
\[\Rightarrow \quad 2 \log_3 (2^x - 5) = \log_3 (2^x - 7/2)\]

\[\Rightarrow \quad (2^x - 5)^2 = 2 \left(\frac{2^x - 7}{2}\right)\]

\[\Rightarrow \quad (2x)^2 - 10.2x + 25 = 2(2x + 1)\]

\[\Rightarrow \quad (2x)^2 - 12x + 32 = 0 \quad \text{Let} \quad 2x = y, \text{ then we get,}\]

\[y^2 - 12y + 32 = 0 \Rightarrow (y - 4)(y - 8) = 0\]

\[\Rightarrow \quad y = 4 \quad \text{or} \quad 8 \Rightarrow 2x = 2^4 \text{ or } 2^3 \Rightarrow x = 2 \text{ or } 3\]

But for \(\log_2 (2^x - 5)\) and \(\log_5 (2^x - 7/2)\) to be defined
\[2^x - 5 > 0 \quad \text{and} \quad 2^x - 7/2 > 0\]

\[\Rightarrow \quad 2^x > 5 \quad \text{and} \quad 2^x > 7/2\]

\[\Rightarrow \quad x > \log_2 5 \quad \text{and} \quad x > \log_2 \frac{7}{2}\]

\[\Rightarrow \quad x \neq 2 \quad \text{and therefore} \quad x = 3.\]

10. Let \(a \) and \(b\) be two numbers and \(A_1, A_2, A_3, \ldots, A_n\) be \(n\) A.M’s between \(a \) and \(b\).

Then \(a, A_1, A_2, \ldots, A_n, b\) are in A.P.

There are \((n + 2)\) terms in the series, so that
\[a + (n + 1) \frac{d}{d} = b \Rightarrow d = \frac{b - a}{n + 1}\]

\[\therefore A_1 = a + \frac{b - a}{n + 1} = \frac{an + b}{n + 1}\]

\[\therefore p = \frac{an + b}{n + 1} \quad \text{...(1)}\]
The first H.M. between \(a\) and \(b\), when nHM’s are inserted between \(a\) and \(b\) can be obtained by replacing \(a\) by \(\frac{1}{a}\) and \(b\) by \(\frac{1}{b}\) in eq. (1) and then taking its reciprocal.

Therefore, \(q = \frac{1}{\frac{1}{a} + \frac{1}{b}} = \frac{(n+1)ab}{bn+a}\)

\[
\therefore q = \frac{(n+1)ab}{a+bn} \quad \ldots(2)
\]

We have to prove that \(q\) cannot lie between \(p\) and \(\frac{(n+1)^2}{(n-1)^2} P\).

Now, \(n+1 > n-1 \Rightarrow \frac{n+1}{n-1} > 1\)

\[
\Rightarrow (n+1)^2 > 1 \text{ or } p \frac{(n+1)^2}{n-1} > p
\]

\[
\Rightarrow p < p \frac{(n+1)^2}{n-1} \quad \ldots(3)
\]

Now to prove the given, we have to show that \(q\) is less than \(p\).

For this, let, \(p = \frac{(na+b)(nb+a)}{(n+1)^2 ab}\)

\[
\Rightarrow p - 1 = \frac{n(a^2+b^2)+ab(n^2+1)-(n+1)^2 ab}{(n+1)^2 ab}
\]

\[
\Rightarrow p - 1 = \frac{n(a^2+b^2-2ab)}{(n+1)^2 ab}
\]

\[
\Rightarrow p - 1 = \frac{n}{(n+1)^2} (\frac{a-b}{\sqrt{ab}})^2 = \frac{n}{(n+1)^2} \left(\sqrt[3]{a} - \sqrt[3]{b}\right)^2
\]

\[
\Rightarrow p - 1 > 0
\]

\[
\Rightarrow \text{(provided } a \text{ and } b \text{ and hence } p \text{ and } q \text{ are +ve)}
\]

\[
\Rightarrow \frac{p}{q} > \frac{q}{p} \quad \ldots(4)
\]

From 3 and 4, we get, \(q < p < \frac{(n+1)^2}{n+1} p\)

\[
\therefore q \text{ can not lie between } p \text{ and } \frac{(n+1)^2}{n+1} p, \text{ if } a \text{ and } b \text{ are +ve numbers.}
\]

11. We have,

\[
S_1 = 1 + \frac{1}{2} + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^3 + \ldots \infty
\]

\[
S_2 = 2 + 2 + \frac{1}{3} + 2 \left(\frac{1}{3}\right)^2 + \ldots \infty
\]

\[
S_3 = 3 + 3 \frac{1}{4} + 3 \left(\frac{1}{4}\right)^2 + \ldots \infty
\]

\[
S_n = n + n \frac{1}{n+1} + n \left(\frac{1}{n+1}\right)^2 + \ldots \infty
\]

\[
\Rightarrow S_1 = \frac{1}{1-\frac{1}{2}} = 2
\]

\[
\begin{align*}
S_2 &= \frac{2}{1-\frac{1}{3}} = 3, \\
S_3 &= \frac{3}{1-\frac{1}{4}} = 4,
\end{align*}
\]

\[
S_n = \frac{n}{1-\frac{1}{n+1}} = (n+1)
\]

\[
\therefore S_1^2 + S_2^2 + S_3^2 + \ldots + S_{2n-1}^2
\]

\[= 2^2 + 3^2 + 4^2 + \ldots + (n+1)^2 + (2n)^2
\]

\[= \frac{2n(2n+1)(4n+1)-1^2}{6}
\]

\[
= n(2n+1)(4n+1)-\frac{3}{3}
\]

12. Since \(x_1, x_2, x_3\) are in A.P. Therefore, let \(x_1 = a-d, x_2 = a\) and \(x_3 = a+d\) and \(x_1, x_2, x_3\) are the roots of \(x^3 - x^2 + \beta x + \gamma = 0\)

We have \(\sum \alpha \beta = a-d + a + a = 3a = 1 \quad \ldots(1)\)

\[
\Sigma \alpha \beta = (a-d) a + a + (a+d) = \beta \quad \ldots(2)
\]

\[
\alpha \beta \gamma = (a-d) a (a+d) = -\gamma \quad \ldots(3)
\]

From (1), we get, \(3a = 1 \Rightarrow a = 1/3\)

From (2), we get, \(3a^2 - d^2 = \beta\)

\[
\Rightarrow 3 (1/3)^2 - d^2 = \beta \quad \Rightarrow 1/3 - \beta = d^2
\]

We know that \(d^2 \geq 0 \forall d \in \mathbb{R}\)

\[
\Rightarrow \frac{1}{3} - \beta \geq 0 \quad \therefore d^2 \geq 0
\]

\[
\Rightarrow \beta \leq \frac{1}{3} \Rightarrow \beta \in (-\infty, 1/3]
\]

From (3), \(a (a^2 - d^2) = -\gamma\)

\[
\Rightarrow \frac{1}{3} \left(\frac{1}{9} - d^2\right) = -\gamma \Rightarrow \frac{1}{27} - \frac{1}{3} d^2 = -\gamma
\]

\[
\Rightarrow \gamma + \frac{1}{27} = \frac{1}{3} d^2 \Rightarrow \gamma + \frac{1}{27} \geq 0
\]

\[
\Rightarrow \gamma \geq -\frac{1}{27} \Rightarrow \gamma \in \left[-\frac{1}{27}, \infty\right)
\]

Hence \(\beta \in (-\infty, 1/3]\) and \(\gamma \in [-1/27, \infty]\)
13. Solving the system of equations, \( u + 2v + 3w = 6 \), 
\( 4u + 5v + 6w = 12 \) and \( 6u + 9v = 4 \) 
we get \( u = -1/3, \ v = 2/3, \ w = 5/3 \) 
\[ \therefore \ u + v + w = 2, \ \frac{1}{u} + \frac{1}{v} + \frac{1}{w} = -\frac{9}{10} \]

Let \( r \) be the common ratio of the G.P. \( a, b, c, d \). Then \( b = ar \), 
\( c = ar^2 \), \( d = ar^3 \).

Then the first equation 
\[ \left( \frac{1}{u} + \frac{1}{v} + \frac{1}{w} \right) x^2 + [(b - c)^2 + (c - a)^2 + (d - b)^2]x + (u + v + w) = 0 \]
becomes 
\[ -\frac{9}{10} x^2 + [(ar - ar^2)^2 + (ar^2 - a)^2 + (ar^3 - ar^2)^2] x + 2 = 0 \]
i.e., \( 9x^2 - 10ax^2 (1-r^2) + (a^2 - a^2) + (ar^3 - ar^2)^2 x - 20 = 0 \)
i.e., \( 9x^2 - 10ax^2 (1-r^2) + (a^2 - a^2) + (ar^3 - ar^2)^2 x - 20 = 0 \)
i.e., \( 9x^2 - 10ax^2 (1-r^2) + (a^2 - a^2) + (ar^3 - ar^2)^2 x - 20 = 0 \)
\[ \ldots (1) \]

The second equation is, 
\[ 20x^2 + 10(x - ar^2)^2 = 0 \]
i.e., \( 20x^2 + 10(x - ar^2)^2 = 0 \)
\[ \ldots (2) \]

Since (2) can be obtained by the substitution \( x = 1/x \), 
equations (1) and (2) have reciprocal roots.

14. Let \( a - 3d, a - d, a + d \) and \( a + 3d \) be any four consecutive terms of an A.P. with common difference \( 2d \). \( \therefore \) Terms of A.P. are integers, \( 2d \) is also an integer.
Hence \( P = (2d)^4 + (a - 3d)(a - d)(a + d)(a + 3d) = 16d^4 + (a^2 - 9d^2)(a^2 - d^2) = 16d^4 + 2a^2d^2 - 10d^4 \)
\[ = 2a^2d^2 - 4d^2 = a^2(d - 2d)(2a + d) = (a - 3d)(a + 3d)(2a + d) \]
\( \therefore \) Thus, \( P \) is a square of an integer.

15. Given that \( a_1, a_2, \ldots, a_n \) are real no.'s in G.P.
\[ a_1 = a \]
\[ a_2 = ar \]
\[ \vdots \]
\[ a_n = ar^{n-1} \]
\( \therefore \) \( a_n \) is A.M. of \( a_1, a_2, \ldots, a_n \)
\[ A_n = \frac{a_1 + a_2 + \ldots + a_n}{n} = \frac{a + ar + \ldots + ar^{n-1}}{n} \]
\[ A_n = \frac{a(1-r^n)}{n(1-r)} \] \[ \ldots (1) \text{ (For } r \neq 1 \) \]
\( G_n \) is G.M. of \( a_1, a_2, \ldots, a_n \)
\[ G_n = \sqrt[n]{a_1 a_2 \ldots a_n} = \sqrt[n]{a a r a r^2 \ldots a r^{n-1}} \]
\[ = n \sqrt[n]{a^n r, \frac{n(n-1)}{2} = ar^2} \]
\[ \frac{n-1}{2} \] \[ \ldots (2) \text{ (r } \neq 1) \]
\( H_n \) is H.M. of \( a_1, a_2, \ldots, a_n \)
\[ H_n = \frac{1}{a_1} + \frac{1}{a_2} + \ldots + \frac{1}{a_n} = \frac{1}{a} + \frac{1}{ar} + \ldots + \frac{1}{ar^{n-1}} \]
\[ = \frac{n}{a(1-r^n)} \]
\[ \therefore \]
\[ \frac{n}{1 - r^n} \]
\[ a \]
\[ \frac{1}{r} \]

\[ H_n = \frac{an r^{n-1} (1-r)}{(1-r^n)} \] \[ \ldots (3) \]

We also observe that
\[ A_n H_n = \frac{a(1-r^n)}{(n(1-r))} \times \frac{an r^{n-1} (1-r)}{(1-r^n)} = a^n r^{n-1} = G_n^2 \]
\[ \therefore \]
\[ A_n H_n = G_n^2 \] \[ \ldots (4) \]
\[ \therefore \] Now, G.M. of \( G_1, G_2, \ldots, G_n \) is
\[ G = \sqrt[n]{G_1 \ldots G_n} \]
\[ G = \sqrt[n]{A_n H_n} \]
\[ G = \sqrt{A_n H_n} \]
\[ G = (A_1 A_2 \ldots A_n H_1 H_2 \ldots H_n)^{1/2n} \] \[ \ldots (5) \]

If \( r = 1 \) then
\[ A_n = G_n = H_n = a \]
Also \( A_n H_n = G_n^2 \)
\( \therefore \) For \( r = 1 \) also, equation (5) holds.
Hence we get,
\[ G = (A_1 A_2 \ldots A_n H_1 H_2 \ldots H_n)^{1/2n} \]

16. Clearly \( A_1 + A_2 = a + b \)
\[ \frac{1}{H_1} + \frac{1}{H_2} = \frac{a + b}{ab} \]
\[ \Rightarrow \]
\[ H_1 + H_2 = \frac{a + b}{ab} \rightarrow \frac{G_1 G_2}{H_1 H_2} = \frac{a + b}{H_1 H_2} = \frac{A_1 + A_2}{H_1 + H_2} \]
Also \( \frac{1}{H_1} = \frac{1}{a} + \frac{1}{(3b - a)} \Rightarrow H_1 = \frac{3ab}{2b + a} \)
\[ \frac{1}{H_2} = \frac{1}{a} + \frac{2}{3b - a} \Rightarrow H_2 = \frac{3ab}{2a + b} \]
\[ \Rightarrow \frac{A_1 + A_2}{H_1 + H_2} = \frac{a + b}{3ab\left(\frac{1}{2b + a} + \frac{1}{2a + b}\right)} \]
\[ = (2b + a)(2a + b) \]
\[ \Rightarrow \]
\[ \frac{9ab}{2} \]

17. Given that \( a, b, c \) are in A.P.
\[ \Rightarrow 2b = a + c \] \[ \text{and } a^2, b^2, c^2 \text{ are in H.P.} \]
\[ \Rightarrow \frac{1}{b^2} = \frac{1}{a^2} = \frac{1}{c^2} \]
\[ \Rightarrow \frac{(a - b)(a + b)}{b^2 a^2} = \frac{(b - c)(b + c)}{b^2 c^2} \]
\[ \Rightarrow \frac{ac (a - c) + b (c - a) (c + a) = 0}{(c - a)(ab + bc + ca) = 0} \]
\[ \Rightarrow \text{either } c - a = 0 \text{ or } ab + bc + ca = 0 \]
either \( c = a \) or \( (a + c) b + ca = 0 \)
and then from (i) \( 2b^2 + ca = 0 \)

Either \( a = b = c \) or \( b^2 = a \left( \frac{-c}{2} \right) \)
i.e., \( a, b, c \) are in G.P.  

Hence Proved.

18. \( a_n = \frac{3}{4} \left( \frac{3}{4} \right)^n + \frac{3}{4} \left( \frac{3}{4} \right)^{n-1} + \ldots + \left( -\frac{3}{4} \right)^n \)

\[ a_n = \frac{3}{4} \left( \frac{1 - \left( \frac{3}{4} \right)^n}{1 + \frac{3}{4}} \right) = \frac{3}{7} \left( 1 - \left( \frac{3}{4} \right)^n \right) \]

\( b_n = 1 - a_n \) and \( b_n > a_n \) \( \forall n \geq n_0 \)

\( 1 - a_n > a_n \) \( \Rightarrow 2a_n < 1 \)

\( \frac{6}{7} \left( 1 - \left( \frac{3}{4} \right)^n \right) < 1 \) \( \Rightarrow - \left( \frac{3}{4} \right)^n < -\frac{1}{6} \)

\( \left( -\frac{3}{4} \right)^{n+1} < 2^{2n-1} \)

For \( n \) to be even, inequality always holds. For \( n \) to be odd, it holds for \( n \geq 7 \).

\( \therefore \) The least natural no., for which it holds is 6  
(\( \because \) it holds for every even natural no.)

**G. Comprehension Based Questions**

1. (b) \( V_1 + V_2 + \ldots + V_n = \sum_{r=1}^{n} V_r = \sum_{r=1}^{n} \left( r^3 - \frac{r^2}{2} + \frac{r}{2} \right) \)

\[ = \sum_{r=1}^{n} r^3 - \frac{\sum_{r=1}^{n} r^2}{2} + \frac{\sum_{r=1}^{n} r}{2} \]

\[ = n^2 (n+1)^2 \left( \frac{12}{4} + \frac{n(n+1)}{4} \right) \]

\[ = \frac{n(n+1)}{4} \left[ n(n+1) - \frac{2n+1}{3} + 1 \right] \]

\[ = \frac{n(n+1)(3n^2+n+2)}{12} \]

2. (d) \( T_r = V_{r+1} - V_r - 2 \)

\[ = \left[ (r+1)^3 - \frac{(r+1)^2}{2} + \frac{r+1}{2} \right] - \left[ r^3 - \frac{r^2}{2} + \frac{r}{2} \right] - 2 \]

\[ = 3r^2 + 2r + 1 \]

\( T_r = (r+1)(3r-1) \)

For each \( r \), \( T_r \) has two different factors other than 1 and itself.

\( \therefore \) \( T_r \) is always a composite number.

3. (b) \( Q_{r+1} - Q_r = T_{r+2} - T_r + (T_{r+1} - T_r) \)

\[ = T_{r+2} - 2T_{r+1} + T_r \]

\[ = (r+3)(3r+5) - 2(r+2)(3r+2) + (r+1)(3r-1) \]

\( \therefore \) \( Q_{r+1} - Q_r = 6(r+1) + 5 - 6r - 5 = 6 \) (constant)

\( \therefore \) \( Q_1, Q_2, Q_3, \ldots \) are in AP with common difference 6.

4. (c) Given \( A_1 = \frac{a+b}{2} \), \( G_1 = \sqrt{ab} \), \( H_1 = \frac{2ab}{a+b} \)

**H. Assertion & Reason Type Questions**

1. (c) Given \( a_1, a_2, a_3, a_4 \) are in GP.

Then \( b_1, b_2, b_3, b_4 \) are the numbers

\( a_1, a_1 + a_2, a_1 + a_2 + a_3, a_1 + a_2 + a_3 + a_4 \)

or \( a, a + ar, a + ar + ar^2, a + ar + ar^2 + ar^3 \)

Clearly above numbers are neither in AP nor in G.P. and hence statement 1 is true.

Also \( \frac{1}{a}, \frac{1}{a + ar}, \frac{1}{a + ar + ar^2}, \frac{1}{a + ar + ar^2 + ar^3} \) are not in A.P.

\( \therefore \) \( b_1, b_2, b_3, b_4 \) are not in H.P.

\( \therefore \) Statement 2 is false.

**I. Integer Value Correct Type**

1. (3) Using \( S_n = \frac{a}{1-r}, \) we get

\[
S_k = \begin{cases} 
\frac{-1}{k!}, & k \neq 1 \\
0, & k = 1 \\
\frac{1}{(k-1)!}, & k \geq 2 
\end{cases}
\]
Sequences and Series

\[
\begin{align*}
\text{Now } & \sum_{k=1}^{100} (k^2 - 3k + 1)S_k = \sum_{k=2}^{100} (k^2 - 3k + 1) \frac{1}{(k-1)!} \\
= & -1 + \sum_{k=3}^{100} \frac{(k^2 - 1) + 3(k-1) - 2}{(k-1)!} \quad \text{as } k^2 - 3k + 1 > 0 \forall k \geq 3 \\
= & 1 + \sum_{k=3}^{100} \frac{1}{(k-3)!} - \frac{1}{(k-1)!} \\
= & 1 + \left( \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \cdots \right) + \cdots + \frac{1}{96!} - \frac{1}{98!} + \frac{1}{97!} - \frac{1}{99!} \\
= & 3 - \frac{1}{98!} - \frac{1}{99!} = 3 - \frac{9000}{100!} - \frac{100}{100!} = 3 - \frac{10000}{100!} = 3 - \frac{(100)^2}{100!} \\
\therefore \; 100^2 & + \sum_{k=1}^{100} (k^2 - 3k + 1)S_k = 3.
\end{align*}
\]

2. (0) Given that \(a_k = 2a_{k-1} - a_{k-2}\)

\[
\Rightarrow \frac{a_{k-2} + a_k}{2} = a_{k-1}, \; 3 \leq k \leq 11
\]

\[
\Rightarrow a_1, a_2, a_3, \ldots, a_{11} \text{ are in AP.}
\]

If \(a\) is the first term and \(D\) the common difference then

\[
a_1^2 + a_2^2 + \cdots + a_{11}^2 = 990
\]

\[
\Rightarrow 11a^2 + d^2 (1^2 + 2^2 + \cdots + 10^2) + 2ad (1 + 2 + \cdots + 10) = 990
\]

\[
\Rightarrow 11a^2 + \frac{10 \times 11 \times 21}{6}d^2 + 2ad \times \frac{10 \times 11}{2} = 990
\]

\[
\Rightarrow a^2 + 35d^2 + 150d = 90
\]

Using \(a = 15\), we get

\[
35d^2 + 150d + 135 = 0 \text{ or } 7d^2 + 30d + 27 = 0
\]

\[
\Rightarrow (d + 3)(7d + 9) = 0 \Rightarrow d = -3 \text{ or } -9/7
\]

then \(a_2 = 15 - 3 = 12\) or \(15 - \frac{9}{7} = \frac{96}{7} > \frac{27}{2}\)

\[
\therefore \; d \neq -9/7
\]

\[
\text{Hence } a_1 + a_2 + \ldots + a_{11} = \frac{11}{2} \left[ 2 \times 15 + 10(-3) \right] = 0
\]

3. (9)

We have

\[
\frac{S_m}{S_n} = \frac{S_{m-n}}{S_n} = \frac{5n}{2} \left[ \frac{2 \times 3 + (5n-1)d}{6 + (n-1)d} \right]
\]

\[
= \frac{5[(6-d) + 5nd]}{(6-d) + nd}
\]

which will be independent of \(n\) if \(d = 6\) or \(d = 0\)

For a proper A.P. we take \(d = 6\)

then \(a_k = 3 + 6 = 9\)

4. (5) Let \(k, k+1\) be removed from pack.

\[
\Rightarrow (1 + 2 + 3 + \cdots + n) - (k + k+1) = 1224
\]

\[
n(n+1) - 2k = 1225
\]

\[
k = \frac{n(n+1) - 2450}{4}
\]

for \(n = 50, \; k = 25\)

\[
\therefore \; k = 25 = 5
\]

5. (4) \(\therefore a, b, c\) are in G.P.

\[
\therefore b = ar \text{ and } c = ar^2
\]

Also \(\frac{b}{a}\) is an integer

\[
\Rightarrow r \text{ is an integer}
\]

\[
\therefore \text{A.M. of } a, b, c \text{ is } b + 2
\]

\[
\Rightarrow a + b + c = 3 + b + 2
\]

\[
\Rightarrow a + ar + ar^2 = 3ar + 6
\]

\[
\Rightarrow a(r^2 - 2r + 1) = 6
\]

\[
\Rightarrow a(r - 1)^2 = 6
\]

\[
\therefore a \text{ and } r \text{ are integers}
\]

\[
\therefore \text{The only possible values of } a \text{ and } r \text{ can be 6 and 2 respectively.}
\]

\[
\text{Then } \frac{a^2 + a - 14}{a + 1} = \frac{36 + 6 - 14}{6 + 1} = \frac{28}{7} = 4
\]

\[
\frac{7}{2} \left[ 2a + 6d \right] = \frac{6}{11} \Rightarrow a = 9d
\]

\[
\frac{11}{2} \left[ 2a + 10d \right] = \frac{6}{11}
\]

\[
a_2 = a + 6d = 15d
\]

\[
\therefore \; 130 < 15d < 140 \Rightarrow d = 9
\]

\[
(\therefore \text{All terms are natural numbers} \Rightarrow d \in \mathbb{N})
\]

6. (9)

\[
\frac{11}{2} \left[ 2a + 10d \right] = \frac{6}{11} \Rightarrow a = 9d
\]

\[
a_2 = a + 6d = 15d
\]

\[
\therefore \; 130 < 15d < 140 \Rightarrow d = 9
\]

\[
(\therefore \text{All terms are natural numbers} \Rightarrow d \in \mathbb{N})
\]

7. (8) In expansion of \((1 + x)(1 + x^2)(1 + x^3) \ldots (1 + x^{100})\)

\(x^9\) can be found in the following ways

\[
x^9, x^1 + 8, x^2 + 7, x^3 + 6, x^4 + 5, x^1 + 2 + 6, x^1 + 3 + 5, x^2 + 3 + 4
\]

The coefficient of \(x^9\) in each of the above 8 cases is 1.

\[
\therefore \text{Required coefficient} = 8.
\]
1. (b) \[ \log_9 (3^{1-x} + 2), \log_3 (4.3^x - 1) \text{ are in A.P.} \]
\[ \Rightarrow 2 \log_9 (3^{1-x} + 2) = 1 + \log_9 (4.3^x - 1) \]
\[ \Rightarrow \log_3 (3^{1-x} + 2) = \log_3 3 + \log_3 (4.3^x - 1) \]
\[ \Rightarrow \log_3 (3^{1-x} + 2) = \log_3 [3(4.3^x - 1)] \]
\[ \Rightarrow 3^{1-x} + 2 = 3(4.3^x - 1) \]
\[ \Rightarrow 3.3^x + 2 = 12.3^x - 3. \]
Put \( 3^x = t \)
\[ \Rightarrow \frac{3}{t} + 2 = 12t - 3 \text{ or } 12t^2 - 5t - 3 = 0; \]
Hence \( t = \frac{3}{4} \) \( \Rightarrow 3^x = \frac{3}{4} \) (as \( 3^x \neq -ve \))
\[ \Rightarrow x = \log_3 \left( \frac{3}{4} \right) \text{ or } x = \log_3 3 - \log_3 4 \]
\[ \Rightarrow x = 1 - \log_3 4 \]

2. (d) \[ l = \text{AR}^{p-1} \Rightarrow \log l = \log A + (p - 1) \log R \]
\[ m = \text{AR}^{q-1} \Rightarrow \log m = \log A + (q - 1) \log R \]
\[ n = \text{AR}^{r-1} \Rightarrow \log n = \log A + (r - 1) \log R \]

Now,
\[
\begin{bmatrix}
\log l & p & 1 \\
\log m & q & 1 \\
\log n & r & 1
\end{bmatrix} = \begin{bmatrix}
\log A + (p - 1) \log R & p & 1 \\
\log A + (q - 1) \log R & q & 1 \\
\log A + (r - 1) \log R & r & 1
\end{bmatrix}
\]

Operating \( C_1 - (\log R) C_2 + (\log R - \log A) C_3 \)
\[
= \begin{bmatrix}
0 & p & 1 \\
0 & q & 1 \\
0 & r & 1
\end{bmatrix} = 0
\]

3. (b) The product is \( P = 2^{1/4} \cdot 2^{2/8} \cdot 2^{3/16} \ldots \ldots \infty \)
\[ = 2^{1/4 + 2/8 + 3/16 + \ldots \ldots} \infty \]

Now let \( S = \frac{1}{4} + \frac{2}{8} + \frac{3}{16} + \ldots \ldots \infty \) \ldots (1)
\[ \frac{1}{2} S = \frac{1}{8} + \frac{2}{16} + \ldots \ldots \infty \] \ldots (2)

Subtracting (2) from (1)
\[ \Rightarrow \frac{1}{2} S = \frac{1}{4} + \frac{1}{16} + \ldots \ldots \infty \]
or \[ \frac{1}{2} S = \frac{1}{4} \frac{1}{1 - 1/2} = \frac{1}{2} \Rightarrow S = 1 \]
\[ \therefore P = 2^S = 2 \]

4. (b) \( a \cdot ar \cdot ar^2 \cdot ar^3 \cdot ar^4 \cdot ar^5 \cdot ar^6 \cdot ar^7 \cdot ar^8 = a^9 r^{36} = (ar^4)^9 = 2^9 = 512 \)

5. (b) Let \( a \) = first term of G.P. and \( r \) = common ratio of G.P.
Then G.P. is \( a, ar, ar^2 \)
Given \( S_\infty = 20 \Rightarrow \frac{a}{1-r} = 20 \Rightarrow a = 20(1-r) \ldots (i) \)
Also \( a^2 + a^2r^2 + a^2r^4 + \ldots \) to \( \infty = 100 \)
\[ \Rightarrow \frac{a^2}{1-r^2} = 100 \Rightarrow a^2 = 100(1-r)(1+r) \ldots (ii) \]
From (i), \( a^2 = 400(1-r)^2 \); From (ii), we get \( 100(1-r)(1+r) = 400(1-r)^2 \)
\[ \Rightarrow 1 + r = 4 - 4r \Rightarrow 5r = 3 \Rightarrow r = \frac{3}{5} \]

6. (a) \[ \begin{align*}
1^3 & - 2^3 + 3^3 - 4^3 + \ldots + 9^3 \\
& = 1^3 + 2^3 + 3^3 + \ldots + 9^3 - 2(2^3 + 4^3 + 6^3 + 8^3) \\
& = \left[ \frac{9 \times 10^2}{2} \right] - 2.23 \left[ \frac{1^3 + 2^3 + 3^3 + 4^3}{2} \right] \\
& = (45)^2 - 16 \left[ \frac{4 \times 5^2}{2} \right] = 2025 - 1600 = 425
\end{align*} \]

7. (a) \[ \frac{1}{1.2} - \frac{1}{2.3} + \frac{1}{3.4} - \ldots \ldots \infty \]
\[ \left| T_n \right| = \frac{1}{n(n+1)} = \left( \frac{1}{n} - \frac{1}{n+1} \right) \]
\[ S = T_1 - T_2 + T_3 - T_4 + T_5 \ldots \ldots \infty \]
\[ = \left[ \frac{1}{1} - \frac{1}{2} \right] - \left[ \frac{1}{2} - \frac{1}{3} \right] + \ldots \ldots \ldots \ldots \ldots \]
\[ = 1 - \frac{1}{2} \left[ \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \ldots \ldots \infty \right] \]
\[ = 1 - 2[- \log(1+1) + 1] = 2 \log 2 - 1 = \log \left( \frac{4}{e} \right) \]

8. (d) \[ S_n = \frac{1}{n C_0} + \frac{1}{n C_1} + \frac{1}{n C_2} + \ldots + \frac{1}{n C_n} \]
\[ t_n = \frac{0}{n C_0} + \frac{1}{n C_1} + \ldots + \frac{n}{n C_n} \]
\[ t_n = \frac{n-1}{n C_{n-1}} + \frac{n-2}{n C_{n-2}} + \ldots + \frac{0}{n C_0} \]

Add, \( 2t_n = (n) \left[ \frac{1}{n C_0} + \frac{1}{n C_1} + \ldots + \frac{1}{n C_n} \right] = nS_n \)
\[ \therefore \frac{t_n}{S_n} = \frac{n}{2} \]
9. \( T_m = a + (m - 1)d = \frac{1}{n} \) ..........(1)
\( T_n = a + (n - 1)d = \frac{1}{m} \) ..........(2)

\( (1) - (2) \Rightarrow (m - n)d = \frac{1}{n} - \frac{1}{m} \Rightarrow d = \frac{1}{mn} \)

From (1) \( a = \frac{1}{mn} \Rightarrow a - d = 0 \)

10. (b) If \( n \) is odd, the required sum is
\[ 1^2 + 2.2^2 + 3^2 + 2.4^2 + \ldots + 2.(n-1)^2 + n^2 \]
\[ = \frac{(n-1)(n+1)^2}{2} + n^2 \]
\[ \because (n-1) \) is even
\[ \therefore \text{using given formula for the sum of } (n-1) \text{ terms.} \]
\[ = \left( \frac{n-1}{2} + 1 \right) n^2 = \frac{n^2(n+1)}{2} \]

11. (b) We know that \( e = 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \ldots \ldots \ldots \)

and \( e^{-1} = 1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots \ldots \ldots \)

\[ \therefore e + e^{-1} = 2 \left[ 1 + \frac{1}{2!} + \frac{1}{4!} + \ldots \right] \]

\[ \therefore \frac{1}{2!} + \frac{1}{4!} + \ldots = \frac{e + e^{-1}}{2} - 1 \]

\[ = \frac{e^2 + 1 - 2e}{2e} = \frac{(e-1)^2}{2e} \]

12. (c) Given \( \frac{mC_{r-1}}{mCr} = \frac{mC_{r+1}}{mC_r} \) are in A.P.

\[ \Rightarrow 2 = \frac{mC_{r-1}}{mC_{r+1}} + \frac{mC_{r+1}}{mC_r} = \frac{r}{m-r+1} + \frac{m-r}{r+1} \]

\[ \Rightarrow m^2 - m(4r + 1) + 4r^2 - 2 = 0 \]

13. (d) \( x = \sum_{n=0}^{\infty} a^n = \frac{1}{1-a}, \quad a = 1 - \frac{1}{x} \)
\( y = \sum_{n=0}^{\infty} b^n = \frac{1}{1-b}, \quad b = 1 - \frac{1}{y} \)
\( z = \sum_{n=0}^{\infty} c^n = \frac{1}{1-c}, \quad c = 1 - \frac{1}{z} \)

\( a, b, c \) are in A.P. OR \( 2b = a + c \)

\( 2 \left( 1 - \frac{1}{y} \right)^{-1} = 1 - \frac{1}{x} + \frac{1}{y} \)

\( \frac{2}{y} = 1 + \frac{1}{x} \Rightarrow x, y, z \) are in H.P.

14. (d)
\[ \frac{e^x + e^{-x}}{2} = 1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \frac{x^6}{6!} \]

Putting \( x = \frac{1}{2} \) we get
\[ 1 + \frac{1}{4.2!} + \frac{1}{16.4!} + \frac{1}{64.6!} + \ldots \]

\[ \therefore \frac{\sqrt{e^2 + e^{-2}}}{2} = \frac{\sqrt{e} + \frac{1}{\sqrt{e}}}{2} = e + 1 \]

\[ \frac{p}{q} = \frac{[2a_1 + (p-1)d]}{[2a_1 + (q-1)d]} \]

\[ \frac{p}{q} = \frac{[2a_1 + (p-1)d]}{[2a_1 + (q-1)d]} \]

For \( a_{61} = \frac{p}{q}, \quad p = 11, \quad q = 41 \Rightarrow \frac{a_6}{a_{21}} = \frac{11}{41} \)

16. (d) \( \frac{1}{a_2} = \frac{1}{a_1} + \frac{1}{a_3} = \ldots = \frac{m-r}{a_{r+1}} + \frac{m-r}{a_{r+1}} = \frac{r}{d} \)

\[ \Rightarrow a_{r+1} = a_{r+1} - a_n \]

\[ \therefore a_1a_2 + a_2a_3 + \ldots + a_{n-1}a_n \]

\[ = \frac{a_1 - a_n}{d} \]

\[ = \frac{1}{d} [a_1 - a_2 + a_2a_3 + \ldots + a_{n-1} - a_n] = \frac{a_1 - a_n}{d} \]

\[ \Rightarrow \frac{a_1}{a_n} - \frac{a_n}{a_1} = (n-1)d \Rightarrow \frac{a_1 - a_n}{a_1a_n} = (n-1)d \]

Which is the required result.
17. (d) We know that 
\[ e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots \cdots \infty \]
Put \( x = -1 \)

\[ e^{-1} = 1 - 1 + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \cdots \cdots \infty \]

\[ e^{-1} = \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} - \cdots \cdots \infty \]

18. (b) Let the series \( a, ar, ar^2, \ldots \) are in geometric progression.
Given, \( a = ar + ar^2 \)

\[ 1 = r + r^2 \Rightarrow r^2 + r - 1 = 0 \]

\[ r = \frac{-1\pm\sqrt{1-4\times-1}}{2} \Rightarrow r = \frac{-1\pm\sqrt{5}}{2} \]

\[ r = \frac{-1 + \sqrt{5}}{2} \]

\[ \therefore \text{terms of G.P. are positive} \]

\[ \therefore r \text{ should be positive} \]

19. (b) As per question,
\[ a + ar = 12 \quad \ldots \ldots \text{(1)} \]
\[ ar^2 + ar^3 = 48 \quad \ldots \ldots \text{(2)} \]

\[ \frac{ar^2(1+r)}{a(1+r)} = \frac{48}{12} \Rightarrow r^2 = 4, \Rightarrow r = -2 \]

\[ \therefore \text{terms are + ve and -ve alternately} \]

\[ a = -12 \]

20. (a) We have
\[ S = 1 + \frac{2}{3} + \frac{6}{3^2} + \frac{6}{3^3} + \frac{10}{3^4} + \cdots \cdots \infty \quad \ldots \ldots \text{(1)} \]

Multiplying both sides by \( \frac{1}{3} \) we get

\[ \frac{1}{3} S = \frac{1}{3} + \frac{2}{3^2} + \frac{6}{3^3} + \frac{10}{3^4} + \cdots \cdots \infty \quad \ldots \ldots \text{(2)} \]

Subtracting eqn. (2) from eqn. (1) we get

\[ \frac{2}{3} S = 1 + \frac{1}{3} + \frac{4}{3^2} + \frac{4}{3^3} + \frac{4}{3^4} + \cdots \cdots \infty \]

\[ \Rightarrow \frac{2}{3} S = \frac{4}{3} + \frac{4}{3^2} + \frac{4}{3^3} + \frac{4}{3^4} + \cdots \cdots \infty \]

\[ \Rightarrow \frac{2}{3} S = \frac{4}{3} \times \frac{1}{-\frac{1}{3}} \Rightarrow S = 3 \]

21. (a) Till 10th minute number of counted notes = 1500
\[ 3000 = \frac{n}{2} [2 \times 148 + (n - 1)(-2)] = n[148 - n + 1] \]
\[ n^2 - 149n + 3000 = 0 \]
\[ \Rightarrow n = 125, 24 \]
But \( n = 125 \) is not possible
\[ \therefore \text{total time} = 24 + 10 = 34 \text{ minutes.} \]

22. (c) Let required number of months = \( n \)
\[ \Rightarrow 200 \times 3 + (240 + 280 + 320 + \cdots \cdots + (n - 3)\text{th term}) = 11040 \]
\[ \Rightarrow \frac{n - 3}{2} [2 \times 240 + (n - 4) \times 40] = 11040 - 600 \]
\[ \Rightarrow (n - 3)(240 + 20n - 80) = 10440 \]
\[ \Rightarrow (n - 3)(20n + 160) = 10440 \]
\[ \Rightarrow (n - 3)(n + 8) = 522 \]
\[ \Rightarrow n^2 + 5n - 546 = 0 \Rightarrow (n + 26)(n - 21) = 0 \]
\[ \therefore n = 21 \]

23. (b) \( n \)th term of the given series
\[ T_n = (n - 1)^2 + (n - 1)n + n^2 \]
\[ = \left(\frac{(n - 1)^3 - n^3}{(n - 1) - n}\right) = n^3 - (n - 1)^3 \]

\[ \Rightarrow S_n = \sum_{k=1}^{n} [k^3 - (k - 1)^3] \Rightarrow 8000 = n^3 \]
\[ \Rightarrow n = 20 \text{ which is a natural number.} \]
Now, put \( n = 1, 2, 3, \ldots, 20 \)
\[ T_1 = 1^3 - 0^3 \]
\[ T_2 = 2^3 - 1^3 \]
\[ \vdots \]
\[ T_{20} = 20^3 - 19^3 \]

Now, \( T_1 + T_2 + \cdots + T_{20} = S_{20} \)
\[ \Rightarrow S_{20} = 20^3 - 0^3 = 8000 \]
Hence, both the given statements are true and statement 2 supports statement 1.

24. (c) Given sequence can be written as
\[ \frac{7}{10} + \frac{77}{100} + \frac{777}{1000} + \cdots \cdots + \text{up to} \ 20 \text{ terms} \]
\[ = \frac{7}{9} \left[ \frac{1}{10} + \frac{11}{100} + \frac{111}{1000} + \cdots \cdots + \text{up to} \ 20 \text{ terms} \right] \]

Multiply and divide by 9
\[ = \frac{7}{9} \left[ \frac{9}{10} + \frac{99}{100} + \frac{999}{1000} + \cdots \cdots \text{up to} \ 20 \text{ terms} \right] \]
\[ = \frac{7}{9} \left[ \frac{1 - \frac{1}{10}}{1 - \frac{1}{10}} \right] \]
\[ = \frac{7}{9} \left[ \frac{1 - \left(10^{-1}\right)^{20}}{1 - \frac{1}{10}} \right] \]
\[ = \frac{7}{9} \left[ \frac{179 + \left(10^{-1}\right)^{20}}{9 + 10 \times 10^{-20}} \right] = \frac{7}{81} \left[ 179 + (10)^{-20} \right] \]
25. (a) Let \(10^9 + 2 \times 11 \times 10^8 + 3 \times 11^2 \times 10^7 + \ldots + 10(11)^9 = k(10)^9\)

Let \(x = 10^9 + 2 \times 11 \times 10^8 + 3 \times 11^2 \times 10^7 + \ldots + 10(11)^9\) 

Multiplied by \(\frac{11}{10}\) on both the sides 

\[
\frac{11}{10} x = 11.10^8 + 2.11^2 \times 10^7 + \ldots + 9(11)^9 + 11 \times 10^9
\]

\[
x \left(1 - \frac{11}{10}\right) = 10^9 + 11(10)^9 + 11^2 \times (10)^7 + \ldots + 11^9 - 11^{10}
\]

\[
\Rightarrow \frac{x}{10} = 10^9 \left[\frac{11}{10} - 1\right] \left(1 - \frac{11}{10}\right) = 11^{10}
\]

\[
\Rightarrow \frac{x}{10} = (11^{10} - 10^{10}) - 11^{10} = -10^{10}
\]

\[
\Rightarrow x = 10^{11} = k.10^9 \quad \text{Given} \quad \Rightarrow k = 100
\]

26. (b) Let \(a,\ ar,\ ar^2\) are in G.P.

According to the question
\(a,\ 2ar,\ ar^2\) are in A.P.
\[\Rightarrow 2 \times 2ar = a + ar^2\]
\[\Rightarrow 4r = 1 + r^2 \quad \Rightarrow r^2 - 4r + 1 = 0\]

\[
r = \frac{4 \pm \sqrt{16 - 4}}{2} = 2 \pm \sqrt{3}
\]

Since \(r > 1\)
\[\therefore \quad r = 2 - \sqrt{3} \quad \text{is rejected}\]

Hence, \(r = 2 + \sqrt{3}\)

27. (d) \(n^{th}\) term of series = \[
\frac{n(n + 1)^2}{2n^2}\]

\[
= \frac{1}{4} \left[n(n + 1)^2\right]
\]

Sum of \(n\) term = \[
\sum \frac{1}{4} (n + 1)^2
\]

\[
= \frac{1}{4} \left[\Sigma n^2 + 2\Sigma n + n\right]
\]

\[
= \frac{1}{4} \left[\frac{n(n + 1)(2n + 1)}{6} + \frac{2n(n + 1)}{2} + n\right]
\]

Sum of 9 terms
\[
= \frac{1}{4} \left[\frac{9 \times 10 \times 19 + 18 \times 10 + 9}{6} + 9\right] = \frac{384}{4} = 96
\]

28. (d) \(m = \frac{l + n}{2}\) and common ratio of G.P. = \(r = \left(\frac{n}{l}\right)^4\)

\[\therefore \quad G_1 = l^{1/l4} n^{1/4},\ G_2 = l^{1/2} n^{1/2},\ G_3 = l^{1/4} n^{3/4}\]

\[G_1^4 + 2G_2^4 + G_3^4 = l^3 n + 2l^2 n^2 + ln^3\]

\[= ln (l + n)^2\]

\[= ln \times 2m^2\]

\[= 4lm^2n\]

29. (d) Let the GP be \(a,\ ar,\ ar^2\) then \(a = A + d;\ ar = A + 4d;\ ar^2 = A + 8d\)

\[\Rightarrow \quad ar^2 - ar = (A + 8d) - (A + 4d)\]

\[\Rightarrow \quad ar - a = (A + 4d) - (A + d)\]

\[r = \frac{4}{3}\]

30. (d) \(\left(\frac{8}{5}\right)^2 + \left(\frac{12}{5}\right)^2 + \left(\frac{16}{5}\right)^2 + \left(\frac{20}{5}\right)^2 + \ldots + \left(\frac{44}{5}\right)^2\)

\[S = \frac{16}{25} \left(2^2 + 3^2 + 4^2 + \ldots + 11^2\right)\]

\[= \frac{16}{25} \left(\frac{11(11 + 1)(22 + 1)}{6} - 1\right)\]

\[= \frac{16}{25} \times 505 = \frac{16}{5} \times 101\]

\[\Rightarrow \quad \frac{16}{5} = \frac{16}{5} \times 101\]

\[\Rightarrow m = 101\].
Straight Lines and Pair of Straight Lines

Section-A

**JEE Advanced/ IIT-JEE**

### A. Fill in the Blanks

1. \[ |x| + |y| = 1 \]
   The curve represents four lines 
   
   \[ x + y = 1, x - y = 1, -x + y = 1, -x - y = 1 \]
   
   which enclose a square of side = distance between opp. sides \( x + y = 1 \) and \( x + y = -1 \)
   
   \[ \text{Side} = \frac{1+1}{\sqrt{1+1}} = \sqrt{2} \]
   
   ∴ Req. area = \((side)^2 = 2 \text{ sq. units}\).

2. As \( y = \log_{10} x \) can be obtained by replacing \( x \) by \( y \) and \( y \) by \( x \) in \( y = 10^x \)
   
   \[ \therefore \text{The line of reflection is } y = x. \]

3. Given that \( 3a + 2b + 4c = 0 \) \( \Rightarrow \)
   
   \[ \frac{3}{4}a + \frac{1}{2}b + c = 0 \]
   
   \( \Rightarrow \) The set of lines \( ax + by + c = 0 \) passes through the point \((3/4, 1/2)\).

4. \[ |AP - BP| = 6 \]
   
   We know that locus of a point, difference of whose distances from two fixed points is constant, is hyperbola with the fixed points as focii and the difference of distances as length of transverse axis.
   
   Thus, \( ae = 4 \) and \( 2a = 6 \) \( \Rightarrow \)
   
   \[ a = 3, e = 4/3 \]
   
   \[ \Rightarrow b^2 = 9\left(\frac{16}{9} - 1\right) = 7 \quad \therefore \text{Equation is } \frac{x^2}{9} - \frac{y^2}{7} = 1 \]

5. If \( a, b, c \) are in A.P. then
   
   \[ a + c = 2b \]
   
   \[ \Rightarrow \]
   
   \[ ax + by + c = 0 \]
   
   passes through \((-1, -2)\).

6. **First quadrant.**
   
   The equations of sides of triangle \( ABC \) are
   
   \[ AB : x + y = 1 \]
   
   \[ BC : 2x + 3y = 6 \]
   
   \[ CA : 4x - y = -4 \]
   
   Solving these pairwise we get the vertices of \( \Delta \) as follows
   
   \[ A(-3/5, 8/5), B(-3, 4), C(-3/7, 16/7) \]
   
   Now \( AD \) is line \( \perp \) to \( BC \) and passes through \( A \). Any line perpendicular to \( BC \) is \( 3x - 2y + \lambda = 0 \)
   
   As it passes through \( A(-3/5, 8/5) \)
   
   \[ \frac{-9}{5} - \frac{16}{5} + \lambda = 0 \]
   
   \[ \therefore \lambda = 5 \]
   
   \[ \therefore \text{Equation of altitude } AD \text{ is } 3x - 2y + 5 = 0 \]

### B. True / False

1. Intersection point of \( x + 2y - 10 = 0 \) and \( 2x + y + 5 = 0 \) is
   
   \[ \left(\frac{-20}{3}, \frac{25}{3}\right) \]
   
   which clearly satisfies the line \( 5x + 4y = 0 \). Hence the given statement is true.
2. The given lines cut x-axis at
   \[ A\left(\frac{17}{9}, 0\right), C\left(-\frac{19}{2}, 0\right) \]
   and y-axis at \( B\left(0, \frac{17}{6}\right) \) and \( D\left(0, -\frac{19}{3}\right) \).

   Now, \( A, B, C, D \) are concyclic if for \( AC \) and \( BD \) intersecting at \( O \) we have \( AO \times OC = BO \times OD \)

   \[ \begin{align*}
   \text{or, } \frac{AO}{BO} &= \frac{OD}{OC} \\
   \text{if } &\frac{17/9}{17/6} = \frac{-19/3}{2} \Rightarrow \frac{2}{3} = \frac{-19}{3} \\
   \therefore \text{The given statement is true.}
   \end{align*} \]

3. (a) Solving the given equations of lines pairwise, we get the vertices of \( \Delta \) as
   \[ A\left(-2, 2\right), B\left(2, -2\right), C\left(1, 1\right) \]
   Then \( AB = \sqrt{16+16} = 4\sqrt{2} \)
   \( BC = \sqrt{9+1} = \sqrt{10} \)
   \( CA = \sqrt{9+9} = \sqrt{10} \)
   \( \therefore \Delta \) is isosceles.

4. (a) We have
   \[ P = (1, 0), Q = (-1, 0), R = (2, 0) \]
   Let \( S = (x, y) \)
   \[ \text{ATQ } SQ^2 + SP^2 = 2SP^2 \]
   \[ \Rightarrow (x+1)^2 + y^2 + (x-2)^2 + y^2 = 2(x^2 + y^2) \]
   \[ \Rightarrow 2x^2 + 2y^2 - 2x + 5 = 2x^2 + 2y^2 - 4x + 2 \]
   \[ \Rightarrow 2x + 3 = 0 \Rightarrow x = -3/2 \]
   Which is a straight line parallel to y-axis.

5. (b) As \( L \) has intercepts \( a \) and \( b \) on axes, equation of \( L \) is
   \[ \frac{x}{a} + \frac{y}{b} = 1 \]
   
   Let \( x \) and \( y \) axes be rotated through an angle \( \theta \) in anticlockwise direction.
   In new system intercepts are \( p \) and \( q \), therefore equation of \( L \) becomes
   \[ \frac{x}{p} + \frac{y}{q} = 1 \]
   
   KEY CONCEPT : As the origin is fixed in rotation, the distance of line from origin in both the cases should be same.

   \[ \therefore \text{We get } d = \left| \frac{1}{\sqrt{a^2 + b^2}} \right| = \left| \frac{1}{\sqrt{p^2 + q^2}} \right| \]
   \[ \Rightarrow \frac{1}{a^2 + b^2} = \frac{1}{p^2 + q^2} \]
   \[ \therefore \text{(b) is the correct answer.} \]

6. (a) Let the two perpendicular lines be the co-ordinate axes.
   Let \( (x, y) \) be the point sum of whose distances from two axes is 1 then we must have
   \[ |x| + |y| = 1 \text{ or } \pm x \pm y = 1 \]
   These are the four lines
   \[ x + y = 1, -x - y = 1, -x + y = 1, x - y = 1 \]
Straight Lines and Pair of Straight Lines

Any two adjacent sides are perpendicular to each other. Also each line is equidistant from origin. Therefore figure formed is a square.

7. (a) If variable point is $P$ and $S (-2, 0)$ then $PS = \frac{2}{3} PM$

where $PM$ is the perpendicular distance of point $P$ from given line $x = -9/2$

$\therefore$ By definition $P$ describes an ellipse. $\left(e = \frac{2}{3} < 1\right)$

8. (c) The sides of parallelogram are $x = 2, x = 3, y = 1, y = 5$.

$D (2, 5) \quad C (3, 5)$

$A (2, 1) \quad B (3, 1)$

$\therefore$ Diagonal $AC$ is $\frac{x_2-x_1}{y_2-y_1} = \frac{x_3-x_1}{y_3-y_1} \Rightarrow y = 4x - 7$

Equation diagonal $BD$ is $\frac{x_2-x_1}{y_2-y_1} = \frac{x_3-x_1}{y_3-y_1} \Rightarrow 4x + y = 13$

9. (c) The lines by which $\Delta$ is formed are $x = 0, y = 0$ and $x + y = 1$.

Clearly, it is right $\Delta$ and we know that in a right $\Delta$ orthocentre coincides with the vertex at which right $\angle$ is formed.

$\therefore$ Orthocentre is $(0, 0)$.

10. (b) Let $m$ be the slope of $PQ$ then

$tan 45^\circ = \left|\frac{m-(-2)}{1+m(-2)}\right|$

$\Rightarrow 1 = \left|\frac{m+2}{1-2m}\right| \Rightarrow \pm 1 = \frac{m+2}{1-2m}$

$\Rightarrow m+2 = 1-2m \quad or \quad 1+2m = m+2$

$\Rightarrow m = \frac{1}{3} \quad or \quad m = 3$

As $PR$ also makes $\angle 45^\circ$ with $RQ$.

$\therefore$ The above two values of $m$ are for $PQ$ and $PR$.

$\therefore$ Equation of $PQ, y - 1 = \frac{1}{3} (x - 2)$

$\Rightarrow 3y - 3 = x - 2 \Rightarrow x + 3y - 5 = 0$

11. (a) $x_2 = x_1r, x_3 = x_1r^2$ and so is $y_2 = y_1r, y_3 = y_1r^2$

$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$

$\Delta = x_2 y_3 - y_2 x_3 = r^2 = 0$

Hence the points lie on a line, i.e., they are collinear.

$S$ is the midpoint of $Q$ and $R$

$\begin{vmatrix} \frac{7+6}{2} & \frac{3-1}{2} \\ \frac{13}{2} & 1 \end{vmatrix}$

$\therefore S = \left(\frac{13}{2}, 1\right)$

Now slope of $PS = m = \frac{-2-1}{2-13/2} = -\frac{2}{9}$

Now equation of the line passing through $(1, -1)$ and parallel to $PS$ is

$y+1 = \frac{-2}{9} (x-1) \quad or \quad 2x + 9y + 7 = 0$

13. (d) Here $AB = BC = CA = 2$. So, it is an equilateral triangle and the incentre coincides with centroid.

Therefore,

$\text{Incentre} = \left(\frac{0+1+2}{3}, \frac{0+0+\sqrt{3}}{3}\right) = \left(1, \frac{1}{\sqrt{3}}\right)$

14. (a) Intersection of $3x + 4y = 9$ and $y = mx + 1$.

For $x$ co-ordinate

$3x + 4(mx + 1) = 9 \Rightarrow (3 + 4m)x = 5$

$x = \frac{5}{3 + 4m}$

For $x$ to be an integer $3 + 4m$ should be a divisor of 5 i.e., $1, -1, 5$ or $-5$.

$3 + 4m = 1 \quad \Rightarrow m = -1/2$ (not integer)

$3 + 4m = -1 \quad \Rightarrow m = -1$ (integer)

$3 + 4m = 5 \quad \Rightarrow m = 1/2$ (not an integer)

$3 + 4m = -5 \quad \Rightarrow m = -2$ (integer)

$\therefore$ There are 2 integral values of $m$.

$\therefore$ (a) is the correct alternative.

15. (d)
The vertices, \( O(0,0), A\left(\frac{1}{m-n}, \frac{m}{m-n}\right), B(0,1) \)

\[ A_r(\parallel g^m) OABC = 2 A_r(\Delta OAB) \]

\[ = 2 \cdot \frac{1}{2} \left[ 0 \left(\frac{m}{m-n} - 1\right) + \frac{1}{m-n} (1-0) + 0 \left(0 - \frac{m}{m-n}\right) \right] \]

\[ = \frac{1}{|m-n|} \]

16. (d) Clearly \( OP = OQ = 1 \) and \( \angle QOP = \alpha - \theta = \alpha - 2\theta \).

The bisector of \( \angle QOP \) will be a perpendicular to \( PQ \) and also bisect it. Hence \( Q \) is reflection of \( P \) in the line \( OM \) which makes an angle \( \angle MOP + \angle POX \) with \( x \)-axis,

i.e., \( \frac{1}{2}(\alpha - 2\theta) + \theta = \alpha / 2 \).

So that slope of \( OM \) is \( \tan \alpha / 2 \).

17. (c) \( \tan \theta = \sqrt{3} \Rightarrow \theta = 60^\circ \Rightarrow \angle PQR = 120^\circ \)

\[ \Rightarrow \text{bisector will have slope } \tan 120^\circ \]

\[ \Rightarrow \text{equation of bisector is } \sqrt{3}x + y = 0 \]

18. (b) The given lines are

\[ 2x + y = \frac{9}{2} \] ...... (1)

\[ 2x + y = -6 \] ...... (2)

Signs of constants on R.H.S. show that two lines lie on opp. sides of origin. Let any line through origin meets these lines in \( P \) and \( Q \) respectively then req. ratio is \( OP : OQ \)

19. (b) Total no. of points within the square \( OABC \)

\[ = 20 \times 20 = 400 \]

Points on line \( AB = 20 \) \((1, 1), (2, 2), \ldots, (20, 20)\)

\[ \Rightarrow \text{Points within } \triangle OBC \text{ and } \triangle ABC = 400 - 20 = 380 \]

By symmetry points within \( \triangle OAB = \frac{380}{2} = 190 \)

20. (c) We know that orthocentre is the meeting point of altitudes of a \( \Delta \).

Equation of alt. \( AD \)

\[ \Rightarrow \text{line parallel to } y \text{-axis through } (3, 4) \]

\[ x = 3 \] ........ (1)

Similarly eqn of \( OE \perp AB \) is

\[ y = \frac{3 - 4}{4 - 0} x \]

\[ \Rightarrow y = \frac{x}{4} \] ........ (2)

Solving (1) and (2), we get orthocentre as \((3, 3/4)\).

21. (a) \( x^2 - y^2 + 2y = 1 \Rightarrow x = \pm (y - 1) \)

Bisectors of above lines are \( x = 0 \) and \( y = 1 \).
22. (c) \[ \text{Area} = \frac{1}{2} \times 2 \times 2 = 2 \text{ sq. units.} \]

23. (b) Let the slope of line \( L \) be \( m \).

Then \[ \frac{m + \sqrt{3}}{1 - \sqrt{3}m} = \sqrt{3} \]

\[ \Rightarrow \sqrt{3}x + y = 1 \]

\( \Rightarrow \quad m + \sqrt{3} = \pm (\sqrt{3} - 3m) \)

\( \Rightarrow 4m = 0 \) or \( 2m = 2\sqrt{3} \Rightarrow m = 0 \) or \( m = \sqrt{3} \)

\( \therefore \text{L intersects x-axis,} \quad \therefore m = \sqrt{3} \)

\( \therefore \text{Equation of L is} \quad y + 2 = \sqrt{3} (x - 3) \)

or \[ \sqrt{3} x - y - (2 + 3\sqrt{3}) = 0 \]

D. MCQs with ONE or MORE THAN ONE Correct

1. \( (a, b, c) \)

For concurrency of three lines
\[ \begin{align*}
px + qy + r &= 0, \\
qx + ry + p &= 0, \\
rx + py + q &= 0
\end{align*} \]

We must have,

\[ \begin{vmatrix}
p & q & r \\
q & r & p \\
r & p & q \\
\end{vmatrix} = 0 \]

\[ \Rightarrow \quad C_1 + C_2 + C_3, \quad \frac{p+q+r}{p+q+r} q r \]

\[ \Rightarrow \quad C_1 + C_2 + C_3, \quad \frac{p+q+r}{p+q+r} p q \]

2. (e) Let \( A(0, 8/3), B(1, 3) \) and \( C(82, 30) \).

Now, slope of line \( AB = \frac{3 - \frac{8}{3}}{1 - 0} = \frac{1}{3} \)

Slope of line \( BC = \frac{30 - 3}{82 - 1} = \frac{27}{81} = \frac{1}{3} \)

\( \Rightarrow \quad AB \parallel BC \) and \( B \) is common point.

\( \Rightarrow \quad A, B, C \) are collinear.

3. (a, c) Substituting the co-ordinates of the points \( (1, 3), (5, 0) \)

and \( (-1, 2) \) in \( 3x + 2y \), we obtain the values \( 8, 15 \) and \( 1 \)

which are all +ve. Therefore, all the points lying inside the

triangle formed by given points satisfy \( 3x + 2y \geq 0 \).

Hence (a) is correct answer.

Substituting the co-ordinates of the given points

in \( 2x + y - 13 \), we find the values \( -8, -3 \) and \( -13 \) which

are all –ve.

So, (b) is not correct.

Again substituting the given points in \( 2x - 3y - 12 \) we get \( -19, -2, -20 \) which are all –ve.

It follows that all points lying inside the triangle formed

by given points satisfy \( 2x - 3y - 12 \leq 0 \).

So, (c) is the correct answer.

Finally substituting the co-ordinates of the given points

in \( -2x + y \), we get \( 1, -10 \) and \( 4 \) which are not all +ve.

So, (d) is not correct.
Hence, (a) and (c) are the correct answers.

4. (b) Consider \( \mathbf{a} = 2\mathbf{i} + j \) with respect to original axes and \( \mathbf{a} = (p+1)i + j \) with respect to new axes.

Now, as length of vector will remain the same

\[
\begin{align*}
\mathbf{a} &= \sqrt{(2p)^2 + 1} = \sqrt{(p+1)^2 + 1} \\
\Rightarrow p^2 + 2p + 2 &= 4p^2 + 1 \\
\Rightarrow 3p^2 - 2p - 1 &= 0 \\
\Rightarrow p &= 1 \text{ or } -1/3
\end{align*}
\]

\( \therefore \) (b) is the correct answer.

5. (c) \( PQRS \) will represent a parallelogram if and only if the mid-point of \( PR \) is same as that of the mid-point of \( QS \).

That is, if and only if

\[
\begin{align*}
\frac{1+5}{2} &= \frac{4+a}{2} \quad \text{and} \quad \frac{2+7}{2} = \frac{6+b}{2} \\
\Rightarrow a &= 2 \text{ and } b = 3.
\end{align*}
\]

6. (d) Slope of \( x+3y = 4 \) is \(-1/3\) and slope of \( 6x - 2y = 7 \) is \(3\).

Therefore, these two lines are perpendicular which shows that both diagonals are perpendicular. Hence \( PQRS \) must be a rhombus.

7. (a, c, d) Since the co-ordinates of the centre depend on lengths of side of \( \Delta \), it can have irrational coordinates.

8. (b, c) We know that length of intercept made by a circle on a line is given by \(2\sqrt{r^2 - p^2}\)

where \( p = \perp \text{ distance of line from the centre of the circle.} \)

Here circle is \( x^2 + y^2 - x + 3y = 0 \) with centre \( \left( \frac{1}{2}, -\frac{3}{2} \right) \)

and radius \( \frac{\sqrt{10}}{2} \)

\( L_1: y = mx \) (any line through origin)

\( L_2: x + y - 1 = 0 \) (given line)

ATQ circle makes equal intercepts on \( L_1 \) and \( L_2 \)

\[
\begin{align*}
2\left( \frac{\left( \frac{m+3}{2} \right)^2}{m^2+1} \right) &= 2\left( \frac{\left( \frac{1}{2} - \frac{3}{2} \right)^2}{2} \right) \\
\Rightarrow \frac{\left( \frac{m+3}{2} \right)^2}{m^2+1} &= 2
\end{align*}
\]

\[
\Rightarrow m^2 + 6m + 9 = 8m^2 + 8 \Rightarrow 7m^2 - 6m - 1 = 0
\]

\[
\Rightarrow 7m^2 - 7m + m - 1 = 0 \Rightarrow (7m + 1)(m - 1) = 0
\]

\[
\Rightarrow m = -\frac{1}{7} \quad \text{or} \quad m = 1
\]

\( \therefore \) The required line \( L_1 \) is \( y = x \) or \( y = \frac{-x}{7} \),

i.e., \( x - y = 0 \) or \( x + 7y = 0 \).

9. (a) The intersection point of two lines is \( \left( \frac{-c}{a+b}, \frac{-c}{a+b} \right) \)

Distance between \((1, 1)\) and \( \left( \frac{-c}{a+b}, \frac{-c}{a+b} \right) \) is less than \( 2\sqrt{2} \)

\[
\Rightarrow 2\left( 1 + \frac{c}{a+b} \right)^2 < 8 \Rightarrow \frac{1 + \frac{c}{a+b}}{a+b} < 2
\]

\[
\Rightarrow a+b-c > 0
\]

E. Subjective Problems

1. Let \( P (x, y) \) divides line segment \( AB \) in the ratio \( 1:2 \), so that \( AP = \frac{\ell}{3} \) and \( BP = 2\frac{\ell}{3} \) where \( AB = \ell \).

Then \( PN = x \) and \( PM = y \)

Let \( \angle PAM = \theta = \angle BPN \)

In \( \Delta PMA \),

\[
\sin \theta = \frac{y}{\frac{\ell}{3}} = \frac{3y}{\ell}
\]

In \( \Delta PNB \),

\[
\cos \theta = \frac{x}{2\frac{\ell}{3}} = \frac{3x}{2\ell}
\]

Now, \( \sin^2 \theta + \cos^2 \theta = 1 \)

\[
\Rightarrow \frac{9y^2}{\ell^2} + \frac{9x^2}{4\ell^2} = 1 \Rightarrow 9x^2 + 36y^2 = 4\ell^2
\]

2. Let \( A \) lies on the line \( y = x + 3 \), let the co-ordinates of \( C \) be \((\lambda, \lambda + 3)\). Also \( A (2, 1), B (3, -2) \).

Then area of \( \Delta ABC \) is given by

\[
\begin{vmatrix}
1 & 2 & 1 \\
2 & 3 & -2 \\
\lambda & \lambda + 3 & 1
\end{vmatrix} = \pm 5
\]

\[
\Rightarrow |2 (-2 - \lambda - 3) - 1 (3 - \lambda) (3\lambda + 9 + 2\lambda)| = 10
\]

\[
\Rightarrow |2\lambda - 10 - 3 + \lambda + 5\lambda + 9| = 10 \Rightarrow |4\lambda - 4| = 10
\]

\[
4\lambda - 4 = 10 \quad \text{or} \quad 4\lambda - 4 = -10
\]

\[
\Rightarrow \lambda = \frac{7}{2} \quad \text{or} \quad \lambda = -\frac{3}{2}
\]

\( \therefore \) Coordinates of \( C \) are \( \left( \frac{7}{2}, \frac{13}{2} \right) \) or \( \left( -\frac{3}{2}, -\frac{3}{2} \right) \)

3. Let side \( AB \) of rectangle \( ABCD \) lies along \( 4x + 7y + 5 = 0 \).

As \((-3, 1)\) lies on the line, let it be vertex \( A \). Now \((1, 1)\) is either vertex \( C \) or \( D \).

\[
\begin{array}{c}
D \quad C (1, 1) \\
A \quad 4x + 7y + 5 = 0 \quad B \quad (-3, 1)
\end{array}
\]

If \((1, 1)\) is vertex \( D \) then slope of \( AD = 0 \)

\( \Rightarrow AD \) is not perpendicular to \( AB \).
Straight Lines and Pair of Straight Lines

But it is a contradiction as \(ABCD\) is a rectangle.

\(\therefore\) \((1, 1)\) are the co-ordinates of vertex \(C\).

\(CD\) is a line parallel to \(AB\) and passing through \(C\), therefore equation of \(CD\) is

\[y - 1 = \frac{4}{7}(x - 1) \Rightarrow 4x + 7y - 11 = 0\]

Also \(BC\) is a line perpendicular to \(AB\) and passing through \(C\), therefore equation of \(BC\) is

\[y - 1 = \frac{7}{4}(x - 1) \Rightarrow 7x - 4y - 3 = 0\]

Similarly, \(AD\) is a line perpendicular to \(AB\) and passing through \(A (-3, 1)\), therefore equation of line \(AD\) is

\[y - 1 = \frac{7}{4}(x + 3) \Rightarrow 7x - 4y + 25 = 0\]

4. (a) \(AH \perp BC \Rightarrow m_{AH} \times m_{BC} = -1\)

\[\Rightarrow \frac{k}{h} \times \frac{3 + 1}{-2 - 5} = -1\]

\[\Rightarrow 4k - 7h = 0 \quad \text{........(1)}\]

Also, \(BH \perp AC\)

\[\Rightarrow \frac{-1}{5} \times \frac{3 - k}{-2 - h} = -1 \Rightarrow 3 - k = -10 - 5h\]

\[\Rightarrow 5h - k + 13 = 0 \quad \text{........(2)}\]

Solving (1) and (2), we get \(h = -4, k = -7\)

\(\therefore\) Third vertex is \((-4, -7)\).

(b) The given lines are \(x - 2y + 4 = 0\) \quad \text{........(1)}

and \(4x - 3y + 2 = 0\) \quad \text{........(2)}

Both the lines have constant terms of same sign.

\(\therefore\) The equation of bisectors of the angles between the given lines are

\[\frac{x - 2y + 4}{\sqrt{1 + 4}} = \pm \frac{4x - 3y + 2}{\sqrt{16 + 9}}\]

Here \(a_1a_2 + b_1b_2 > 0\) therefore, taking +ve sign on RHS, we get obtuse angle bisector as

\[(4 - \sqrt{5})x + (2\sqrt{5} - 3)y - (4\sqrt{5} - 2) = 0 \quad \text{........(3)}\]

5. The given line is \(5x - y = 1\)

\(\therefore\) The equation of line \(L\) which is perpendicular to the given line is \(x + 5y = \lambda\). This line meets co-ordinate axes at \(A (\lambda, 0)\) and \(B (0, \frac{\lambda}{5})\).

\[\therefore\] Area of \(\triangle OAB = \frac{1}{2} \times OA \times OB\]

\[\Rightarrow 5 = \frac{1}{2} \times \lambda \times \frac{\lambda}{5} \Rightarrow \lambda^2 = 5^2 \times 2 \Rightarrow \lambda = \pm 5\sqrt{2}\]

\(\therefore\) The equation of line \(L\) is \(x + 5y - 5\sqrt{2} = 0\) or \(x + 5y + 5\sqrt{2} = 0\).

6. From figure,

\[x = OA - AL = c \cos \alpha - AN \cos \alpha\]

\[\therefore c \cos \alpha - (AP \sin \alpha) \cos \alpha\]

\[= c \cos \alpha - c \sin \alpha \cos \alpha\]

\[= c \cos (1 - \sin^2 \alpha) = c \cos \alpha\]

\[y = OB - MB = c \sin \alpha - BN \sin \alpha\]

\[= c \sin \alpha - BP \cos \alpha \sin \alpha\]

\[= c \sin \alpha - c \cos \alpha \cos \sin \alpha\]

\[= c \sin \alpha (1 - \cos^2 \alpha) = c \sin \alpha\]

\(\therefore\) Locus of \((x, y)\) is \(\left(\frac{x^2}{c^3} + \frac{y^2}{c^3}\right)^{\frac{1}{3}} = 1 \text{ or } x^3 + y^3 = c^3\)

7. Slope of \(BC\) = \(\frac{a(t_1 + t_3) - a(t_2 + t_3)}{at_1t_2 - at_2t_3}\)

\[= \frac{a(t_1 + t_3) - t_2 - t_3}{a(t_3)(t_1 - t_2)} = \frac{1}{t_3}\]

\(\therefore\) Slope of \(AD = -t_3\)

\(\therefore\) Eq. of \(AD\),

\[y - a(t_1 + t_2) = -t_3(x - at_1t_2)\]

or \(x + y = a(t_1t_2 + a(t_1 + t_2))\) \quad \text{........(1)}

Similarly, by symm. equation of \(BE\) is
\[ x_1 + y = a(t_1 + t_1) + t_2 t_3 \quad \ldots (2) \]

Solving (1) and (2), we get \( x = -a \)

\[ y = a(t_1 + t_2 + t_3) + at_1 t_2 t_3 \]

\[ \therefore \text{Orthocentre } H(-a, a(t_1 + t_2 + t_3) + at_1 t_2 t_3) \]

8. Area of \( \triangle ABC \) = \[
\begin{vmatrix}
6 & 3 & 1 \\
4 & -2 & 1 \\
\end{vmatrix}
\]

\[ \frac{1}{2} |6(7) + 3(5) + 4(-2)| = \frac{49}{2} \]

Area of \( \triangle APBC \) = \[
\begin{vmatrix}
x & y & 1 \\
3 & 5 & 1 \\
4 & 2 & 1 \\
\end{vmatrix}
\]

\[ \frac{1}{2} |7x + 7y - 14 - 7x - y - 2| \]

\[ \frac{AT_3}{Ar(\triangle APBC)} = \frac{\frac{7}{2} |x + y - 2|}{\frac{49}{2}} = \frac{|x + y - 2|}{7} \]

9. Let equations of equal sides \( AB \) and \( AC \) of isosceles \( \triangle ABC \) are

\[ 7x - y + 3 = 0 \quad \ldots (1) \]

and \( x + y - 3 = 0 \quad \ldots (2) \)

The third side \( BC \) of \( \triangle \) passes through the point \((1, -10)\). Let its slope be \( m \).

\[ \text{As } AB = AC \]

\[ \therefore \quad \angle B = \angle C \]

\[ \tan B = \tan C \quad \ldots (3) \]

Now slope of \( AB = 7 \) and slope of \( AC = -1 \)

Using \( \tan \theta = \frac{m_1 - m_2}{1 + m_1 m_2} \), we get

\[ \tan B = \frac{7 - m}{1 + 7m} \quad \text{and} \quad \tan C = \frac{-1 - m}{1 - m} \]

From eq. (3), we get

\[ \frac{7 - m}{1 + 7m} = \frac{-1 - m}{1 - m} \]

\[ \Rightarrow 7 - m = \pm \frac{-1 - m}{1 - m} \]

Taking '+' sign, we get

\[ (7 - m)(1 - m) = - (1 + m)(1 + 7m) \]

\[ 7 - 8m + m^2 + 7m^2 + 8m + 1 = 0 \]

\[ 8m^2 + 8 = 0 \quad \Rightarrow m^2 + 1 = 0 \]

It has no real solution.

\[ \text{Topic-wise Solved Papers - MATHEMATICS} \]

Taking '-' sign, we get

\[ (7 - m)(1 - m) = (1 + m)(1 + 7m) \]

\[ 7 - 8m + m^2 - 7m^2 - 8m - 1 = 0 \]

\[ -6m^2 - 16m + 6 = 0 \quad \Rightarrow 3m^2 + 8m - 3 = 0 \]

\[ (3m - 1)(m + 3) = 0 \quad \Rightarrow m = 1/3, -3 \]

\[ \therefore \text{The required line is} \]

\[ y + 10 = \frac{1}{3}(x - 1) \quad \text{or} \quad y + 10 = -3(x - 1) \]

i.e. \( x - 3y - 31 = 0 \) or \( 3x + y + 7 = 0 \)

10. Let \( O \) be the centre of the circle. \( M \) is the mid point of \( AB \). Then

\[ OM \perp AB \]

Let \( OM \) when produced meets the circle at \( P \) and \( Q \).

\[ P \]

\[ M \]

\[ Q \]

\[ (-3, 4) \]

\[ (5, 4) \]

\[ (-3 + 5, 4 + 4) \]

\[ (1, 4) \]

\[ M = \left( \frac{-3 + 5}{2}, \frac{4 + 4}{2} \right) = (1, 4) \]

Slope of \( AB = \frac{4 - 4}{5 + 3} = 0 \)

\[ \therefore \text{\( PQ \), being perpendicular to \( AB \), is a line parallel to} \ y \text{-axis passing through (1, 4).} \]

\[ \therefore \text{Its equation is} \]

\[ x = 1 \quad \ldots (1) \]

Also eq. of one of the diameter given is

\[ 4y = x + 7 \quad \ldots (2) \]

Solving (1) and (2), we get co-ordinates of centre \( O \)

\( O(1, 2) \)

Also let co-ordinates of \( D \) be \( (a, \beta) \)

Then \( O \) is mid point of \( BD \), therefore

\[ \left( \frac{a + 5}{2}, \frac{\beta + 4}{2} \right) = (1, 2) \quad \Rightarrow a = -3, \beta = 0 \]

\[ \therefore D(-3, 0) \]

Using the distance formula we get

\[ AD = \sqrt{(-3 + 3)^2 + (4 - 0)^2} = 4 \]

\[ AB = \sqrt{(5 + 3)^2 + (4 - 4)^2} = 8 \]

\[ \therefore \text{Area of rectangle} ABCD = AB \times AD = 8 \times 4 = 32 \text{ square units.} \]

11. A being on y-axis, may be chosen as \((0, a)\).
The diagonals intersect at \( P(1, 2) \).
Again we know that diagonals will be parallel to the angle bisectors of the two sides \( y = x + 2 \) and \( y = 7x + 3 \)
\[
\frac{x - y + 2}{\sqrt{2}} = \pm \frac{7x - y + 3}{5\sqrt{2}}
\]
\[
\Rightarrow 5x - 5y + 10 = \pm (7x - y + 3)
\]
\[
\Rightarrow 2x + 4y - 7 = 0 \quad \text{and} \quad 12x - 6y + 13 = 0
\]
\[
m_1 = -\frac{1}{2} \quad \quad m_2 = \frac{2}{3}
\]
Let diagonal \( d_1 \) be parallel to \( 2x + 4y - 7 = 0 \) and diagonal \( d_2 \) be parallel to \( 12x - 6y + 13 = 0 \). The vertex \( A \) could be on any of the two diagonals. Hence slope of \( AP \) is either \(-1/2\) or \( 2 \).

\[
\Rightarrow \frac{2 - a}{1 - 0} = 2 \quad \quad \text{or} \quad \quad \frac{-1}{2}
\]

\[
\Rightarrow a = 0 \quad \quad \text{or} \quad \quad \frac{5}{2}
\]
\[
\therefore \quad A \text{ is } (0, 0) \text{ or } (0, 5/2)
\]

**12.** Let the equation of other line \( L \), which passes through the point of intersection \( P \) of lines

\[
L_1 = ax + by + c = 0 \quad \quad \text{.........(1)}
\]

and

\[
L_2 = \ell x + my + n = 0 \quad \quad \text{.........(2)}
\]

be

\[
L_1 + \lambda L_2 = 0
\]

i.e. \((ax + by + c) + \lambda(\ell x + my + n) = 0 \quad \quad \text{.........(3)}
\]

From figure it is clear that \( L_1 \) is the bisector of the angle between the lines given by (2) and (3) [i.e. \( L_2 \) and \( L \)]

Let \( M(\alpha, \beta) \) be any point on \( L_1 \) then

\[
a \alpha + b \beta + c = 0 \quad \quad \text{.........(4)}
\]

Also from \( M \), lengths of perpendiculars to lines \( L \) and \( L_2 \) given by equations (3) and (4), are equal

\[
\frac{\ell \alpha + m \beta + n}{\sqrt{\ell^2 + m^2}} = \pm \frac{(a \alpha + b \beta + c) + \lambda (a \alpha + m \beta + n)}{\sqrt{(a + \lambda)^2 + (b + \lambda m)^2}}
\]

\[
\Rightarrow \frac{1}{\sqrt{\ell^2 + m^2}} = \pm \frac{\lambda}{\sqrt{(\ell^2 + m^2) \lambda^2 + 2(a \ell + bm) \lambda + (a^2 + b^2)}}
\]

[Using 4]

\[
\Rightarrow \ell^2 + m^2 \lambda^2 + 2(a \ell + bm) \lambda + (a^2 + b^2) = \lambda^2 (\ell^2 + m^2)
\]

\[
\Rightarrow \lambda = -\frac{a^2 + b^2}{2(a \ell + bm)}
\]

Substituting this value of \( \lambda \) in eq. (3), we get \( L \) as

\[
(ax + by + c) - \frac{(a^2 + b^2)}{2(a \ell + bm)} (\ell x + my + n) = 0
\]

\[
\Rightarrow (a^2 + b^2)(\ell x + my + n) - 2(a \ell + bm)(ax + by + c) = 0
\]

**13.** Let \( BC \) be taken as \( x \)-axis with origin at \( D \), the mid-point of \( BC \), and \( DA \) will be \( y \)-axis.

Let \( BC = 2a \), then the co-ordinates of \( B \) and \( C \) are \((-a, 0)\) and \((a, 0)\).

Let \( DA = h \), so that co-ordinates of \( A \) are \((0, h)\).

Then equation of \( AC \) is \( \frac{x}{a} + \frac{y}{h} = 1 \) \quad \quad \text{.........(1)}

And equation of \( DE \perp \) to \( AC \) and passing through origin is

\[
\frac{x}{h} + \frac{y}{a} = 0 \Rightarrow x = \frac{hy}{a} \quad \quad \text{.........(2)}
\]

Solving (1) and (2) we get the co-ordinates of pt \( E \) as follows

\[
\frac{hy}{a^2} + \frac{y}{h} = 1 \Rightarrow h^2 y + a^2 y = a^2 h
\]

\[
\Rightarrow y = \frac{a^2 h}{a^2 + h^2} \Rightarrow x = \frac{ah^2}{a^2 + h^2}
\]

\[
\therefore \quad \quad E\left(\frac{ah^2}{a^2 + h^2}, \frac{a^2 h}{a^2 + h^2}\right)
\]

Since \( F \) is mid pt. of \( DE \), therefore, its co-ordinates are

\[
F\left(\frac{ah^2}{2(a^2 + h^2)}, \frac{a^2 h}{2(a^2 + h^2)}\right)
\]

\[
\therefore \quad \text{Slope of } \quad AF = \frac{h - \frac{ah^2}{a^2 + h^2}}{\frac{2h(a^2 + h^2) - a^2 h}{-ah^2}} = \frac{2h(a^2 + h^2) - a^2 h}{-ah^2}
\]

\[
\Rightarrow m_1 = \frac{-a^2 + 2h^2}{ah} \quad \quad \text{.........(i)}
\]

And slope of \( BE = \frac{a^2 h}{a^2 + h^2 - 0} = \frac{a^2 h}{ah^2 + a + h^2}
\]

\[
\Rightarrow m_2 = \frac{ah}{a^2 + 2h^2} \quad \quad \text{.........(ii)}
\]
From (i) and (ii), we observe that 
\[ m_1m_2 = -1 \Rightarrow AF \perp BE. \]  
Hence Proved.

14. The given st. lines are \(3x + 4y = 5\) and \(4x - 3y = 15\). Clearly these st. lines are perpendicular to each other \((m_1m_2 = -1)\), and intersect at \(A\). Now \(B\) and \(C\) are pts on these lines such that \(AB = AC\) and \(BC\) passes through \((1, 2)\).

From fig. it is clear that
\[ \angle B = \angle C = 45^\circ \]

Let slope of \(BC\) be \(m\). Then using
\[ \tan 45^\circ = \left| \frac{m + 3/4}{1 - 3/4m} \right| \]
\[ \Rightarrow 4m + 3 = \pm (4 - 3m) \]
\[ \Rightarrow 4m + 3 = 4 - 3m \text{ or } 4m + 3 = -4 + 3m \]
\[ \Rightarrow m = 1/7 \text{ or } m = -7 \]
\[ \therefore \text{ Eq. of } BC \text{ is, } y - 2 = \frac{1}{7}(x - 1) \]
or \[ y - 2 = -7(x - 1) \]
\[ \Rightarrow 7y - 14 = x - 1 \text{ or } y - 2 = -7x + 7 \]
\[ \Rightarrow x - 7y + 13 = 0 \text{ or } 7x + y - 9 = 0 \]

15. Eq. of the line \(AB\) is
\[ \frac{x}{7} + \frac{y}{5} = 1 \quad [A(7, 0), B(0, -5)] \]
\[ \Rightarrow 5x - 7y - 35 = 0 \]

Eq. of line \(PQ \perp AB\) is \(7x + 5y + \lambda = 0\) which meets axes of \(x\) and \(y\) at pts \(P(-\lambda/7, 0)\) and \(Q(0, -\lambda/5)\) resp.

Eq. of \(AQ\) is,
\[ \frac{x}{\lambda} + \frac{y}{-\lambda/5} = 1 \Rightarrow \lambda x - 35y - 7\lambda = 0 \]  
.........(2)

Eq. of \(BP\) is,
\[ \frac{-7x}{\lambda} + \frac{y}{5} = 1 \Rightarrow 35x + \lambda y + 5\lambda = 0 \]  
.........(3)

Topic-wise Solved Papers - MATHEMATICS

Locus of \(R\) the pt. of intersection of (2) and (3) can be obtained by eliminating \(\lambda\) from these eq. 's, as follows
\[ 35x + (5 + y)\left(\frac{35y}{x - 7}\right) = 0 \]
\[ \Rightarrow 35x(x - 7) + 35y(5 + y) = 0 \Rightarrow x^2 + y^2 - 7x + 5y = 0 \]

16. Let the equation of line through \(A\) which makes an intercept of 2 units between.
\[ 2x + y = 3 \quad \text{.........(1)} \]
\[ \text{and } \quad 2x + y = 5 \quad \text{.........(2)} \]
\[ \text{be } \frac{x - 2}{\cos \theta} = \frac{y - 3}{\sin \theta} = r \]

Let \(AP = r\) then \(AQ = r + 2\)

Then for pt \(P(x_1, y_1)\),
\[ \frac{x_1 - 2}{\cos \theta} = \frac{y_1 - 3}{\sin \theta} = r \Rightarrow \frac{2(x_1 - 2) + (y_1 - 3)}{2\cos \theta + \sin \theta} = r \]
\[ \left( \frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{\lambda a_1 + \mu b_1}{\lambda a_2 + \mu b_2} \right) \]
\[ \Rightarrow \left( \frac{2x_1 + y_1 - 7}{2\cos \theta + \sin \theta} = r \Rightarrow \frac{5 - 7}{2\cos \theta + \sin \theta} = r \right) \]
[Using \(2x_1 + y_1 = 5\) as \(P(x_1, y_1)\) lies on \(2x + y = 5\)]
\[ \Rightarrow \frac{-2}{2\cos \theta + \sin \theta} = r \quad \text{.........(i)} \]

For pt \(Q(x_2, y_2)\),
\[ \frac{x_2 - 2}{\cos \theta} = \frac{y_2 - 3}{\sin \theta} = r + 2 \]
\[ \Rightarrow \frac{2(x_2 - 2) + (y_2 - 3)}{2\cos \theta + \sin \theta} = r + 2 \]
\[ \Rightarrow \frac{-4}{2\cos \theta + \sin \theta} = r + 2 \quad \text{.........(ii)} \]

\(\text{Subtracting (ii) from (i)}\)
\[ \Rightarrow \frac{-2}{2\cos \theta + \sin \theta} = 2 \]
\[ \Rightarrow 2\cos \theta + \sin \theta = -1 \quad \text{.........(3)} \]
\[ \Rightarrow 2\cos \theta = -1 \quad (1 + \sin \theta) \]

Squaring on both sides, we get
\[ 4\cos^2 \theta = 1 + 2\sin \theta + \sin^2 \theta \]
\[ (5\sin \theta - 3)(\sin \theta + 1) = 0 \Rightarrow \sin \theta = 3/5, -1 \]
\[ \cos \theta = -4/5, 0 \]  
[Using eq. (3)]
17. The given curve is 
\[ 3x^2 - y^2 - 2x + 4y = 0 \quad \ldots (1) \]
Let \( y = mx + c \) be the chord of curve (1) which subtends an angle of 90° at origin.
Then the combined equation of lines joining points of intersection of curve (1) and chord \( y = mx + c \) to the origin, can be obtained by making the eq. of curve homogeneous with the help of eq. of chord, as follows.

\[ 3x^2 - y^2 - 2x \left( \frac{y - mx}{c} \right) + 4y \left( \frac{y - mx}{c} \right) = 0 \]
\[ \Rightarrow (3c + 2m)x^2 - 2(1 + 2m)xy + (4 - c)y^2 = 0 \]
As the lines represented by this pair are perpendicular to each other, therefore we must have
\[ \text{coeff. of } x^2 + \text{coeff. of } y^2 = 0 \]
\[ \Rightarrow 3c + 2m + 4 - c = 0 \]
\[ \Rightarrow -2m + 4 - c = 0 \]
\[ \Rightarrow -2 = m \quad \text{and} \quad c \]
Which on comparison with eq. of chord, implies that \( y = mx + c \) passes though \((1, -2)\).
Hence the family of chords must pass through \((1, -2)\).

18. The points of intersection of given lines are

\[ A \left( \frac{1}{3}, \frac{1}{9} \right), B(-7, 5), C \left( \frac{5}{4}, \frac{7}{8} \right) \]

If \((\alpha, \alpha^2)\) lies inside the \( \Delta \) formed by the given lines, then

\[ \left( \frac{1}{3}, \frac{1}{9} \right) \quad \text{and} \quad (\alpha, \alpha^2) \quad \text{lie on the same side of the line } x + 2y - 3 = 0 \]
\[ \Rightarrow \frac{\alpha + 2\alpha^2 - 3}{1 + 2 - 3} > 0 \Rightarrow 2\alpha^2 + \alpha - 3 < 0 \ldots (1) \]

Similarly \( \left( \frac{5}{4}, \frac{7}{8} \right) \) and \((\alpha, \alpha^2)\) lie on the same side of the line
\[ 2x + 3y - 1 = 0. \]
\[ \Rightarrow \frac{2\alpha + 3\alpha^2 - 1}{10 + 21 - 1} > 0 \Rightarrow 3\alpha^2 + 2\alpha - 1 > 0 \ldots (2) \]

\( (-7, 5) \) and \((\alpha, \alpha^2)\) lie on the same side of the line
\[ 5x - 6y - 1 = 0. \]

\[ \Rightarrow \frac{5\alpha + 6\alpha^2 - 1}{-35 - 30 - 1} > 0 \Rightarrow 6\alpha^2 - 5\alpha + 1 > 0 \ldots (3) \]

Now common solution of (1), (2) and (3) can be obtained as in the previous method,
\[ \alpha \in \left( -1, -\frac{1}{2} \right) \cup \left( 1, \frac{1}{2} \right) \]

19. The given curve is
\[ y = x^3 \quad \ldots (1) \]
Let the pt, \( P_1 \) be \((t, t^3)\), \( t \neq 0 \)
Then slope of tangent at \( P_1 \) is \( \frac{dy}{dx} = (3x^2)_{x=t} = 3t^2 \)
\[ \therefore \text{Equation of tangent at } P_1 \text{ is } y - t^3 = 3t^2 (x - t) \Rightarrow y = 3t^2 x - 2t^3 \]
\[ \Rightarrow 3t^2 x - y - 2t^3 = 0 \]

Now this tangent meets the curve again at \( P_2 \) which can be obtained by solving (1) and (2)
\[ 3t^2 x - y - 2t^3 = 0 \quad \text{and} \quad x^3 - 2t^2 x + 2t^3 = 0 \]
\[ (x - t)^2 (x + 2t) = 0 \Rightarrow x = -2t \text{ as } x = t \text{ is for } P_1 \]
\[ \therefore y = -8t^3 \]

Hence \( P_2 \) is \((-2t, -8t^3)\) \( (t_1, t_1^3) \) say.
Similarly, we can find that tangent at \( P_2 \) which meets the curve again at \( P_3 \) \((2t_1, -8t_3)\) i.e., \((4t, 64t^3)\).
Similarly, \( P_4 \) \((-8t, -512t^3)\) and so on.

We observe that absicissae of pts. \( P_1, P_2, P_3, \ldots \) are \( t, -2t, 4t, \ldots \) which form a GP with common ratio \( -2 \). Also ordinate of these pts. \( t^3, -8t^3, 64t^3, \ldots \) also form a GP with common ratio \( -8 \).

\begin{align*}
\text{Now,} \quad \frac{Ar(\Delta P_1 P_2 P_3)}{Ar(\Delta P_2 P_3 P_4)} &= \begin{vmatrix}
1 & t & t^3 \\
1 & -2t & -8t^3 \\
1 & 4t & 64t^3
\end{vmatrix} \\
&= \frac{1}{16} \text{ sq. units.}
\end{align*}

20. Let \( \theta \) be the inclination of line through \( A(-5, -4) \). Therefore equation of this line is
\[
\frac{x+5}{\cos \theta} = \frac{y+4}{\sin \theta} = r_1, r_2, r_3
\]
\[
\Rightarrow B (r_1 \cos \theta - 5, r_1 \sin \theta - 4) \\
C (r_2 \cos \theta - 5, r_2 \sin \theta - 4) \\
D (r_3 \cos \theta - 5, r_3 \sin \theta - 4)
\]
But \(B\) lies on \(x + 3y + 2 = 0\), therefore
\[
r_1 \cos \theta - 5 + 3r_1 \sin \theta - 12 + 2 = 0
\]
\[
\Rightarrow \eta = \frac{15}{\cos \theta + 3 \sin \theta} = AB
\]
\[
\Rightarrow \frac{15}{AB} = \cos \theta + 3 \sin \theta \quad \cdots (1)
\]
As \(C\) lies on \(2x + y + 4 = 0\), therefore
\[
2 (r_2 \cos \theta - 5) + (r_2 \sin \theta - 4) + 4 = 0
\]
\[
\Rightarrow r_2 = \frac{10}{2 \cos \theta + \sin \theta} = AC
\]
\[
\Rightarrow \frac{10}{AC} = 2 \cos \theta + \sin \theta \quad \cdots (2)
\]
Similarly \(D\) lines on \(x - y - 5 = 0\), therefore
\[
r_3 \cos \theta - 5 - r_3 \sin \theta + 4 - 5 = 0
\]
\[
\Rightarrow r_3 = \frac{6}{\cos \theta - \sin \theta} = AD
\]
\[
\Rightarrow \frac{6}{AD} = \cos \theta - \sin \theta \quad \cdots (3)
\]
Now, \(ATQ, \frac{(\frac{15}{AB})^2 + (\frac{10}{AC})^2}{(\frac{6}{AD})^2} = \) [Using (1), (2) and (3)]
\[
\Rightarrow (\cos \theta + 3 \sin \theta)^2 + (2 \cos \theta + \sin \theta)^2 = (\cos \theta - \sin \theta)^2
\]
\[
\Rightarrow 4 \cos^2 \theta + 9 \sin^2 \theta + 12 \sin \theta \cos \theta = 0
\]
\[
\Rightarrow 2 \cos \theta + 3 \sin \theta = 0
\]
\[
\Rightarrow \tan \theta = -\frac{2}{3}
\]
\[
\therefore \text{Equation of req. line is } y + 4 = -\frac{2}{3} (x + 5)
\]
\[
\Rightarrow 2x + 3y + 22 = 0
\]
\[
21. \quad \text{Let the co-ordinates of } Q \text{ be } (b, \alpha) \text{ and that of } S \text{ be } (-b, \beta). \text{ Let } PR \text{ and } SQ \text{ intersect each other at } G.
\]
\[
\therefore \quad \text{G is the mid pt of } SQ.
\]
\[
\therefore \quad \text{x co-ordinates of } G \text{ must be } a.
\]
Let the co-ordinates of \(R\) be \((h, k)\).
\[
\therefore \quad \text{The x-coordinates of } P \text{ is } -h
\]
\[
(\because \text{G is the mid point of } PR)
\]
As \(P\) lies on \(y = a\), therefore coordinates of \(P\) are \((-h, a)\).

\[
\text{Topic-wise Solved Papers - MATHEMATICS}
\]
\[
\therefore \quad \text{PQ is parallel to } y = mx, \quad \text{Slope of } PQ = m
\]
\[
\therefore \quad \frac{\alpha - a}{b + h} = m \Rightarrow \alpha = a + m(b + h) \quad \cdots (1)
\]
Also \(RQ \perp PQ \Rightarrow \)
\[
\therefore \quad \text{Slope of } RQ = \frac{-1}{m}
\]
\[
\therefore \quad \frac{k - \alpha}{h - b} = \frac{-1}{m} \Rightarrow \alpha = k + \frac{1}{m} (h - b) \quad \cdots (2)
\]
From (1) and (2) we get
\[
a + m(b + h) = k + \frac{1}{m} (h - b)
\]
\[
\Rightarrow (m^2 - 1) h - mk + b (m^2 + 1) + am = 0
\]
\[
\therefore \quad \text{Locus of vertex } R(h, k) \text{ is }
\]
\[
(m^2 - 1) x - my + b (m^2 + 1) + am = 0
\]
\[
22. \quad \text{Let } A(x_1, y_1), B(x_2, y_2), C(x_3, y_3) \text{ be the vertices of } \Delta ABC
\]
\[
\therefore \quad \text{Then equation of alt. } AD \text{ is }
\]
\[
y - y_1 = \frac{x_2 - x_3}{y_2 - y_3} (x - x_1)
\]
or \((x - x_1) (x_2 - x_3) + (y - y_1) (y_2 - y_3) = 0 \quad \cdots (1)
\]
Similarly equations of other two attitudes are
\[
(x - x_2) (x_3 - x_1) + (y - y_2) (y_3 - y_1) = 0 \quad \cdots (2)
\]
and \((x - x_3) (x_1 - x_2) + (y - y_3) (y_1 - y_2) = 0 \quad \cdots (3)
\]
Now, above three lines will be concurrent if
\[
\begin{vmatrix}
(x_2 - x_3) & y_2 - y_3 & -x_1 (x_2 - x_3) - y_1 (y_2 - y_3) \\
(x_3 - x_1) & y_3 - y_1 & -x_2 (x_3 - x_1) - y_2 (y_3 - y_1) \\
x_1 - x_2 & y_1 - y_2 & -x_3 (x_1 - x_2) - y_3 (y_1 - y_2)
\end{vmatrix} = 0
\]
\[
\begin{vmatrix}
(x_2 - x_3) & y_2 - y_3 & -x_1 (x_2 - x_3) - y_1 (y_2 - y_3) \\
(x_3 - x_1) & y_3 - y_1 & -x_2 (x_3 - x_1) - y_2 (y_3 - y_1) \\
x_1 - x_2 & y_1 - y_2 & -x_3 (x_1 - x_2) - y_3 (y_1 - y_2)
\end{vmatrix} = 0
\]
On L.H.S.
Operating \(R_1 + R_2 + R_3, R_1 \) becomes row of zeros.
\[
\therefore \quad \text{Value of determinant } = 0 = \text{R.H.S.}
\]
Hence the altitudes are concurrent.

23. \quad \text{Let } P(h, k) \text{ be a general point in the first quadrant such that } d(P, A) = d(P, O)
\[
\Rightarrow |h - 3| + |k - 2| = |h| + |k| = h + k \quad \cdots (1)
\]
[h and k are + ve, pt (h, k) being in I quadrant.]

If \(h < 3, k < 2\) then \((h, k)\) lies in region I.
It \(h > 3, k < 2, (h, k)\) lies in region II.
If \(h > 3, k > 2, (h, k)\) lies in region III.
Straight Lines and Pair of Straight Lines

If \( h < 3, k > 2 \) \((h, k)\) lies in region IV.

In region I, eq. (1)

\[ 3 - h + 2 - k = h + k \Rightarrow h + k = \frac{5}{2} \]

In region II, eq. (1) becomes

\[ h - 3 + 2 - k = h + k \Rightarrow k = -\frac{1}{2} \text{ not possible.} \]

In region III, eq. (1) becomes

\[ h - 3 + k - 2 = h + k \Rightarrow -5 = 0 \text{ not possible.} \]

In region IV, eq. (1) becomes

\[ 3 - h + k - 2 = h + k \Rightarrow h = 1/2 \]

\( \Rightarrow \) Hence required set consists of line segment \( x + y = 5/2 \)

of finite length as shown in the first region and the ray \( x = 1/2 \)

in the fourth region.

24. Let the co-ordinates of the vertices of the \( \Delta ABC \) be \( A(a_1, b_1), B(a_2, b_2) \) and \( C(a_3, b_3) \) and co-ordinates of the vertices of the \( \Delta PQR \) be

\[ P(x_1, y_1), B(x_2, y_2) \text{ and } R(x_3, y_3) \]

Slope of \( QR = \frac{y_2 - y_3}{x_2 - x_3} \)

\( \Rightarrow \) Slope of straight line perpendicular to \( QR \)

\[ QR = \frac{x_2 - x_3}{y_2 - y_3} \]

Equation of straight line passing through \( A(a_1, b_1) \) and perpendicular to \( QR \) is

\[ y - b_1 = \frac{x_2 - x_3}{y_2 - y_3} (x - a_1) \]

\( \Rightarrow \) \( (x_2 - x_3)x + (y_2 - y_3)y - a_1(x_2 - x_3) - b_1(y_2 - y_3) = 0 \) \( \ldots (1) \)

Similarly equation of straight line from \( B \) and perpendicular to \( PR \) is

\( (x_3 - x_2)x + (y_3 - y_2)y - a_2(x_3 - x_2) - b_2(y_3 - y_2) = 0 \) \( \ldots (2) \)

and eqn \( 8 \) of straight line from \( C \) and perpendicular to \( PQ \) is

\( (x_1 - x_2)x + (y_1 - y_2)y - a_3(x_1 - x_2) - b_3(y_1 - y_2) = 0 \) \( \ldots (3) \)

As straight lines \( (1), (2) \) and \( (3) \) are given to be concurrent, we should have

\[
\begin{vmatrix}
x_2 - x_3 & y_2 - y_3 & a_1(x_2 - x_3) + b_1(y_2 - y_3) \\
x_3 - x_1 & y_3 - y_1 & a_2(x_3 - x_1) + b_2(y_3 - y_1) \\
x_1 - x_2 & y_1 - y_2 & a_3(x_1 - x_2) + b_3(y_1 - y_2)
\end{vmatrix} = 0
\]

Operating \( R_1 \rightarrow R_1 + R_2 + R_3 \), we get

\[
\begin{vmatrix}
0 & 0 & S \\
x_3 - x_1 & y_3 - y_1 & a_2(x_3 - x_1) + b_2(y_3 - y_1) \\
x_1 - x_2 & y_1 - y_2 & a_3(x_1 - x_2) + b_3(y_1 - y_2)
\end{vmatrix} = 0
\]

where

\[
S = a_1(x_2 - x_3) + b_1(y_2 - y_3) + a_2(x_3 - x_1) + b_2(y_3 - y_1) + a_3(x_1 - x_2) + b_3(y_1 - y_2)
\]

Expanding along \( R_1 \)

\[
[(x_3 - x_1)(y_1 - y_2) - (x_1 - x_2)(y_3 - y_1)] S = 0
\]

\[
\Rightarrow \begin{vmatrix}
y_1 - y_2 & y_3 - y_1 & x_1 - x_2 \\
x_1 - x_2 & x_3 - x_1 & y_1 - y_2
\end{vmatrix} = 0
\]

\[
\Rightarrow [m_{PQ} - m_{PR}] S = 0 \Rightarrow S = 0
\]

\[
[m_{PQ} - m_{PR}] \parallel PR
\]

which is not possible in \( \Delta PQR \)

\[
\Rightarrow a_1(x_2 - x_3) + b_1(y_2 - y_3) + a_2(x_3 - x_1) + b_2(y_3 - y_1) + a_3(x_1 - x_2) + b_3(y_1 - y_2) = 0 \ldots (5)
\]

\[
\Rightarrow x_1(a_3 - a_2) + y_1(b_3 - b_2) + x_2(a_1 - a_3) + y_2(b_1 - b_3) + x_3(a_2 - a_1) + y_3(b_2 - b_1) = 0 \ldots (6)
\]

(Rearranging the equation \( 5 \))

But above condition shows

\[
\begin{vmatrix}
a_3 - a_2 & b_3 - b_2 & x_1(a_3 - a_2) + y_1(b_3 - b_2) \\
a_1 - a_3 & b_1 - b_3 & x_2(a_1 - a_3) + y_2(b_1 - b_3) \\
a_2 - a_1 & b_2 - b_1 & x_3(a_2 - a_1) + y_3(b_2 - b_1)
\end{vmatrix} = 0 \ldots (7)
\]

(Using the fact that as \( 4 \) \( \Leftrightarrow \) \( 5 \) in the same way \( 6 \) \( \Leftrightarrow \) \( 7 \))

Clearly equation \( 7 \) shows that lines through \( P \) and perpendicular to \( BC \), through \( Q \) and perpendicular to \( AB \) are concurrent.

Hence Proved.

25. \( C_1 \rightarrow aC_1 \)

\[
\Delta = \frac{1}{a} \begin{vmatrix}
a^2 - ab - ac & bx + ay & cx + a \\
abx + a^2y & -ax + by - c & cy + b \\
acx + a^2 & cy + b & -ax - by + c
\end{vmatrix}
\]

Applying \( C_1 \rightarrow C_1 + bC_2 + cC_3 \)

\[
\Delta = \frac{1}{a} \begin{vmatrix}
(a^2 + b^2 + c^2)x & ay + bx & cx + a \\
(a^2 + b^2 + c^2)y & by - cx - ax & cy + b \\
(a^2 + b^2 + c^2) & b + cy & -ax - by + c
\end{vmatrix}
\]

\[
= \frac{1}{a} \begin{vmatrix}
x & ay + bx & cx + a \\
ay + bx & cx + a \\
1 & b + cy & c - ax - by
\end{vmatrix}
\]

as \( a^2 + b^2 + c^2 = 1 \)

\[
C_2 \rightarrow C_2 - bC_1 \text{ and } C_3 \rightarrow C_3 - cC_1
\]

then \( \Delta = \frac{1}{a} \begin{vmatrix}
x & ay & a \\
y & -c - ax & b \\
1 & cy & -ax - by
\end{vmatrix}
\]

\[
= \frac{1}{ax} \begin{vmatrix}
x^2 & axy & ax \\
y & -c - ax & b \\
1 & cy & -ax - by
\end{vmatrix}
\]

\[
R_1 \rightarrow R_1 + yR_2 + R_3
\]

\[
\Delta = \frac{1}{ax} \begin{vmatrix}
x^2 + y^2 + 1 & 0 & 0 \\
y & -c - ax & b \\
1 & cy & -ax - by
\end{vmatrix}
\]
On expanding along $R_1$
\[ \Delta = \frac{(x^2+y^2+1)}{ax+by+c} \]
\[ = \frac{(x^2+y^2+1)}{(ax+by+c)} \]
Given $\Delta = 0$
\[ \Rightarrow ax + by + c = 0, \text{which represents a straight line.} \]
\[ \therefore x^2+y^2+1 \neq 0, \text{being +ve}. \]

26. The line $y = mx$ meets the given lines in
\[ P \left( \frac{1}{m+1}, \frac{m}{m+1} \right) \text{ and } Q \left( \frac{3}{m+1}, \frac{3m}{m+1} \right) \]
Hence equation of $L_1$ is
\[ y - \frac{m}{m+1} = 2 \left( x - \frac{1}{m+1} \right) \]
\[ \Rightarrow y - 2x - 1 = \frac{-3}{m+1} \]
and that of $L_2$ is
\[ y - \frac{3m}{m+1} = \frac{6}{m+1} \]
\[ \Rightarrow y + 3x - 3 = \frac{6}{m+1} \]
From (1) and (2)
\[ \frac{y - 2x - 1}{y + 3x - 3} = \frac{-1}{2} \]
\[ \Rightarrow x - 3y + 5 = 0 \text{ which is a straight line.} \]

27. Let the equation of the line be
\[ (y - 2) = m(x - 8) \text{ where } m < 0 \]
\[ \Rightarrow P \left( 8 - \frac{2}{m}, 0 \right) \text{ and } Q \left( 0, 2 - 8m \right) \]
Now, $OP + OQ = \left| 8 - \frac{2}{m} \right| + \left| 2 - 8m \right|$
\[ = 10 + \frac{2}{m} + 8(-m) \geq 10 + \frac{2}{m} + 8(-m) \geq 18 \]

28. A line passing through $P(h, k)$ and parallel to $x$-axis is
\[ y = k \]
The other two lines given are
\[ y = x \]
and
\[ x + y = 2 \]
Let $ABC$ be the $\Delta$ formed by the points of intersection of the lines (1), (2) and (3), as shown in the figure.

The required region is the shaded region in the figure given below.
1. (a) \( AB = \sqrt{(4+1)^2 + (0+1)^2} = \sqrt{26} \);
\[ BC = \sqrt{(3+1)^2 + (5+1)^2} = \sqrt{52} \]
\[ CA = \sqrt{(4-3)^2 + (0-5)^2} = \sqrt{26} \]
In isosceles triangle side \( AB = CA \)
For right angled triangle, \( BC^2 = AB^2 + AC^2 \)
So, \( BC = \sqrt{52} \) or \( BC^2 = 52 \)
or \( \sqrt{26}^2 + \sqrt{26}^2 = 52 \)
So, the given triangle is right angled and also isosceles
2. (d) Equation of \( AB \) is
\[ x \cos \alpha + y \sin \alpha = p; \]
\[ \Rightarrow \frac{x \cos \alpha + y \sin \alpha}{p} = 1; \]
\[ \Rightarrow \frac{x}{p / \cos \alpha} + \frac{y}{p / \sin \alpha} = 1 \]
So co-ordinates of \( A \) and \( B \) are
\( \left( \frac{p}{\cos \alpha}, 0 \right) \) and \( \left( 0, \frac{p}{\sin \alpha} \right) \);
So coordinates of midpoint of \( AB \) are
\( \left( \frac{p}{2 \cos \alpha}, \frac{p}{2 \sin \alpha} \right) = (x_1, y_1) \);
\[ x_1 = \frac{p}{2 \cos \alpha} \] and \( y_1 = \frac{p}{2 \sin \alpha} ; \]
\[ \Rightarrow \cos \alpha = \frac{p}{2x_1} \] and \( \sin \alpha = \frac{p}{2y_1} ; \]
\[ \cos^2 \alpha + \sin^2 \alpha = 1 \Rightarrow \frac{p^2}{4 \left( \frac{1}{x_1^2} + \frac{1}{y_1^2} \right)} = 1 \]
Locus of \((x_1, y_1)\) is \( \frac{1}{x^2} + \frac{1}{y^2} = \frac{4}{p^2} \).
3. (a) Put \( x = 0 \) in the given equation
\[ \Rightarrow by^2 + 2fy + c = 0. \]
For unique point of intersection \( f^2 - bc = 0 \)
\[ \Rightarrow a^2 - abc = 0. \]
Since \( abc + 2fgh - a^2 - bg^2 - ch^2 = 0 \)
\[ \Rightarrow 2fgh - bg^2 - ch^2 = 0 \]
4. (a) \( 3a + a^2 - 2 = 0 \Rightarrow a^2 + 3a - 2 = 0 \);
\[ \Rightarrow a = \frac{-3 \pm \sqrt{9+8}}{2} = \frac{-3 \pm 17}{2} \]
5. (a) Co-ordinates of \( A = (a \cos \alpha, a \sin \alpha) \)
Equation of \( OB \),
\[ y = \tan \left( \frac{\pi}{4} + \alpha \right) x \]
\[ CA \perp \text{to } OB \]
\[ \therefore \text{ slope of } CA = -\cot \left( \frac{\pi}{4} + \alpha \right) \]
Equation of \( CA \)
\[ y - a \sin \alpha = -\cot \left( \frac{\pi}{4} + \alpha \right) (x - a \cos \alpha) \]
\[ \Rightarrow (y - a \sin \alpha) \left( \tan \left( \frac{\pi}{4} + \alpha \right) \right) = (a \cos \alpha - x) \]
\[ \Rightarrow (y - a \sin \alpha) \left( \frac{\tan \frac{\pi}{4} + \tan \alpha}{1 - \tan \frac{\pi}{4} \tan \alpha} \right) = (a \cos \alpha - x) \]
\[ \Rightarrow (y - a \sin \alpha) (1 + \tan \alpha) = (a \cos \alpha - x) (1 - \tan \alpha) \]
\[ \Rightarrow (y - a \sin \alpha) (a \cos \alpha + \sin \alpha) = (a \cos \alpha - x) (a \cos \alpha - \sin \alpha) \]
\[ \Rightarrow y(a \cos \alpha + \sin \alpha) - a \sin \alpha \cos \alpha - a \sin^2 \alpha \]
\[ = a \cos^2 \alpha - a \cos \alpha \sin \alpha - x (a \cos \alpha - \sin \alpha) \]
\[ \Rightarrow y(a \cos \alpha + \sin \alpha) + x (a \sin \alpha - \sin \alpha) = a \]
\[ y \sin (\alpha + \alpha) + x (a \sin \alpha - \sin \alpha) = a \]
6. (a) Equation of bisectors of second pair of straight lines
\[ qx^2 + 2xy - qy^2 = 0 \]
\[ \text{is,} \quad \text{.....(1)} \]
It must be identical to the first pair
\[ x^2 - 2pxy - y^2 = 0 \]
\[ \text{.....(2)} \]
\[ \text{from (1) and (2) } \]
\[ q = \frac{2}{1 - 2p}, \text{ implies } pq = -1. \]
7. (c) \[ x = \frac{a \cos t + b \sin t + 1}{3} \]
\[ y = \frac{a \sin t - b \cos t}{3} \]
Squaring & adding, \( (3x - 1)^2 + (3y)^2 = a^2 + b^2 \)
8. (b) Taking co-ordinates as
\[ \left( \frac{x}{r}, \frac{y}{r} \right), (x, y) \] & \((x_r, y_r)\).
Then slope of line joining
\[ \left( \frac{x}{r}, \frac{y}{r} \right), (x, y) = \frac{y \left( \frac{1}{r} \right)}{x \left( \frac{1}{r} \right)} = \frac{y}{x} \]
and slope of line joining \((x, y)\) and \((x_r, y_r)\)
\[ \frac{y(r-1)}{x(r-1)} = \frac{y}{x} \quad \therefore m_1 = m_2 \]
\[ \Rightarrow \text{Points lie on the same straight line.} \]
9. (b) \[ (x-a_1)^2 + (y-b_1)^2 = (x-a_2)^2 + (y-b_2)^2 \]
\[ (a_1-a_2)x + (b_1-b_2)y \]
\[ + \frac{1}{2}(a_2^2 + b_2^2 - a_1^2 - b_1^2) = 0 \]
\[ c = \frac{1}{2}(a_2^2 + b_2^2 - a_1^2 - b_1^2) \]
10. (d) Let the vertex C be \((h, k)\), then the centroid of \(\Delta ABC\) is \(\left(\frac{2 - 2 + h}{3}, \frac{-3 + 1 + k}{3}\right)\) or \(\left(\frac{h}{3}, \frac{-2 + k}{3}\right)\). It lies on \(2x + 3y = 1\)

\[\Rightarrow \frac{2h}{3} - 2 + k = 1 \Rightarrow 2h + 3k = 9\]

\(= \text{Locus of } C \text{ is } 2x + 3y = 9\)

11. (a) Let the required line be \(\frac{x}{a} + \frac{y}{b} = 1 \quad \ldots \ldots (1)\)

then \(a + b = -1 \quad \ldots \ldots (2)\)

(1) passes through \((4, 3)\), \(\Rightarrow \frac{4}{a} + \frac{3}{b} = 1\)

\(\Rightarrow 4b + 3a = ab \quad \ldots \ldots (3)\)

Eliminating \(b\) from (2) and (3), we get

\(a^2 - 4 = 0 \Rightarrow a = \pm 2 \Rightarrow b = -3 \text{ or } 1\)

\(\therefore \) Equations of straight lines are

\(\frac{x}{2} + \frac{y}{-3} = 1 \text{ or } \frac{x}{-2} + \frac{y}{1} = 1\)

12. (c) Let the lines be \(y = m_1x\) and \(y = m_2x\) then

\(m_1 + m_2 = \frac{-2c}{7} \text{ and } m_1m_2 = \frac{-1}{7}\)

Given \(m_1 + m_2 = 4\) \(m_1m_2\)

\(\Rightarrow \frac{2c}{7} = -4 \Rightarrow c = 2\)

13. (a) \(3x + 4y = 0\) is one of the lines of the pair

\(6x^2 - xy + 4cy^2 = 0\), \(\text{ Put } y = -\frac{3}{4}x\),

we get \(6x^2 + \frac{3}{4}x^2 + 4c\left(-\frac{3}{4}x\right)^2 = 0\)

\(\Rightarrow 6 + \frac{3}{4} \cdot \frac{9c}{4} = 0 \Rightarrow c = -3\)

14. (a) The line passing through the intersection of lines

\(ax + 2by = 3b = 0\) and \(bx - 2ay - 3a = 0\) is

\(ax + 2by + 3b + \lambda (bx - 2ay - 3a) = 0\)

\(\Rightarrow (a + \lambda b)x + (2b - 2a\lambda)y + 3b - 3\lambda a = 0\)

\(\therefore \text{As this line is parallel to}_x\)-axis.

\(\therefore a + \lambda b = 0 \Rightarrow \lambda = -\frac{a}{b}\)

\(\Rightarrow ax + 2by + 3b - \frac{a}{b} (bx - 2ay - 3a) = 0\)

\(\Rightarrow ax + 2by + 3b - ax + \frac{2a^2}{b}y + \frac{3a^2}{b} = 0\)

\(y \left(2b + \frac{2a^2}{b}\right) + 3b + \frac{3a^2}{b} = 0\)

15. (c) Vertex of triangle is \((1, 1)\) and midpoint of sides through this vertex is \((-1, 2)\) and \((3, 2)\)

\(\Rightarrow\) vertex \(B\) and \(C\) come out to be \((-3, 3)\) and \((5, 3)\)

\(\therefore \text{Centroid is } \left(\frac{1 - 3 + 5}{3}, \frac{1 + 3 + 5}{3}\right) = \left(\frac{1}{3}, \frac{7}{3}\right)\)

16. (c) 

\(\therefore A \text{ is the mid point of } PQ\), therefore

\(\frac{a + 0}{2} = 3\), \(\frac{0 + b}{2} = 4 \Rightarrow a = 6, b = 8\)

\(\therefore \text{Equation of line is } \frac{x}{6} + \frac{y}{8} = 1 \text{ or } 4x + 3y = 24\)

17. (c) Clearly for point \(P\),

\(\text{Equation of line is } \frac{x}{2} + \frac{y}{3} = 1\)

\(\therefore a^2 - 3a < 0 \text{ and } a^2 - \frac{a}{2} > 0 \Rightarrow \frac{1}{2} < a < 3\)

18. (a) Given: The vertices of a right angled triangle \(A(1, k), \ B(1, 1)\) and \(C(2, 1)\) and Area of \(\triangle ABC\) = 1 square unit
We know that, area of right angled triangle
\[ \frac{1}{2} \times BC \times AB = \frac{1}{2} (l)(k-1) \]
\[ \Rightarrow \pm (k-1) = 2 \Rightarrow k = -1, 3 \]

19. (c) Given: The coordinates of points P, Q, R are (-1, 0), (0, 0), (3,3\sqrt{3}) respectively.

![Diagram showing point P, Q, and R]  
\[ \text{Slope of QR} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{3\sqrt{3}}{3} \]
\[ \Rightarrow \tan \theta = \sqrt{3} \Rightarrow \theta = \frac{\pi}{3} \Rightarrow \angle RQX = \frac{\pi}{3} \]
\[ \therefore \, \angle RQP = \pi - \frac{\pi}{3} = \frac{2\pi}{3} \]

Let QM bisect the \( \angle PQR \),
\[ \therefore \text{Slope of the line QM} = \tan \left( \frac{2\pi}{3} \right) = -\sqrt{3} \]
\[ \therefore \text{Equation of line QM is} \, y - 0 = -\sqrt{3} (x - 0) \]
\[ \Rightarrow y = -\sqrt{3} x \Rightarrow \sqrt{3} x + y = 0 \]

20. (a) Equation of bisectors of lines, \( xy = 0 \) are \( y = \pm x \)

![Diagram showing equation \( y = x \) and \( y = -x \)]
\[ \therefore \, \text{Put} \, y = \pm x \text{ in the given equation} \]
\[ my^2 + (1 - m^2)xy - mx^2 = 0 \]
\[ \therefore \, mx^2 + (1 - m^2)x^2 - mx^2 = 0 \]
\[ \Rightarrow 1 - m^2 = 0 \Rightarrow m = \pm 1 \]

21. (d) Slope of \( PQ = \frac{3 - 4}{k - 1} = \frac{-1}{k - 1} \)
\[ \therefore \text{Slope of perpendicular bisector of} \, PQ = (k - 1) \]

Also mid point of \( PQ = \left( \frac{k + 1}{2}, \frac{7}{2} \right) \).
\[ \therefore \text{Equation of perpendicular bisector is} \]
\[ y - \frac{7}{2} = (k - 1) \left( x - \frac{k + 1}{2} \right) \]
\[ \Rightarrow 2y - 7 = 2(k - 1)x - (k^2 - 1) \]
\[ \Rightarrow 2(k - 1)x - 2y + (8 - k^2) = 0 \]
\[ \therefore \text{y-intercept} = -\frac{8 - k^2}{-2} = 4 \]
\[ \Rightarrow 8 - k^2 = -4 \text{ or } k^2 = 16 \Rightarrow k = \pm 4 \]

22. (d) Let \( (a^2, a) \) be the point of shortest distance on \( x = y^2 \)
Then distance between \( (a^2, a) \) and line \( x - y + 1 = 0 \) is given by
\[ D = a^2 - a + 1 \]
\[ \therefore \text{It is min when} \, a = \frac{1}{2} \text{ and} \, D_{\text{min}} = \frac{3}{4} = \frac{\sqrt{2}}{2} \]

23. (a) If the lines \( p(p^2 + 1) x - y + q = 0 \) and \( (p^2 + 1)x + (p^2 + 1)y + 2q = 0 \)
are perpendicular to a common line then these lines must be parallel to each other,
\[ \therefore \, m_1 = m_2 \Rightarrow p(p^2 + 1) = -(p^2 + 1)^2 \]
\[ \Rightarrow (p^2 + 1)(p + 1) = 0 \]
\[ \Rightarrow p = -1 \]
\[ \therefore \, p \text{ can have exactly one value.} \]

24. (a) Given that
\[ P(1, 0), Q(-1, 0) \text{ and} \, \frac{AP}{AQ} = \frac{BP}{BQ} = \frac{CP}{CQ} = \frac{1}{3} \]
\[ \Rightarrow 3AP = AQ \]
Let \( A = (x, y) \) then \( 3AP = AQ \Rightarrow 9AP^2 = AQ \)
\[ \Rightarrow 9(x - 1)^2 + 9y^2 = (x + 1)^2 + y^2 \]
\[ \Rightarrow 9x^2 - 18x + 9 + 9y^2 = x^2 + 2x + 1 + y^2 \]
\[ \Rightarrow 8x^2 - 20x + 8y^2 + 8 = 0 \]
\[ \Rightarrow x^2 + y^2 - \frac{5}{3} x + 1 = 0 \, \ldots \ldots (1) \]
\[ \therefore \text{A lies on the circle given by eq} \, (1) \text{. As} \, B \text{ and} \, C \text{ also follow the same condition, they must lie on the same circle.} \]
\[ \therefore \text{Centre of circumcircle of} \, \Delta ABC \]
\[ = \text{Centre of circle given by} \, (1) = \left( \frac{5}{4}, 0 \right) \]

25. (c) Slope of line \( L = \frac{-b}{5} \)
Slope of line \( K = \frac{-3}{c} \)
Line \( L \) is parallel to line \( k \).
\[ \Rightarrow \frac{b}{5} = \frac{3}{c} \Rightarrow bc = 15 \]
\( (13, 32) \) is a point on \( L \).
\[ \Rightarrow \frac{13}{5} + \frac{32}{b} = 1 \Rightarrow \frac{32}{b} = \frac{-8}{5} \]
\[ \Rightarrow b = -20 \Rightarrow c = \frac{-3}{4} \]
Equation of \( K: \, y - 4x = 3 \Rightarrow 4x - y + 3 = 0 \)
Distance between \( L \) and \( K = \frac{|52 - 32 + 3|}{\sqrt{17}} = \frac{23}{\sqrt{17}} \)
26. (b)

\[ L_1 : y-x=0 \]
\[ L_2 : 2x+y=0 \]
\[ L_3 : y+2=0 \]

On solving the equation of line \( L_1 \) and \( L_2 \) we get their point of intersection \((0, 0)\) i.e., origin \(O\).

On solving the equation of line \( L_1 \) and \( L_3 \), we get \( P=(-2, -2)\).

Similarly, we get \( Q=(-1, -2) \).

We know that bisector of an angle of a triangle, divide the opposite side the triangle in the ratio of the sides including the angle [Angle Bisector Theorem of a Triangle]

\[ \therefore \frac{PR}{RQ} = \frac{OP}{OQ} = \frac{\sqrt{(-2)^2 + (-2)^2}}{\sqrt{(-1)^2 + (-2)^2}} = \frac{2\sqrt{2}}{\sqrt{5}} \]

27. (c)

Let the joining points be \( A(1, 1) \) and \( B(2, 4) \).

Let point \( C \) divides line \( AB \) in the ratio 3 : 2.

So, by section formula we have

\[ C = \left( \frac{3 \times 2 + 2 \times 1}{3 + 2}, \frac{3 \times 4 + 2 \times 1}{3 + 2} \right) = \left( \frac{8}{5}, \frac{14}{5} \right) \]

Since Line \( 2x+y=k \) passes through \( C \left( \frac{8}{5}, \frac{14}{5} \right) \)

\[ \therefore \quad C \text{ satisfies the equation } 2x+y=k. \]

\[ \Rightarrow \quad \frac{2}{5} \times \frac{8}{5} + \frac{14}{5} = k \quad \Rightarrow \quad k = 6 \]

28. (b)

Suppose \( B(0, 1) \) be any point on given line and co-ordinate of \( A \) is \( (\sqrt{3}, 0) \). So, equation of

\[ B(0, 1), A(\sqrt{3}, 0) \]

Reflected Ray is \( \frac{-1-0}{0-\sqrt{3}} = \frac{y-0}{x-\sqrt{3}} \)

\[ \Rightarrow \quad \sqrt{3}y = x - \sqrt{3} \]

29. (b)

From the figure, we have

\( a = 2, \ b = 2\sqrt{2}, \ c = 2 \)

\( x_1 = 0, \ x_2 = 0, \ x_3 = 2 \)

30. (d)

Now, \( x \)-co-ordinate of incentre is given as

\[ \frac{ax_1 + bx_2 + cx_3}{a+b+c} \]

\[ \Rightarrow \quad x \text{-coordinate of incentre} = \frac{2 \times 0 + 2\sqrt{2} \times 2 + 2.2}{2 + 2 + 2\sqrt{2}} \]

\[ = \frac{2}{2 + \sqrt{2}} = 2 - \sqrt{2} \]

Let \( P, Q, R \), be the vertices of \( \triangle PQR \)

\( P(2, 2), Q(6, -1), R(7, 3) \)

Since \( PS \) is the median, \( S \) is mid-point of \( QR \)

So, \( S = \left( \frac{7+6}{2}, \frac{3-1}{2} \right) = \left( \frac{13}{2}, 1 \right) \)

Now, slope of \( PS = \frac{2-1}{2-\frac{13}{2}} = -\frac{2}{9} \)

Since, required line is parallel to \( PS \) therefore slope of required line = slope of \( PS \) Now, eqn of line passing through \((1, -1)\) and having slope \(-\frac{2}{9}\) is

\[ y-(-1) = -\frac{2}{9}(x-1) \]

\[ 9y + 9 = -2x + 2 \quad \Rightarrow \quad 2x + 9y + 7 = 0 \]

31. (a)

Given lines are

\[ 4ax + 2ay + c = 0 \]
\[ 5bx + 2by + d = 0 \]

The point of intersection will be

\[ \frac{x}{2ad-2bc} = \frac{-y}{4ad-5bc} = \frac{1}{8ab-10ab} \]

\[ \Rightarrow \quad x = \frac{2(ad-bc)}{-2ab} = \frac{bc-ad}{ab} \]

\[ \Rightarrow \quad y = \frac{5bc-4ad}{-2ab} = \frac{4ad-5bc}{2ab} \]
32. (b) Total number of integral points inside the square OABC
\[40 \times 40 = 1600\]

No. of integral points on AC

\[= \text{No. of integral points on OB}
\]
\[= 40 \text{ [namely (1, 1), (2, 2) \ldots (40, 40)]}\]

33. (a) Let other two sides of rhombus are
\[x - y + \lambda = 0\]
and \[7x - y + \mu = 0\]
then O is equidistant from AB and DC and from AD and BC
\[\therefore |1 + 2 + 1| = |1 + 2 + \lambda| \Rightarrow \lambda = -3\]
and \[|7 + 2 - 5| = |7 + 2 + \mu| \Rightarrow \mu = 15\]
\[\therefore \text{Other two sides are } x - y - 3 = 0 \text{ and } 7x - y + 15 = 0\]
On solving the eq\'s of sides pairwise, we get
the vertices as \(\left(\frac{1}{3}, \frac{-8}{3}\right), (1, 2), \left(\frac{-7}{3}, \frac{-4}{3}\right), (-3, -6)\)
Circle

**Section-A**

**JEE Advanced/ IIT-JEE**

1. **A. Fill in the Blanks**
   1. As \( P \) lies on a circle and \( A \) and \( B \) two points in the plane such that \( \frac{PA}{PB} = k \),
      then \( k \) can be any real number except 1 as otherwise \( P \) will lie on perpendicular bisector of \( AB \) which is a line.

2. For point of intersection of line
   \[ 4x - 3y - 10 = 0 \]  
   and circle \( x^2 + y^2 - 2x + 4y - 20 = 0 \),
   Solving (1) and (2), we get
   \[ \left( \frac{3y + 10}{4} \right)^2 + y^2 - 2 \left( \frac{3y + 10}{4} \right) + 4y - 20 = 0 \]
   \[ y^2 + 4y - 12 = 0 \]  
   \[ y = 2, -6 \]  
   \[ x = 4, -2 \]
   \( \therefore \) Points are \((4, 2)\) and \((-2, -6)\).

3. Let \( 3x - 4y + 4 = 0 \) be the tangent at point \( A \) and \( 6x - 8y - 7 = 0 \) be the tangent of point \( B \) of the circle.
   As the two tangents parallel to each other,
   \( \therefore \) \( AB \) should be the diameter of the circle.
   \( \therefore \) \( AB = \text{distance between parallel lines} \)
   \[ 3x - 4y + 4 = 0 \text{ and } 6x - 8y - 7 = 0 \]
   \[ = \text{distance between } 6x - 8y + 8 = 0 \text{ and } 6x - 8y - 7 = 0 \]
   \[ = \frac{8 + 7}{\sqrt{36 + 64}} = \frac{15}{10} = \frac{3}{2} \]
   \( \therefore \) radius of circle = \( \frac{1}{2} (AB) = \frac{3}{4} \)

4. **8 sq. units**
   **KEY CONCEPT:**
   Length of tangent from a point \((x_1, y_1)\) to a circle \( x^2 + y^2 + 2gx + 2fy + c = 0 \) is given by
   \[ \sqrt{x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c} \]
   The equation of circle is,
   \[ x^2 + y^2 - 4x - 2y - 11 = 0 \]
   It's centre is \((2, 1)\), radius = \( \sqrt{4 + 1 + 11} = 4 \) = \( BC \)
   \( A \)
   \( (4, 5) \)
   \( B \)
   \( \sqrt{16 + 25 - 16 - 10 - 11} = \sqrt{4} = 2 = AB \)
   \( \therefore \) Area of quad. \( ABCD \)
   \[ = 2 \times (\text{Area of } \triangle ABC) = 2 \times \frac{1}{2} \times AB \times BC \]
   \[ = 2 \times \frac{1}{2} \times 2 \times 4 = 8 \text{ sq. units.} \]

5. The equation of given circle is
   \( (x - 1)^2 + y^2 = 1 \)
   or \( x^2 + y^2 - 2x = 0 \)
   \( \quad \ldots (1) \)

6. **KEY CONCEPT:** We know that equation of chord of curve
   \( S = 0 \), whose mid point is \((x_1, y_1)\) is given by \( T = S_1 \) where \( T \) is tangent to curve \( S = 0 \) at \((x_1, y_1)\).
   \( \therefore \) If \((x_1, y_1)\) is the mid point of chord of given circle (1), then equation of chord is
   \[ xx_1 + yy_1 - (x + x_1) = x_1^2 + y_1^2 - 2x_1 \]
   \[ (x_1 - 1)x + y_1y + x_1 - x_1^2 - y_1^2 = 0 \]
   At it passes through origin, we get
   \[ x_1 - x_1^2 - y_1^2 = 0 \text{ or } x_1^2 + y_1^2 - x_1 = 0 \]
   \( \therefore \) locus of \((x_1, y_1)\) is \( x^2 + y^2 - x = 0 \)

7. The equation of two circles are
   \( x^2 + y^2 - \frac{2}{3} x + 4y - 3 = 0 \)
   \( \quad \ldots (1) \)
   \( \text{and } x^2 + y^2 + 6x + 2y - 15 = 0 \)
   \( \quad \ldots (2) \)
   Now we know eq. of common chord of two circles \( S_1 = 0 \) and \( S_2 = 0 \text{ is } S_1 - S_2 = 0 \)
   \[ 6x + \frac{2}{3} x + 2y - 4y - 15 + 3 = 0 \]
   \[ \Rightarrow \frac{20x - 2y - 12 = 0 \Rightarrow 10x - 3y - 18 = 0} \]

8. From \( P(4, 3) \) two tangents \( PT \) and \( PT' \) are drawn to the circle
   \( x^2 + y^2 = 9 \) with \( O(0, 0) \) as centre and \( r = 3 \).
   To find the area of \( \Delta PTT' \).
Let \( R \) be the point of intersection of \( OP \) and \( TT' \). Then we can prove by simple geometry that \( OP \) is perpendicular bisector of \( TT' \).

Equation of chord of contact \( TT' \) is \( 4x + 3y = 9 \)

Now, \( OR = \text{length of the perpendicular from } O \text{ to } TT' \) is

\[
OT = \sqrt{4^2 + 3^2} = 5
\]

\[
\therefore \quad TR = \sqrt{OT^2 - OR^2} = \sqrt{9 - \frac{81}{25}} = \frac{12}{5}
\]

Again \( OP = \sqrt{(4-0)^2 + (3-0)^2} = 5 \)

\[
\therefore \quad PR = OP - OR = \frac{9}{5} - \frac{16}{5} = \frac{16}{5}
\]

Area of the triangle

\[
PTT' = PR \times TR = \frac{16}{5} \times \frac{12}{5} = \frac{192}{25}
\]

9. We have \( C_1 : x^2 + y^2 = 16 \), Centre \( O_1 (0, 0) \) radius = 4. \( C_2 \) is another circle with radius 5, let its centre \( O_2 \) be \((h, k)\).

Now the common chord of circles \( C_1 \) and \( C_2 \) is of maximum length when chord is diameter of smaller circle \( C_1 \), and then it passes through centre \( O_1 \) of circle \( C_1 \). Given that slope of this chord is \(3/4\).

\[
\therefore \quad \text{Equation of } AB \text{ is, }
\]

\[
y = \frac{3}{4}x \Rightarrow 3x - 4y = 0 \quad \ldots (1)
\]

In right \( \Delta O_1 O_2 \),

\[
O_1 O_2 = \sqrt{5^2 - 4^2} = 3
\]

Also \( O_1 O_2 = \text{L} \text{ar} \text{ distance from } (h, k) \text{ to } (1) \)

\[
\Rightarrow \quad 3 = \left| \frac{3h - 4k}{\sqrt{3^2 + 4^2}} \right| \quad \Rightarrow \pm \frac{3h - 4k}{5} = 3
\]

\[
\Rightarrow \quad 3h - 4k = 15 = 0 \quad \ldots (2)
\]

Again \( AB \perp O_1 O_2 \Rightarrow m_{AB} \times m_{O_1 O_2} = -1 \)

\[
\Rightarrow \quad \frac{3}{4} \times \frac{k}{h} = -1 \Rightarrow 4h + 3k = 0 \quad \ldots (3)
\]

Solving, \( 3h - 4k + 15 = 0 \) and \( 4h + 3k = 0 \)

We get \( h = -9/5, k = 12/5 \)

Again solving \( 3h - 4k = 15 \) and \( 4h + 3k = 0 \)

We get \( h = 9/5, k = -12/5 \)

Thus the required centre is \( \left( \frac{-9}{5}, \frac{12}{5} \right) \) or \( \left( \frac{9}{5}, \frac{-12}{5} \right) \).

10. Tangent at \( P(1, \sqrt{3}) \) to the circle \( x^2 + y^2 = 4 \) is

\[
x \cdot 1 + y \cdot \sqrt{3} = 4
\]

It meets \( x \)-axis at \( A (4, 0) \), \( \therefore \ OA = 4 \)

Also \( OP = \text{radius of circle } = 2, \therefore \ PA = \sqrt{4^2 - 2^2} = 2\sqrt{3} \)

\[
\therefore \quad \text{Area of } \Delta OPA = \frac{1}{2} \times OP \times PA = \frac{1}{2} \times 2 \times 2\sqrt{3} = \sqrt{3} \quad \text{sq. units}
\]

11. The given lines are \( 3x - y + 1 = 0 \) and \( x - 2y + 3 = 0 \) which meet \( x \)-axis at \( A \left( -\frac{1}{3}, 0 \right) \) and \( B \left( 3, 0 \right) \) and \( y \)-axis at \( C \left( 0, 1 \right) \) and \( D \left( 0, \frac{3}{2} \right) \) respectively.

Then we must have, \( OA \times OB = OC \times OD \)

\[
\Rightarrow \quad \left( \frac{1}{\lambda}, -3 \right) \times \frac{1}{2} \Rightarrow \lambda = 2
\]

12. The given circle is

\[
4x^2 + 4y^2 - 12x + 4y + 1 = 0
\]

or \( x^2 + y^2 - 3x + y + \frac{1}{4} = 0 \) with centre \( \left( \frac{3}{2}, -\frac{1}{2} \right) \)

and \( r = \sqrt{\frac{9}{4} + \frac{1}{4} + \frac{1}{4} + \frac{1}{4}} = \frac{3}{2} \)

Let \( M (h, k) \) be the mid pt. of the chord \( AB \) of the given circle, then \( CM \perp AB, \angle ACB = 120^\circ \).

In \( \Delta ACM \),

\[
\angle ACM = \frac{1}{2} \angle ACB = 60^\circ
\]

and \( \angle A = 30^\circ \)

\[
\therefore \quad \sin A = \frac{CM}{AC}
\]

\[
\sin 30^\circ = \frac{\sqrt{(h-3/2)^2 + (k+1/2)^2}}{3/2}
\]
\[
\Rightarrow \left( \frac{3}{4} \right)^2 = \left( \frac{h - 3}{2} \right)^2 + \left( \frac{k + 1}{2} \right)^2
\]
\[
\Rightarrow 16h^2 + 16k^2 - 48h + 16k + 31 = 0
\]
\[\therefore\text{ locus of} (h, k) \text{ is} 16x^2 + 16y^2 - 48x + 16y + 31 = 0 \]

13. Equation of any circle passing through the point of
intersection of \(x^2 + y^2 - 2x = 0\) and \(y = x\) is
\[x^2 + y^2 - 2x + \lambda (y - x) = 0\]
or \[x^2 + y^2 - (2 + \lambda)x + \lambda y = 0\]
Its centre is \(\left( \frac{2 + \lambda}{2}, \frac{-\lambda}{2} \right)\)

For \(AB\) to be the diameter of the required circle, the centre
must lie on \(AB\). That is,
\[\frac{2 + \lambda}{2} = \frac{-\lambda}{2} \Rightarrow \lambda = -1\]
Thus, equation of required circle is
\[x^2 + y^2 - 2x - y + x = 0\]
or \[x^2 + y^2 - x - y = 0\]

14. The radius of circle \(C_1\) is 1 cm, \(C_2\) is 2 cm and soon.
It starts from \(A_1(1, 0)\) on \(C_1\), moves a distance of 1 cm on \(C_1\)
to come to \(B_1\). The angle subtended by \(A_1B_1\) at the centre
will be \(\frac{1}{r}\) radians, i.e. 1 radian.
From \(B_1\) it moves along radius, \(OB_1\) and comes to \(A_2\) on circle \(C_2\) of radius 2. From \(A_2\) it moves on \(C_2\) a distance 2 cm
and comes to \(B_2\). The angle subtended by \(A_2B_2\) is again 2 as
before 1 radian. The total angle subtended at the centre is 2
radians. The process continues. In order to cross the x-axis
again it must describe 2\(n\) radians i.e. \(2 \times \frac{22}{7} = 6.7\) radians.
Hence it must be moving on circle \(C_7\)
\[\therefore n = 7\]

15. Let \((h, k)\) be any point on the given line
\[2x + k = 4\] and chord of contact is \(hx + ky = 1\)
or \(hx + (4 - 2h)y = 1\) or \((4y - 1) + h(x - 2y) = 0\)
\[P + \lambda Q = 0\]. It passes through the intersection of \(P = 0\) and
\[Q = 0\] i.e. \(\left( \frac{1}{2}, \frac{1}{4} \right)\).

B. True/False

1. The circle passes through the points \(A(1, \sqrt{3}), B(1, -\sqrt{3})\)
and \(C (3, -3)\).
Here line \(AB\) is parallel to y-axis and \(BC\) is parallel to x-axis,
there \(\angle ABC = 90^\circ\)
\[\therefore AC\] is a diameter of circle.
\[\therefore\text{ Eq. of circle is}\]
\[(x - 1)(x - 3) + (y - \sqrt{3})(y + \sqrt{3}) = 0\]
\[\Rightarrow x^2 + y^2 - 4x = 0 \quad \ldots (1)\]
Let us check the position of pt \((5/2, 1)\) with. respect to the
circle \(1)\), we get \(S_1 = \frac{25}{4} + 1 - 10 < 0\)
\[\therefore\text{ Point lies inside the circle.}\]
\[\therefore\text{ No tangent can be drawn to the given circle from point}\]
\((5/2, 1)\).
\[\therefore\text{ Given statement is true.}\]

2. The centre of the circle \(x^2 + y^2 - 6x + 2y = 0\) is \((3, -1)\) which
lies on the line \(x + 3y = 0\)
\[\therefore\text{ The statement is true.}\]

C. MCQs with ONE Correct Answer

1. (d) The given circle is \(x^2 + y^2 - 2x + 4y + 3 = 0\). Centre
\((1, -2)\). Lines through centre \((1, -2)\) and parallel to
axes are \(x = 1\) and \(y = -2\).
\[\text{Let the side of square be} 2k.\]
Then sides of square are \(x = 1 - k\) and \(x = 1 + k\)
and \(y = -2 - k\) and \(y = -2 + k\)
\[\therefore\text{ Co-ordinates of} \ P, Q, R, S \text{ are}\]
\((1 + k, -2 + k),\)
\((1 - k, -2 - k),\)
\((1 + k, -2 - k)\) respectively.
Also \(P(1 + k, -2 + k)\) lies on circle
\[\therefore (1 + k)^2 + (2 + k)^2 - 2 (1 + k) + 4 (2 + k) + 3 = 0\]
\[\Rightarrow 2k^2 = 2 \Rightarrow k = 1 \text{ or } -1\]
If \(k = 1, P(2, -1), Q(0, -1), R(0, -3), S(2, -3)\)
If \(k = -1, P(0, -3), Q(2, -3), R(2, -1), S(0, -1)\)

2. (b) The circle through points of intersection of the two
circles \(x^2 + y^2 - 6x = 0\) and \(x^2 + y^2 - 6x + 8 = 0\) is
\((x^2 + y^2 - 6) + \lambda (x^2 + y^2 - 6x + 8) = 0\)
As it passes through \((1, 1)\)
\[(1 + 1 - 6) + 1 (1 + 1 - 6 + 8) = 0 \Rightarrow \lambda = \frac{4}{4} = 1\]
\[\therefore\text{ The required circle is}\]
\[2x^2 + 2y^2 - 6x + 2 = 0\] or \[x^2 + y^2 - 3x + 1 = 0\]

3. (c) Let \(C(h, k)\) be the centre of circle touching \(x^2 = y\) at \(B(2, 4)\). Then equation of common tangent at \(B\) is
$2x = \frac{1}{2}(y + 4) \text{ i.e., } 4x - y = 4$

Radius is perpendicular to this tangent
\[
\Rightarrow \quad 4\left(\frac{k - 4}{h - 2}\right) = -1 \Rightarrow 4k = 18 \quad \ldots (1)
\]

Also $AC = BC$
\[
\Rightarrow \quad h^2 + (k - 1)^2 = (h - 2)^2 + (k - 4)^2
\]
\[
\Rightarrow \quad 4h + 6k = 19 \quad \ldots (2)
\]

Solving (1) and (2) we get the centre as \(\left(-\frac{16}{5}, \frac{53}{10}\right)\).

4. (b) **KEY CONCEPT**
Circle through pts. of intersection of two circles $S_1 = 0$ and $S_2 = 0$ is $S_1 + \lambda S_2 = 0$
\[
\Rightarrow \quad \text{Req. circle is,}
\]
\[
(x^2 + y^2 + 13x - 3y) + \lambda(x^2 + y^2 + 2x - \frac{7}{2}y - \frac{25}{2}) = 0
\]
\[
\Rightarrow \quad (1 + \lambda)x^2 + (1 + \lambda)y^2 + (13 + 2\lambda)x + (\frac{7}{2} - \frac{25\lambda}{2})y = 0
\]

As it passes through (1, 1)
\[
\Rightarrow \quad 1 + \lambda + 1 + \lambda + 13 + 2\lambda - 3 - \frac{7\lambda}{2} - \frac{25\lambda}{2} = 0
\]
\[
\Rightarrow \quad -12\lambda + 1 = 0 \Rightarrow \lambda = 1
\]
\[
\Rightarrow \quad \text{Req. circle is,}
\]
\[
x^2 + y^2 + 15x - 13y - 25 = 0
\]

5. (c) Let $AB$ be the chord with its mid pt $M(h, k)$.
\[
\text{As } \angle AOB = 90^\circ
\]
\[
\Rightarrow \quad AB = \sqrt{2^2 + 2^2} = 2\sqrt{2}.
\]
\[
\Rightarrow \quad AM = \sqrt{2}
\]

**NOTE THIS STEP**
By prop. of rt. $\triangle$ $AM = MB = OM$
\[
\Rightarrow \quad OM = \sqrt{2} \Rightarrow h^2 + k^2 = 2
\]
\[
\Rightarrow \quad \text{locus of } (h, k) \text{ is } x^2 + y^2 = 2
\]

6. (a) **KEY CONCEPT**
Two circles $x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0$ and $x^2 + y^2 + 2g_2x + 2f_2y + c_2 = 0$ are orthogonal iff
\[
2g_1g_2 + 2f_1f_2 = c_1 + c_2
\]
\[
\text{Let the required circle be,}
\]
\[
x^2 + y^2 + 2gx + 2fy + c = 0 \quad \ldots (1)
\]

As it passes through (a, b), we get,
\[
a^2 + b^2 + 2ag + 2bf + c = 0 \quad \ldots (2)
\]

Also (1) is orthogonal with the circle,
\[
x^2 + y^2 = k^2 \quad \ldots (3)
\]

For circle (1)
\[
g_1 = g, f_1 = f, c_1 = c
\]

For circle (3)
\[
g_2 = 0, f_2 = 0, c_2 = -k^2
\]
\[
\Rightarrow \quad \text{By the condition of orthogonality,}
\]
\[
2g_1g_2 + 2f_1f_2 = c_1 + c_2
\]

We get, $c = k^2$

7. (a) **KEY CONCEPT**
We have two circles $(x - 1)^2 + (y - 3)^2 = r^2$
Centre (1, 3), radius = $r$
and $x^2 + y^2 - 8x + 2y + 8 = 0$
Centre (4, -1), radius = $\sqrt{16 + 1 - 8} = 3$

As the two circles intersect each other in two distinct points we should have
\[
C_1C_2 < r_1 + r_2 \quad \text{and} \quad C_1C_2 > |r_1 - r_2|
\]
\[
\Rightarrow \quad C_1C_2 < r + 3 \text{and} \quad C_1C_2 < |r_1 - r_2|
\]
\[
\Rightarrow \quad \sqrt{9 + 16} < r + 3 \quad \text{and} \quad 5 > |r - 3|
\]
\[
\Rightarrow \quad 5 < r + 3 \Rightarrow |r - 3| < 5
\]
\[
\Rightarrow \quad r > 2 \ldots (i) \Rightarrow -5 < r - 3 < 5
\]
\[
\Rightarrow \quad 2 < r < 8 \ldots (ii)
\]

Combining (i) and (ii), we get
\[
2 < r < 8
\]

8. (c) As $2x - 3y - 5 = 0$ and $3x - 4y - 7 = 0$ are diameters of circles.
\[
\Rightarrow \quad \text{Centre of circle is solution of these two eq. 's, i.e.}
\]
\[
\frac{x}{21 - 20} = \frac{y}{-15 + 14} = \frac{1}{-8 + 9}
\]
\[
\Rightarrow \quad x = 1, y = -1
\]
\[
\Rightarrow \quad C(1, -1)
\]

Also area of circle, $\pi r^2 = 154$
\[
\Rightarrow \quad r^2 = \frac{154}{22} \times 7 = 49 \Rightarrow r = 7
\]

Equation of required circle is $(x - 1)^2 + (y + 1)^2 = 7^2 \Rightarrow x^2 + y^2 - 2x + 2y = 47$

9. (d) **KEY CONCEPT**
Let the equation of the circle be $x^2 + y^2 + 2gx + 2fy + c = 0$.
As this circle passes through (0, 0) and (1, 0) we get $c = 0, 1 + 2g = 0$
\[
\Rightarrow \quad g = -\frac{1}{2}
\]

According to the question this circle touches the given circle $x^2 + y^2 = 9$
\[
\Rightarrow \quad 2 \times \text{radius of required circle} = \text{radius of given circle}
\]
\[
\Rightarrow \quad 2\sqrt{g^2 + f^2} = 3 \Rightarrow g^2 + f^2 = \frac{9}{4}
\]
\[
\Rightarrow \quad \frac{1}{4} + f^2 = \frac{9}{4} \Rightarrow f^2 = 2 \Rightarrow f = \pm \sqrt{2}
\]
\[
\Rightarrow \quad \text{The centre is } \left(\frac{1}{2}, \sqrt{2}\right), \left(\frac{1}{2}, -\sqrt{2}\right).
\]
10. (d) The given circle is \(x^2 + y^2 - 6x + 14 = 0\), centre \((3, 3)\), radius \(r = 2\).
Let \((h, k)\) be the centre of touching circle. Then radius of touching circle = \(h\) [as it touches y-axis also].
\[
\therefore \quad \text{Distance between centres of two circles} = \text{sum of the radii of two circles}
\]
\[
\Rightarrow \sqrt{(h-3)^2 + (k-3)^2} = 2 + h
\]
\[
\Rightarrow (h-3)^2 + (k-3)^2 = (2 + h)^2
\]
\[
\Rightarrow k^2 - 10h - 6k + 14 = 0
\]
\[
\therefore \quad \text{locus of} \ (h, k) \ \text{is} \ y^2 - 10x - 6y + 14 = 0
\]
11. (c) Centres and radii of two circles are \(C_1 (5, 0); \ r = r_1\) and \(C_2 (0, 0); \ r = r_2\).
As circles intersect each other in two distinct points,
\[
|r_1 - r_2| < C_1C_2 < r_1 + r_2
\]
\[
\Rightarrow |r_1 - r_2| < 5 < r_1 + r_2 \quad \Rightarrow \frac{2}{2} < r < 8
\]
12. (d) Centre of the circle \(x^2 + y^2 + 4x - 6y + 9 \sin^2 \alpha + 13 \cos^2 \alpha = 0\) is \(C (-2, 3)\) and its radius is
\[
\sqrt{2^2 + (-3)^2 - 9 \sin^2 \alpha - 13 \cos^2 \alpha} = 2 \sin \alpha
\]
Let \(P(h, k)\) be any point on the locus. The \(\angle APC = \alpha\).
Also \(\angle PAC = \frac{\pi}{2}\).
That is, triangle \(APC\) is a right triangle.
Thus, \(\sin \alpha = \frac{AC}{PC} = \frac{2 \sin \alpha}{\sqrt{(h+2)^2 + (k-3)^2}}\)
\[
\Rightarrow \sqrt{(h+2)^2 + (k-3)^2} = 2
\]
\[
\Rightarrow (h+2)^2 + (k-3)^2 = 4
\]
or \(h^2 + k^2 + 4h - 6k + 9 = 0\)
Thus required equation of the locus is \(x^2 + y^2 + 4x - 6y + 9 = 0\).
13. (d) The given equation of the circle is \(x^2 + y^2 - px - qy + r = 0\), \(p, q \neq 0\).
Let the chord drawn from \((p, q)\) is bisected by \(x\)-axis at point \((x_1, 0)\).
Then equation of chord is \(x_1 \frac{x - p}{2} + \frac{y}{2} (y + 0) = x_1^2 - px_1\) (using \(T=S_1\)).
As it passes through \((p, q)\), therefore,
\[
p x_1 - \frac{p}{2} (x + x_1) - \frac{q}{2} (y + 0) = x_1^2 - px_1
\]
\[
\Rightarrow x_1^2 - \frac{3}{2} px_1 + \frac{p^2}{2} + \frac{q^2}{2} = 0
\]
\[
\Rightarrow 2x_1^2 - 3px_1 + p^2 + q^2 = 0
\]
As through \((p, q)\) two distinct chords can be drawn.
\(\therefore \) Roots of above equation be real and distinct, i.e., \(D > 0\).
14. (c) \(O\) is the point at centre and \(P\) is the point at circumference. Therefore, angle \(QOR\) is double the angle \(QPR\).
\[
\Rightarrow 9p^2 - 4 \times 2 (p^2 + q^2) > 0
\]
\[
\Rightarrow p^2 > 8q^2
\]
So, it sufficient to find the angle \(QOR\). Now slope of \(QQ = \frac{4}{3}\).
Slope of \(OR = -\frac{3}{4}\).
Again \(m_1m_2 = -1\).
Therefore, \(\angle QOR = 90^\circ\) which implies that \(\angle QPR = 45^\circ\).
15. (a) \(2g_1g_2 + 2f_1f_2 = c_1 + c_2\) (formula for orthogonal intersection of two circles)
\[
\Rightarrow 2 (1) (0) + 2 (k) (k) = 6 + k
\]
\[
\Rightarrow 2k^2 - k - 6 = 0 \Rightarrow k = -3, 2\,
\]
16. (b) \(x^2 + y^2 = r^2\) is a circle with centre at \((0, 0)\) and radius \(r\) units.
Any arbitrary pt \(P\) on it is \((r \cos \theta, r \sin \theta)\).
Choosing \(A\) and \(B\) as \((-r, 0)\) and \((0, -r)\).
[So that \(\angle AOB = 90^\circ\)]
For locus of centroid of \(\triangle ABP\)
\[
\left(\frac{r \cos \theta - r}{3}, \ \frac{r \sin \theta - r}{3}\right) = (x, y)
\]
\[
\Rightarrow r \cos \theta - r = 3x
\]
\[
r \sin \theta - r = 3y
\]
\[
r \cos \theta = 3x + r
\]
\[
r \sin \theta = 3y + r
\]
Squaring and adding \((3x + r)^2 + (3y + r)^2 = r^2\) which is a circle.
17. (a) \(\angle RPS = \theta\)
\(\angle XPO = 90^\circ\).
\(\because \ \angle PXQ = 90^\circ\)
\(\therefore \ \Delta PRS \sim \Delta QPO\) (AA similarity)
18. (c) Line \(5x - 2y + 6 = 0\) is intersected by tangent at \(P\) to circle \(x^2 + y^2 + 6x + 6y - 2 = 0\) on \(y\)-axis at \(Q(0, 3)\). In other words tangent passes through \((0, 3)\)
\[\therefore \quad \frac{PR}{QP} = \frac{RS}{PR} \Rightarrow PR^2 = PQ \cdot RS\]
\[\Rightarrow \quad PR = \sqrt{PQ \cdot RS} = 2r = \sqrt{PQ} \cdot RS\]

19. (a) \[x^2 - 8x + 12 = 0 \Rightarrow (x - 6)(x - 2) = 0\]
\[y^2 - 14y + 45 = 0 \Rightarrow (y - 5)(y - 9) = 0\]
Thus sides of square are:
\[x = 2, x = 6, y = 5, y = 9\]
Then centre of circle inscribed in square will be:
\[\left(\frac{2 + 6}{2}, \frac{5 + 9}{2}\right) = (4, 7)\]

19. (c) The given circle is:
\[x^2 + y^2 - 2x - 6y + 6 = 0\] with centre \(C(1, 3)\) and radius \(r = \sqrt{1 + 9 - 6} = 2\). Let \(AB\) be one of its diameter which is the chord of other circle with centre at \(C_1(2, 1)\).
Then in \(\triangle C_1CB\):
\[C_1B^2 = CC_1^2 + CB^2\]
\[r^2 = [(2 - 1)^2 + (1 - 3)^2] + (2)^2\]
\[\Rightarrow r^2 = 1 + 4 + 4 \Rightarrow r^2 = 9 \Rightarrow r = 3\]

20. (d) Let the centre of circle \(C\) be \((h, k)\). Then as this circle touches axis of \(x\), its radius is \(|k|\)
Also it touches the given circle \(x^2 + (y - 1)^2 = 1\), centre \((0, 1)\) radius 1, externally.
Therefore, the distance between centres = sum of radii
\[\Rightarrow \sqrt{(h - 0)^2 + (k - 1)^2} = 1 + |k|\]
\[\Rightarrow h^2 + k^2 - 2k + 1 = (1 + |k|)^2\]
\[\Rightarrow h^2 + k^2 - 2k + 1 = 1 + 2|k| + k^2\]
\[\Rightarrow h^2 = 2k + 2|k|\]
\[\therefore \quad \text{Locus of } (h, k) \text{ is, } x^2 = 2y + 2|y|\]
Now if \(y > 0\), it becomes \(x^2 = 4y\)
and if \(y < 0\), it becomes \(x = 0\)
\[\therefore \quad \text{Combining the two, the required locus is } \{(x, y) : x^2 = 4y\} \cup \{(0, y) : y \leq 0\}\]

21. (b) Tangents PA and PB are drawn from the point \(P(1, 3)\) to circle \(x^2 + y^2 - 6x - 4y - 11 = 0\) with centre \(C(3, 2)\)

23. (d) Let centre of the circle be \((h, 2)\) then radius \(= |h|\)
\[\therefore \quad \text{Equation of circle becomes } (x - h)^2 + (y - 2)^2 = h^2\]
As it passes through \((-1, 0)\)
\[\Rightarrow (-1 - h)^2 + (0 - 2)^2 = h^2 \Rightarrow h = \frac{-5}{2}\]
\[\therefore \quad \text{Centre } \left(\frac{-5}{2}, 2\right) \text{ and } r = \frac{5}{2}\]
Distance of centre from \((-4, 0)\) is \(\frac{5}{2}\)
\[\therefore \quad \text{It lies on the circle.}\]

24. (a) Any point \(P\) on line \(4x - 5y = 20\) is \(\left(\alpha, \frac{4\alpha - 20}{5}\right)\).
Equation of chord of contact \(AB\) to the circle \(x^2 + y^2 = 9\)
drawn from point \(P\left(\alpha, \frac{4\alpha - 20}{5}\right)\) is
\[x. \alpha + y. \left(\frac{4\alpha - 20}{5}\right) = 9\]  
\[\quad \text{....(1)}\]
Circle

Also the equation of chord $AB$ whose mid point is $(h, k)$ is

$$hx + ky = h^2 + k^2$$ ... (2)

Hence Equations (1) and (2) represent the same line, therefore

$$\frac{h}{a} = \frac{k}{b} = \frac{h^2 + k^2}{9}$$

$$\Rightarrow 5k\alpha = 4h\alpha = 20h \quad \text{and} \quad 9h = \alpha \left(h^2 + k^2\right)$$

$$\Rightarrow \alpha = \frac{20h}{4h-5k} \quad \text{and} \quad \alpha = \frac{9h}{h^2 + k^2}$$

$$\Rightarrow \frac{20h}{4h-5k} = \frac{9h}{h^2 + k^2} \Rightarrow 20(h^2 + k^2) = 9(4h-5k)$$

Hence Locus of $(h, k)$ is

$$20\left(x^2 + y^2\right) - 36x + 45y = 0$$

D. MCQs with ONE or MORE THAN ONE Correct

1. **(a, c)** The given circle is $x^2 + y^2 - 2rx - 2hy + h^2 = 0$ with centre $(r, h)$ and radius $r$.

   Clearly circle touches y-axis so one of its tangent is $x = 0$.

   ![Diagram](image)

   Let $y = mx$ be the other tangent through origin.

   Then length of perpendicular from $C(r, h)$ to $y = mx$ should be equal to $r$.

   $$\Rightarrow \frac{mr - h}{\sqrt{m^2 + 1}} = r$$

   $$\Rightarrow m^2r^2 - 2mrh + h^2 = m^2r^2 + r^2$$

   $$\Rightarrow m = \frac{h^2 - r^2}{2rh}$$

   Other tangent is $y = \frac{h^2 - r^2}{2rh} x$

2. **(b)**

   Centre $C_1 = (0, 0)$ and $R_1 = 2$.

   Also for circle $x^2 + y^2 - 6x - 8y - 24 = 0$

   $C_2 = (3, 4)$ and $R_2 = 7$.

   Again $C_1 C_2 = 5 = R_2 - R_1$

   Therefore, the given circles touch internally such that they can have just one common tangent at the point of contact.

3. **(a, b, c and d)**

   Putting $y = \frac{x^2}{a^2}$ in $x^2 + y^2 = a^2$

   we obtain $x^2 + \frac{x^4}{a^2} = a^2$

   $$\Rightarrow x^4 - a^2x^2 + c^4 = 0$$

   As $x_1, x_2, x_3$ and $x_4$ are roots of (1),

   $$\Rightarrow x_1 + x_2 + x_3 + x_4 = 0 \quad \text{and} \quad x_1 x_2 x_3 x_4 = c^4$$

   Similarly, forming equation in $y$, we get

   $$y_1 + y_2 + y_3 + y_4 = 0 \quad \text{and} \quad y_1 y_2 y_3 y_4 = c^4$$

4. **(a, c)** There can be two possibilities for the given circle as shown in the figure.

   ![Diagram](image)

   The equations of circles can be

   $$(x - 3)^2 + (y - 4)^2 = 16$$

   or $$(x - 3)^2 + (y + 4)^2 = 16$$

   i.e. $x^2 + y^2 - 6x - 8y + 9 = 0$

   or $x^2 + y^2 - 6x + 8y + 9 = 0$

5. **(b, c)** Let the equation of circle be

   $$x^2 + y^2 + 2gx + 2fy + c = 0$$

   It passes through $(0, 1)$

   $$\Rightarrow 1 + 2f + c = 0$$ ... (i)

   This circle is orthogonal to $(x - 1)^2 + y^2 = 16$

   i.e. $x^2 + y^2 - 2x - 15 = 0$

   and $x^2 + y^2 - 1 = 0$

   $$\Rightarrow \sigma\text{ We should have}\$$

   $$2g(-1) + 2f(0) = c - 15$$

   or $2g + c - 15 = 0$ ... (ii)

   and $2g(0) + 2f(0) = c - 1$

   or $c = 1$ ... (iii)

   Solving (i), (ii) and (iii), we get

   $$c = 1, g = 7, f = -1$$

   $$\therefore \sigma \text{ Required circle is }$$

   $x^2 + y^2 + 14x - 2y + 1 = 0$

   With centre $(-7, 1)$ and radius $7$

   $\therefore \sigma \text{ (b) and (c) are correct options.}$

6. **(a, c)** Circle : $x^2 + y^2 = 1$

   Equation of tangent at P($\cos \theta, \sin \theta$)

   $x \cos \theta + y \sin \theta = 1$ ... (1)

   Equation of normal at P

   $y = x \tan \theta$ ... (2)

   Equation of tangent at S is $x = 1$

   $$\Rightarrow \sigma \left(1, \frac{1 - \cos \theta}{\sin \theta}\right) = \sigma \left(1, \frac{\tan \theta}{2}\right)$$
\[ 4x - 2y - (x + 4) - 2(y - 2) - 20 = 0 \]
\[ 3x - 4y - 20 = 0 \]... (2)
For pt C, solving (1) and (2), we get
\[ x = 16, y = 7 \quad \therefore \quad C(16, 7). \]
Now, clearly \( ar(\text{quad} \ ABCD) = 2 \ ar(\triangle \ ABC) \)
\[ = 2 \times \frac{1}{2} \times AB \times BC = AB \times BC \]
where \( AB = \text{radius of circle} = 5 \)
and \( BC = \text{length of tangent from C to circle} \)
\[ = \sqrt{16^2 + 7^2 - 32 - 28 - 20} = \sqrt{225} = 15 \]
\[ \therefore \quad ar(\text{quad} \ ABCD) = 5 \times 15 = 75 \text{ sq. units.} \]

3. Given st. lines are \( x + y = 2 \)
\[ x - y = 2 \]

As centre lies on \( \perp \) bisector of given equations (lines) which are the lines \( y = 0 \) and \( x = 2. \)
\[ \therefore \quad \text{Centre lies on x axis or } x = 2. \]
But as it passes through \((-4, 3)\), i.e., II quadrant.
\[ \therefore \quad \text{Centre must lie on x-axis} \]
Let it be \((a, 0)\) then distance between \((a, 0)\) and \((-4, 3)\) is =
length of \( \perp \) lar distance from \((a, 0)\) to \(x + y - 2 = 0 \)
\[ (a + 4)^2 + (0 - 3)^2 = \left( \frac{a - 2}{\sqrt{2}} \right)^2 \]
\[ a^2 + 20a + 46 = 0 \quad \Rightarrow \quad a = -10 \pm \sqrt{54} \]
\[ \therefore \quad \text{Equation of circle is} \]
\[ [x + (10 \pm \sqrt{54} )]^2 + y^2 = [-(10 \pm \sqrt{54} ) + 4]^2 + 3^2 \]
\[ x^2 + y^2 + 2(10 \pm \sqrt{54} )x + 8(10 \pm \sqrt{54} ) - 25 = 0 \]
\[ x^2 + y^2 + 2(10 \pm \sqrt{54} )x + 55 \pm \sqrt{54} = 0. \]

4. Equation of chord whose mid point is given is
\[ T = S_1 \]
[Consider \((x_1, y_1)\) be mid pt. of \(AB\)]
\[ xx_1 + yy_1 - r^2 = x_1^2 + y_1^2 - r^2 \]
As it passes through \((h, k)\),
\[ \Rightarrow \]
\[ hx_1 + ky_1 = x_1^2 + y_1^2 \]
\[ \therefore \]
\[ \text{locus of } (x_1, y_1) \text{ is, } \]
\[ x^2 + y^2 = hx + ky \]

5. Let the two points be
\[ A = (\alpha_1, \beta_1) \text{ and } B = (\alpha_2, \beta_2) \]
Thus \(\alpha_1, \alpha_2\) are roots of
\[ x^2 + 2ax - b^2 = 0 \]
\[ \therefore \]
\[ \alpha_1 + \alpha_2 = -2a \quad \text{... (1)} \]
\[ \alpha_1 \alpha_2 = -b^2 \quad \text{... (2)} \]
\[ \beta_1, \beta_2 \text{ are roots of } x^2 + 2px - q^2 = 0 \]
\[ \therefore \]
\[ \beta_1 + \beta_2 = -2p \quad \text{... (3)} \]
\[ \beta_1 \beta_2 = -q^2 \quad \text{... (4)} \]
Now equation of circle with \(AB\) as diameter is
\[ (x - \alpha_1)(x - \alpha_2) + (y - \beta_1)(y - \beta_2) = 0 \]
\[ \Rightarrow \]
\[ x^2 - (\alpha_1 + \alpha_2)x + \alpha_1 \alpha_2 + y^2 - (\beta_1 + \beta_2)y + \beta_1 \beta_2 = 0 \]
\[ \Rightarrow \]
\[ x^2 + 2ax - b^2 + y^2 + 2py - q^2 = 0 \]
[Using eq. (1), (2), (3) and (4)]
\[ \Rightarrow \]
\[ x^2 + y^2 + 2ax + 2py - b^2 - q^2 = 0 \]
Which is the equation of required circle, with its centre \((-a, -p)\) and radius \(\sqrt{a^2 + p^2 + b^2 + q^2}\).

6. Let equation of tangent \(PAB\) be \(5x + 12y - 10 = 0\) and that of \(PXY\) be
\[ 5x - 12y - 40 = 0 \]
Now let centre of circles \(C_1\) and \(C_2\) be \((h, k)\).
Let \(CM \perp PAB\) then \(CM = \text{radius of } C_1 = 3\)
Also \(C_2\) makes an intercept of length 8 units on \(PAB \Rightarrow AM = 4\)

Then in \(\Delta AMC\), we get
\[ AC = \sqrt{5^2 + 3^2} = 5 \]
\[ \therefore \]
Radius of \(C_2\) is \(5\) units
Also, as \(5x + 12y - 10 = 0 \quad \text{... (1)}\)
and \(5x - 12y - 40 = 0 \quad \text{... (2)}\)
are tangents to \(C_1\), length of perpendicular from \(C\) to \(AB\) is \(3\) units
\[ \therefore \]
\[ \text{We get } \frac{5h + 12k - 10}{13} = \pm 3 \]
\[ \Rightarrow \]
\[ 5h + 12k - 49 = 0 \quad \text{... (i)} \]
or \[ 5h + 12k + 29 = 0 \quad \text{... (ii)} \]
Similarly, \[ \frac{5h - 12k - 40}{13} = \pm 3 \]
\[ \Rightarrow \]
\[ 5h - 12k - 79 = 0 \quad \text{... (iii)} \]
or \[ 5h - 12k + 1 = 0 \quad \text{... (iv)} \]
As \(C\) lies in first quadrant
\[ \therefore \]
\[ h, k \text{ are } +ve \]
\[ \therefore \]
Eq. (ii) is not possible.

Solving (i) and (iii), we get
\[ h = 64/5, k = -5/4 \]
This is also not possible.
Now solving (i) and (iv), we get \(h = 5, k = 2\).
Thus centre for \(C_2\) is \((5, 2)\) and radius 5.
Hence, equation of \(C_2\) is \((x - 5)^2 + (y - 2)^2 = 5^2\)
\[ \Rightarrow \]
\[ x^2 + y^2 - 10x - 4y + 4 = 0 \]

7. Let the equation of \(L_1\) be
\[ x \cos \alpha + y \sin \alpha = p_1 \]
Then any line perpendicular to \(L_1\) is
\[ x \sin \alpha - y \cos \alpha = p_2, \text{ where } p_2 \text{ is a variable.} \]
Then \(L_1\) meets \(x\)-axis at \(P(p_1, \sec \alpha, 0)\) and \(y\)-axis at \(Q(0, p_1 \cosec \alpha)\).
Similarly \(L_2\) meets \(x\)-axis at \(R(p_2, \cosec \alpha, 0)\) and \(y\)-axis at \(S(0, -p_2 \sec \alpha)\).

Now equation of \(PS\) is,
\[ \frac{x}{p_1 \sec \alpha} + \frac{y}{p_2 \sec \alpha} = 1 \Rightarrow \frac{x}{p_1} - \frac{y}{p_2} = \sec \alpha \quad \text{... (1)} \]
Similarly, equation of \(QR\) is,
\[ \frac{x}{p_2 \cosec \alpha} + \frac{y}{p_1 \cosec \alpha} = 1 \Rightarrow \frac{x}{p_2} + \frac{y}{p_1} = \cosec \alpha \quad \text{... (2)} \]
Locus of point of intersection of \(PS\) and \(QR\) can be obtained by eliminating the variable \(p_2\) from (1) and (2)
i.e.
\[ \left(\frac{x}{p_1} - \sec \alpha\right) \frac{x}{p_1} + \frac{y}{p_1} = \cosec \alpha \]
[Substituting the value of \(\frac{1}{p_2}\) from (1) in (2)]
\[ \Rightarrow (x - p_1 \sec \alpha) x + y^2 = p_1 y \sec \alpha \]
\[ \Rightarrow x^2 + y^2 - p_1 x \sec \alpha - p_1 y \cosec \alpha = 0 \]
which is a circle through origin.

8. The given circle is
\[ x^2 + y^2 - 4x - 4y + 4 = 0 \]
This can be re-written as
\[ (x - 2)^2 + (y - 2)^2 = 4 \]
which has centre \((2, 2)\) and radius 2.

Let the eq. of third side \(AB\) of \(\Delta OAB\) is \(\frac{x}{a} + \frac{y}{b} = 1\) such that
\(A(a, 0)\) and \(B(0, b)\)
9. Given that \( m_1, m_2, m_3, m_4 \) are four distinct points on a circle. Let the equation of circle be \( x^2 + y^2 + 2gx + 2fy + c = 0 \). As the point \( \left( m, \frac{1}{m} \right) \) lies on it, therefore, we have

\[
m^2 + \frac{1}{m^2} + 2gm + \frac{2f}{m} + c = 0
\]

\[
\Rightarrow m^4 + 2gm^3 + cm^2 + 2fm + 1 = 0
\]

10. Let \( AB \) be the length of chord intercepted by circle on \( y-x=0 \). Let \( CM \) be perpendicular to \( AB \) from centre \( C(h, k) \).

Also \( y-x=0 \) and \( y+x=0 \) are perpendicular to each other. 

\[
OPCM \text{ is rectangle.}
\]

\[
CM = OP = 4\sqrt{2}.
\]

Let \( r \) be the radius of circle.

Also \( AM = \frac{1}{2} AD = \frac{1}{2} \times 6 \sqrt{2} = 3 \sqrt{2} \)

\[
\Rightarrow AC^2 = AM^2 + MC^2
\]

\[
\Rightarrow r^2 = (3\sqrt{2})^2 + (4\sqrt{2})^2 \Rightarrow r^2 = (5\sqrt{2})^2
\]

\[
\Rightarrow r = 5\sqrt{2}
\]

Again \( y-x \) is tangent to the circle at \( P \)

\[
CP = r
\]

\[
\Rightarrow \left| \frac{h-k}{\sqrt{2}} \right| = 5\sqrt{2} \Rightarrow h-k = \pm 10 \quad \ldots (1)
\]

Also \( CM = 4\sqrt{2} \)

\[
\Rightarrow \left| \frac{h+k}{\sqrt{2}} \right| = 4\sqrt{2} \Rightarrow h+k = \pm 8 \quad \ldots (2)
\]

Solving four sets of eq's given by (1) and (2), we get the possible centres as

\( (9, -1), (1, -9), (-1, 9), (-9, 1) \)

\[
\Rightarrow \begin{align*}
\text{Possible circles are} & \quad (x-9)^2 + (y+1)^2 - 50 = 0 \\
& \quad (x-1)^2 + (y+9)^2 - 50 = 0 \\
& \quad (x+1)^2 + (y-9)^2 - 50 = 0 \\
& \quad (x+9)^2 + (y-1)^2 - 50 = 0
\end{align*}
\]

But the pt \( (10, 2) \) lies inside the circle.

\[
\Rightarrow S < 0 \text{ which is satisfied only for} \quad (x+9)^2 + (y-1)^2 - 50 = 0
\]

The required eq. of circle is

\[
x^2 + y^2 + 18x - 2y + 32 = 0.
\]

11. Let \( r \) be the radius of circle.

Let \( A \) and \( B \) be the centres of the circles, required. Clearly, \( AB \) is the line perpendicular to \( r \) and passing through \( P(1, 2) \).
Therefore eq. of $AB$ is
\[
\frac{x-1}{4/5} = \frac{x-2}{3/5} = r
\]
As slope of $t$ is $-4/3$
\[
\therefore \text{ slope of } AB \text{is } 3/4 = \tan \theta
\]
\[
\therefore \cos \theta = 4/5; \sin \theta = 3/5
\]
For pt $A, r = -5$ and for pt $B, r = 5$, we get
\[
\frac{x-1}{4/5} = \frac{y-2}{3/5} = -5, \frac{r}{5} \text{ (radius of each circle )}
\]
\[
\Rightarrow \text{ For pt } A; x = -4 + 1, y = -3 + 2
\]
\[
\text{and for pt } B; x = 4 + 1, y = 3 + 2
\]
\[
\therefore A(-3, -1); B(5, 5).
\]
\[
\text{Eq.'s of required circles are}
\]
\[
(x + 3)^2 + (y + 1)^2 = 5^2
\]
\[
\text{and } (x - 5)^2 + (y - 5)^2 = 5^2
\]
\[
\Rightarrow \quad x^2 + y^2 + 6x + 2y - 15 = 0
\]
\[
\text{and } x^2 + y^2 - 10x - 10y + 25 = 0
\]
12. The given circle is
\[
2x(x-a) + y(2y-b) = 0(a, b \neq 0)
\]
\[
\Rightarrow 2x^2 + 2y^2 - 2ax - by = 0 \quad \ldots (1)
\]
Let us consider the chord of this circle which passes through

the pt \(\left(\frac{a}{2}, \frac{b}{2}\right)\) and whose mid pt. lies on x-axis.

\[B(a, b/2)\]

\[A(h, 0)\]

\[M(h, 0)\]

Let \((h, 0)\) be the mid pt. of the chord, then eq. of chord can be obtained by \(T = S_1\)
\[
i.e., \quad 2xh + 2y(0-a)(x + h) - \frac{b}{2}(y + 0) = 2h^2 - 2ah
\]
\[
\Rightarrow (2h-a)x - \frac{b}{2}y + ah - 2h^2 = 0
\]
This chord passes through \(\left(\frac{a}{2}, \frac{b}{2}\right)\), therefore
\[
(2h-a)\left(\frac{a}{2}\right) - \frac{b}{2} + ah - 2h^2 = 0
\]
\[
\Rightarrow 8h^2 - 12ah + (4a^2 + b^2) = 0
\]
As given in question, two such chords are there, so we should have two real and distinct values of \(h\) from the above quadratic in \(h\), for which
\[
D>0
\]
\[
\Rightarrow (12a^2 - 4 \times 8 \times (4a^2 + b^2)) > 0
\]
\[
\Rightarrow a^2 > 2b^2
\]
13. Let the family of circles, passing through \(A(3, 7)\) and \(B(6, 5)\), be
\[
x^2 + y^2 + 2gx + 2fy + c = 0
\]
As it passes through \(3, 7)\)
\[
\therefore 9 + 49 + 6g + 14f + c = 0
\]
\[
or, \quad 6g + 14f + c + 58 = 0 \quad \ldots (1)
\]
As it passes through \(6, 5)\)
\[
\therefore 36 + 25 + 12g + 10f + c = 0
\]
\[
12g + 10f + c + 61 = 0 \quad \ldots (2)
\]
\[
(2) - (1) \text{ gives },\quad 6g - 4f + 3 = 0 \quad \Rightarrow \quad g = \frac{4f - 3}{6}
\]
Substituting the value of \(g\) in equation (1), we get
\[
4f - 3 + 14f + c + 58 = 0
\]
\[
\Rightarrow 18f + 55 + c = 0 \quad \Rightarrow \quad c = -18f - 55
\]
Thus the family is
\[
x^2 + y^2 + \left(\frac{4f - 3}{3}\right) x + 2fy - (18f + 55) = 0
\]
Members of this family are cut by the circle
\[
x^2 + y^2 - 4x - 6y - 3 = 0
\]
\[
\therefore \text{ Equation of family of chords of intersection of above two circles is}
\]
\[
S_1 - S_2 = 0
\]
\[
\Rightarrow \left(\frac{4f - 3}{3}\right) x + (2f + 6)y - 18f + 52 = 0
\]
which can be written as
\[
(3x + 6y - 52) + \left(\frac{4}{3}\right)(x + 2y - 18) = 0
\]
which represents the family of lines passing through the pt. of intersection of the lines
\[
3x + 6y - 52 = 0 \text{ and } 4x + 6y - 54 = 0
\]
Solving which we get \(x = 2\) and \(y = 23/3\).

Thus the required pt. of intersection is \(\left(2, \frac{23}{3}\right)\)

14. The given circles are
\[
x^2 + y^2 - 4x - 2y = -4
\]
and \[
x^2 + y^2 - 12x - 8y = -36
\]
i.e., \[
x^2 + y^2 - 4x - 2y + 4 = 0 \quad \ldots (1)
\]
\[
x^2 + y^2 - 12x - 8y + 36 = 0 \quad \ldots (2)
\]
with centres \(C_1(2, 1)\) and \(C_2(6, 4)\) and radii 1 and 4 respectively.
Also \(C_1C_2 = 5\)
\[
\text{As } \quad r_1 + r_2 = C_1C_2\]
\[
\Rightarrow \text{ Two circles touch each other externally, at } P.
\]

Clearly, \(P\) divides \(C_1C_2\) in the ratio 1 : 4
\[
\therefore \text{ Co-ordinates of } P \text{ are}
\]
\[
\left(\frac{1 \times 6 + 4 \times 1}{1 + 4}, \frac{1 \times 4 + 4 \times 1}{1 + 4}\right) = \left(\frac{14}{5}, \frac{8}{5}\right)
\]
Let \(AB\) and \(CD\) be two common tangents of given circles, meeting each other at \(T\). Then \(T\) divides \(C_1C_2\) externally in the ratio 1 : 4.

**KEY CONCEPT:** [As the direct common tangents of two circles pass through a pt. which divides the line segment joining the centres of two circles externally in the ratio of their radii.]

Hence, \(T = \left(\frac{1 \times 6 - 4 \times 2}{1 - 4}, \frac{1 \times 4 - 4 \times 1}{1 - 4}\right) = \left(\frac{2}{3}, 0\right)\)
15. Let the given point be

\[(p, \bar{p}) = \left(\frac{1 + \sqrt{2}a}{2}, \frac{1 - \sqrt{2}a}{2}\right)\]

and the equation of the circle becomes

\[x^2 + y^2 - px - \bar{p}y = 0\]

Since the chord is bisected by the line \(x + y = 0\), its mid-point can be chosen as \((k, -k)\). Hence the equation of the chord by \(T = S_1\) is

\[kx - ky - \frac{p}{2}(x + k) - \frac{\bar{p}}{2}(y - k) = k^2 + k^2 - pk + \bar{p}k\]

It passes through \(A(p, \bar{p})\)

\[kp - k\bar{p} - \frac{p}{2}(p + k) - \frac{\bar{p}}{2}(\bar{p} - k) = 2k^2 - pk + \bar{p}k\]

or

\[3k(p - \bar{p}) = 4k^2 + (p^2 + \bar{p}^2)\]  \hspace{1cm} (1)

Put \(p - \bar{p} = a\sqrt{2}, p^2 - \bar{p}^2 = 2. \left(\frac{1 + 2a^2}{4}\right) = \frac{1 + 2a^2}{2}\)  \hspace{1cm} (2)

Hence, from (1) by the help of (2), we get

\[4k^2 - 3\sqrt{2}ak + \frac{1}{2}(1 + 2a^2) = 0 \quad \ldots (3)\]

Since, there are two chords which are bisected by \(x + y = 0\), we must have two real values of \(k\) from (3)

\[\Delta > 0\]

or \[18a^2 - 8(1 + 2a^2) > 0\]

or \[2a^2 - 4 > 0\]

or \[(a + 2)(a - 2) > 0\]

\[a < -2 \text{ or } > 2\]

\[a \in (-\infty, -2) \cup (2, \infty)\]

or \[a \in [-\infty, -2] \cup [2, \infty]\]

16. Let \(r\) be the radius of circle, then \(AC = 2r\)

Since, \(AC\) is the diameter
Circle

Eliminating \( y \), we get,

\[
x^2 + \left( \frac{r^2 - hx}{k} \right)^2 = r^2
\]

or,

\[
x^2 (h^2 + k^2) - 2r^2 h x + r^2 - r^2 \cdot k^2 = 0
\]

or,

\[
x^2 (4r^2 - 2r^2 \cdot h^2 + r^2 - k^2) = 0
\]

\[\therefore\ x_1 + x_2 = \frac{2r^2 h}{4r^2} = \frac{h}{2}, y_1 + y_2 = \frac{k}{2}
\]

If \((x, y)\) be the centroid of \(\Delta PAB\), then

\[
3x = x_1 + x_2 + h = \frac{h}{2} + h = \frac{3h}{2}
\]

\[\therefore\ \frac{h}{2} \text{ or } h = 2x \text{ and similarly } k = 2y
\]

Putting in \((1)\) we get

\[
4x^2 + 4y^2 = 4r^2
\]

\[\therefore\ \text{Locus is } x^2 + y^2 = r^2 \text{ i.e., } C_1
\]

19. The given circle is \(x^2 + y^2 = 1\) ... \((1)\)

Centre \(O(0, 0)\) radius = 1

Let \(T_1\) and \(T_2\) be the tangents drawn from \((-2, 0)\) to the circle \((1)\).

Let \(m\) be the slope of tangent then equations of tangents are

\[
y - 0 = m(x + 2)
\]

or,

\[
mx - y + 2m = 0
\]

As it is tangent to circle \((1)\) length of \(\perp\) lar from \((0, 0)\) to \((2)\) = radius of \((1)\)

\[
\Rightarrow \left| \frac{2m}{\sqrt{m^2 + 1}} \right| = 1 \Rightarrow 4m^2 = m^2 + 1 \Rightarrow m = \pm 1/\sqrt{3}
\]

\[\therefore\ \text{The two tangents are } x + \sqrt{3}y + 2 = 0(T_1) \text{ and } x - \sqrt{3}y + 2 = 0(T_2)
\]

Now any other circle touching \((1)\) and \(T_1, T_2\) is such that its centre lies on \(x\)-axis.

Let \((h, 0)\) be the centre of such circle, then from fig.

\[OC_1 = OA + AC_1 \Rightarrow |h| = 1 + |AC_1|
\]

But \(AC_1 = \perp\) lar distance of \((h, 0)\) to tangent

\[
|h| = 1 + \left| \frac{h + 2}{2} \right| \Rightarrow |h| - 1 = \left| \frac{h + 2}{2} \right|
\]

\[
\text{Squaring,}\ h^2 - 2|h| + 1 = \frac{h^2 + 4h + 4}{4}
\]

\[
\Rightarrow 4h^2 + 8h + 4 = h^2 + 4h + 4
\]

\[\therefore\ 3h^2 = -4h \Rightarrow h = -4/3
\]

\[\therefore\ 3h^2 = 12h \Rightarrow h = 4
\]

Thus centres of circles are \((4, 0), \left( \frac{-4}{3}, 0 \right)\).

\[\therefore\ \text{Radius of circle with centre } (4, 0) \text{ is } 4 - 1 = 3 \text{ and radius of circle with centre } \left( \frac{-4}{3}, 0 \right) \text{ is } \frac{4}{3} - 1 = \frac{1}{3}
\]

\[\therefore\ \text{The two possible circles are}\ (x - 4)^2 + y^2 = 3^2 \quad \ldots \(3)\]

\[\text{And } \left( x + \frac{4}{3} \right)^2 + y^2 = \left( \frac{1}{3} \right)^2 \quad \ldots \(4)\]

Now, common tangents of \((1)\) and \((3)\). Since \((1)\) and \((3)\) are two touching circles they have three common tangents \(T_1, T_2\) and \(x = 1\) (clear from fig.)

Similarly common tangents of \((1)\) and \((4)\) are \(T_1, T_2\) and \(x = -1\).

For the circles \((3)\) and \((4)\) there will be four common tangents of which two are direct common tangents.

\(XY\) and \(x'y'\) and two are indirect common tangents. Let us find two common indirect tangents. We know that

In two similar \(\Delta's\) \(C_1XN\) and \(C_2YN\)

\[
\frac{3}{1/3} = \frac{C_1N}{C_2N} \Rightarrow N \text{ divides } C_1C_2 \text{ in the ratio } 9:1.
\]

Clearly \(N\) lies on \(x\)-axis.

\[\therefore\ N = \left( \frac{9\times(-4/3) + 1 \times 4}{10}, 0 \right) = \left( \frac{-4}{5}, 0 \right)
\]

Any line through \(N\) is

\[y = m\left( x + \frac{4}{5} \right) \text{ or } 5mx - 5y + 4m = 0
\]

If it is tangent to \((3)\) then

\[
\left| \frac{20m + 4m}{\sqrt{25m^2 + 25}} \right| = 3
\]

\[\Rightarrow \frac{24m}{15m^2 + 1} \Rightarrow 64m^2 = 25m^2 + 25
\]

\[\Rightarrow 39m^2 = 25 \Rightarrow m = \pm 5/\sqrt{39}
\]

\[\therefore\ \text{Required tangents are}\ y = \pm \frac{5}{\sqrt{39}} \left( x + \frac{4}{5} \right).
\]

20. The equation \(2x^2 - 3xy + y^2 = 0\) represents pair of tangents \(OA\) and \(OA'\).

Let angle between these to tangents be \(20\).

Then, \(\tan 2\theta = \frac{2\sqrt{\frac{-3^2}{2} - 2 \times 1}}{2+1}\)
Using \( \tan \theta = \frac{2 \sqrt{h^2 - ab}}{a + b} \)

\[
\frac{2 \tan \theta}{1 - \tan^2 \theta} = 1 \Rightarrow \tan^2 \theta + 6 \tan \theta - 1 = 0
\]

\[
\tan \theta = \frac{-6 \pm \sqrt{36 + 4}}{2} = -3 \pm \sqrt{10}
\]

As \( \theta \) is acute, \( \tan \theta = -3 + \sqrt{10} \).

Now we know that the line joining the point through which tangents are drawn to the centre bisects the angle between the tangents.

\[
\angle AOC = \angle A'OAC = \theta
\]

In \( \triangle AOC \),

\[
\tan \theta = \frac{3}{OA} \Rightarrow OA = \frac{3}{\sqrt{10} - 3} \times \frac{\sqrt{10} + 3}{\sqrt{10} + 3}
\]

\[
OA = 3(3 + \sqrt{10})
\]

21. Let equation of \( C_1 \) be \( x^2 + y^2 = \eta^2 \) and of \( C_2 \) be

\[
(x - a)^2 + (y - b)^2 = r_2^2
\]

Let centre of \( C \) be \((h, k)\) and radius be \( r \), then by the given conditions.

\[
\sqrt{(h - a)^2 + (k - b)^2} = r + r_2 \quad \text{and} \quad \sqrt{h^2 + k^2} = \eta - r
\]

\[
\Rightarrow \sqrt{(h - a)^2 + (k - b)^2} + \sqrt{h^2 + k^2} = \eta + r_2
\]

Required locus is

\[
\sqrt{(x - a)^2 + (y - b)^2} + \sqrt{x^2 + y^2} = \eta + r_2
\]

which represents an ellipse whose foci are at \((a, b)\) and \((0, 0)\).

\[
\text{[Note : } PS + PS' = \text{constant} \Rightarrow \text{locus of } P \text{ is an ellipse with foci at } S \text{ and } S']
\]

22. The given circle is \( x^2 + y^2 = r^2 \)

From pt. \((6, 8)\) tangents are drawn to this circle.

Then length of tangent

\[
PL = \sqrt{6^2 + 8^2 - r^2} = \sqrt{100 - r^2}
\]

Also equation of chord of contact \( LM \) is

\[
6x + 8y - r^2 = 0
\]

\[
PN = \text{length of } \perp \text{ from } P \text{ to } LM
\]

\[
= \frac{36 + 64 - r^2}{\sqrt{36 + 64}} = \frac{100 - r^2}{10}
\]

Now in rt. \( \triangle PLN \), \( LN^2 = PL^2 - PN^2 \)

\[
= (100 - r^2) - \frac{(100 - r^2)^2}{100} = \frac{(100 - r^2)^3}{100}
\]

\[
\Rightarrow LN = \frac{r \sqrt{100 - r^2}}{10}
\]

\[
\Rightarrow LM = \frac{r \sqrt{100 - r^2}}{5} \quad (\because LM = 2LN)
\]

\[
\text{Area of } \triangle PLM = \frac{1}{2} \times LM \times PN
\]

\[
= \frac{1}{2} \times \frac{r \sqrt{100 - r^2}}{5} \times \frac{100 - r^2}{100} = \frac{1}{100} \left[ r (100 - r^2)^2 \right]
\]

For max value of area, we should have

\[
\frac{dA}{dr} = 0
\]

\[
\Rightarrow \frac{1}{100} \left[ (100 - r^2)^3 \right. + r \left. \frac{3}{2} (100 - r^2)^2 (-2r) \right] = 0
\]

\[
\Rightarrow (100 - r^2)^2 (100 - r^2 - 3r^2) = 0 \Rightarrow r = 10 \text{ or } r = 5
\]

But \( r = 10 \) gives length of tangent \( PL = 0 \)

\[
\therefore \quad r = 5
\]

23. We are given that line \( 2x + 3y + 1 = 0 \) touches a circle \( S = 0 \) at \((1, -1)\).

So, eqn of this circle can be given by

\[
(x - 1)^2 + (y + 1)^2 + \lambda (2x + 3y + 1) = 0
\]

[\text{Note : } (x - 1)^2 + (y + 1)^2 = 0 \text{ represents a pt. circle with centre at } (1,-1)]

Thus \( x^2 + y^2 + 2x (\lambda - 1) + y (3\lambda + 2) + (\lambda + 2) = 0 \) ....(1)

But given that this circle is orthogonal to the circle, the extremities of whose diameter are \((0, 3)\) and \((-2, -1)\) i.e.

\[
x (x + 2) + y (y - 3) (y + 1) = 0
\]

\[
x^2 + y^2 + 2x - 2y - 3 = 0
\]

\[
\therefore \quad x^2 + y^2 + 2x + (y + 1) (y - 3) = 0
\]

\[
\Rightarrow 2\lambda - 2 - 3\lambda - 2 = -\lambda - 1
\]

\[
[2g_1g_2 + 2f_1f_2 = c_1 + c_2]
\]
\[ 2\lambda = -3 \Rightarrow \lambda = \frac{-3}{2} \]

Substituting this value of \( \lambda \) in eq. (1) we get the required circle as

\[ x^2 + y^2 - 5x - \frac{5}{2}y + \frac{1}{2} = 0 \]

or, \( 2x^2 + 2y^2 - 10x - 5y + 1 = 0 \)

24. Given these circles with centres at \( C_1, C_2 \) and \( C_3 \) and with radii \( 3, 4 \) and \( 5 \) respectively. The three circles touch each other externally as shown in the figure.

\( P \) is the point of intersection of the three tangents drawn at the pts of contacts, \( L, M \) and \( N \). Since lengths of tangents to a circle from a point are equal, we get

\[ PL = PM = PN \]

Also \( PL \perp C_1C_2, \ PM \perp C_2C_3, \ PN \perp C_1C_3 \)

\( \therefore \) tangent is perpendicular to the radius at pt. of contact

Clearly \( P \) is the incentre of \( \triangle C_1C_2C_3 \) and its distance from pt. of contact i.e., \( PL \) is the radius of incircle of \( \triangle C_1C_2C_3 \).

In \( \triangle C_1C_2C_3 \) sides are

\[ a = 3 + 4 = 7, \ b = 4 + 5 = 9, \ c = 5 + 3 = 8 \]

\[ \therefore \ s = \frac{a + b + c}{2} = 12 \]

\[ \therefore \ \Delta = \sqrt{s(s-a)(s-b)(s-c)} = \sqrt{12 \times 5 \times 3 \times 4} = 12\sqrt{5} \]

\[ \therefore \ \frac{\Delta}{s} = \frac{12\sqrt{5}}{12} = \sqrt{5} \]

G. Comprehension Based Questions

1. (a) Without loss of generality we can assume the square \( ABCD \) with its vertices \( A (1, 1), B (-1, 1), C(-1,-1), D (1,-1) \)

\( P \) to be the point \((0, 1)\) and \( Q \) as \((\sqrt{2}, 0)\).

Then, \[
\frac{PA^2 + PB^2 + PC^2 + PD^2}{QA^2 + QB^2 + QC^2 + QD^2} = \frac{1 + 1 + 5 + 5}{2[(\sqrt{2} - 1)^2 + 1] + 2[(\sqrt{2} + 1)^2 + 1]} = \frac{12}{16} = 0.75
\]

2. (b) Let \( C' \) be the said circle touching \( C_1 \) and \( L \), so that \( C_1 \) and \( C' \) are on the same side of \( L \). Let us draw a line \( T \) parallel to \( L \) at a distance equal to the radius of circle \( C_1 \), on opposite side of \( L \). Then the centre of \( C' \) is equidistant from the centre of \( C_1 \) and from line \( T \).

\[ \Rightarrow \text{locus of centre of } C' \text{ is a parabola.} \]

3. (c) Since \( S \) is equidistant form \( A \) and line \( BD \), it traces a parabola. Clearly, \( AC \) is the axis, \( A (1, 1) \) is the focus

\[ \text{and } T_1 \left( \frac{1}{2}, \frac{1}{2} \right) \text{ is the vertex of parabola.} \]

\[ AT_1 = \frac{1}{\sqrt{2}} \]

\[ T_2T_3 = \text{latus rectum of parabola} \]

\[ \text{Area } (\Delta T_1T_2T_3) = \frac{1}{2} \sqrt{2} \times \sqrt{2} = 1 \text{ sq. units} \]
4. (d) Slope of $CD = \frac{1}{\sqrt{3}}$

\[ \therefore \text{Parametric equation of } CD \text{ is } \frac{x - 3\sqrt{3}}{\sqrt{3}} = \frac{y - 3}{2} = \pm 1 \]

\[ \therefore \text{Two possible coordinates of } C \text{ are } \left( \frac{\sqrt{3} + 3\sqrt{3}}{2}, \frac{1 + 3}{2} \right) \text{ or } \left( \frac{-\sqrt{3} + 3\sqrt{3}}{2}, \frac{-1 + 3}{2} \right) \]

\[ \text{i.e. } (2\sqrt{3}, 2) \text{ or } (\sqrt{3}, 1) \]

As $(0, 0)$ and $C$ lie on the same side of $PQ$

\[ \therefore \text{coordinates of } C \text{ should be coordinates of } C. \]

**Note:** Remember $(x_1, y_1)$ and $(x_2, y_2)$ lie on the same or opposite side of a line $ax + by + c = 0$ according as $ax_1 + by_1 + c > 0 \text{ or } < 0$.

\[ \therefore \text{Equation of the circle is } (x - \sqrt{3})^2 + (y - 1)^2 = 1 \]

5. (a) $\Delta PQR$ is an equilateral triangle, the incentre $C$ must coincide with centroid of $\Delta PQR$ and $D$, $E$, $F$ must coincide with the midpoints of sides $PQ$, $QR$ and $RP$ respectively.

Also $\angle CPD = 30^\circ \Rightarrow PD = \sqrt{3}$

Writing the equation of side $PQ$ in symmetric form we get

\[ \frac{x - 3\sqrt{3}}{\sqrt{3}} = \frac{y - 3}{2} = \mp \sqrt{3} \]

\[ \therefore \text{Coordinates of } P = \left( \frac{\sqrt{3} + 3\sqrt{3}}{2}, \frac{1 + 3}{2} \right) \text{ or } (2\sqrt{3}, 0) \text{ and } \]

coordinates of $Q = \left( \frac{-\sqrt{3} + 3\sqrt{3}}{2}, \frac{-1 + 3}{2} \right) = (\sqrt{3}, 3)$

Let coordinates of $R$ be $(\alpha, \beta)$, then using the formula for centroid of $\Delta$ we get

\[ \frac{\sqrt{3} + 2\sqrt{3} + \alpha}{3} = \sqrt{3} \text{ and } \frac{3 + 0 + \beta}{3} = 1 \]

\[ \therefore \alpha = 0 \text{ and } \beta = 0 \]

\[ \therefore \text{Coordinates of } R = (0, 0) \]

Now coordinates of $E = \text{mid point of } QR = \left( \frac{\sqrt{3}}{2}, \frac{3}{2} \right)$

and coordinates of $F = \text{mid point of } PR = (\sqrt{3}, 0)$

6. (d) Equation of side $QR$ is $y = \sqrt{3}x$ and equation of side $RP$ is $y = 0$

7. (a) Equation of tangent $PT$ to the circle $x^2 + y^2 = 4$ at the point $P(\sqrt{3}, 1)$ is $x\sqrt{3} + y = 4$

Let the line $L$, perpendicular to tangent $PT$ be $x - y\sqrt{3} + \lambda = 0$

As it is tangent to the circle $(x - 3)^2 + y^2 = 1$

\[ \Rightarrow \frac{|3 + \lambda|}{2} = 1 \Rightarrow \lambda = -1 \text{ or } -5 \]

\[ \therefore \text{Equation of } L \text{ can be } x - \sqrt{3}y = 1 \text{ or } x - \sqrt{3}y = 5 \]

8. (d) From the figure it is clear that the intersection point of two direct common tangents lies on $x$-axis.

Also $\Delta PTC_1 = \Delta PTC_2$

\[ \Rightarrow PC_1 : PC_2 = 2 : 1 \]

or $P$ divides $C_1C_2$ in the ratio $2 : 1$ externally

\[ \therefore \text{Coordinates of } P \text{ are } (6, 0) \]

Let the equation of tangent through $P$ be $y = m(x - 6)$

As it touches $x^2 + y^2 = 4$

\[ \therefore \frac{6m}{\sqrt{m^2 + 1}} = 2 \Rightarrow 36m^2 = 4(m^2 + 1) \]

\[ \Rightarrow m = \pm 1 \]

\[ \therefore \text{Equations of common tangents are } y = \pm 1 \]

Also $x = 2$ is the common tangent to the two circles.

**H. Assertion & Reason Type Questions**

1. (a) Equation of director circle of the given circle $x^2 + y^2 = 169$ is $x^2 + y^2 = 2 \times 169 = 338$.

We know from every point on director circle, the tangents drawn to given circle are perpendicular to each other.

Here $(17, 7)$ lies on director circle.

\[ \therefore \text{The tangent from } (17, 7) \text{ to given circle are mutually perpendicular.} \]
2. (c) The given circle is $x^2 + y^2 + 6x - 10y + 30 = 0$
Centre (-3, 5), radius = 2
$L_1 : 2x + 3y + (p - 3) = 0$ ;
$L_2 : 2x + 3y + p + 3 = 0$
Clearly $L_1 \parallel L_2$
Distance between $L_1$ and $L_2$
$$\frac{|p + 3 - p + 3|}{\sqrt{2^2 + 3^2}} = \frac{6}{\sqrt{13}} < 2$$
$\Rightarrow$ If one line is a chord of the given circle, other line may or may not the diameter of the circle.
$\therefore$ Statement 1 is true and statement 2 is false.

1. **Integer Value Correct Type**

1. **(8)** Let $r$ be the radius of required circle.
   Clearly, in $\triangle C_1 C_2 C$, $C_1 C = C_2 C = r + 1$
   and $P$ is mid point of $C_1 C_2$
   $\therefore CP \perp C_1 C_2$
   Also $PM \perp C_1 C$
   Now $\triangle PMC_1 \sim \triangle CPC_1$ (by AA similarity)
   $\therefore \frac{MC_1}{PC_1} = \frac{PC_1}{CC_1}$
   We observe that only two points $\left(\frac{2}{3}, \frac{3}{4}\right)$ and $\left(\frac{1}{4}, -\frac{1}{4}\right)$ satisfy both the inequations (1) and (2)
   $\therefore$ 2 points in S lie inside the smaller part.

Section-B

1. **(c)** Equation of circle $x^2 + y^2 = 1 = (1)^2$
   $\Rightarrow x^2 + y^2 = (y - mx)^2 \Rightarrow x^2 = m^2x^2 - 2mxy$;
   $\Rightarrow x^2 (1 - m^2) + 2mxy = 0$. Which represents the pair of lines between which the angle is 45°.
   $$\tan 45 = \frac{2\sqrt{m^2 - 0}}{1 - m^2} = \pm \frac{2m}{1 - m^2};$$
   $\Rightarrow 1 - m^2 = \pm 2m \Rightarrow m^2 = 1 \mp 2m = 0$
   $\Rightarrow m = \frac{-2 \pm \sqrt{4 + 4}}{2} = \frac{-2 \pm 2\sqrt{2}}{2} = -1 \pm \sqrt{2}.$

2. **(a)** For any point $P (x, y)$ in the given circle,

   $OA \leq OP \leq OB \Rightarrow (5 - 3) \leq \sqrt{x^2 + y^2} \leq 5 + 3$
   $\Rightarrow 4 \leq x^2 + y^2 \leq 64$
3. (b) Let the required circle be $x^2 + y^2 + 2gx + 2fy + c = 0$

Since it passes through $(0, 0)$ and $(1, 0)$

$\Rightarrow c = 0$ and $g = -\frac{1}{2}$

Points $(0, 0)$ and $(1, 0)$ lie inside the circle $x^2 + y^2 = 9$, so two circles touch internally

$\Rightarrow c_1c_2 = r_1 - r_2$

$\therefore \sqrt{g^2 + f^2} = 3 - \sqrt{g^2 + f^2} \Rightarrow \sqrt{g^2 + f^2} = \frac{3}{2}$

$\Rightarrow f^2 = \frac{9}{4} - \frac{1}{4} = 2 \quad \therefore f = \pm \sqrt{2}$  

Hence, the centres of required circle are

\[ \left( \frac{1}{2}, \sqrt{2} \right) \quad \text{or} \quad \left( \frac{1}{2}, -\sqrt{2} \right) \]

4. (c) Let $ABC$ be an equilateral triangle, whose median is $AD$.

\[ \text{Given } AD = 3a. \]

In $\triangle ABD$, $AB^2 = AD^2 + BD^2$;

$\Rightarrow x^2 = 9a^2 + (x^2/4)$ where $AB = BC = AC = x$.

\[ \frac{3}{4} x^2 = 9a^2 \Rightarrow x^2 = 12a^2. \]

In $\triangle OBD$, $OB^2 = OD^2 + BD^2$

$\Rightarrow r^2 = (3a - r)^2 + \frac{x^2}{4}$

$\Rightarrow r^2 = 9a^2 - 6ar + r^2 + 3a^2$;

$\Rightarrow 6ar = 12a^2$

$\Rightarrow r = 2a$

So equation of circle is $x^2 + y^2 = 4a^2$.

5. (b) $|\eta - r_2| < C_1C_2$ for intersection

$\Rightarrow r - 3 < 5 \Rightarrow r < 8 \quad ...(1)$

and $\eta + r_2 > C_1C_2$, $r + 3 > 5 \Rightarrow r > 2 \quad ...(2)$

From (1) and (2), $2 < r < 8$.

6. (d) $\pi r^2 = 154 \Rightarrow r = 7$

For centre on solving equation $2x - 3y = 5 \& 3x - 4y = 7$ we get $x = 1, y = -1$

$\therefore$ centre $= (1, -1)$

Equation of circle, $(x-1)^2 + (y+1)^2 = 7^2$

$x^2 + y^2 - 2x + 2y = 47$

7. (b) Let the variable circle is

$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \ldots \ldots \ldots \ldots \ldots (1)$

It passes through $(a, b)$

$\therefore a^2 + b^2 + 2ga + 2fb + c = 0 \quad \ldots \ldots \ldots \ldots \ldots (2)$

8. (d) Let the variable circle be

$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \ldots \ldots \ldots \ldots \ldots (1)$

$\therefore p^2 + q^2 + 2gp + 2fq + c = 0 \quad \ldots \ldots \ldots \ldots \ldots (2)$

Circle (1) touches x-axis,

$\therefore g^2 - c = 0 \Rightarrow c = g^2$. From (2)

$p^2 + q^2 + 2gp + 2fq + g^2 = 0 \quad \ldots \ldots \ldots \ldots \ldots (3)$

Let the other end of diameter through $(p, q)$ be $(h, k)$,

then, $\frac{h + p}{2} = -g$ and $\frac{k + q}{2} = -f$

Put in (3)

$p^2 + q^2 + 2p\left(-\frac{h + p}{2}\right) + 2q\left(-\frac{k + q}{2}\right) + \left(\frac{h + p}{2}\right)^2 = 0$

$\Rightarrow p^2 - 2hp - 4kq = 0$

$\therefore$ locus of $(h, k)$ is $x^2 + p^2 - 2xp - 4yq = 0$

$\Rightarrow (x - p)^2 = 4qy$

9. (d) Two diameters are along

$2x + 3y + 1 = 0$ and $3x - y - 4 = 0$

solving we get centre $(1, -1)$

circumference $= 2\pi r = 10\pi$

$\therefore r = 5$.

Required circle is, $(x - 1)^2 + (y + 1)^2 = 5^2$

$\Rightarrow x^2 + y^2 - 2x + 2y - 23 = 0$

10. (d) Solving $y = x$ and the circle

$x^2 + y^2 - 2x = 0$, we get

$x = 0, y = 0$ and $x = 1, y = 1$

$\therefore$ Extremities of diameter of the required circle are $(0, 0)$ and $(1, 1)$. Hence, the equation of circle is

$(x - 0)(x - 1) + (y - 0)(y - 1) = 0$

$\Rightarrow x^2 + y^2 - x - y = 0$

11. (b) $s_1 = x^2 + y^2 + 2ax + cy + a = 0$

$s_2 = x^2 + y^2 - 3ax + dy - 1 = 0$

Equation of common chord of circles $s_1$ and $s_2$ is given by $s_1 - s_2 = 0$

$\Rightarrow 5ax + (c - d)y + a + 1 = 0$

Given that $5x + by - a = 0$ passes through $P$ and $Q$.  

Circle

\[ \therefore \text{The two equations should represent the same line} \]
\[ \Rightarrow \frac{a}{c-d} = \frac{a+1}{-a} \Rightarrow a+1 = -a^2 \]
\[ a^2 + a + 1 = 0 \]
No real value of \( a \).

12. (d) Equation of circle with centre \((0, 3)\) and radius 2 is
\[ x^2 + (y-3)^2 = 4 \]
Let locus of the variable circle is \((\alpha, \beta)\)
\[ \therefore \text{It touches x-axis.} \]
\[ \therefore \text{Its equation is} \ (x-\alpha)^2 + (y+\beta)^2 = \beta^2 \]

Circle touch externally \( \Rightarrow c_1c_2 = \eta + r_2 \)
\[ \therefore \sqrt{\alpha^2 + (\beta-3)^2} = 2 + \beta \]
\[ \alpha^2 + (\beta-3)^2 = \beta^2 + 4 + 4\beta \Rightarrow \alpha^2 = 10(\beta - 1/2) \]
\[ \therefore \text{Locus is} \ x^2 = 10\left(y - \frac{1}{2}\right) \text{which is a parabola.} \]

13. (d) Let the centre be \((\alpha, \beta)\)
\[ \therefore \text{It cuts the circle} \ x^2 + y^2 = p^2 \text{orthogonally} \]
\[ \therefore \text{Using} \ 2c_1c_2 + 2f_1f_2 = c_1 + c_2, \text{we get} \]
\[ 2(-\alpha) \times 0 + 2(-\beta) \times 0 = \alpha - p^2 \Rightarrow \alpha = p^2 \]

Let equation of circle is
\[ x^2 + y^2 - 2\alpha x - 2\beta y + p^2 = 0 \]
It passes through
\((a,b) \Rightarrow a^2 + b^2 - 2\alpha a - 2\beta b + p^2 = 0 \]
\[ \therefore \text{Locus of} \ (\alpha, \beta) \text{is} \]
\[ 2ax + 2by - (a^2 + b^2 + p^2) = 0. \]

14. (d)

As per question area of one sector = 3 area of another sector
\[ \therefore \text{angle at centre by one sector} = 3 \times \text{angle at centre by another sector} \]
Let one angle be \( \theta \) then other = \( 3\theta \)
Clearly \( \theta + 3\theta = 180 \Rightarrow \theta = 45^\circ \)

\[ \therefore \text{Angle between the diameters represented by combined equation} \]
\[ ax^2 + 2(a+b)xy + by^2 = 0 \text{is} \ 45^\circ \]
\[ \therefore \text{Using} \ \tan \theta = \frac{2\sqrt{h^2 - ab}}{a+b} \]
\[ \text{we get} \ \tan 45^\circ = \frac{2\sqrt{(a+b)^2 - ab}}{a+b} \]
\[ \Rightarrow 1 = \frac{2\sqrt{a^2 + b^2 - ab}}{a+b} \Rightarrow (a+b)^2 = 4\left(a^2 + b^2 + ab\right) \]
\[ \Rightarrow a^2 + b^2 + 2ab = 4a^2 + 4b^2 + 4ab \]
\[ \Rightarrow 3a^2 + 3b^2 + 2ab = 0 \]

15. (d) Point of intersection of \(3x - 4y - 7 = 0\) and
\[ 2x - 3y - 5 = 0 \] is \((1, -1)\) which is the centre of the circle and radius = 7
\[ \therefore \text{Equation is} \ (x-1)^2 + (y+1)^2 = 49 \]
\[ \Rightarrow x^2 + y^2 - 2x + 2y - 47 = 0 \]

16. (d) Let \(M(h, k)\) be the mid point of chord \(AB\) where
\[ \angle AOB = \frac{2\pi}{3} \]
\[ \therefore \ \angle AOM = \frac{\pi}{3}. \text{Also} \ OM = 3 \cos \frac{\pi}{3} = \frac{3}{2} \]
\[ \Rightarrow \sqrt{h^2 + k^2} = \frac{3}{2} \Rightarrow h^2 + k^2 = \frac{9}{4} \]
\[ \therefore \text{Locus of} \ (h, k) \text{is} \ x^2 + y^2 = \frac{9}{4} \]

17. (d) Equation of circle whose centre is \((h, k)\)
i.e \((x-h)^2 + (y-k)^2 = k^2 \)
(radius of circle = \(k\) because circle is tangent to x-axis)
Equation of circle passing through \((-1, +1)\)
\[ \therefore (-1-h)^2 + (1-k)^2 = k^2 \]
\[ \Rightarrow 1 + h^2 + 2h + 1 + k^2 - 2k = k^2 \Rightarrow h^2 + 2h - 2k + 2 = 0 \]
\[ D \geq 0 \]
\[ \therefore (2)^2 - 4 \times 1(-2k + 2) \geq 0 \]
\[ \Rightarrow 4 - 4(-2k + 2) \geq 0 \Rightarrow 1 + 2k - 2 \geq 0 \Rightarrow k \geq \frac{1}{2} \]
18. (c) The given circle is \( x^2 + y^2 + 2x + 4y - 3 = 0 \)

Centre \((-1, -2)\)
Let \(O(\alpha, \beta)\) be the point diametrically opposite to the point \(P(1, 0)\),
\[
\frac{1 + \alpha}{2} = -1 \quad \text{and} \quad \frac{0 + \beta}{2} = -2
\]
\(\Rightarrow \alpha = -3, \beta = -4\), So, \(O\) is \((-3, -4)\)

19. (c) Let the centre of the circle be \((h, k)\)
\(\therefore\) Equation of circle is
\[(x - h)^2 + (y - 2k)^2 = 25 \quad \ldots(1)\]
Differentiating with respect to \(x\), we get
\[2(x - h) + 2(y - 2k)\frac{dy}{dx} = 0 \]
\(\Rightarrow x - h = -(y - 2k)\frac{dy}{dx} \]
Substituting in equation (1) we get
\[(y - 2k)^2 \left(\frac{dy}{dx}\right)^2 + (y - 2k)^2 = 25 \]
\(\Rightarrow (y - 2k)^2 (\frac{dy}{dx})^2 = 25 - (y - 2k)^2 \)

20. (a) The given circles are
\(S_1 = x^2 + y^2 + 3x + 7y + 2p - 5 = 0 \quad \ldots(1)\)
\(S_2 = x^2 + y^2 + 2x + 2y - p^2 = 0 \quad \ldots(2)\)
\(\therefore\) Equation of common chord \(PQ\) is 
\(S_1 - S_2 = 0\)
\(\Rightarrow L = x + 5y + p^2 + 2p - 5 = 0 \)
\(\Rightarrow\) Equation of circle passing through \(P\) and \(Q\) is 
\(S_1 + \lambda L = 0\)
\(\Rightarrow (x^2 + y^2 + 3x + 7y + 2p - 5) + \lambda (x + 5y + p^2 + 2p - 5) = 0 \)
As it passes through \((1, 1)\), therefore
\(\Rightarrow (7 + 2p) + \lambda (2p + p^2 + 1) = 0 \)
\(\Rightarrow \lambda = -\frac{2p + 7}{(p + 1)^2} \), which does not exist for \(p = -1\)

21. (a) Circle \(x^2 + y^2 - 4x - 8y - 5 = 0\)
Centre \((2, 4), \text{Radius} = \sqrt{4 + 16 + 5} = 5\)
If circle is intersecting line \(3x - 4y = m\), at two distinct points,
\(\Rightarrow\) length of perpendicular from centre to the line < radius
\[\frac{|6 - 16 - m|}{5} < 5 \quad \Rightarrow |10 + m| < 25 \]
\(\Rightarrow -25 < m + 10 < 25 \Rightarrow -35 < m < 15 \)

22. (a) As centre of one circle is \((0, 0)\) and other circle passes through \((0, 0)\), therefore
\[C = (x - 1)^2 + (y - 1)^2 = 1\]

23. (a) Let centre of the circle be \((1, h)\)
\(\therefore\) circle touches \(x\)-axis at \((1, 0)\]
Let the circle passes through the point \(B(2, 3)\)
\(\therefore CA = CB\) (radius)
\(\Rightarrow CA^2 = CB^2\)
\(\Rightarrow (1 - 1)^2 + (h - 0)^2 = (1 - 2)^2 + (h - 3)^2\)
\(\Rightarrow h^2 = 1 + h^2 + 9 - 6h \Rightarrow h = \frac{10}{6} = \frac{5}{3}\)
Thus, diameter is \(2h = \frac{10}{3}\).

24. (c) Since circle touches \(x\)-axis at \((3, 0)\)
\(\therefore\) The equation of circle be \((x - 3)^2 + (y - 0)^2 + \lambda y = 0\)
As it passes through \((1, -2)\)
\(\therefore\) \(x = 1, y = -2\)
\(\Rightarrow (1 - 3)^2 + (-2)^2 + \lambda(-2) = 0 \Rightarrow \lambda = 4\)
\(\therefore\) equation of circle is \((x - 3)^2 + y^2 - 8 = 0\)
Now, from the options \((5, -2)\) satisfies equation of circle.

25. (b) Equation of circle \(C = (x - 1)^2 + (y - 1)^2 = 1\)
Circle

Radius of $T = |y|$

$T$ touches $C$ externally
therefore, Distance between the centres = sum of their radii

$$\Rightarrow \sqrt{(0-1)^2 + (y-1)^2} = 1 + |y|$$
$$\Rightarrow (0-1)^2 + (y-1)^2 = (1 + |y|)^2$$
$$\Rightarrow 1 + y^2 + 1 - 2y = 1 + y^2 + 2|y|$$
$$2|y| = 1 - 2y$$

If $y > 0$ then $2y = 1 - 2y \Rightarrow y = \frac{1}{4}$
If $y < 0$ then $-2y = 1 - 2y \Rightarrow 0 = 1$
(not possible)

$$\therefore y = \frac{1}{4}$$

26. (a) Intersection point of $2x - 3y + 4 = 0$ and $x - 2y + 3 = 0$ is $(1, 2)$

Since, $P$ is the fixed point for given family of lines
So, $PB = PA$

$$(\alpha - 1)^2 + (\beta - 2)^2 = (2 - 1)^2 + (3 - 2)^2$$

$$(\alpha - 1)^2 + (\beta - 2)^2 = 1 + 1 = 2$$

$$(x - 1)^2 + (y - 2)^2 = (\sqrt{2})^2$$

$$(x - a)^2 + (y - b)^2 = r^2$$

Therefore, given locus is a circle with centre $(1, 2)$ and radius $\sqrt{2}$.

27. (a) $x^2 + y^2 - 4x - 6y - 12 = 0$ \hspace{1cm} ..(i)

Centre, $c_1 = (2, 3)$ and Radius, $r_1 = 5$ units

$x^2 + y^2 + 6x + 18y + 26 = 0$ \hspace{1cm} ..(ii)

Centre, $c_2 = (-3, -9)$ and Radius, $r_2 = 8$ units

$C_1C_2 = \sqrt{(2 + 3)^2 + (3 + 9)^2} = 13$ units

$r_1 + r_2 = 5 + 8 = 13$

$\therefore C_1C_2 = r_1 + r_2$

Therefore there are three common tangents.

28. (b)

For the given circle, centre : $(4, 4)$
radius = 6

$k = \sqrt{(h - 4)^2 + (k - 4)^2}$

$(h - 4)^2 = 20k + 20$

$\therefore$ locus of $(h, k)$ is $(x - 4)^2 = 20(y + 1)$
which is a parabola.

29. (d)

Centre of $S : O (-3, 2)$ centre of given circle $A(2, -3)$
$OA = 5\sqrt{2}$

Also $AB = 5$ \hspace{1cm} $\therefore AB = r$ of the given circle
$\Rightarrow$ Using pythagoras theorem in $\Delta OAB$

$r = 5\sqrt{3}$
Conic Sections

Section-A: JEE Advanced/ IIT-JEE

A 1. \((-1, 0)\)

Section-A

**JEE Advanced/ IIT-JEE**

**A. Fill in the Blanks**

1. Given parabola is $y^2 = 4x$, $a = 1$

   Extremities of latus rectum are (1, 2) and (1, -2) tangent to
   $y^2 = 4x$ at (1, 2) is $y = 2(x + 1)$ i.e. $y = x + 1$ ...(1)

   Similarly tangent at (1, -2) is, $y = -x - 1$ ....(2)

   Intersection pt. of these tangents can be obtained by solving
   (1) and (2), which is $(-1, 0)$.

2. Rough graph of $x^2 + y^2 = 1$ (circle) ...(1)
   and $x^2 - y^2 = 1$ (hyperbola) ...(2)
   is as shown below.

   ![Graph of Circle and Hyperbola](image)

   It is clear from graph that there are two common tangents to
   the curves (1) and (2) namely $x = 1$ and $x = -1$ out of which
   $x = 1$ is nearer to pt. $P$.

   Hence directrix of required ellipse is $x - 1 = 0$

   Also $e = 1/2$, focus $(1/2, 1)$ then equation of ellipse is given by

   
   $$(x - 1/2)^2 + (y - 1)^2 = 1/4(x - 1)^2$$

   $\Rightarrow\frac{(x-1/3)^2}{1/3^2} + \frac{(y-1)^2}{(1/2\sqrt{3})^2} = 1$

   which is the standard equation of the ellipse.

**C. MCQs with ONE Correct Answer**

1. (d) Given that $\frac{x^2}{1-r} - \frac{y^2}{1+r} = 1$, $r > 1$

   As $r > 1$

   $\therefore\ 1-r<0$ and $1 + r > 0$

   $\therefore\ 1-r=-a^2, 1+r=b^2$, then we get

   $$\frac{x^2}{-a^2} - \frac{y^2}{b^2} = 1 \Rightarrow \frac{x^2}{a^2} + \frac{y^2}{b^2} = -1$$

   which is not possible for any real values of $x$ and $y$.

2. (c) $x^2 + 2y^2 \leq 1$ represents interior region of an ellipse

   where on taking any two pts the mid pt of that segment will also lie inside that ellipse

   (b) $\max \{|x|, |y|\} \leq 1$

   $\Rightarrow |x| \leq 1, |y| \leq 1 \Rightarrow -1 \leq x \leq 1$ and $-1 \leq y \leq 1$

   which represents the interior region of a square

   with its sides $x = \pm 1$ and $y = \pm 1$ in which for any two pts, their mid pt also lies inside the region.

(c) $x^2 - y^2 \geq 1$ represents the exterior region of hyperbola in which if we take two point $(2,0)$ and

   $(-2,0)$ then their mid pt $(0,0)$ does not lie in the same region (as shown in the figure.)

   ![Graph of Hyperbola](image)

   (d) $y^2 \leq x$ represents interior region of parabola in

   which for any two pts, their mid point also lie

   inside the region.

   We have $2x^2 + 3y^2 - 8x - 18y + 35 = k$

   $\Rightarrow\ 2(x-2)^2 + 3(y-3)^2 = k$

   For $k = 0$, we get $2(x-2)^2 + 3(y-3)^2 = 0$ which

   represents the point $(2,3)$.

4. (d) Since $1^2 + 2^2 = 5 < 9$ and $2^2 + 1^2 = 5 < 9$ both $P$ and $Q$ lie

   outside $C$.

   Also $\frac{12}{9} + \frac{2}{4} = \frac{1}{2} + 1 > 1$ and $\frac{2}{9} + \frac{1}{4} = \frac{25}{36} < 1$, $P$ lies

   outside $E$ and $Q$ lies inside $E$. Thus $P$ lies inside $C$ but

   outside $E$.

5. (a) The focus of parabola $y^2 = 2px$ is $(\frac{p}{2}, 0)$ and directrix

   $x = -p/2$.

   ![Graph of Parabola](image)

   In the figure, we have supposed that $p > 0$

   $\therefore$ Centre of circle is $(\frac{p}{2}, 0)$ and radius $= \frac{p}{2} + \frac{p}{2} = p$

   $\therefore$ Equation of circle is $\left( x - \frac{p}{2} \right)^2 + y^2 = p^2$

   For pts of intersection of $y^2 = 2px$ ...(i)

   and $4x^2 + 4y^2 - 8px - 3p^2 = 0$ ...(ii)

   can be obtained by solving (i) and (ii) as follows

   $4x^2 + 8px - 4px - 3p^2 = 0 \Rightarrow (2x + 3p)(2x - p) = 0$

   $\Rightarrow\ x = \frac{-3p}{2}$, $\frac{p}{2}$

   $\Rightarrow\ y^2 = -3p^2$ (not possible), $p^2 \Rightarrow y = \pm p$

   $\therefore$ Required pts are $(\frac{p}{2}, p), (\frac{p}{2}, -p)$
6. (a) For ellipse \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \), \( a = 4, b = 3 \)

\[
\Rightarrow e = \sqrt{1 - \left(\frac{3}{4}\right)^2} = \frac{\sqrt{7}}{4}
\]

\[\therefore \text{ Foci are } (\sqrt{7}, 0) \text{ and } (-\sqrt{7}, 0)\]

Centre of circle is at \((0, 3)\) and it passes through \((\pm\sqrt{7}, 0)\), therefore radius of circle \(= \sqrt{(\sqrt{7})^2 + (3)^2} = 4\)

7. (d) **KEY CONCEPT:**

Equation of the normal to the hyperbola \( \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \)

at the point \((a \sec \alpha, b \tan \alpha)\) is given by \(ax \cos \alpha + by \cot \alpha = a^2 + b^2\)

Normals at \(\theta, \phi\) are \(\left\{\begin{array}{l}
ax \cos \theta + by \cot \theta = a^2 + b^2 \\
ax \cos \phi + by \cot \phi = a^2 + b^2
\end{array}\right.\]

where \(\phi = \frac{\pi}{2} - \theta\) and these pass through \((h, k)\)

\[\therefore \quad ah \cos \theta + bk \cot \theta = a^2 + b^2\]

\[ah \sin \theta + bk \tan \theta = a^2 + b^2\]

Eliminating \(h, bk \) \((\cot \theta \sin \theta = -\tan \cos \theta)\) or \(k = -\left((a^2 + b^2)/b\right)\)

8. (b) Chord \(x = 9\) meets \(x^2 - y^2 = 9\) at \((9, 6\sqrt{2})\) and \((9, -6\sqrt{2})\) at which tangents are

\[9x - 6\sqrt{2}y = 9 \quad \text{and} \quad 9x + 6\sqrt{2}y = 9\]

or \(3x - 2\sqrt{2}y - 3 = 0\) and \(3x + 2\sqrt{2}y - 3 = 0\)

\[\therefore \text{ Combined equation of tangents is } (3x - 2\sqrt{2}y - 3)(3x + 2\sqrt{2}y - 3) = 0\]

or \(9x^2 - 8y^2 - 18x = 0\)

9. (c) **KEY CONCEPT**

The equation \(ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0\) represents a parabola if \(\Delta \neq 0\) and \(h^2 = ab\)

where \(\Delta = abc + 2gh - af^2 - bg^2 - ch^2\)

Now we have \(x = t^2 + t + 1\) and \(y = t^2 - t + 1\)

\[\frac{x+y}{2} = t^2 + 1, \quad \frac{x-y}{2} = t \quad (\text{Adding and subtracting values of } x \text{ and } y)\]

Eliminating \(t, 2(x+y) = (x-y)^2 + 4 \quad \ldots \quad (1)\)

\[\Rightarrow x^2 - 2xy + y^2 - 2x - 2y + 4 = 0 \quad \ldots \quad (2)\]

Here, \(a = 1, h = -1, b = 1, g = -1, f = -1, c = 4\)

\[\therefore \Delta \neq 0 \quad \text{and} \quad h^2 = ab\]

Hence the given curve represents a parabola.

10. (b) \(y = mx + c\) is normal to the parabola \(y^2 = 4ax\)

\(\Rightarrow y^2 = 4ax \text{ if } c = -2am - am^2\)

Here \(m = -1, c = k \text{ and } a = 3\)

\[c = k = -2(3)(-1) - 3(-1)^3 = 9\]

11. (e) **KEY CONCEPT:** The directrix of the parabola \(y^2 = 4a\)

\((x - x_1)\) is given by \(x = x_1 - a\).

\[y^2 = kx - 8 \Rightarrow y^2 = k\left(x - \frac{8}{k}\right)\]

12. (c) Let the equation of tangent to \(y^2 = 4x\) be \(y = mx + \frac{1}{m}\)

where \(m\) is the slope of the tangent.

If it is tangent to the circle \((x - 3)^2 + y^2 = 9\) then length of perpendicular to tangent from centre \((3, 0)\) should be equal to the radius 3.

\[\quad 3m + \frac{1}{m} = 3\]

\[\Rightarrow 9m^2 + \frac{1}{m^2} + 6 = 9m^2 + 9 \Rightarrow m = \pm \frac{1}{\sqrt{3}}\]

\[\therefore \text{ Tangents are } x - y\sqrt{3} + 3 = 0 \quad \text{and} \quad x + y\sqrt{3} + 3 = 0 \quad \text{out of which }\]

\(x + y\sqrt{3} + 3 = 0 \quad \text{meets the parabola at } (3, 2\sqrt{3}) \text{ i.e., above x-axis.}\)

13. (d) \(y^2 + 4y + 4 = 0 \quad y^2 + 4y + 4 = -4x + 2\)

\((y + 2)^2 = -4(x - 1/2)\)

It is of the form \(Y^2 = -4AX\)

whose directrix is given by \(X = A\)

\[\therefore \text{ Req. equation is } x - 1/2 = 1 \Rightarrow x = 3/2.\]

14. (a) Given that \(a > 2b > 0 \text{ and } m > 0\)

\[\text{Also } y = mx - b \sqrt{1 + m^2} \quad \ldots \quad (1)\]

is tangent to \(x^2 + y^2 = b^2 \quad \ldots \quad (2)\)

as well as to \(x - a)^2 + y^2 = b^2 \quad \ldots \quad (3)\)

\[\therefore (1) \text{ is tangent to (3)}\]

\[
\frac{am-b\sqrt{1+m^2}}{\sqrt{m^2+1}} = b
\]

[length of perpendicular from \((a, 0)\) to \((1)\) is \((b, 0)\)]

\[\Rightarrow am - b\sqrt{1 + m^2} = \pm b\sqrt{1 + m^2} \Rightarrow am - 2b\sqrt{1 + m^2} = 0\]

or \(am = 0\) (not possible as \(a, m > 0\))

\[\Rightarrow a^2m^2 = 4b^2 (1 + m^2) \Rightarrow m^2 = \frac{4b^2}{a^2 - 4b^2}\]

\[\Rightarrow m = \frac{2b}{\sqrt{a^2 - 4b^2}} \quad (\because m > 0)\]

15. (e) If \((h, k)\) is the midpoint of line joining focus \((0, 0)\) and \(Q(at^2, 2at)\) on parabola then \(h = \frac{a + at^2}{2}, k = at\)

Eliminating \(t\), we get \(2h = a + \left(\frac{k^2}{a}\right)\)

\[\Rightarrow k^2 = a(2h - a) \Rightarrow k^2 = 2a(h - a/2)\]

\[\therefore \text{ Locus of } (h, k) \text{ is } y^2 = 2a(x - a/2)\]

whose directrix is \((x - a/2) - \frac{a}{2}\)

\[\Rightarrow x = 0\]
16. (d) The given curves are
\[ y^2 = 8x \quad \ldots (1) \]
and
\[ xy = 1 \quad \ldots (2) \]
If \( m \) is the slope of tangent to (1), then eqn of tangent is
\[ y = mx + \frac{2}{m} \]
If this tangent is also a tangent to (2), then putting value of \( y \) in curve (2)
\[ x \left( mx + \frac{2}{m} \right) = -1 \]
\[ \Rightarrow mx^2 + \frac{2}{m} x + 1 = 0 \Rightarrow m^2 x^2 + 2x + m = 0 \]
We should get repeated roots for the eqn (condition of tangency)
\[ \Rightarrow D = 0 \]
\[ \Rightarrow (2)^2 - 4m^2 \cdot m = 0 \]
\[ \Rightarrow m^3 = 1 \quad \Rightarrow m = 1 \]
Hence required tangent is \( y = x + 2 \)

17. (d) The given ellipse is
\[ \frac{x^2}{9} + \frac{y^2}{5} = 1 \]
Then \( a^2 = 9, b^2 = 5 \Rightarrow e = \sqrt{1 - \frac{5}{9}} = \frac{2}{3} \]
\[ \therefore \text{end point of latus rectum in first quadrant is} \ L(2, 5/3) \]
Equation of tangent at \( L \) is
\[ \frac{2x}{9} + \frac{y}{3} = 1 \]
It meets x-axis at \( A \ (9/2, 0) \) and y-axis at \( B \ (0, 3) \)
\[ \therefore \text{Area of} \ \Delta OAB = \frac{1}{2} \times \frac{9}{2} \times 3 = \frac{27}{4} \]

By symmetry area of quadrilateral
\[ = 4 \times (\text{Area} \ \Delta OAB) = 4 \times \frac{27}{4} = 27 \text{ sq. units.} \]

18. (a) For parabola \( y^2 = 16x \), focus = \( (4, 0) \). Let \( m \) be the slope of focal chord then eqn is \( y = m(x - 4) \) \( \ldots (1) \)
But given that above is a tangent to the circle \( (x - 6)^2 + y^2 = 2 \)
With Centre, \( C \ (6, 0) \), \( r = \sqrt{2} \)
\[ \therefore \text{Length of} \ \perp \text{from} \ (6, 0) \ \text{to} \ (1) = r \]
\[ \Rightarrow \frac{6m - 4m}{\sqrt{m^2 + 1}} = \sqrt{2} \Rightarrow 2m = \sqrt{2(m^2 + 1)} \]
\[ \Rightarrow 2m^2 = m^2 + 1 \Rightarrow m^2 = 1 \Rightarrow m = \pm 1 \]

19. (b) The given eqn of hyperbola is
\[ \frac{x^2}{\cos^2 \alpha} - \frac{y^2}{\sin^2 \alpha} = 1 \]
\[ \Rightarrow a = \cos \alpha, b = \sin \alpha \]
\[ \Rightarrow e = \sqrt{1 + \frac{b^2}{a^2}} = \sqrt{1 + \tan^2 \alpha} = \sec \alpha \]
\[ \Rightarrow ae = 1 \]
\[ \therefore \text{foci remain constant with respect to} \ \alpha. \]

20. (a) Any tangent to ellipse \( \frac{x^2}{2} + \frac{y^2}{1} = 1 \) is
\[ \frac{x \cos \theta}{\sqrt{2}} + y \sin \theta = 1 \]

\[ \therefore A(\sqrt{2} \sec \theta, 0); B \ (0, \csc \theta) \]
\[ \Rightarrow 2h = \sqrt{2} \ \sec \theta \text{ and } 2k = \csc \theta \]
(Using mid pt. formula)
\[ \Rightarrow \cos \theta = \frac{1}{\sqrt{2} h} \text{ and } \sin \theta = \frac{1}{2k} \]
\[ \Rightarrow \left( \frac{1}{\sqrt{2}h} \right)^2 + \left( \frac{1}{2k} \right)^2 = 1 \Rightarrow \frac{1}{2h^2} + \frac{1}{4k^2} = 1 \]
Required locus,
\[ \frac{1}{2x^2} + \frac{1}{4y^2} = 1 \]

21. (c) \( y = mx + 1/m \)
Above tangent passes through \( (1, 4) \)
\[ \Rightarrow 4 = m + 1/m \Rightarrow m^2 - 4m + 1 = 0 \]
Now angle between the lines is given by
\[ \tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right| = \sqrt{(m_1 + m_2)^2 - 4m_1 m_2} \]
\[ \frac{16 - 4}{1 + 1} = \sqrt{3} \Rightarrow \theta = \frac{\pi}{3} \]

22. (d) Equation of tangent to hyperbola \( x^2 - 2y^2 = 4 \) at any point \( (x_1, y_1) \) is \( xx_1 - 2yy_1 = 4 \)
Comparing with \( 2x + \sqrt{6} y = 2 \) or \( 4x + 2\sqrt{6} y = 4 \)
\[ \Rightarrow x_1 = 4 \text{ and } -2y_1 = 2\sqrt{6} \Rightarrow (4, -\sqrt{6}) \text{ is the required point.} \]
23. (a) Any tangent to the ellipse \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \) at 

\[ P(a \cos \theta, b \sin \theta) = \frac{x \cos \theta}{a} + \frac{y \sin \theta}{b} = 1 \]

It meets co-ordinate axes at \( A(a \sec \theta, 0) \) and 
\( B(0, b \csc \theta) \)

\[ \therefore \Delta = \frac{ab}{\sin 2\theta} \]

For \( \Delta \) to be min, \( \sin 2\theta \) should be max. and we know max value of \( \sin 2\theta = 1 \)

\[ \therefore \Delta_{\text{max}} = ab \text{ sq. units} \]

The given curve is \( y = x^2 + 6 \)

Equation of tangent at \((1, 7)\) is

\[ \frac{1}{2}(y + 7) = x \cdot 1 + 6 \]

\[ \Rightarrow 2x - y + 5 = 0 \] ... (1)

As given this tangent (1) touches the circle

\[ x^2 + y^2 + 16x + 12y + c = 0 \text{ at } O \]

Centre of circle = \((-8, -6)\).

Then equation of \( CO \) which is perpendicular to (1) and

passes through \((-8, -6)\) is \( y + 6 = -\frac{1}{2}(x + 8) \)

\[ \Rightarrow x + 2y + 20 = 0 \] ... (2)

Now \( O \) is pt. of intersection of (1) and (2)

\[ \therefore \text{Solving eqn } (1) \& (2) \text{ we get} \]

\[ x = -6, y = -7 \]

\[ \therefore \text{Req. pt. is } (-6, -7). \]

24. (d) Since, distance of vertex from origin is \( \sqrt{2} \) and focus is \( 2\sqrt{2} \)

\[ \therefore \text{Vertex is } (1, 1) \text{ and focus is } (2, 2), \text{ directrix } x + y = 0 \]

26. (a) The length of transverse axis = \( 2 \sin \theta = 2a \)

\[ \Rightarrow a = \sin \theta \]

Also for ellipse \( 3x^2 + 4y^2 = 12 \)

or \( \frac{x^2}{4} + \frac{y^2}{3} = 1 \), \( a^2 = 4, b^2 = 3 \)

\[ e = \sqrt{1 - \frac{b^2}{a^2}} = \sqrt{1 - \frac{3}{4}} = \frac{1}{2} \]

\[ \therefore \text{Focus of ellipse } = \left( 2 \times \frac{1}{2}, 0 \right) = (1, 0) \]

As hyperbola is confocal with ellipse, focus of hyperbola = \((1, 0)\) \( \Rightarrow ae = 1 \Rightarrow \sin \theta \times e = 1 \)

\[ e = \cosec \theta \]

\[ \therefore b^2 = a^2(e^2 - 1) = \sin^2 \theta (\cosec^2 \theta - 1) = \cos^2 \theta \]

\[ \therefore \text{Equation of hyperbola is } \]

\[ \frac{x^2}{\sin^2 \theta} - \frac{y^2}{\cos^2 \theta} = 1 \]

or \( x^2 \sec^2 \theta - y^2 \sec^2 \theta = 1 \)

27. (b) \( x^2 - 5xy + 6y^2 = 0 \) represents a pair of straight lines given by \( x - 3y = 0 \) and \( x - 2y = 0 \).

Also \( ax^2 + by^2 + c = 0 \) will represent a circle if \( a = b \) and \( c \) is of sign opposite to that of \( a \).

28. (b) The given hyperbola is

\[ x^2 - 2y^2 - 2\sqrt{2}x - 4\sqrt{2}y - 6 = 0 \]

\[ \Rightarrow (x^2 - 2\sqrt{2}x + 2) - 2(y^2 + 2\sqrt{2}y + 2) = 6 + 2 - 4 \]

\[ \Rightarrow (x - \sqrt{2})^2 - 2(y + \sqrt{2})^2 = 4 \]

\[ \Rightarrow \frac{(x - \sqrt{2})^2}{2} - \frac{(y + \sqrt{2})^2}{2} = 1 \]

\[ \therefore \text{a = 2, b = } \sqrt{2} \Rightarrow e = \sqrt{1 + \frac{2}{4}} = \sqrt{\frac{3}{2}} \]

Clearly \( \triangle ABC \) is a right triangle.
Conic Sections

\[ \text{Area} \triangle ABC = \frac{1}{2} \times AC \times BC = \frac{1}{2} \left( ae - a \right) \times b^2 \]
\[ = \frac{1}{2} (e - 1) \times b^2 = \frac{1}{2} \left( \frac{3}{2} - 1 \right) \times 2 = \frac{3}{2} - 1 \]

29. (d) The given ellipse is \( x^2 + 9y^2 = 9 \) or \( \frac{x^2}{3^2} + \frac{y^2}{1^2} = 1 \)

So, that \( A(3,0) \) and \( B(0,1) \)

\[ \therefore \text{Equation of } AB \text{ is } \frac{x}{3} + \frac{y}{1} = 1 \]

or \( x + 3y - 3 = 0 \)  \hspace{1cm} (1)

Also auxiliary circle of given ellipse is
\[ x^2 + y^2 = 9 \] \hspace{1cm} (2)

Solving equation (1) and (2), we get the point M where line AB meets the auxiliary circle.

Putting \( x = 3 - 3y \) from eqn(1) in eqn(2)

we get \((3 - 3y)^2 + y^2 = 9\)

\[ \Rightarrow 9 - 18y + 9y^2 + y^2 = 9 \Rightarrow 10y^2 - 18y = 0 \]

\[ \Rightarrow y = 0, \frac{9}{5} \Rightarrow x = 3, \frac{-12}{5} \]

Clearly \( M \left( \frac{-12}{5}, \frac{9}{5} \right) \)

\[ \therefore \text{Area of } \triangle OAM = \frac{1}{2} \begin{vmatrix} 0 & 0 & 1 \\ 3 & 0 & 1 \\ -12 & 9 & 1 \end{vmatrix} = \frac{27}{10} \]

30. (c) The given ellipse is \( \frac{x^2}{4^2} + \frac{y^2}{2^2} = 1 \)

such that \( a^2 = 16 \) and \( b^2 = 4 \)

\[ \therefore e^2 = 1 - \frac{4}{16} = \frac{3}{4} \Rightarrow e = \frac{\sqrt{3}}{2} \]

Let \( P(4\cos \theta, 2\sin \theta) \) be any point on the ellipse, then equation of normal at \( P \) is

\[ 4x\sin \theta - 2y\cos \theta = 12\sin \theta \cos \theta \]

\[ \Rightarrow \frac{x}{3\cos \theta} - \frac{y}{6\sin \theta} = 1 \]

\[ \therefore Q, \text{ the point where normal at } P \text{ meets } x \text{-axis}, \text{ has coordinates } (3\cos \theta, 0) \]

\[ \therefore \text{Mid point of } PQ \text{ is } M \left( \frac{7\cos \theta}{2}, \sin \theta \right) \]

For locus of point \( M \) we consider

\[ x = \frac{7\cos \theta}{2} \text{ and } y = \sin \theta \]

\[ \Rightarrow \cos \theta = 2x / 7 \text{ and } \sin \theta = y \]

\[ \Rightarrow \frac{4x^2}{49} + y^2 = 1 \] \hspace{1cm} (1)

Also the latus rectum of given ellipse is
\[ x = \pm ae = \pm 4 \times \frac{\sqrt{3}}{2} = \pm 2\sqrt{3} \text{ or } x = \pm 2\sqrt{3} \] \hspace{1cm} (2)

Solving equations (1) and (2), we get

\[ \frac{4 \times 12}{49} + y^2 = 1 \Rightarrow y^2 = \frac{1}{49} \text{ or } y = \pm \frac{1}{7} \]

\[ \therefore \text{The required points are } \left( \pm 2\sqrt{3}, \pm \frac{1}{7} \right) \]

31. (d) The triangle is formed by the lines

\[ AB : 1 + p)x - py + p(1 + p) = 0 \]
\[ AC : 1 + q)x - qy + q(1 + q) = 0 \]
\[ BC : y = 0 \]

So that the vertices are

\( A(pq, (p+1)(q+1)) \), \( B(-p, 0) \), \( C(-q, 0) \)

Let \( H(h, k) \) be the orthocentre of \( \triangle ABC \). Then as \( AH \perp BC \) and passes through \( A(pq, (p+1)(q+1)) \)

The eq^2 of \( AH \) is \( x = pq \)

\[ \therefore h = pq \] \hspace{1cm} (1)

Also \( BH \) is perpendicular to \( AC \)

\[ m_1m_2 = -1 \Rightarrow \frac{k - 0}{h + p} \times \frac{1 + q}{q} = -1 \]
32. (b) For hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, we have

$$\frac{2x}{a^2} - \frac{2y}{b^2} \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{b^2}{a^2} \frac{y}{x}$$

\[ \therefore \text{Slope of normal at } P(6,3) \]

$$= \frac{1}{\frac{dy}{dx}}_{(6,3)} = -\frac{3a^2}{6b^2} \]

\[ \therefore \text{Equation of normal is} \]

$$\frac{y-3}{x-6} = -\frac{3a^2}{6b^2}$$

As it intersects x-axis at (9, 0)

\[ \therefore \frac{0-3}{9-6} = -\frac{3a^2}{6b^2} \Rightarrow a^2 = 2b^2 \]

Also for hyperbola, $b^2 = a^2 (e^2 - 1)$

Using $a^2 = 2b^2$, we get $b^2 = 2b^2 (e^2 - 1)$

$$\frac{1}{2} = e^2 - 1 \text{ or } e^2 = \frac{3}{2} \text{ or } e = \frac{\sqrt{3}}{2}$$

33. (c) Let A (x, y) = ($t^2$, 2t) be any point on parabola $y^2 = 4x$.

Let P (h, k) divides OA in the ratio 1 : 3

Then (h, k) = \( \left( \frac{t^2}{4}, \frac{2t}{4} \right) \)

\[ \Rightarrow h = \frac{t^2}{4} \text{ and } k = \frac{t}{2} \Rightarrow h = k^2 \]

\[ \therefore \text{locus of } P(h, k) \text{ is } x = y^2. \]

34. (c) As rectangle $ABCD$ circumscribed the ellipse

$$\frac{x^2}{9} + \frac{y^2}{4} = 1$$

Let the tangent to $y^2 = 8x$ be $y = mx + \frac{2}{m}$

If it is common tangent to parabola and circle, then

$y = mx + \frac{2}{m}$ is a tangent to $x^2 + y^2 = 2$

\[ \therefore \left| \frac{2}{m} \right| = \sqrt{2} \Rightarrow \frac{4}{m^2 (1 + m^2)} = 2 \]

$$\Rightarrow m^4 + m^2 - 2 = 0 \Rightarrow (m^2 + 2)(m^2 - 1) = 0$$

\[ \Rightarrow m = 1 \text{ or } -1 \]

\[ \therefore \text{Required tangents are } y = x + 2 \text{ and } y = -x - 2 \]

35. (d) Let the ellipse circumscribing the rectangle $ABCD$ is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Given that it passes through (a, 4)

\[ \therefore b^2 = 16 \]

Also it passes through A (3, 2)

\[ \therefore \frac{9}{a^2} + \frac{4}{16} = 1 \Rightarrow a^2 = 12 \]

\[ \therefore e = \sqrt{1 - \frac{12}{16}} = \frac{\sqrt{2}}{2} = \frac{1}{2} \]
Conic Sections

Their common point is \((-2, 0)\)
\[ \therefore \text{Tangents are drawn from } (-2, 0) \]
\[ \therefore \text{Chord of contact } PQ \text{ to circle is } \]
\[ x(2) + y(0) = 2 \text{ or } x = -1 \]
and Chord of contact RS to parabola is
\[ y = 4(x - 2) \text{ or } x = 2 \]
Hence coordinates of \(P\) and \(Q\) are \((-1, 1)\) and \((-1, -1)\)
Also coordinates of \(R\) and \(S\) are \((2, -4)\) and \((2, 4)\)
\[ \therefore \text{Area of trapezium } PQRS = \frac{1}{2}(2 + 8) \times 3 = 15 \]

D. MCQs with ONE or MORE THAN ONE Correct

1. (c) The given curve is \(\frac{x^2}{4} + \frac{y^2}{1} = 1\) (an ellipse) and given line is \(y = 4x + c\).
   We know that \(y = mx + c\) touches the ellipse
\[ \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \text{ if } c = \pm \sqrt{a^2m^2 + b^2} \]
Here \(c = \pm \sqrt{4 \times 16 + 1} = \pm \sqrt{65} \)
\[ \therefore \text{two values of } c \text{ exist} \]

2. (c) The ellipse can be written as \(\frac{x^2}{25} + \frac{y^2}{16} = 1\)
Here \(a^2 = 25, b^2 = 16\), but \(b^2 = a^2(1 - e^2)\)
\[ \Rightarrow \frac{16}{25} = 1 - e^2 \]
\[ \Rightarrow e^2 = 1 - \frac{25}{25} = \frac{9}{25} \Rightarrow e = \frac{3}{5} \]
Foci of the ellipse are \((\pm 3, 0)\), i.e., \(F_1\) and \(F_2\)
\[ \therefore \text{We have } PF_1 + PF_2 = 2a = 10 \text{ for every point } P \text{ on the ellipse.} \]

3. (b, d) Let \(y = \frac{8}{9}x + C\) be the tangent to \(\frac{x^2}{1/4} + \frac{y^2}{1/9} = 1\)
where \(C = \pm \sqrt{a^2m^2 + b^2} = \pm \frac{1}{4} \times \frac{64}{81} + \frac{1}{9} = \pm \frac{5}{9} \)
and pts of contact are \(\left(\frac{-a^2m}{c}, \frac{b^2}{c} \right) \text{ or } \left(\frac{-2}{5}, \frac{1}{5} \right)\)

4. (a, b) if \(y = mx + c\) is tangent to \(y = x^2\) then
\[ x^2 - mx - c = 0 \text{ has equal roots} \]
\[ \Rightarrow m^2 + 4c = 0 \Rightarrow c = -\frac{m^2}{4} \]
\[ \therefore y = mx - \frac{m^2}{4} \text{ is tangent to } y = x^2 \]
\[ \therefore \text{This is also tangent to } y = -(x - 2)^2 \]
\[ \Rightarrow mx - \frac{m^2}{4} = -x^2 + 4x - 4 \]
\[ \Rightarrow x^2 + (m - 4)x + \left(\frac{4 - m^2}{4}\right) = 0 \text{ has equal roots} \]
\[ \Rightarrow m^2 - 8m + 16 = -m^2 + 16 \Rightarrow m = 0, 4 \]
\[ \Rightarrow y = 0 \text{ or } y = 4x - 4 \text{ are the tangents.} \]

5. (a, c) For the given ellipse \(\frac{x^2}{25} + \frac{y^2}{16} = 1 \Rightarrow e = \sqrt{1 - \frac{16}{25}} = \frac{3}{5} \)
\[ \Rightarrow \text{Eccentricity of hyperbola } = \frac{5}{3} \]
Let the hyperbola be \(\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1\) then
\[ B^2 = A^2 \left(\frac{25}{9} - 1\right) = \frac{16}{9} A^2 \]
\[ \therefore \frac{x^2}{A^2} - \frac{9y^2}{16A^2} = 1 \text{ As it passes through focus of ellipse} \]
i.e. \((3, 0)\)
\[ \therefore \text{we get } A^2 = 9 \Rightarrow B^2 = 16 \]
\[ \therefore \text{Equation of hyperbola is } \frac{x^2}{9} - \frac{y^2}{16} = 1, \text{ focus of hyperbola is } (5, 0), \text{ vertex of hyperbola is } (3, 0). \]

6. (b, c) Given ellipse is \(x^2 + 4y^2 = 4\)
or \(\frac{x^2}{2^2} + \frac{y^2}{1} = 1 \Rightarrow a = 2, b = 1 \)
\[ \therefore e = \sqrt{1 - \frac{1}{4}} = \frac{\sqrt{3}}{2} \Rightarrow ae = \sqrt{3} \]
As per question \(P = (ae, -b^2/a) = \left(\sqrt{3}, -\frac{1}{2}\right) \)
\(Q = (-ae, -b^2/a) = \left(-\sqrt{3}, -\frac{1}{2}\right) \)
\[ \therefore PQ = 2\sqrt{3} \]
Now if \(PQ\) is the length of latus rectum to be found, then \(PQ = 4a = 2\sqrt{3} \Rightarrow a = \frac{\sqrt{3}}{2} \)
Also as \( PQ \) is horizontal, parabola with \( PQ \) as latus rectum can be upward parabola (with vertex at \( A \)) or down ward parabola (with vertex at \( A' \)).

For upward parabola,
\[
AR = a = \frac{\sqrt{3}}{2} \quad : \quad \text{Coordinates of } A = \left( 0, -\left( \frac{\sqrt{3} + 1}{2} \right) \right)
\]

So equation of upward parabola is given by
\[
x^2 = 2\sqrt{3} \left( y + \frac{\sqrt{3} + 1}{2} \right) \quad \text{or} \quad x^2 - 2\sqrt{3}y = 3 + \sqrt{3} \ldots (1)
\]

For downward parabola \( A'R = a = \frac{\sqrt{3}}{2} \)

\[
:\quad \text{Coordinates of } A' = \left( 0, -\left( \frac{1 - \sqrt{3}}{2} \right) \right)
\]

So equation of downward parabola is given by
\[
x^2 = -2\sqrt{3} \left( y + \frac{1 - \sqrt{3}}{2} \right) \quad \text{or} \quad x^2 + 2\sqrt{3}y = 3 - \sqrt{3} \ldots (2)
\]

\[\therefore \quad \text{the equation of required parabola is given by equation (1) or (2).} \]

7. \( \text{(bc)} \) In \( \triangle ABC \), given that
\[
\cos B + \cos C = 4\sin^2 \frac{A}{2}
\]
\[\Rightarrow \quad 2\cos \frac{B+C}{2} \cos \frac{B-C}{2} - 4\sin^2 \frac{A}{2} = 0
\]
\[\Rightarrow \quad 2\sin \frac{A}{2} \left[ \cos \frac{B-C}{2} - 2\sin \frac{A}{2} \right] = 0
\]
\[\Rightarrow \quad \sin \frac{A}{2} = 0 \quad \text{or} \quad \cos \frac{B-C}{2} - 2\cos \frac{B+C}{2} = 0
\]

But in a triangle \( \sin \frac{A}{2} \neq 0 \)

\[\therefore \quad \cos \frac{B-C}{2} - 2\cos \frac{B+C}{2} = 0 \quad \Rightarrow \quad \frac{\cos \frac{B+C}{2}}{\cos \frac{B-C}{2}} = \frac{1}{2}
\]

Applying componendo and dividendo, we get
\[
\frac{\cos \frac{B+C}{2} + \cos \frac{B-C}{2}}{\cos \frac{B+C}{2} - \cos \frac{B-C}{2}} = \frac{1+2}{1-2} = -3
\]

\[\Rightarrow \quad \frac{2\cos \frac{B}{2} \cos \frac{C}{2}}{B\sin \frac{C}{2} - 2\sin \frac{B}{2}} = -3 \quad \Rightarrow \quad \tan \frac{B}{2} \tan \frac{C}{2} = \frac{1}{3}
\]

\[\Rightarrow \quad \frac{(s-a)(s-c)}{s(s-b)} \quad \frac{(s-a)(s-b)}{s(s-c)} = \frac{1}{3}
\]

\[\Rightarrow \quad \frac{s-a}{s} = \frac{1}{3} \quad \text{or} \quad 2s = 3a
\]

8. \( \text{(a,d)} \) Let \( P(\alpha t^2, 2\alpha t) \) be any point on the parabola
\[y^2 = 4ax.
\]

Then tangent to parabola at \( P \) is
\[y = \frac{x}{t} + at
\]

which meets the axis of parabola \( i.e \) \( x \)-axis at
\[T(-\alpha t^2, 0).
\]

Also normal to parabola at \( P \) is
\[tx + y = 2\alpha at^3 + at
\]

which meets the axis of parabola at
\[N(2\alpha + a\alpha^2, 0)
\]

Let \( G(x, y) \) be the centroid of \( \triangle PTN \), then
\[x = \frac{2\alpha t^2 + 2a + at^2}{3} \quad \text{and} \quad y = \frac{2at}{3}
\]

\[\Rightarrow \quad x = \frac{2a + at^2}{3} \quad \text{and} \quad y = \frac{2at}{3}
\]

Eliminating \( t \) from above, we get the locus of centroid \( G \) as
\[3x = 2a + a \left( \frac{3y}{2a} \right)^2 \Rightarrow y = \frac{4a}{3} \left( x - \frac{2}{3} \right)
\]

which is a parabola with vertex \( \left( \frac{2a}{3}, 0 \right) \), directrix as
\[x - \frac{2a}{3} = -\frac{a}{3} \quad \text{or} \quad x = \frac{a}{3}, \text{latus rectum as} \frac{4a}{3} \text{and focus as } (a, 0).
\]

9. \( \text{(a,b)} \) The given hyperbola is
\[x^2 - y^2 = \frac{1}{2}
\]

which is a rectangular hyperbola \( i.e. \ a = b \)

\[\therefore \quad e = \sqrt{2}.
\]

Let the ellipse be \[\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1\]

Its eccentricity \[e = \frac{1}{\sqrt{2}}\]

\[\therefore \quad b^2 = a^2 \left(1 - \frac{1}{2} \right) \Rightarrow b^2 = \frac{a^2}{2}
\]

So, the equation of ellipse becomes
\[x^2 + 2y^2 = a^2 \quad \ldots (2)
\]

Let the hyperbola (1) and ellipse (2) intersect each other at \( P(x_1, y_1) \).

Then slope of hyperbola (1) at \( P \) is given by
\[m_1 = \left( \frac{dy}{dx} \right)_{(x_1, y_1)} = \frac{x_1}{y_1}
\]

and that of ellipse (2) at \( P \) is
\[ m_2 = \left( \frac{dy}{dx} \right)_{(x_1, y_1)} = \frac{-x_1}{2y_1} \]

As the two curves intersect orthogonally,
\[ \Rightarrow \frac{x_1}{y_1} \left( -\frac{x_1}{2y_1} \right) = -1 \Rightarrow x_1^2 = 2y_1^2 \quad \text{...(i)} \]

Also, \( P(x_1, y_1) \) lies on \( x^2 - y^2 = \frac{1}{2} \)
\[ \Rightarrow x_1^2 - y_1^2 = \frac{1}{2} \quad \text{...(ii)} \]

Solving (i) and (ii), we get \( y_1^2 = \frac{1}{2} \) and \( x_1^2 = 1 \)

Also, \( P(x_1, y_1) \) lies on ellipse \( x^2 + 2y^2 = a^2 \)
\[ \Rightarrow x_1^2 + 2y_1^2 = a^2 \Rightarrow 1 + 1 = a^2 \text{ or } a^2 = 2 \]

The required ellipse is \( x^2 + 2y^2 = 2 \) whose foci are \((\pm ae, 0) = (\pm \sqrt{2} \times \frac{1}{\sqrt{2}}, 0) = (\pm 1, 0)\)

10. (c, d) Given parabola \( y^2 = 4x \)

Let \( A(t_1^2, 2t_1) \) and \( B(t_2^2, 2t_2) \)
Then centre of circle drawn with \( AB \) as diameter is \[ \left( \frac{t_1^2 + t_2^2}{2}, t_1 + t_2 \right) \]

As circle touches x-axis
\[ \Rightarrow r = |t_1 + t_2| \Rightarrow t_1 + t_2 = \pm r \]

Also, slope of \( AB = \frac{2(t_2 - t_1)}{t_2^2 - t_1^2} = \frac{2}{t_2 + t_1} = \pm \frac{2}{r} \)

11. (b, d) For \( x^2 + 4y^2 = 4 \) or \( \frac{x^2}{4} + \frac{y^2}{1} = 1 \)

\[ e = \sqrt{1 - \frac{1}{4}} = \frac{\sqrt{3}}{2} \]

As per question, \[ \sqrt{1 + \frac{b^2}{a^2}} = \frac{2}{\sqrt{3}} \Rightarrow \frac{b}{a} = \frac{1}{\sqrt{3}} \]

Focus of ellipse is \((\pm \sqrt{3}, 0)\)

As hyperbola passes through \((\pm \sqrt{3}, 0)\)
\[ \Rightarrow \frac{3}{a^2} = 1 \text{ or } a = \sqrt{3} \]

\[ b = 1 \text{ and focus of hyperbola } (\pm 2, 0) \]

\[ \Rightarrow \text{ Equation of hyperbola } \frac{x^2}{3} - \frac{y^2}{1} = 1 \]

or \( x^2 - 3y^2 = 3 \)

12. (a, b, d)
The equation of normal to \( y^2 = 4x \) is \( y = mx - 2m - m^3 \)
As it passes through \((9, 6)\)
\[ \Rightarrow 6 = 9m - 2m - m^3 \]
\[ \Rightarrow m^3 - 7m + 6 = 0 \Rightarrow (m - 1)(m + 3)(m - 2) = 0 \Rightarrow m = 1, 2, -3 \]

Normal is \( y = x - 3 \) or \( y = 2x - 12 \) or \( y = -3x + 33 \)
\[ \Rightarrow a, b, d \text{ are the correct option.} \]

13. (a, b)

**KEY CONCEPT:** If the slope of tangent is \( m \), then equations of tangents to hyperbola \( \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \) are

\[ y = mx \pm \sqrt{a^2 m^2 - b^2} \]

with the points of contact

\[ \left( \frac{\pm a^2 m}{\sqrt{a^2 m^2 - b^2}}, \frac{\pm b^2}{\sqrt{a^2 m^2 - b^2}} \right) \]

\[ \Rightarrow \text{Tangent to hyperbola } \frac{x^2}{9} - \frac{y^2}{4} = 1 \text{ is parallel to } 2x - y = 1, \]

therefore slope of tangent = 2

\[ \Rightarrow \text{Points of contact are } \left( \frac{9}{2\sqrt{2}}, \frac{1}{\sqrt{2}} \right) \text{ and } \left( \frac{-9}{2\sqrt{2}}, \frac{-1}{\sqrt{2}} \right) \]

i.e., \( \left( \frac{9}{2\sqrt{2}}, \frac{1}{\sqrt{2}} \right) \) and \( \left( \frac{-9}{2\sqrt{2}}, \frac{-1}{\sqrt{2}} \right) \)

14. (a, d) Let point \( P \) in first quadrant, lying on parabola \( y^2 = 2x \)
be \( \left( \frac{a^2}{2}, a \right) \). Let \( Q \) be the point \( \left( \frac{b^2}{2}, b \right) \). Clearly \( a > 0 \).

\[ \angle POQ = 90^\circ \Rightarrow \frac{a}{a^2/2} \times \frac{b}{b^2/2} = -1 \Rightarrow ab = -4 \]

\[ \Rightarrow b \text{ is negative.} \]

Also, \( \Delta PQO = 3\sqrt{2} \)
\[ \Rightarrow \frac{1}{2} \begin{vmatrix} 0 & 0 & 1 \\ a^2/2 & a & 1 \end{vmatrix} = 3\sqrt{2} \]
\[ \Rightarrow \begin{vmatrix} a^2/2 & a & 1 \\ b^2/2 & b & 1 \end{vmatrix} = 3\sqrt{2} \]
\[ \Rightarrow \frac{1}{4}ab(a-b) = \pm 3\sqrt{2} \]
\[ \Rightarrow a-b = \pm 3\sqrt{2} \quad \text{ (using } ab = -4) \]
As a is positive and b is negative, we have \( a - b = 3\sqrt{2} \)
\[ a + \frac{4}{a} = 3\sqrt{2} \quad \text{ (using } ab = -4) \]
\[ \Rightarrow a^2 - 3\sqrt{2} a + 4 = 0 \Rightarrow a^2 - 2\sqrt{2} a - \sqrt{2} a + 4 = 0 \]
\[ \Rightarrow (a - 2\sqrt{2})(a - \sqrt{2}) = 0 \Rightarrow a = 2\sqrt{2}, \sqrt{2} \]
\[ \therefore \text{ Point } P \text{ can be } \left( \frac{(2\sqrt{2})^2}{2}, 2\sqrt{2} \right) \text{ or } \left( \frac{(\sqrt{2})^2}{2}, \sqrt{2} \right) \]
\[ \text{i.e. } (4, 2\sqrt{2}) \text{ or } (1, \sqrt{2}) \]

15. \((a, b)\)

Let \( E_1 : \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \) where \( a > b \)
and \( E_2 : \frac{x^2}{c^2} + \frac{y^2}{d^2} = 1 \) where \( c < d \)
Also \( S : x^2 + (y-1)^2 = 2 \)
Tangent at \( P(x_1, y_1) \) to \( S \) is \( x + y = 3 \)
To find point of contact put \( x = 3 - y \) in \( S \). We get \( P(1, 2) \)
Writing eqn of tangent in parametric form
\[ \frac{x-1}{\sqrt{2}} = \frac{y-2}{\sqrt{2}} = \pm \frac{2\sqrt{2}}{3} \]
x = \frac{-2}{3} + 1 or \( \frac{2}{3} + 1 \) and \( y = \frac{2}{3} + 2 \) or \( -\frac{2}{3} + 2 \)
\[ \Rightarrow x = \frac{5}{3} \text{ or } \frac{8}{3} \text{ and } y = \frac{4}{3} \text{ or } \frac{2}{3} \]
\[ \therefore Q \left( \frac{5}{3}, \frac{4}{3} \right) \text{ and } R \left( \frac{1}{3}, \frac{8}{3} \right) \]
Eqn of tangent to \( E_1 \) at \( Q \) is
\[ \frac{5x}{3a^2} + \frac{4y}{3b^2} = 1 \] which is identical to \( \frac{x}{3} + \frac{y}{3} = 1 \)
\[ \Rightarrow a^2 = 5 \text{ and } b^2 = 4 \Rightarrow e_1^2 = 1 - \frac{4}{5} = \frac{1}{5} \]
Eqn of tangent to \( E_2 \) at \( R \) is
\[ \frac{x}{3c^2} + \frac{8y}{3d^2} = 1 \] identical to \( \frac{x}{3} + \frac{y}{3} = 1 \)
\[ \Rightarrow c^2 = 1, d^2 = 8 \Rightarrow e_2^2 = 1 - \frac{1}{8} = \frac{7}{8} \]
\[ \therefore e_1^2 + e_2^2 = \frac{43}{40}, e_1e_2 = \frac{\sqrt{7}}{2\sqrt{10}}, |e_1^2 - e_2^2| = \frac{27}{40} \]

16. \((a, b, d)\) \( H : x^2 - y^2 = 1 \) : Circle with centre \( N(x_2, 0) \)
Common tangent to \( H \) and \( S \) at \( P(x_1, y_1) \) is
\[ xx_1 - yy_1 = 1 \Rightarrow m_1 = \frac{x_1}{y_1} \]

Also radius of circle \( S \) with centre \( N(x_2, 0) \) through point of contact \( (x_1, y_1) \) is perpendicular to tangent
\[ \therefore m_1m_2 = -1 \Rightarrow \frac{x_1}{y_1} \times 0 - \frac{y_1}{x_2 - x_1} = -1 \]
\[ \Rightarrow x_1 = x_2 - x_1 \text{ or } x_2 = 2x_1 \]
\( M \) is the point of intersection of tangent at \( P \) and \( x \)-axis
\[ \therefore M \left( \frac{1}{x_1}, 0 \right) \]

\[ \therefore \text{ Centroid of } \Delta PNM \text{ is } (\ell, m) \]
\[ \therefore x_1 + \frac{1}{x_1} + x_2 = 3\ell \text{ and } y_1 = 3m \]
Using \( x_2 = 2x_1 \),
\[ \Rightarrow \frac{1}{3} \left( 3x_1 + \frac{1}{x_1} \right) = \ell \text{ and } \frac{y_1}{3} = m \]
\[ \therefore \frac{3}{x_1^2} = 1 \text{ or } \frac{x_1^2}{3} = \frac{1}{3} \]
Also \( (x_1, y_1) \) lies on \( H \), \( \therefore x_1^2 - y_1^2 = 1 \) or \( y_1 = \sqrt{x_1^2 - 1} \)
\[ \therefore m = \frac{1}{3} \sqrt{x_1^2 - 1}, \frac{dm}{dx_1} = \frac{x_1}{3\sqrt{x_1^2 - 1}} \]

17. \((a, b, c)\) \( C_1 : x^2 + y^2 = 3 \)
\( \text{parabola} : x^2 = 2y \)
\( \text{Intersection point of (i) and (ii) in first quadrant} \)
\[ y^2 + 2y - 3 = 0 \Rightarrow y = 1 \text{ (} y \neq -3 \text{) } \]
\[ \therefore x = \sqrt{2} \]
P(\(\sqrt{2}, 1\))
Equation of tangent to circle \( C_1 \) at \( P \) is \( \sqrt{2}x + y - 3 = 0 \)
Let centre of circle \( C_2 \) be \((0, k)\), \( r = 2\sqrt{3} \)
\[ \therefore \frac{|k - 3|}{\sqrt{3}} = 2\sqrt{3} \Rightarrow k = 9 \text{ or } -3 \]
\[ \therefore Q_2(0, 9), Q_3(0, -3) \]
\( a) \ Q_2Q_3 = 12 \)
\((b) \ R_2R_3 = \text{length of transverse common tangent} \)
\[ = \sqrt{(Q_2Q_3)^2 - (r_1 + r_2)^2} \]
\[ = \sqrt{(12)^2 - (4\sqrt{3})^2} = 4\sqrt{6} \]
\((c) \ \text{Area } (\Delta OR_2R_3) = \frac{1}{2} \times R_2R_3 \times \text{length of } \perp \text{ from origin to tangent} \)
\[ = \frac{1}{2} \times 4\sqrt{6} \times 2\sqrt{3} = 6\sqrt{2} \]
\((d) \ \text{Area } (\Delta PQ_2Q_3) = \frac{1}{2} \times Q_2Q_3 \perp \text{distance of } P \text{ from } \)
y-axis = \frac{1}{2} \times 12 \times \sqrt{2} = 6\sqrt{2} \]
18. \((a, c, d)\)

Let point P on parabola \(y^2 = 4x\) be \((t^2, 2t)\)

\[P = (t^2, 2t)\]

\(\therefore\) PS is shortest distance, therefore PS should be the normal to parabola.

Equation of normal to \(y^2 = 4x\) at \(P = (t^2, 2t)\) is

\[y - 2t = -t(x - t^2)\]

It passes through S(2, 8)

\[8 - 2t = -t(2 - t^2) \Rightarrow t^3 = 8 \text{ or } t = 2\]

\[P = (4, 4)\]

Also slope of tangent to circle at \(Q = \frac{-1}{\text{Slope of PS}} = \frac{1}{2}\)

Equation of normal at \(t = 2\) is \(2x + y = 12\)

Clearly \(x\)-intercept = 6

\(SP = 2\sqrt{5}\) and \(SQ = r = 2\)

\(\therefore\) Q divides SP in the ratio \(SP : PQ\)

\[= 2 : 2\left(\sqrt{5} - 1\right) = \left(\sqrt{5} + 1\right) : 4\]

Hence a, c, d are the correct options.

### E. Subjective Problems

1. The equation of a normal to the parabola \(y^2 = 4ax\) in its slope form is given by

\[y = mx - \frac{2am - am^3}{2}\]

\[\therefore\] Eq. of normal to \(y^2 = 4x\), is

\[y = mx - \frac{2m - m^3}{4}\]  \((1)\)

Since the normal drawn at three different points on the parabola pass through \((h, k)\), it must satisfy the equation \((1)\)

\[k = mh - 2m - m^3\]

\[\Rightarrow m^3 - (h - 2)m + k = 0\]

This cubic eq. in \(m\) has three different roots say \(m_1, m_2, m_3\)

\[m_1 + m_2 + m_3 = 0\]  \((2)\)

\[m_1m_2 + m_3m_1 + m_2m_3 = - (h - 2)\]  \((3)\)

Now, \((m_1 + m_2 + m_3)^2 = 0\)

\[\Rightarrow m_1^2 + m_2^2 + m_3^2 = - 2(m_1m_2 + m_2m_3 + m_3m_1)\]

\[\Rightarrow m_1^2 + m_2^2 + m_3^2 = 2(h - 2)\]  \((4)\)

Since LHS of this equation is he sum of perfect squares, therefore it is +ve

\[\therefore\] \(h - 2 > 0 \Rightarrow h > 2\) \(\text{Proved}\)

2. Parabola \(y^2 = 4ax\).

Let at any pt A equation of normal is

\[y = mx - \frac{2am - am^3}{2}\]  \((1)\)

Combined equation of \(OA\) and \(OB\) can be obtained by making equation of parabola homogeneous with the help of normal.

\[\therefore\] Combined eq. of \(OA\) and \(OB\) is

\[y^2 = 4ax\left(\frac{mx - y}{2am + am^3}\right)\]

3. Given parabola is \(y^2 = x\).

Normal is \(y = mx - \frac{m}{2} - \frac{m^3}{4}\)

As per question this normal passes through \((c, 0)\) therefore, we get

\[mc - \frac{m}{2} - \frac{m^3}{4} = 0\]  \((1)\)

\[\Rightarrow m\left(\frac{c - \frac{1}{2} - \frac{m^2}{4}}{1/4}\right) = 0 \Rightarrow m = 0 \text{ or } m^2 = 4\left(c - \frac{1}{2}\right)\]

\(m = 0\) shows normal is \(y = 0\) i.e. \(x\)-axis is always a normal.

Also \(m^2 \geq 0 \Rightarrow 4\left(c - \frac{1}{2}\right) \geq 0 \Rightarrow c \geq 1/2\)

At \(c = \frac{1}{2}\), from \((1)\) \(m = 0\)

\[\therefore\] for other real values of \(m, c > 1/2\)

Now for other two normals to be perpendicular to each other, we must have \(m_1m_2 = -1\)

Or in other words, if \(m_1, m_2\) are roots of \(\frac{m^2}{4} + \frac{1}{2} = c = 0\), then product of roots = -1

\[\Rightarrow \left(\frac{1 - c}{2}\right)^2 = -1 \Rightarrow \frac{1}{2} - c = \frac{1}{4} \Rightarrow c = 3/4\]

4. Let the equation of chord \(OP\) be \(y = mx\).

Then eqn of chord \(OQ\) will be \(y = -\frac{1}{m}x\) \(\therefore OQ \perp OP\)

\(P\) is pt. of intersection of \(y = mx\) and \(y^2 = 4x\).

Solving the two we get \(P\left(\frac{4}{m^2}, \frac{4}{m}\right)\)

\(Q\) is pt. of intersection of \(y = -\frac{1}{m}x\) and \(y^2 = 4x\).
Solving the two we get \( Q (4m^2, -4m) \).
Now eq. of \( PQ \) is,
\[
y + 4m = \frac{4 + 4m}{m^2 - 4m^2} (x - 4m^2)
\]
\( \Rightarrow \) \[
y + 4m = \frac{m}{1 - m^2} (x - 4m^2)
\]
\( \Rightarrow \) \[
(1 - m^2)y + 4m - 4m^3 = mx - 4m^3
\]
\( \Rightarrow \) \[
mx - (1 - m^2)y - 4m = 0
\]
This line meets x-axis where \( y = 0 \) i.e. \( x = 4 \).
\( \Rightarrow \) \( OL = 4 \), which is constant as independent of \( m \). Again let \( (h, k) \) be the mid pt. of \( PQ \), then
\[
h = \frac{4m^2 + 4}{2m^2} \quad \text{and} \quad k = \frac{4}{m} - \frac{4m}{2}
\]
\( \Rightarrow \) \[
h = 2\left( \frac{m^2 + 1}{m^2} \right) \quad \text{and} \quad k = 2\left( \frac{1 - m}{m} \right)
\]
\( \Rightarrow \) \[
h = 2\left[ \frac{1}{m} - m \right] + 2 \quad \Rightarrow \quad k = 2\left[ \frac{1}{4} + 2 \right]
\]
\( \Rightarrow \) \[
h = 2h^2 + 8 \quad \Rightarrow \quad k^2 = 2(1 - 4h)
\]
\( \therefore \) Locus of \( (h, k) \) is \( y^2 = 2(x - 4) \).

5. Let \( P(t_1^2, 2t_1) \) and \( Q(t_2^2, 2t_2) \) be the ends of the chord \( PQ \) of the parabola 
\( y^2 = 4x \) ...

\( \therefore \) Slope of chord \( PQ \) is \( \frac{2t_2 - 2t_1}{t_2^2 - t_1^2} = 2 \)
\( \Rightarrow \) \( t_2 + t_1 = 1 \) ...

6. Equation to the tangent at the point \( P (a \cos \theta, b \sin \theta) \) on \( x^2/a^2 + y^2/b^2 = 1 \) is
\[
x \cdot \cos \theta + \frac{y}{b} \cdot \sin \theta = 1 \quad \text{...(1)}
\]
\( \therefore \) \( d = \text{perpendicular distance of (1) from the centre (0, 0)} \) of the ellipse
\[
\frac{1}{\sqrt{a^2 \cos^2 \theta + b^2 \sin^2 \theta}} = \frac{ab}{\sqrt{a^2 \cos^2 \theta + b^2 \sin^2 \theta}}
\]
\( \Rightarrow \) \[
4a^2 \left( 1 - \frac{b^2}{d^2} \right) = 4a^2 \left( 1 - \frac{b^2 \cos^2 \theta + a^2 \sin^2 \theta}{a^2} \right)
\]
\( = 4(2 - b^2) \cos^2 \theta = 4a^2 e^2 \cos^2 \theta \) ...

The coordinates of foci \( F_1 \) and \( F_2 \) are
\( F_1 = (ae, 0) \) and \( F_2 = (ae, 0) \)
\( \therefore \) \( PF_1 = \sqrt{[(a \cos \theta - ae)^2 + (b \sin \theta)^2]} \)
\( = \sqrt{[(a^2 \cos^2 \theta - e^2)^2 + (b \sin \theta)^2]} \)
\( = \sqrt{[(a^2 \cos^2 \theta - e^2 + a^2(1 - e^2)^2 \sin^2 \theta)]} \)
\( = a\sqrt{[1 + \frac{e^2}{1 - e^2} \sin^2 \theta - 2e \cos \theta]} \)
\( = a \left( 1 - e \cos \theta \right) \)
Similarly, \( PF_2 = a \left( 1 + e \cos \theta \right) \)
\( \therefore \) \( (PF_1 - PF_2)^2 = 4a^2 e^2 \cos^2 \theta \) ...

Hence from (2) and (3), we have
\( (PF_1 - PF_2)^2 = 4a^2 \left( 1 - \frac{b^2}{a^2} \right) \)

7. Let the three points on the parabola \( y^2 = 4ax \) be
\( A(2t_1^2, 2at_1) \), \( B(at_2^2, 2at_2) \) and \( C(at_3^2, 2at_3) \).
Then using the fact that equation of tangent to \( y^2 = 4ax \) at
\( (at^2, 2at) \) is \( y = \frac{x}{t} + at \), we get equations of tangents at \( A, B \) and \( C \) as follows
\[
y = \frac{x}{t_1} + at_1 \quad \text{...(1)}
\]
\[
y = \frac{x}{t_2} + at_2 \quad \text{...(2)}
\]
\[
y = \frac{x}{t_3} + at_3 \quad \text{...(3)}
\]
Solving the above equations pair wise we get the pts.
Conic Sections

\[ P(\alpha t_1, \alpha (t_1 + t_2)) \]
\[ Q(\alpha t_2, \alpha (t_2 + t_3)) \]
\[ R(\alpha t_3, \alpha (t_3 + t_1)) \]

Now, area of \( \Delta ABC = \frac{1}{2} \begin{vmatrix} 1 & \alpha t_1^2 & 2\alpha t_1 \\ 1 & \alpha t_2^2 & 2\alpha t_2 \\ 1 & \alpha t_3^2 & 2\alpha t_3 \end{vmatrix} \]

\[ = a^2 \begin{vmatrix} 1 & t_1 & t_1^2 \\ 1 & t_2 & t_2^2 \\ 1 & t_3 & t_3^2 \end{vmatrix} \]

\[ = a^2 (t_1 - t_2)(t_2 - t_3)(t_3 - t_1) \] ...(4)

Also area of \( \Delta PQR = \frac{1}{2} \begin{vmatrix} 1 & \alpha t_1 t_2 & \alpha (t_1 + t_2) \\ 1 & \alpha t_2 t_3 & \alpha (t_2 + t_3) \\ 1 & \alpha t_3 t_1 & \alpha (t_3 + t_1) \end{vmatrix} \]

\[ = \frac{a^2}{2} \begin{vmatrix} 1 & t_1 t_2 & t_1 + t_2 \\ 1 & t_2 t_3 & t_2 + t_3 \\ 1 & t_3 t_1 & t_3 + t_1 \end{vmatrix} \]

\[ = \frac{a^2}{2} (t_1 - t_3)(t_2 - t_1)(t_3 - t_2) \]

\[ [R_1 \rightarrow R_1 - R_3 \text{ and } R_2 \rightarrow R_2 - R_3] \]

Expanding along \( C_1 \),

\[ = \frac{a^2}{2} (t_1 - t_3)(t_2 - t_1)(t_3 - t_2) \]

\[ = \frac{a^2}{2} (t_1 - t_2)(t_2 - t_3)(t_3 - t_1) \] ...(5)

From equations (4) and (5), we get

\[ \frac{Ar(\Delta ABC)}{Ar(\Delta PQR)} = \frac{a^2 (t_1 - t_2)(t_2 - t_3)(t_3 - t_1)}{\frac{a^2}{2} (t_1 - t_2)(t_2 - t_3)(t_3 - t_1)} = \frac{2}{1} \]

\[ \therefore \text{ The required ratio is } 2:1 \]

This line will touch the circle \( x^2 + y^2 = a^2/2 \)

\[ \frac{a}{m} = \pm \frac{a}{\sqrt{m^2 + 1}} \quad [c = \pm r \sqrt{1 + m^2}] \]

\[ \Rightarrow \frac{a^2}{m^2} = \frac{a^2}{2} (m^2 + 1) \]

\[ \Rightarrow 2 = m^4 + m^2 \Rightarrow m^4 + m^2 - 2 = 0 \]

\[ \Rightarrow (m^2 + 2)(m^2 - 1) = 0 \Rightarrow m = 1, -1 \]

Thus the two tangents (common one) are

\[ y = x + a \] and \( y = -x - a \)

These two intersect each other at \((-a, 0)\)

The chord of contact at \( A(-a, 0) \) for the circle \( x^2 + y^2 = a^2/2 \) is \((-a, x) + 0, y = a^2/2 \) i.e., \( x = -a/2 \)

and the chord of contact at \( A(-a,0) \) for the parabola \( y^2 = 4ax \) is \( 0, y = 2a(x - a) \) i.e., \( x = a \)

Note that \( DE \) is latus rectum of parabola \( y^2 = 4ax \), therefore its lengths is \( 4a \).

Chords of contact are clearly parallel to each other, so req. quadrilateral is a trapezium.

\[ Ar(\text{trap } BCDE) = \frac{1}{2} (BC + DE \times KL) \]

\[ = \frac{1}{2} (a + 4a) \left( \frac{3a}{2} \right) = \frac{15a^2}{4} \]

9. The given ellipses are

\[ \frac{x^2}{4} + \frac{y^2}{1} = 1 \] ...(1)

and \[ \frac{x^2}{6} + \frac{y^2}{3} = 1 \] ...(2)

Then the equation of tangent to (1) at any point \( T \)

(2 \( \cos \theta \), \( \sin \theta \)) is given by

\[ \frac{x.2 \cos \theta}{4} + \frac{y.\sin \theta}{1} = 1 \]

or \[ \frac{x \cos \theta}{2} + \frac{y \sin \theta}{1} = 1 \] ...(3)

Let this tangent meet the ellipse (2) at \( P \) and \( Q \)

Let the tangents drawn to ellipse (2) at \( P \) and \( Q \) meet each other at \( R(x_1, y_1) \)

Then \( PQ \) is chord of contact of ellipse (2) with respect to the pt \( R(x_1, y_1) \) and is given by

\[ \frac{x x_1}{6} + \frac{y y_1}{3} = 1 \] ...(4)

Clearly equations (3) and (4) represent the same lines and hence should be identical. Therefore comparing the coefficients, we get

\[ \frac{\cos \theta}{2} = \frac{\sin \theta}{3} = \frac{1}{1} \]

\[ \Rightarrow x_1 = 3 \cos \theta, y_1 = 3 \sin \theta \quad \Rightarrow x_1^2 + y_1^2 = 9 \]

\[ \Rightarrow \text{ Locus of } (x_1, y_1) \text{ is } x^2 + y^2 = 9 \]
which is the director circle of the ellipse \( \frac{x^2}{6} + \frac{y^2}{3} = 1 \) and

Thus tangents at \( P \) and \( Q \) are at right \( \perp \)’s.

**KEY CONCEPT**: We know that the director circle is the locus of intersection point of the tangents which are at right \( \perp \).

10. Let \( P (e, f) \) be any point on the locus. Equation of pair of tangents from \( P (e, f) \) to the parabola \( y^2 = 4ax \) is

\[
[fy - 2a(x + e)]^2 = (f^2 - 4ae)(y^2 - 4ax) \quad [T^2 = SS]
\]

Here, \( a = \) coefficient of \( x^2 = 4a^2 \) \hspace{1cm} \( \text{(1)} \)

\( 2h = \) coefficient of \( xy = -4af \) \hspace{1cm} \( \text{(2)} \)

and \( b = \) coefficient of \( y^2 = f^2 - (f^2 - 4ae) = 4ae \) \hspace{1cm} \( \text{(3)} \)

If they include an angle \( 45^\circ \), then

\[
1 = \tan 45^\circ = \frac{2\sqrt{h^2 - ab}}{a + b}
\]

or, \( (a + b)^2 = 4(h^2 - ab) \)

or, \( (4a^2 + 4ae) = 4[4a^2f^2 - (4a^2)(4ae)] \)

or, \( (a + e)^2 = f^2 - 4ae \) or \( e^2 + 6ae + a^2 - f^2 = 0 \)

or \( (e + 3a)^2 - f^2 = 8a^2 \)

Hence the required locus is \( (x + 3a)^2 - y^2 = 8a^2 \), which is a hyperbola.

11. Let any point \( P \) on ellipse \( 4x^2 + 25y^2 = 100 \) be \( (5 \cos \theta, 2 \sin \theta) \). So equation of tangent to the ellipse at \( P \) will be

\[
\frac{x \cos \theta}{5} + \frac{y \sin \theta}{2} = 1
\]

Tangent (1) also touches the circle \( x^2 + y^2 = r^2 \), so its distance from origin must be \( r \).

Tangent (2) intersects the coordinate axes at \( A \left(\frac{5}{\cos \theta}, 0\right) \)

and \( B \left(0, \frac{2}{\sin \theta}\right) \) respectively. Let \( M(h, k) \) be the midpoint of \( AB \). Then by mid point formula

\[
h = \frac{5}{2 \cos \theta}, \quad k = \frac{1}{\sin \theta} \quad \Rightarrow \quad \cos \theta = \frac{5}{2h}, \quad \sin \theta = \frac{1}{k}
\]

\[
\Rightarrow \quad \cos^2 \theta + \sin^2 \theta = \frac{25}{4h^2} + \frac{1}{k^2}
\]

Hence locus of \( M(h, k) \) is \( \frac{25}{x^2} + \frac{4}{y^2} = 4 \)

Locus is independent of \( r \).

12. The ellipse is \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \) \hspace{1cm} \( \text{(1)} \)

Since this ellipse is symmetrical in all four quadrants, either there exists no such \( P \) or four points, one in each quadrant. Without loss of generality we can assume that \( a > b \) and \( P \) lies in first quadrant.

Let \( P(a \cos \theta, b \sin \theta) \) then equation of tangent is

\[
\frac{x}{a} \cos \theta + \frac{y}{b} \sin \theta = 1
\]

\[
\therefore \quad ON = \frac{ab}{\sqrt{b^2 \cos^2 \theta + a^2 \sin^2 \theta}}
\]

Equation of ON is, \( \frac{x}{a} \sin \theta - \frac{y}{b} \cos \theta = 0 \)

Equation of normal at \( P \) is

\[
ax \sec \theta - b \csc \theta = a^2 - b^2
\]

\[
\therefore \quad OL = \frac{a^2 - b^2}{\sqrt{a^2 \sec^2 \theta + b^2 \csc^2 \theta}} = \frac{(a^2 - b^2) \sin \theta \cos \theta}{\sqrt{a^2 \sin^2 \theta + b^2 \cos^2 \theta}}
\]

and \( NP = OL \)

\[
\therefore \quad NP = \frac{(a^2 - b^2) \sin \theta \cos \theta}{\sqrt{a^2 \sin^2 \theta + b^2 \cos^2 \theta}}
\]

\[
\therefore \quad Z = \text{Area of } OPN = \frac{1}{2} \times ON \times NP
\]

\[
= \frac{1}{2} ab(a^2 - b^2) \frac{\sin \theta \cos \theta}{\sin^2 \theta + b^2 \cos^2 \theta}
\]

Let \( u = \frac{a^2 \sin^2 \theta + b^2 \cos^2 \theta}{\sin \theta \cos \theta} = a^2 \tan \theta + b^2 \cot \theta \)

\[
\frac{du}{d\theta} = a^2 \sec^2 \theta - b^2 \cosec^2 \theta = 0 \Rightarrow \tan \theta = \frac{b}{a}
\]

\[
\left(\frac{d^2 u}{d\theta^2}\right)_{\tan^{-1} \frac{b}{a}} > 0, \text{u is minimum at } \theta = \tan^{-1} \frac{b}{a}
\]

So \( Z \) is maximum at \( \theta = \tan^{-1} \frac{b}{a} \)

\[
\therefore \quad P \text{ is } \left(\frac{a^2}{\sqrt{a^2 + b^2}}, \frac{b^2}{\sqrt{a^2 + b^2}}\right)
\]

By symmetry, we have four such points

\[
\left(\pm \frac{a^2}{\sqrt{a^2 + b^2}}, \pm \frac{b^2}{\sqrt{a^2 + b^2}}\right)
\]
13. Let $A, B, C$ be the point on circle whose coordinates are

\[ A = [a \cos \theta, a \sin \theta] \]

\[ B = [a \cos \left( \theta + \frac{2\pi}{3} \right), a \sin \left( \theta + \frac{2\pi}{3} \right)] \]

and

\[ C = [a \cos \left( \theta + \frac{4\pi}{3} \right), a \sin \left( \theta + \frac{4\pi}{3} \right)] \]

Further, $P = [a \cos \theta, b \sin \theta]$ (Given)

\[ Q = [a \cos \left( \theta + \frac{2\pi}{3} \right), b \sin \left( \theta + \frac{2\pi}{3} \right)] \]

and

\[ R = [a \cos \left( \theta + \frac{4\pi}{3} \right), b \sin \left( \theta + \frac{4\pi}{3} \right)] \]

It is given that $P, Q, R$ are on the same side of $x$-axis as $A, B, C$.

So required normals to the ellipse are

\[ ax \csc \theta - by \csc \theta = a^2 - b^2 \quad \ldots (1) \]

\[ ax \csc \left( \theta + \frac{2\pi}{3} \right) - by \csc \left( \theta + \frac{2\pi}{3} \right) = a^2 - b^2 \quad \ldots (2) \]

\[ ax \csc \left( \theta + \frac{4\pi}{3} \right) - by \csc \left( \theta + \frac{4\pi}{3} \right) = a^2 - b^2 \quad \ldots (3) \]

Now, above three normals are concurrent

\[ \Delta = 0 \]

where

\[ \Delta = \begin{vmatrix}
\sin \theta & \cos \theta & \sin 2\theta \\
\sin \left( \theta + \frac{2\pi}{3} \right) & \cos \left( \theta + \frac{2\pi}{3} \right) & \sin \left( \theta + \frac{4\pi}{3} \right) \\
\sin \left( \theta + \frac{4\pi}{3} \right) & \cos \left( \theta + \frac{4\pi}{3} \right) & \sin \left( \theta + \frac{2\pi}{3} \right)
\end{vmatrix} = 0 \]

[Operating $R_2 \rightarrow R_2 + R_3$ and simplifying $R_2$, we get $R_2 = R_1$]

Given that

$C_1 : x^2 = y - 1 \quad ; \quad C_2 : y^2 = x - 1$

Let $P(x_1, x_1^2 + 1)$ on $C_1$ and $Q(y_1^2 + 1, y_2)$ on $C_2$.

Now the reflection of pt $P$ in the line $y = x$ can be obtained by interchanging the values of abscissa and ordinate.

Thus reflection of pt. $P(x_1, x_1^2 + 1)$ is $R_1(x_1^2 + 1, x_1)$

and reflection of pt. $Q(y_1^2 + 1, y_2)$ is $Q_1(y_2, y_1^2 + 1)$

It can be seen clearly that $P_1$ lies on $C_2$ and $Q_1$ on $C_1$.

Now $PP_1$ and $QQ_1$ both are perpendicular to mirror line $y = x$.

Also $M$ is mid pt. of $PP_1$ (i.e. $P_1$ is mirror image of $P$ in $y = x$).

\[ PM = \frac{1}{2} PP_1 \]

In rt $\triangle PML$,

\[ PL > PM \quad \Rightarrow \quad PL > \frac{1}{2} PP_1 \quad \ldots (i) \]

Similarly,

\[ LQ > \frac{1}{2} QQ_1 \quad \ldots (ii) \]

Adding (i) and (ii) we get

\[ PL + LQ > \frac{1}{2} (PP_1 + QQ_1) \]

\[ \Rightarrow \quad PQ > \frac{1}{2} (PP_1 + QQ_1) \]

\[ \Rightarrow \quad PQ \text{ is more than the mean of } PP_1 \text{ and } QQ_1 \]

\[ \Rightarrow \quad PQ \geq \min (PP_1, QQ_1) \]

Let $\min (PP_1, QQ_1) = PP_1$

then $PQ^2 \geq PP_1^2 = (x_1^2 + 1 - x_1)^2 + (x_1^2 + 1 - x_1)^2$

\[ = 2(x_1^2 + 1 - x_1)^2 = f(x_1) \]

\[ \Rightarrow \quad f(x_1) = 4(x_1^2 + 1 - x_1)(2x_1 - 1) \]

\[ = 4 \left[ (x_1 - \frac{1}{2})^2 + \frac{3}{4} \right] (2x_1 - 1) \]
\[ f'(x_i) = 0 \text{ when } x_i = \frac{1}{2} \]
Also \( f'(x_i) < 0 \text{ if } x_i < \frac{1}{2} \) \text{ and } \( f'(x_i) > 0 \text{ if } x_i > \frac{1}{2} \)
\[ \Rightarrow f(x_i) \text{ is min when } x_i = \frac{1}{2} \]
Thus if at \( x_i = \frac{1}{2} \) pt \( P \) is \( P_0 \) on \( C_1 \)
\[ P_0 \left( \frac{1}{2}, \left( \frac{1}{2} \right)^2 + 1 \right) = \left( \frac{1}{2}, \frac{5}{4} \right) \]
Similarly \( Q_0 \) on \( C_2 \) will be image of \( P_0 \) with respect to \( y = x \)
\[ \Rightarrow Q_0 \left( \frac{5}{4}, \frac{1}{2} \right) \]

15. Let the co-ordinates of \( P \) be \( (a \cos \theta, b \sin \theta) \) then co-ordinates of \( Q \) are \( (a \cos \theta, a \sin \theta) \)

As \( R(h, k) \) divides \( PQ \) in the ratio \( r : s \), then
\[ k = \frac{s(a \cos \theta) + r(a \cos \theta)}{(r + s)} = a \cos \theta \]
\[ \Rightarrow \cos \theta = \frac{h}{a} \]
\[ k = \frac{s(b \sin \theta) + r(a \sin \theta)}{(r + s)} = \sin \theta \frac{(bs + ar)}{(r + s)} \]
\[ \Rightarrow \sin \theta = \frac{k(r + s)}{(bs + ar)} \]\n\[ \therefore \cos^2 \theta + \sin^2 \theta = 1 \]
\[ \therefore \frac{h^2}{a^2} + \frac{k^2(r + s)^2}{(bs + ar)^2} = 1. \]

Hence locus of \( R \) is \( \frac{x^2}{a^2} + \frac{y^2(r + s)^2}{(bs + ar)^2} = 1 \) which is equation of an ellipse.

16. Let the ellipse be \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \) and \( O \) be the centre.
Tangent at \( P(x_1, y_1) \) is \( \frac{xx_1}{a^2} + \frac{yy_1}{b^2} - 1 = 0 \) whose

\[ \text{slope} = -\frac{b^2 x_1}{a^2 y_1} \text{, Focus is } S(ae, 0). \]

Equation of the line perpendicular to tangent at \( P \) is
\[ y = \frac{a^2 y_1}{b^2 x_1} (x - ae) \] ... (1)

Equation of \( OP \) is \( y = \frac{y_1}{x_1} x \) ... (2)

(1) and (2) intersect \( \Rightarrow \frac{y_1}{x_1} x = \frac{a^2 y_1}{b^2 x_1} (x - ae) \)
\[ \Rightarrow x(a^2 - b^2) = a^2 e \Rightarrow x, a^2 e^2 = a^2 e \]
\[ \Rightarrow x = ae/e \]
Which is the corresponding directrix.

17. Let \( P \) be the pt. \((h, k)\). Then eqn of normal to parabola \( y^2 = 4x \) from point \((h, k)\), if \( m \) is the slope of normal, is
\[ y = mx - 2m - m^3 \]
As it passes through \((h, k)\), therefore
\[ mh - k - 2m - m^3 = 0 \]
\[ \alpha, m^3 + (2 - h) + k = 0 \] ... (1)
Which is cubic in \( m \), giving three values of \( m \) say \( m_1, m_2, m_3 \) and \( m_3 \). Then \( m_1 m_2 m_3 = k \) (from eqn\(^3\)) but given that \( m_1 m_2 = \alpha \)
\[ \therefore \text{ We get } m_3 = -\frac{k}{\alpha} \]
But \( m_3 \) must satisfy eqn\(^1\)
\[ \therefore \frac{-k^3}{\alpha^3} + (2 - h) \left( -\frac{k}{\alpha} \right) + k = 0 \]
\[ \Rightarrow k^2 - 2\alpha^2 - h\alpha^2 - \alpha^3 = 0 \]
\[ \therefore \text{ Locus of } P(h, k) \text{ is } y^2 = \alpha^2 x + (\alpha^3 - 2\alpha^2) \]
But \( ATQ \), locus of \( P \) is a part of parabola \( y^2 = 4x \), therefore
\[ \text{ comparing the two, we get } \alpha^2 = 4 \text{ and } \alpha^3 - 2\alpha^2 = 0 \Rightarrow \alpha = 2 \]

18. The given eqn of parabola is
\[ y^2 - 2y - 4x + 5 = 0 \] ... (1)
\[ (y - 1)^2 = 4(x - 1) \]
Any parametric point on this parabola is \( P(t^2 + 1, 2t + 1) \)
\[ \text{Differentiating (1) w.r. to } x, \text{ we get} \]
\[ 2y \frac{dy}{dx} - 2 \frac{dy}{dx} - 4 = 0 \Rightarrow \frac{dy}{dx} = \frac{2}{y - 1} \]
\[ \therefore \text{ Slope of tangent to (1) at point } P(t^2 + 1, 2t + 1) \text{ is} \]
\[ m = \frac{2}{2t} = \frac{1}{t} \]
\[ \therefore \text{ Eqn of tangent at } P(t^2 + 1, 2t + 1) \text{ is} \]
\[ y - (2t + 1) = \frac{1}{t}(x - t^2 - 1) \]
\[ \Rightarrow y - 2t^2 - t = x - t^2 - 1 \]
\[ \Rightarrow x - yt + (t^2 + t - 1) = 0 \] ... (2)
Now directrix of given parabola is \( (x - 1) = -1 \Rightarrow x = 0 \)

Tangent (2) meets directrix at \( Q \left( 0, \frac{t^2 + t - 1}{t} \right) \)
Let pt. \( R \) be \( (h, k) \)
Conic Sections

ATQ, $R$ divides the line joining $QP$ in the ratio $1:2$ i.e., $1:2$ externally.

\[ h = -(1 + t^2) \text{ and } k = \frac{t - 2}{t} \]

\[ t^2 = 1 - h \text{ and } t = \frac{2}{1 - k} \]

Eliminating $t$, we get $\left(\frac{2}{1 - k}\right)^2 = 1 - h$

\[ 4 = -(1 - k)^2 (1 - h) \]

\[ (h - 1)(k - 1)^2 + 4 = 0 \]

\[ \therefore \text{ Locus of } (h, k) \text{ is } (x - 1)(y - 1)^2 + 4 = 0 \]

19. Any pt on the hyperbola $\frac{x^2}{9} - \frac{y^2}{4} = 1$ is $(3 \sec \theta, 2 \tan \theta)$

Then, equation of chord of contact to the circle $x^2 + y^2 = 9$, with respect to the pt. $(3 \sec \theta, 2 \tan \theta)$ is

$$(3 \sec \theta) x + (2 \tan \theta) y = 9 \quad \text{(i)}$$

If $(h, k)$ be the mid point of chord of contact then equation of chord of contact will be

$$hx + ky = h^2 + k^2 = 9 \quad \text{(ii)}$$

or, $hx + ky = h^2 + k^2$

But equations (i) and (ii) represent the same straight line and hence should be identical, therefore, we get

$$\frac{3 \sec \theta}{h} = \frac{2 \tan \theta}{k} = \frac{9}{h^2 + k^2}$$

\[ \therefore \sec \theta = \frac{3h}{h^2 + k^2}, \tan \theta = \frac{9k}{2(h^2 + k^2)} \]

\[ \sec^2 \theta - \tan^2 \theta = 1 \]

\[ \Rightarrow \frac{9h^2}{(h^2 + k^2)^2} - \frac{81k^2}{4(h^2 + k^2)^2} = 1 \]

\[ \Rightarrow 4h^2 - 9k^2 = \frac{4}{9}(h^2 + k^2)^2 \]

or, $\frac{h^2 - k^2}{4} = \left(\frac{h^2 + k^2}{9}\right)^2$

\[ \therefore \text{ Locus of } (h, k) \text{ is } \frac{x^2}{9} - \frac{y^2}{4} = \left(\frac{x^2 + y^2}{9}\right)^2 \]

\[ \Rightarrow 25m^2 + 4 = 16m^2 + 16 \Rightarrow 9m^2 = 12 \]

\[ m = \frac{2}{\sqrt{3}} \]

[Leaving +ve sign to consider tangent in I quadrant]

\[ \therefore \text{ Equation of common tangent is } y = -\frac{2}{\sqrt{3}}x + 4\sqrt{\frac{7}{3}} \]

This tangent meets the axes at $A(2\sqrt{7}, 0)$ and $B(0.4, \frac{7}{\sqrt{3}})$

\[ \therefore \text{ Length of intercepted portion of tangent between axes } AB = \sqrt{2(2\sqrt{7}) + \left(4\sqrt{\frac{7}{3}}\right)^2} = 14/\sqrt{3} \]

F. Match the Following

1. Let $y = mx - 2m - m^3$ be the equation of normal to $y^2 = 4x$.

As it passes through $(3, 0)$, we get $m = 0, 1, -1$

Then three points on parabola are given by $(m^2, -2m)$ for $m = 0, 1, -1$

\[ \therefore P(0, 0), Q(1, 2), R(1, -2) \]

\[ \therefore \text{ Area of } \Delta PQR = \frac{1}{2} \begin{vmatrix} 0 & 0 & 1 \\ 1 & 2 & 1 \\ 1 & -2 & 1 \end{vmatrix} = 2 \text{ sq. units} \]

Radius of circum-circle,

$$R = \frac{abc}{4\Delta} = \frac{\sqrt{5} \times \sqrt{5} \times 4}{5} = \frac{\sqrt{2}}{2} \text{ NOTE THIS STEP}$$

(where, $a, b, c$ are the sides of $\Delta PQR$)

Centroid of $\Delta PQR = \left(\frac{2}{3}, 0\right)$

Circumcentre $= \left(\frac{5}{2}, 0\right)$

Thus, (A) - (p); (B) - (q); (C) - (s); (D) - (r)

2. Let the common tangent to circle $x^2 + y^2 = 16$ and ellipse $x^2/25 + y^2/4 = 1$ be

\[ y = mx + \sqrt{25m^2 + 4} \quad \text{(i)} \]

As it is tangent to circle $x^2 + y^2 = 16$, we should have

\[ \sqrt{25m^2 + 4} = 4 \]

\[ \sqrt{m^2 + 1} \]

[Using : length of perpendicular from $(0, 0)$ to $(1, 4)$]

\[ \therefore \text{ It is clear from the figure that two intersecting circles have a common tangent and a common normal joining the centres (B) - p, q} \]

\[ (C) - q, r \]

Two circle when one is completely inside the other have a common normal $C_1C_2$ but no common tangent.
4. (a) Equation of tangent to \( y^2 = 16x \) at \( F(x_0, y_0) \)
\[ y_0 = 8(x + x_0) \]
\[ \Rightarrow \quad G \left( 0, \frac{8x_0}{y_0} \right) \]
Area of \( \Delta EFG = \frac{1}{2} \times (3-y_1) \times x_0 \)
\[ A = \frac{1}{2} x_0 \left( \frac{3 - 8x_0}{y_0} \right) \]
\[ A = \frac{1}{2} \times \frac{y_0^2}{16} \left( 3 - \frac{y_0}{2} \right) = \frac{1}{32} \left( 3y_0^2 - \frac{y_0^2}{2} \right) \]
\[ \frac{dA}{dy_0} = \frac{1}{32} (6y_0 - 3y_0^2) = \frac{0}{y_0} = 4 \Rightarrow x_0 = 1 \]
\[ \therefore \quad y_1 = \frac{8 \times 1}{4} = 2 \]
Also \( y_0 = mx_0 + 3 \)
\[ 4 = m + 3 \]
\[ m = 1 \]
Maximum area of \( \Delta EFG \)
\[ = \frac{1}{32} \left[ 3 \times 4^2 - \frac{4^3}{2} \right] \]
\[ = \frac{1}{32} [48 - 32] = \frac{1}{2} \]
\[ \therefore \quad (P) \rightarrow (4), (Q) \rightarrow (1), (R) \rightarrow (2), (S) \rightarrow (3) \]

**G. Comprehension Based Questions**

For Qs. 1-3:

1. (c) \[ \frac{Ar\Delta PQS}{Ar\Delta PQR} = \frac{\frac{1}{2} PQ \times ST}{\frac{1}{2} PQ \times TR} = \frac{ST}{TR} = \frac{2}{8} = \frac{1}{4} \]

2. (b) For \( \Delta PRS \),

\[ Ar(\Delta PRS) = \Delta = \frac{1}{2} \times SR \times PT = \frac{1}{2} \times 10 \times 2\sqrt{2} \]
\[ \therefore \quad \Delta = 10\sqrt{2}, a = PS = 2\sqrt{3} \]
\[ b = PR = 6\sqrt{2}, c = SR = 10 \]
\[ \therefore \quad \text{Radius of circumference} \]
\[ R = \frac{abc}{4\Delta} = \frac{2\sqrt{3} \times 6\sqrt{2} \times 10}{4 \times 10 \sqrt{2}} = 3\sqrt{3} \]
Conic Sections

3. (d) Radius of incircle

\[
\text{area of } \triangle PQR = \frac{\Delta}{\text{semi perimeter of } \triangle PQR} = \frac{\Delta}{s}
\]

We have \(a = PR = 6\sqrt{2}\), \(b = QP = PR = 6\sqrt{2}\)
\(c = PQ = 4\sqrt{2}\)
and \(\Delta = \frac{1}{2} \times PQ \times TR = 16\sqrt{2}\)

\[
\therefore \quad s = \frac{6\sqrt{2} + 6\sqrt{2} + 4\sqrt{2}}{2} = 8\sqrt{2} \quad \therefore \quad r = \frac{16\sqrt{2}}{8\sqrt{2}} = 2
\]

4. (b) Any tangent to \(\frac{x^2}{9} - \frac{y^2}{4} = 1\) is \(x \sec \alpha - \frac{y \tan \alpha}{2} = 1\)
It touches circle with center \((4,0)\) and radius \(4\)
\[4 \sec \alpha - 3 = \frac{3}{\sec^2 \alpha + \frac{\tan^2 \alpha}{4}}
\]
\[\Rightarrow 16 \sec^2 \alpha - 24 \sec \alpha + 9 = 144 \left(\frac{\sec^2 \alpha}{9} + \frac{\tan^2 \alpha}{4}\right)
\]
\[\Rightarrow 12 \sec^2 \alpha + 8 \sec \alpha - 15 = 0 \quad \Rightarrow \sec \alpha = \frac{5}{6} \text{ or } -\frac{3}{2}
\]
but \(\sec \alpha = \frac{5}{6} < 1\) is not possible
\[\therefore \sec \alpha = -\frac{3}{2} \Rightarrow \tan \alpha = \pm \frac{\sqrt{5}}{2}
\]
\[\therefore \text{slope of tangent} = \frac{2 \sec \alpha}{3 \tan \alpha} = \frac{2(-3/2)}{3(-\sqrt{5}/2)} = \frac{2}{\sqrt{5}}
\]
\[\therefore \text{Equation of tangent is } -\frac{x}{\sqrt{5}} + \frac{y\sqrt{5}}{2} = 1
\]
or \(2x - \sqrt{5}y + 4 = 0\)

5. (a) The intersection points of given circle
\[x^2 + y^2 - 8x = 0 \quad \cdots(1)
\]
and hyperbola \(4x^2 - 9y^2 - 36 = 0 \quad \cdots(2)\)
can be obtained by solving these equations
Substituting value of \(y^2\) from eqn (1) in eqn (2), we get
\[4x^2 - 9(8x - x^2) = 36 \Rightarrow 13x^2 - 72x - 36 = 0
\]
\(\Rightarrow x = \frac{6}{13}, \frac{-6}{13} \Rightarrow y^2 = 12, \frac{-48 - 36}{13} \text{ (not possible)}
\]
\[\therefore (6, \sqrt{3}) \text{ and } (6, -\sqrt{3}) \text{ are points of intersection.}
\]
So eqn of required circle is \((x - 6)(x - 6) + (y - 2\sqrt{3})(y + 2\sqrt{3}) = 0\)
\[\Rightarrow x^2 + 36 - 12x + y^2 - 12 = 0
\]
\[\Rightarrow x^2 + y^2 - 12x + 24 = 0
\]

6. (d) Tangent to \(x^2 + \frac{y^2}{2} = 1\) at the point \((3\cos \theta, 2\sin \theta)\) is
\[\frac{x\cos \theta}{3} + \frac{y\sin \theta}{2} = 1
\]
As it passes through \((3,4)\), we get
\[\cos \theta + 2\sin \theta = 1
\]
\[\Rightarrow 4\sin^2 \theta = 1 + \cos^2 \theta - 2\cos \theta
\]
\[\Rightarrow 5\cos^2 \theta - 2\cos \theta - 3 = 0
\]
\[\Rightarrow \cos \theta = 1, -\frac{3}{5} \Rightarrow \sin \theta = 0, \frac{4}{5}
\]
\[\therefore \text{Required points are } A(3,0) \text{ and } B\left(-\frac{9}{5}, \frac{8}{5}\right)
\]

7. (c) Let \(H\) be the orthocentre of \(\triangle PAB\), then as \(BH \perp AP\), \(BH\) is a horizontal line through \(B\).
\[\therefore \text{y-coordinate of } B = \frac{8}{5}
\]
Let \(H\) has co-ordinates \((\alpha, \beta/5)\)
Then slope of \(PH = \frac{\beta/5 - 4}{\alpha - 3} = -\frac{12}{5(\alpha - 3)}
\]
and slope of \(AB = \frac{8 - 0}{\frac{9}{5} - 3} = \frac{8}{-24} = \frac{-1}{3}
\]
But PH \perp AB \Rightarrow \frac{-12}{5(\alpha - 3)} \times \left(\frac{-1}{3}\right) = -1
\Rightarrow 4 = -5\alpha + 15 \text{ or } \alpha = 11/5

Hence H(1/5, 8/5).

8. (a) Clearly the moving point traces a parabola with focus at P(3, 4) and directrix as

AB: \frac{y - 0}{x - 3} = \frac{-1}{3} \text{ or } x + 3y - 3 = 0
\therefore \text{ Equation of parabola is}
\begin{align*}
(x - 3)^2 + (y - 4)^2 &= \frac{(x + 3y - 3)^2}{10} \\
or 9x^2 + y^2 - 6xy - 54x - 62y + 241 &= 0
\end{align*}

9. (b) \begin{align*}
PQ &= \sqrt{\left(at^2 - \frac{a}{t^2}\right)^2 + \left(2at + \frac{2a}{t}\right)^2} \\
&= a\sqrt{\left(t + \frac{1}{t}\right)^2 - \frac{1}{t^2}} + 4\left(t + \frac{1}{t}\right)^2 \\
&= a\left(t + \frac{1}{t}\right)^2 - \frac{1}{t^2} + 4 = a\left(\frac{t}{t^2}\right)^2 = 5a
\end{align*}

10. (d) As PQ is the focal chord of \(y^2 = 4ax\)
\therefore \text{ Coordinates of P and Q can be taken as}

\[ \begin{array}{c}
\text{R} \\
\text{O} \\
\text{s} (a, 0) \\
\text{P} (at^2, 2at) \\
\text{Q} \left(\frac{a}{t^2}, -\frac{2a}{t}\right)
\end{array} \]

Tangents at P and Q are
\[ y = \frac{x}{t} + at \quad \text{and} \quad y = -xt - \frac{a}{t} \]
which intersect each other at \(R(-a, a\left(t-\frac{1}{t}\right))\)

As R lies on the y = 2x + a, \ a > 0
\[ \therefore a\left(t-\frac{1}{t}\right) = -2a + a \Rightarrow t - \frac{1}{t} = -1 \Rightarrow t + \frac{1}{t} = \sqrt{5} \]

Now, \(m_{OP} = \frac{2}{t} \text{ and } m_{OQ} = -2t\)
\[ \therefore \tan \theta = \frac{2 + 2t}{1 - 4} = \frac{2(t + 1)}{-3} = \frac{2\sqrt{5}}{-3} \]

11. (d) \(\therefore PQ \text{ is a focal chord, } Q\left(\frac{a}{t^2}, -\frac{2a}{t}\right)\)
Also QR \parallel PK \Rightarrow m_{QR} = m_{PK}
\begin{align*}
\Rightarrow \frac{-2a}{t^2} - \frac{2at}{t^2} &= 0 - \frac{2at}{t^2} \\
\Rightarrow \frac{-2a(1 + r)}{a} &= \frac{-2at}{a(2 - t^2)} \\
\Rightarrow 2 - r^2 &= \frac{t}{r} \\
\Rightarrow 2 - t^2 &= 1 + r \Rightarrow r = \frac{t^2 - 1}{t}
\end{align*}

12. (b) Tangent at \(P\) is

\(ty = x + at^2\) \hspace{1cm} (i)

Normal at \(S\)

\(sx + y = 2as + as^3\) \hspace{1cm} (ii)

But given \(st = 1 \Rightarrow s = \frac{1}{t}\)
\[
\therefore \frac{x}{t} + y = \frac{2a}{t} + \frac{a}{t^3}
\]
\[ \Rightarrow xt^2 = yr^3 = 2at^2 + a \]
Putting value of \(x\) from equation (i) in above equation we get
\[ \Rightarrow t^2\left(ty - at^2\right) + yr^3 = 2at^2 + a \]
\[ \Rightarrow \left(t^3 + r^3\right)y - at^4 = 2at^2 + a \]
\[ \Rightarrow 2r^3y = a\left(\frac{t^4 + 2r^2 + 1}{2r^2}\right) \]
\[ y = \frac{a\left(t^4 + 2r^2 + 1\right)}{2r^2} \]

For (Q. 13 and 14)
For ellipse \(\frac{x^2}{9} + \frac{y^2}{8} = 1, \ e = \sqrt{\frac{1 - 9}{9} = \frac{1}{3}} \)
\[ \therefore F_1(-1, 0) \text{ and } F_2 (1, 0) \]
Parabola with vertex at \((0, 0)\) and focus at \(F_2(1, 0)\) is \(y^2 = 4x\).

Intersection points of ellipse and parabola are \(M\left(\frac{3}{2}, \sqrt{3}\right)\) and

\[ N\left(\frac{3}{2}, -\sqrt{3}\right) \]
13. (a) For orthocentre of $\triangle F_1MN$, clearly one altitude is x-axis i.e. $y = 0$ and altitude from M to $F_1N$ is

$$y - \sqrt{6} = \frac{5}{2\sqrt{6}} \left( \frac{x}{2} - 3 \right)$$

Putting $y = 0$ in above equation, we get

$$x = -\frac{9}{10}$$

$\therefore$ Orthocentre $\left( -\frac{9}{10}, 0 \right)$

14. (c) Tangents to ellipse at M and N are

$$\frac{x}{6} + \frac{y\sqrt{6}}{8} = 1 \text{ and } \frac{x}{6} - \frac{y\sqrt{6}}{8} = 1$$

Their intersection point is R $(6, 0)$

Also normal to parabola at $M \left( \frac{3}{2}, \sqrt{6} \right)$ is

$$y - \sqrt{6} = -\frac{\sqrt{6}}{2} \left( x - \frac{3}{2} \right)$$

Its intersection with x-axis is $Q \left( \frac{7}{2}, 0 \right)$

Now $ar (\triangle MQR) = \frac{1}{2} \times \frac{5}{2} \times \sqrt{6} = \frac{5\sqrt{6}}{4}$

Also area $(MF_1NF_2) = 2 \times ar (F_1MF_2)$

$$= 2 \times \frac{1}{2} \times 2 \times \sqrt{6} = 2\sqrt{6}$$

$$\therefore \frac{ar (\triangle MQR)}{ar (MF_1NF_2)} = \frac{5\sqrt{6}}{4\times2\sqrt{6}} = 5:8$$

H. Assertion & Reason Type Questions

1. (a) The given curve is $y = -\frac{x^2}{2} + x + 1$

or $(x - 1)^2 = -2(y - 3/2)$

which is a parabola, so should be symmetric with respect to its axis $x - 1 = 0$

$\therefore$ Both the statements are true and statement 2 is a correct explanation for statement 1.

II. Integer Value Correct Type

1. (2) Intersection point of nearest directrix $x = \frac{a}{e}$ and x-axis is $\left( \frac{a}{e}, 0 \right)$

As $2x + y = 1$ passes through $\left( \frac{a}{e}, 0 \right)$

$\therefore \frac{2a}{e} = 1 \Rightarrow a = \frac{e}{2}$

Also $y = -2x + 1$ is a tangent to $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

$\therefore a^2 (-2)^2 - b^2 = 4a^2 - b^2 = 1$

$\Rightarrow 4a^2 - a^2 (e^2 - 1) = 1 \Rightarrow 4 \times \frac{e^2}{4} - \frac{e^2}{4} (e^2 - 1) = 1$

$\Rightarrow 4e^2 - e^4 + e^2 = 4 \Rightarrow e^4 - 5e^4 + 4 = 0$

$\Rightarrow e^2 = 4$ as $e > 1$ for hyperbola. $\Rightarrow e = 2$

2. (2)

$\Delta_1 = \text{Area of } \Delta PLL' = \frac{1}{2} \times 8 \times \frac{3}{2} = 6$

Equation of AB, $y = 2x + 1$ Equation of AC, $y = x + 2$

Equation of BC, $-y = x + 2$

Solving above equations we get A $(1, 3)$, B $(-1, -1)$, C $(-2, 0)$

$\therefore \Delta_2 = \begin{vmatrix} 1 & 3 & 1 \\ -1 & -1 & 1 \\ -2 & 0 & 1 \end{vmatrix} = 3 \Rightarrow \frac{\Delta_1}{\Delta_2} = 2$

3. (4) We observe both parabola $y^2 = 8x$ and circle $x^2 + y^2 - 2x - 4y = 0$ pass through origin.

$\therefore$ One end of common chord PQ is origin. Say P $(0, 0)$

Let Q be the point $(2t^2, 4t)$, then it will satisfy the equation of circle.

$\therefore 4t^4 + 16t^2 - 4t^2 - 16t = 0$

$\Rightarrow t^4 + 3t^2 - 4t = 0 \Rightarrow t(t^3 + 3t - 4) = 0$

$\Rightarrow t(t - 1)(t^2 + t - 4) = 0 \Rightarrow t = 0$ or 1

For $t = 0$, we get point P, therefore $t = 1$ gives point Q as $(2, 4)$.

We also observe here that P $(0, 0)$ and Q $(2, 4)$ are end points of diameter of the given circle and focus of the parabola is the point S $(2, 0)$. 
4. (9) Vertical line $x = h$, meets the ellipse $\frac{x^2}{4} + \frac{y^2}{3} = 1$ at

$$P \left( h, \frac{\sqrt{3}}{2} \sqrt{4-h^2} \right) \text{ and } Q \left( h, -\frac{\sqrt{3}}{2} \sqrt{4-h^2} \right)$$

By symmetry, tangents at $P$ and $Q$ will meet each other at $x$-axis.

Tangent at $P$ is $\frac{xh}{4} + \frac{y\sqrt{3}}{6} \sqrt{4-h^2} = 1$

which meets $x$-axis at $R \left( \frac{4}{h}, 0 \right)$

Area of $\Delta PQR = \frac{1}{2} \times \sqrt{3} \sqrt{4-h^2} \times \left( \frac{4}{h} - h \right)$

i.e., $\Delta(h) = \frac{\sqrt{3}}{2} \frac{(4-h^2)^{3/2}}{h}$

$$\frac{d\Delta}{dh} = -\sqrt{3} \left[ \frac{\sqrt{4-h^2} (h^2+2)}{h^2} \right] < 0$$

5. (2) End points of latus rectum of $y^2 = 4x$ are $(1, \pm 2)$

Equation of normal to $y^2 = 4x$ at $(1, 2)$ is $y-2 = -1(x-1)$ or $x+y-3 = 0$

As it is tangent to circle $(x-3)^2 + (y+2)^2 = r^2$

$$\sqrt{\frac{3+(-2)-3}{2}} = r \Rightarrow r^2 = 2$$

6. (4) Let $(t^2, 2t)$ be any point on $y^2 = 4x$. Let $(h, k)$ be the image of $(t^2, 2t)$ in the line $x + y + 4 = 0$. Then

$$\frac{h-t^2}{1} = \frac{k-2t}{1} = \frac{-2(t^2+2t+4)}{2}$$

$\Rightarrow h = -(2t+4)$ and $k = -(t^2+4)$

For its intersection with $y = -3$, we have $-(t^2+4) = -5 \Rightarrow t = \pm 1$

i.e., $A(-6, -5)$ and $B(-2, -5)$

$AB = 4.$

7. (4) Ellipse $\frac{x^2}{9} + \frac{y^2}{5} = 1$

$\Rightarrow a = 3, b = \sqrt{5}$ and $e = \frac{2}{3}$

i.e., $f_1 = 2$ and $f_2 = -2$

$P_1 : y^2 = 8x$ and $P_2 : y^2 = -16x$

$T_1 : y = m_1 x + \frac{2}{m_1}$

It passes through $(-4, 0)$,

$0 = -4m_1 + \frac{2}{m_1} \Rightarrow m_1^2 = \frac{1}{2}$

$T_2 : y = m_2 x - \frac{4}{m_2}$

It passes through $(2, 0)$

$0 = 2m_2 - \frac{4}{m_2} \Rightarrow m_2^2 = 2$

$\Rightarrow \frac{1}{m_1^2} + m_2^2 = 4$
1. (b) Any tangent to the parabola \( y^2 = 8ax \) is
\[
y = mx + \frac{2a}{m} \quad \ldots \text{(i)}
\]
If (i) is a tangent to the circle, \( x^2 + y^2 = 2a^2 \) then,
\[
\sqrt{2a} = \pm \frac{2a}{m\sqrt{m^2 + 1}}
\]
\[
\Rightarrow m^2(1 + m^2) = 2 \Rightarrow (m^2 + 2)(m^2 - 1) = 0 \Rightarrow m = \pm 1.
\]
So from (i), \( y = \pm (x + 2a) \).

2. (b) Equation of the normal to a parabola \( y^2 = 4bx \) at point \( (bt_1^2, 2bt_1) \) is
\[
y = -t_1x + 2bt_1 + bt_1^3
\]
As given, it also passes through \( (bt_2^2, 2bt_2) \) then
\[
2bt_2 = -t_1 bt_2^2 + 2bt_1 + bt_1^3
\]
\[
2t_2 - 2t_1 = -t_1 \left( t_2^2 - t_1^2 \right) = -t_1(t_2 + t_1)(t_2 - t_1)
\]
\[
\Rightarrow 2 = -t_1(t_2 + t_1) \Rightarrow t_2 + t_1 = \frac{-2}{t_1}
\]
\[
\Rightarrow t_2 = -t_1 - \frac{2}{t_1}
\]

3. (d) \[
\frac{x^2}{144} - \frac{y^2}{81} = 1
\]
\[
a = \sqrt{144}, \quad b = \sqrt{81}, \quad e = \frac{15}{12} = \frac{5}{4}
\]
\[
\therefore \text{ Foci } = (\pm 3, 0)
\]
\[
\therefore \text{ foci of ellipse = foci of hyperbola}
\]
\[
\therefore \text{ for ellipse } ae = 3 \text{ but } a = 4,
\]
\[
\therefore e = \frac{3}{4}
\]
Then \( b^2 = a^2(1 - e^2) \quad \Rightarrow b^2 = 16 \left( 1 - \frac{9}{16} \right) = 7 \)

4. (d) Solving equations of parabolas
\[y^2 = 4ax \text{ and } x^2 = 4ay\]
we get \((0, 0)\) and \((4a, 4a)\)
Substituting in the given equation of line
\[2bx + 3cy + 4d = 0,\]
we get \(d = 0 \text{ and } 2b + 3c = 0 \Rightarrow a^2 + (2b + 3c)^2 = 0\)

5. (b) \[e = \frac{1}{2}, \quad \text{Directrix}, \quad x = \frac{a}{e} = 4\]
\[
\Rightarrow a = 4 \times \frac{1}{2} = 2 \quad \therefore b = 2 \sqrt{\frac{1}{4} - \frac{1}{4}} = \sqrt{3}
\]
Equation of ellipse is \[\frac{x^2}{4} + \frac{y^2}{3} = 1 \Rightarrow 3x^2 + 4y^2 = 12\]

6. (a) \[P = (1, 0) \quad Q = (h, k) \quad \text{Such that } K^2 = 8h \]
Let \((\alpha, \beta)\) be the midpoint of \(PQ\)
\[
\alpha = \frac{h + 1}{2}, \quad \beta = \frac{k + 0}{2}
\]
\[
2\alpha - 1 = h \quad 2\beta = k.
\]
\[
(2\beta)^2 = 8(2\alpha - 1) \Rightarrow \beta^2 = 4\alpha - 2
\]
\[
\Rightarrow y^2 - 4x + 2 = 0.
\]

7. (d) Tangent to the hyperbola \[\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1\]
is
\[y = mx \pm \sqrt{a^2m^2 - b^2}\]
Given that \(y = \alpha x + \beta\) is the tangent of hyperbola
\[
\Rightarrow m = \alpha \text{ and } a^2m^2 - b^2 = \beta^2
\]
\[
\therefore a^2\alpha^2 - b^2 = \beta^2
\]
Locus is \(a^2x^2 - y^2 = b^2\) which is hyperbola.

8. (a) \[\because \angle FBF' = 90^\circ \Rightarrow FB^2 + F'B^2 = FF'^2\]
\[
\therefore \left(\sqrt{a^2e^2 + b^2}\right)^2 + \left(\sqrt{a^2e^2 + b^2}\right)^2 = (2ae)^2
\]
\[
\Rightarrow 2(a^2e^2 + b^2) = 4a^2e^2 \Rightarrow e^2 = \frac{b^2}{a^2}
\]
Also \[e^2 = 1 - b^2 / a^2 = 1 - e^2\]
\[
\Rightarrow 2e^2 = 1, \quad e = \frac{1}{\sqrt{2}}.
\]
9. (a) Given parabola is \( y = \frac{a^3x^2}{3} + \frac{a^2x}{2} - 2a \)
\[
\Rightarrow y = \frac{a^3}{3} \left( x^3 + \frac{3x}{2a} + \frac{9}{16a^2} \right) - \frac{3a}{16} - 2a
\]
\[
\Rightarrow y + \frac{35a}{16} = \frac{a^3}{3} \left( x + \frac{3}{4a} \right)^2
\]

\( \therefore \) Vertex of parabola is \( \left( -\frac{3}{4a}, -\frac{35a}{16} \right) \)

To find locus of this vertex,
\[
x = -\frac{3}{4a} \quad \text{and} \quad y = -\frac{35a}{16}
\]
\[
\Rightarrow a = -\frac{3}{4x} \quad \text{and} \quad a = -\frac{16y}{35}
\]
\[
\Rightarrow -\frac{3}{4x} = -\frac{16y}{35} \quad \Rightarrow 64xy = 105
\]
\[
\Rightarrow xy = \frac{105}{64} \quad \text{which is the required locus.}
\]

10. (a) \( 2ae = 6 \quad \Rightarrow \quad ae = 3, \quad 2b = 8 \quad \Rightarrow \quad b = 4 \)
\[
b^2 = a^2(1-e^2) \quad ; \quad 16 = a^2 - a^2e^2 \quad \Rightarrow \quad a^2 = 16 + 9 = 25
\]
\[
\Rightarrow a = 5 \quad \therefore \quad e = \frac{3}{a} = \frac{3}{5}
\]

11. (b) \( \frac{dy}{dx} = 2x - 5 \quad \therefore \quad m_1 = (2x - 5)(2,0) = -1, \)
\[
m_2 = (2x - 5)(3,0) = 1 \quad \Rightarrow \quad m_1m_2 = -1
\]
i.e. the tangents are perpendicular to each other.

12. (b) Given, equation of hyperbola is \( \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \)

We know that the equation of hyperbola is
\[
\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{Here,} \quad a^2 = \cos^2\alpha \quad \text{and} \quad b^2 = \sin^2\alpha
\]

We know that, \( b^2 = a^2(e^2 - 1) \)
\[
\Rightarrow \sin^2\alpha = \cos^2\alpha(e^2 - 1)
\]
\[
\Rightarrow \sin^2\alpha + \cos^2\alpha = \cos^2\alpha, e^2
\]
\[
\Rightarrow e^2 = 1 + \tan^2\alpha = \sec^2\alpha \quad \Rightarrow \quad e = \sec\alpha
\]

\( \therefore \quad ae = \cos\alpha \cdot \frac{1}{\cos\alpha} = 1 \)

Co-ordinates of foci are \((\pm ae, 0)\) i.e. \((\pm 1, 0)\)

Hence, abscissae of foci remain constant when \(\alpha\) varies.

13. (b) Parabola \( y^2 = 8x \)
\[
\text{We know that the locus of point of intersection of two perpendicular tangents to a parabola is its directrix.}
\]

Point must be on the directrix of parabola

\( \therefore \) equation of directrix \( x + 2 = 0 \quad \Rightarrow \quad x = -2 \)

Hence the point is \((-2, 0)\)

14. (b) Equation of normal at \( (x,y) \) is \( y - y_n = -\frac{dx}{dy} (X - x) \)
\[
\text{Coordinate of } G \text{ at } X \text{ axis is } (X, 0) \text{ (let)}
\]
\[
\therefore \quad 0 = y - y_n = -\frac{dx}{dy} (X - x) \quad \Rightarrow \quad y = \frac{dy}{dx} = X - x
\]
\[
\Rightarrow X = x + y \frac{dy}{dx} \quad \therefore \text{Co-ordinate of } G \left( x + y \frac{dy}{dx}, 0 \right)
\]

Given distance of \( G \) from origin = twice of the abscissa of \( P \).

\( \therefore \) distance cannot be –ve, therefore abscissa \( x \) should be +ve

\( \therefore \quad x + y \frac{dy}{dx} = 2x \quad \Rightarrow \quad y = \frac{dy}{dx} = x \quad \Rightarrow \quad ydy = xdx
\]

On Integrating \( \frac{y^2}{2} = x^2 + c_1 \quad \Rightarrow \quad x^2 - y^2 = -2c_1 \)

\( \therefore \) the curve is a hyperbola

15. (a) Perpendicular distance of directrix from focus
\[
= \frac{a}{e} - ae = 4
\]
\[
\Rightarrow a \left( 2 - \frac{1}{2} \right) = 4
\]
\[
\Rightarrow a = \frac{8}{3}
\]

\( \therefore \) Semi major axis = 8/3

16. (b) Vertex of a parabola is the mid point of focus and the point where directrix meets the axis of the parabola.

Here focus is \( O(0, 0) \) and directrix meets the axis at \( B(2, 0) \)

\( \therefore \) Vertex of the parabola is \((1, 0)\)
Conic Sections

17. (a) The given ellipse is \( \frac{x^2}{4} + \frac{y^2}{1} = 1 \)

So \( A = (2, 0) \) and \( B = (0, 1) \)

If \( PQRS \) is the rectangle in which it is inscribed, then \( P = (2, 1) \).

Let \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \)

be the ellipse circumscribing the rectangle \( PQRS \).

Then it passes through \( P (2, 1) \)

\[ \therefore \frac{4}{a^2} + \frac{1}{b^2} = 1 \quad \ldots(\text{a}) \]

Also, given that, it passes through \( (4, 0) \)

\[ \therefore \frac{16}{a^2} + 0 = 1 \Rightarrow a^2 = 16 \]

\[ \Rightarrow b^2 = 4/3 \quad \text{[substituting } a^2 = 16 \text{ in eqn(} \text{a})] \]

\[ \therefore \text{The required ellipse is } \frac{x^2}{16} + \frac{y^2}{4/3} = 1 \text{ or } x^2 + 12y^2 = 16 \]

18. (b) The locus of perpendicular tangents is directrix i.e., \( x = -1 \)

19. (d) Let the ellipse be \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \)

It passes through \((-3, 1)\) so \( \frac{9}{a^2} + \frac{1}{b^2} = 1 \) \( \ldots(i) \)

Also, \( b^2 = a^2(1 - 2/5) \)

\[ \Rightarrow 5b^2 = 3a^2 \quad \ldots(ii) \]

Solving (i) and (ii) we get \( a^2 = \frac{32}{3}, b^2 = \frac{32}{5} \)

So, the equation of the ellipse is \( 3x^2 + 5y^2 = 32 \)

20. (b) Given equation of ellipse is \( 2x^2 + y^2 = 4 \)

\[ \Rightarrow \frac{2x^2}{4} + \frac{y^2}{4} = 1 \Rightarrow \frac{x^2}{2} + \frac{y^2}{4} = 1 \]

Equation of tangent to the ellipse \( \frac{x^2}{2} + \frac{y^2}{4} = 1 \) is

\[ y = mx \pm \sqrt{2m^2 + 4} \quad \ldots(1) \]

(\( \therefore \) equation of tangent to the ellipse \( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \)

is \( y = mx + c \) where \( c = \pm \sqrt{a^2 m^2 + b^2} \)

Now, Equation of tangent to the parabola \( y^2 = 16\sqrt{3}x \) is \( y = mx + \frac{4\sqrt{3}}{m} \) \( \ldots(2) \)

(\( \therefore \) equation of tangent to the parabola \( y^2 = 4ax \) is \( y = mx + \frac{a}{m} \))

On comparing (1) and (2), we get

\[ \frac{4\sqrt{3}}{m} = \pm\sqrt{2m^2 + 4} \]

Squaring on both the sides, we get

\[ \begin{align*}
16 & = 2m^2 + 4 \Rightarrow 2m^4 = 48 \\
\Rightarrow & m^4 + m^2 - 2 = 0 \Rightarrow m^2 + 2m^2 - 48 = 0 \\
\Rightarrow & m^2 = 4 \Rightarrow m = \pm 2
\end{align*} \]

\( \therefore \) Equation of common tangents are \( y = \pm 2x \pm 2\sqrt{3} \)

Thus, statement-1 is true.

Statement-2 is obviously true.

21. (d) Equation of circle is \( (x - 1)^2 + y^2 = 1 \)

\( \Rightarrow \) radius = 1 and diameter = 2

\[ \therefore \text{Length of semi-minor axis is } 2. \]

Equation of circle is \( x^2 + (y - 2)^2 = 4 = (2)^2 \)

\[ \Rightarrow \text{radius } 2 \text{ and diameter } 4 \]

\[ \therefore \text{Length of semi major axis is } 4 \]

We know, equation of ellipse is given by

\[ \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \]

\[ \Rightarrow \frac{x^2}{(4)^2} + \frac{y^2}{(2)^2} = 1 \Rightarrow \frac{x^2}{16} + \frac{y^2}{4} = 1 \Rightarrow x^2 + 4y^2 = 16 \]

22. (a) From the given equation of ellipse, we have

\[ a = 4, \quad b = 3, \quad e = \sqrt{1 - \frac{9}{16}} \]

\[ \Rightarrow e = \frac{\sqrt{7}}{4} \]

Now, radius of this circle = \( a^2 = 16 \)

\[ \Rightarrow \text{Focii } (\pm \sqrt{7}, 0) \]

Now equation of circle is \( (x - 0)^2 + (y - 3)^2 = 16 \)

\( x^2 + y^2 - 6y - 7 = 0 \)

23. (b) Let common tangent be

\[ y = mx + \frac{\sqrt{5}}{m} \]

Since, perpendicular distance from centre of the circle to the common tangent is equal to radius of the circle,

\[ \frac{\sqrt{5}}{1 + m^2} = \sqrt{\frac{5}{2}} \]

On squaring both the side, we get

\[ m^2(1 + m^2) = 2 \]

\[ \Rightarrow m^4 + m^2 - 2 = 0 \Rightarrow (m^2 + 2)(m^2 - 1) = 0 \]

\[ \Rightarrow m = \pm 1 \quad \ldots(\therefore \text{m } \neq \pm \sqrt{2}) \]

\[ y = \pm (x + \sqrt{5}) \], both statements are correct as \( m = \pm 1 \) satisfies the given equation of statement-2.
24. (a) Given eqn of ellipse can be written as
\[ \frac{x^2}{6} + \frac{y^2}{2} = 1 \Rightarrow a^2 = 6, b^2 = 2 \]
Now, equation of any variable tangent is
\[ y = mx \pm \sqrt{a^2 m^2 + b^2} \quad \ldots(i) \]
where m is slope of the tangent
So, equation of perpendicular line drawn from centre to tangent is
\[ y = \frac{-x}{m} \quad \ldots(ii) \]
Eliminating m, we get
\[ (x^4 + y^4 + 2x^2 y^2) = a^2 x^2 + b^2 y^2 \]
\[ (x^2 + y^2)^2 = a^2 x^2 + b^2 y^2 \]
\[ \Rightarrow (x^2 + y^2)^2 = 6x^2 + 2y^2 \]

25. (c) Let tangent to \( y^2 = 4x \) be \( y = mx + \frac{1}{m} \)
Since this is also tangent to \( x^2 = -32y \)
\[ \therefore x^2 = -32 \left( mx + \frac{1}{m} \right) \Rightarrow x^2 + 32mx + \frac{32}{m} = 0 \]
Now, \( D = 0 \)
\[ (32)^2 - 4 \left( \frac{32}{m} \right) = 0 \Rightarrow m^3 = \frac{4}{32} \Rightarrow m = \frac{1}{2} \]

26. (b) Let P(h, k) divides OQ in the ratio 1 : 3
Let any point Q on \( x^2 = 8y \) is \( (4t, 2t^2) \)
Then by section formula
\[ k = \frac{t^2}{2} \quad \text{and} \quad h = t \]
\[ \Rightarrow 2k = h^2 \]
Required locus of P is \( x^2 = 2y \)

27. (b) Given curve is
\[ x^2 + 2xy - 3y^2 = 0 \quad \ldots(1) \]
Differentiate w.r.t. x, \( 2x + 2x \frac{dy}{dx} + 2y - 6y \frac{dy}{dx} = 0 \)
\[ \left( \frac{dy}{dx} \right)_{(1,1)} = 1 \]
Equation of normal at \( (1, 1) \) is
\[ y = 2 - x \quad \ldots(2) \]
Solving eqq. (1) and (2), we get \( x = 1, 3 \)
Point of intersection \( (1, 1), (3, -1) \)
Normal cuts the curve again in 4th quadrant.

28. (b) Topic-wise Solved Papers - MATHEMATICS
The end point of latus rectum of ellipse
\[ \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \text{in first quadrant is} \quad \left( \frac{ae^2}{a}, \frac{b^2}{b} \right) \quad \text{and the tangent at this point intersects x-axis at} \quad \left( \frac{a}{e^2}, 0 \right) \quad \text{and}
\]
y-axis at \( (0, a) \).
The given ellipse is \( \frac{x^2}{9} + \frac{y^2}{5} = 1 \)
Then \( a^2 = 9, b^2 = 5 \quad \Rightarrow \quad e = \sqrt{\frac{5}{9}} = \frac{2}{3} \)
\[ \therefore \quad \text{end point of latus rectum in first quadrant is} \quad L(2, \frac{5}{3}) \]
Equation of tangent at \( L \) is \( \frac{2x}{9} + \frac{y}{3} = 1 \)
It meets x-axis at \( A \left( \frac{9}{2}, 0 \right) \) and y-axis at \( B(0, 3) \)
\[ \therefore \quad \text{Area of} \Delta OAB = \frac{1}{2} \times \frac{9}{2} \times 3 = \frac{27}{4} \]

29. (c) Minimum distance \( \Rightarrow \) perpendicular distance
Eqn of normal at \( P(2t^2, 4t) \)
\[ y = -tx + 4t + 2t^3 \]
It passes through \( C(0, -6) \) \( \Rightarrow t^3 + 2t + 3 = 0 \quad \Rightarrow \quad t = -1 \)

30. (a) \( \frac{2b^2}{a} = 8 \) and \( 2b = \frac{1}{2} (2ae) \)
\[ \Rightarrow 4b^2 = a^2 e^2 \Rightarrow 4a^2 (e^2 - 1) = a^2 e^2 \Rightarrow 3e^2 = 4 \quad \Rightarrow e = \frac{2}{\sqrt{3}} \]

### Section-A  
**JEE Advanced/ IIT-JEE**

1. For the given function to be defined
   \[
   \frac{\pi^2}{16} - x^2 \geq 0 \Rightarrow -\frac{\pi}{4} \leq x \leq \frac{\pi}{4}
   \]
   \[
   \therefore D_f = [-\pi/4, \pi/4]
   \]

   Now, for \(x \in [-\pi/4, \pi/4]\), \(\sqrt{\frac{\pi^2}{16} - x^2} \in [0, \pi/4]\) and sine function increases on \([0, \pi/4]\)
   \[
   \therefore 0 = \sin 0 \leq \sin \sqrt{\frac{\pi^2}{16} - x^2} \leq \sin \pi/4 = 1/\sqrt{2}
   \]
   \[
   \Rightarrow 0 \leq 3 \sin \sqrt{\frac{\pi^2}{16} - x^2} \leq 3/\sqrt{2}
   \]
   \[
   \therefore f(x) = [0, 3/\sqrt{2}]
   \]

2. \(f(x) = \begin{cases} \frac{x}{1 + e^{1/x}}, & x \neq 0 \\ 0, & x = 0 \end{cases}\)

   \[
   f'(0^+) = \lim_{h \to 0} \frac{f(0+h) - f(0)}{h}
   \]

   \[
   = \lim_{h \to 0} \frac{1 + e^{1/h}}{h} = \lim_{h \to 0} \frac{1}{1 + e^{1/h}}
   \]

   \[
   = \lim_{h \to 0} e^{-1/h} = 0
   \]

   \[
   f'(0^-) = \lim_{h \to 0} \frac{f(0) - f(0-h)}{h}
   \]

   \[
   = \lim_{h \to 0} \frac{0}{h} = 0
   \]
3. To find domain of function \( f(x) = \sin^{-1}\left( \frac{x^2}{2} \right) \)

For \( f(x) \) to be defined we should have, \(-1 \leq \log_2\left( \frac{x^2}{2} \right) \leq 1\)

**NOTE THIS STEP:**

\[
\Rightarrow 2^{-1} \leq \frac{x^2}{2} \leq 2^1 \Rightarrow 1 \leq x^2 \leq 4
\]

\[
\Rightarrow -2 \leq x \leq -1 \text{ or } 1 \leq x \leq 2
\]

\[
\Rightarrow x \in [-2, -1] \cup [1, 2]
\]

4. **Set** \( A \) has \( n \) distinct elements.

Then to define a function from \( A \) to \( A \), we need to associate each element of set \( A \) to any one the \( n \) elements of set \( A \). So total number of functions from set \( A \) to set \( A \) is equal to the number of ways of doing \( n \) jobs where each job can be done in \( n \) ways. The total number such ways is \( n \times n \times n \times \ldots \times n \) \((n \times n)\times n\) times.

**Hence the total number of functions from** \( A \) to \( A \) is \( n^n \).

Now for an onto function from \( A \) to \( A \), we need to associate each element of \( A \) to one and only one element of \( A \). So total number of onto functions from set \( A \) to \( A \) is equal to number of ways of arranging \( n \) elements in range (set \( A \)) keeping \( n \) elements fixed in domain (set \( A \)). \( n \) elements can be arranged in \( n! \) ways.

Hence, the total number of functions from \( A \) to \( A \) is \( n! \).

5. The given function is,

\[
f(x) = \sin\left( \ln\left( \frac{\sqrt{4-x^2}}{1-x} \right) \right)
\]

For \( \ln \) to be defined \( \frac{\sqrt{4-x^2}}{1-x} > 0 \Rightarrow 1-x > 0 \)

Also \( 4-x^2 > 0 \Rightarrow x < 1 \) and \( -2 < x < 2 \)

Combining these two inequalities, we get \( x \in (-2, 1) \)

\[
\Rightarrow \text{ Domain of } f(x) = (-2, 1)
\]

Also \( \sin \theta \) always lies in \([-1, 1]\).

\[
\Rightarrow \text{ Range of } f(x) = [-1, 1]
\]

**KEY CONCEPT**: Every linear function is either strictly increasing or strictly decreasing. If \( f(x) = ax + b \), \( D_f = \{p, q\} \), \( R_f = [m, n] \)

Then \( f(p) = m \) and \( f(q) = n \), if \( f(x) \) is strictly increasing and \( f(p) = m, f(q) = n \). If \( f(x) \) is strictly decreasing function.

Let \( f(x) = ax + b \) be the linear function which maps \([-1, 1]\) onto \([0, 2]\), then \( f(-1) = 0 \) and \( f(1) = 2 \)

\[
f(-1) = 2 \text{ and } f(1) = 0
\]

Depending upon \( f(x) \) is increasing or decreasing respectively.

\[
\Rightarrow -a + b = 0 \text{ and } a + b = 2 \quad \ldots (1)
\]

or \( -a + b = 2 \) and \( a + b = 0 \quad \ldots (2) \)

Solving (1), we get \( a = 1, b = 1 \).

Solving (2), we get \( a = -1, b = 1 \)

Thus there are only two functions i.e., \( x + 1 \) and \( -x + 1 \).

7. Given that \( f(x) = f\left(\frac{x+1}{x+2}\right) \) and \( f \) is an even function

\[
\Rightarrow f(x) = f(-x) = f\left(\frac{-x+1}{-x+2}\right)
\]

\[
\Rightarrow x = \frac{-x+1}{-x+2} \Rightarrow x^2 - 3x + 1 = 0 \Rightarrow x = \frac{3\pm\sqrt{5}}{2}
\]

Also \( f(x) = f\left(\frac{x+1}{x+2}\right) = f(-x) \)

\[
\Rightarrow x + 1 = x - x + 2 \Rightarrow x^2 - 3x + 1 = 0 \Rightarrow x = \frac{3\pm\sqrt{5}}{2}
\]

\[
\Rightarrow \text{ Four values of } x \text{ are}
\]

\[
\frac{3+\sqrt{5}}{2}, \frac{3-\sqrt{5}}{2}, -\frac{3+\sqrt{5}}{2}, -\frac{3-\sqrt{5}}{2}
\]

8. \( f(x) = \sin^2 x + \sin^2 \left( x + \frac{\pi}{3} \right) + \cos x \cos \left( x + \frac{\pi}{3} \right) \)

\[
\Rightarrow f(x) = \sin^2 x + \left[ \sin \left( x + \frac{\pi}{3} \right)^2 \right] + \cos x \cos \left( x + \frac{\pi}{3} \right)
\]

\[
\Rightarrow f(x) = \sin^2 x + \frac{1}{4} (\sin x + \sqrt{3} \cos x)^2
\]

\[
+ \frac{1}{2} \cos x (\cos x - \sqrt{3} \sin x)
\]

\[
= \frac{5}{4} \sin^2 x + \cos^2 x = \frac{5}{4}
\]

\[
\Rightarrow (gof) x = g[f(x)] = g(5/4) = 1
\]

**B. True/False**

1. \( f(x) = (a-x^a)^{1/n} \), \( a > 0 \), \( n \) is an even integer

\[
f[f(x)] = f[(a-x^a)^{1/n}] = [a-(a-x^a)^{1/n}]^{1/n} = x
\]

2. **KEY CONCEPT**: A function is one-one if it is strictly increasing or strictly decreasing, other wise it is many one.

\[
f(x) = \frac{x^2 + 4x + 30}{x^2 - 8x + 18} \Rightarrow f'(x) = \frac{-12[x^2 + 2x - 26]}{(x^2 - 8x + 18)^2}
\]

\[
\Rightarrow f'(x) = \frac{-12(x - 3\sqrt{3} + 1)(x + 3\sqrt{3} + 1)}{(x^2 - 8x + 18)^2}
\]

\[
\Rightarrow f(x) \text{ increases on } (-3\sqrt{3} - 1, 3\sqrt{3} - 1) \text{ and decreases otherwise.}
\]

\[
\Rightarrow f(x) \text{ is many one.}
\]

3. We know that sum of any two functions is defined only on the points where both \( f_1 \) as well as \( f_2 \) are defined that is \( f_1 + f_2 \) is defined on \( D_1 \cap D_2 \).

\[
\Rightarrow \text{ The given statement is false}
\]

C. MCQs with ONE Correct Answer

1. \( f(x) = x^2 \) is many one as \( f(1) = f(-1) = 1 \)

   Also \( f \) is into as \(-\text{ve real number have no pre-image.}

   \[
   \Rightarrow F \text{ is neither injective nor surjective.}
   \]
2. (b) \[ y = x^2 + (k - 1)x + 9 = \left( x + \frac{k + 1}{2} \right)^2 + 9 - \left( \frac{k - 1}{2} \right)^2 \]

For entire graph to be above x-axis, we should have
\[ 9 - \left( \frac{k - 1}{2} \right)^2 > 0 \]
\[ \Rightarrow k^2 - 2k - 35 < 0 \Rightarrow (k - 7)(k + 5) < 0 \]
\[ \text{i.e., } -5 < k < 7 \]

3. (d) \[ f(x) = |x - 1| = \begin{cases} -x + 1, & x < 1 \\ x - 1, & x \geq 1 \end{cases} \]

Consider \( f(x^2) = (f(x))^2 \)
If it is true it should be \( \forall x \)
\[ f(2) = 2 \Rightarrow LHS = f(2)^2 = 4 \text{ and RHS} = (f(2))^2 = 1 \]
\[ \therefore \text{ (a) is not correct} \]
Consider \( f(x + y) = f(x) + f(y) \)
Put \( x = 2, y = 5 \) we get
\[ f(7) = 6; f(2) + f(5) = 1 + 4 = 5 \]
\[ \therefore \text{ (b) is not correct} \]
Consider \( f(|x|) = f(x) \)
Put \( x = -5 \) then \( f(|-5|) = f(5) = 4 \)
\[ |f(-5)| = |5 - 1| = 6 \]
\[ \therefore \text{ (c) is not correct} \]
Hence (d) is the correct alternative.

4. (c) \[ |x - 1| + |x - 2| + |x - 3| \geq \]
Consider \( f(x) = |x - 1| + |x - 2| + |x - 3| \)
\[ f(x) = \begin{cases} 6 - 3x, & x < 1 \\ 4 - x, & 1 \leq x < 2 \\ x, & 2 \leq x < 3 \\ 3x - 6, & x \geq 3 \end{cases} \]

NOTE THIS STEP:

5. (d) \[ f(x) = \cos (\log x) \]
\[ \therefore f(x)f(y) = \frac{1}{2} \left( f(x) + f(y) \right) \]
\[ = \cos (\log x) \cos (\log y) - \frac{1}{2} \left[ \cos (\log x - \log y) + \cos (\log x + \log y) \right] \]

6. (c) \[ y = \frac{1}{\log_{10}(1-x)} + \sqrt{x + 2} \]
\[ y = f(x) + g(x) \]

NOTE THIS STEP: Then domain of given function is \( D_f \cap D_g \)

Now, for domain of \( f(x) = \frac{1}{\log_{10}(1-x)} \)
We know it is defined only when \( 1 - x > 0 \) and \( 1 - x \neq 1 \)
\[ \Rightarrow x < 1 \text{ and } x \neq 0 \]
\[ \therefore D_f = (-\infty, 1) - \{0\} \]
For domain of \( g(x) = \sqrt{x + 2} \)
\[ x + 2 \geq 0 \]
\[ \Rightarrow x \geq -2 \]
\[ \therefore D_g = [-2, \infty) \]

\[ \therefore \text{ Common domain is } (-\infty, 1) - \{0\} \]

7. (a) \[ f(x) = x - [x] = \begin{cases} x - 1, & 1 \leq x < 2 \\ x - 2, & 2 \leq x < 3 \\ x - 3, & 3 \leq x < 4 \\ \ldots \end{cases} \]

graph of function is

Clearly it is a periodic function with period 1.
\[ \therefore \text{ (a) is the correct alternative} \]

8. (d) We have \( f \circ g(x) = f(g(x)) = \sin (\ln |x|) \)
\[ \therefore R_1 = \{ u : -1 \leq u \leq 1 \} \]
\[ \therefore -\infty < \ln |\sin x| \leq 0 \]
\[ \therefore R_2 = \{ v : -\infty < v \leq 0 \} \]
Also \( g \circ f(x) = g(f(x)) = \ln |\sin x| \)
\[ \therefore 0 \leq |\sin x| \leq 1 \]
\[ \therefore -\infty < \ln |\sin x| \leq 0 \]
\[ \therefore R_2 = \{ v : -\infty < v \leq 0 \} \]

9. (c) \[ f(x) = f^{-1}(x) \Rightarrow fof(x) = x \]
\[ [(x + 1)^2 - 1 + 1]^2 - 1 = x \]
\[ \Rightarrow (x + 1)^4 = x + 1 \]
\[ \therefore x = 0 \text{ or } -1 \]
\[ \therefore \text{ Req. set is } \{0, -1\} \]
10. (c) \[ f(x) = |px - q| + r|/x| \]
\[
= \begin{cases} 
px + qr, & x \leq 0 \\
-px + qr, & 0 < x < q/p \\
px - qr, & q/p < x 
\end{cases}
\]
For \( r = p, f'(x) < 0 \) if \( x < 0 \)
= 0 if \( 0 < x < q/p \)
> 0 if \( x > q/p \)

From graph (i) infinite many points for min value of \( f(x) \)
for \( r < p, f'(x) < 0 \) if \( x \leq 0 \)
< 0 if \( 0 < x < q/p \)
> 0 if \( x > q/p \)

11. (d) \[ f(x) = \frac{x}{y} \rightarrow f(x)^2 - xy + 1 = 0 \]
\[
\Rightarrow x = \frac{y \pm \sqrt{y^2 - 4}}{2} 
\]
\[
\Rightarrow x = \frac{y + \sqrt{y^2 - 4}}{2} \quad (\because x \geq 1 \text{ and } y \geq 2) 
\]
\[ f^{-1}(x) = \frac{x + \sqrt{x^2 - 4}}{2} \]

NOTE THIS STEP:

12. (b) \[ f(x) = \frac{\alpha x}{x + 1}, x \neq -1 \]
\[ f(f(x)) = \frac{\alpha x}{x + 1} \]
\[ \Rightarrow \alpha(\frac{\alpha x}{x + 1} + 1) = x \Rightarrow \frac{\alpha^2 x}{(\alpha + 1)(x + 1)} = x \]
\[ \Rightarrow (\alpha + 1)x^2 + (1 - \alpha^2)x = 0 \]
\[ \Rightarrow \alpha + 1 = 0 \quad \text{and} \quad 1 - \alpha^2 = 0 \Rightarrow \alpha = -1 \]

13. (c) Let \( h(x) = |x| \) then \( g(x) = |f(x)| = h(f(x)) \)
Since composition of two continuous functions is continuous, therefore \( g \) is continuous if \( f \) is continuous.

14. (d) It is given that \( 2^x + 2^y = 2 \quad \forall x, y \in R \)
but \( 2^x, 2^y > 0 \quad \forall x, y \in R \)
Therefore, \( 2^x = 2 - 2^y \)
\[ \Rightarrow 0 < 2^x < 2 \Rightarrow x < 1 \]
Hence domain = \((-\infty, 1)\)

15. (b) \[ g(x) = 1 + x - [x] \]
\[ f(x) = \begin{cases} 
-1, & x < 0 \\
0, & x = 0 \\
1, & x > 0 
\end{cases} \]

For integral values of \( x, g(x) = 1 \)
For \( x < 0; \) (but not integral value) \( x - [x] > 0 \Rightarrow g(x) > 1 \)
For \( x > 0, \) (but not integral value) \( x - [x] > 0 \Rightarrow g(x) > 1 \)
\[ \therefore g(x) \geq 1, \forall x \quad \therefore f(g(x)) = 1, \forall x \]

16. (a) \[ f(x) = x + \frac{1}{x} = y \Rightarrow x^2 - yx + 1 = 0 \]
\[ \Rightarrow x = \frac{y \pm \sqrt{y^2 - 4}}{2} \]
\[ \Rightarrow x = \frac{y + \sqrt{y^2 - 4}}{2} \quad (\because x \geq 1 \text{ and } y \geq 2) 
\]
\[ \therefore f^{-1}(x) = \frac{x + \sqrt{x^2 - 4}}{2} \]

17. (d) For domain of \( f(x) = \frac{\log_2(x + 3)}{x^2 + 3x + 2} \)
\[ x^2 + 3x + 2 \neq 0 \text{ and } x + 3 > 0 \]
\[ \Rightarrow x \neq -1, -2 \text{ and } x > -3 \]
\[ \therefore D_f = (-\infty, -2) \cup (-2, \infty) \]

18. (a) From \( E \) to \( F \) we can define, in all, \( 2 \times 2 \times 2 \times 2 = 16 \) functions (2 options for each element of \( E \)) out of which 2 are into, when all the elements of \( E \) either map to 1 or to 2.
\[ \therefore \text{No. of onto functions} = 16 - 2 = 14 \]

19. (d) \[ f(x) = \frac{\alpha x}{x + 1}, x \neq -1 \]
\[ f(f(x)) = x \Rightarrow \frac{\alpha x}{x + 1} = x \Rightarrow \frac{\alpha^2 x}{(\alpha + 1)(x + 1)} = x \]
\[ \Rightarrow (\alpha + 1)x^2 + (1 - \alpha^2)x = 0 \]
\[ \Rightarrow \alpha + 1 = 0 \quad \text{and} \quad 1 - \alpha^2 = 0 \Rightarrow \alpha = -1 \]
20. (d) Given that $f(x) = (x + 1)^2, x \geq -1$
Now if $g(x)$ is the reflection of $f(x)$ in the line $y = x$ then it can be obtained by interchanging $x$ and $y$ in $f(x)$
i.e., $y = (x + 1)^2$ changes to $x = (y + 1)^2$
$\Rightarrow y + 1 = \sqrt{x}$
$\Rightarrow y + 1 \neq -\sqrt{x},$ since $y \geq -1$
as in figure.
$\Rightarrow y = \sqrt{x} - 1$ defined $\forall x \geq 0$

21. (a) Given that
$f(x) = 2x + \sin x, \ x \in R \Rightarrow f'(x) = 2 + \cos x$
But $-1 \leq \cos x \leq 1$
$\Rightarrow 1 \leq 2 + \cos x \leq 3 \Rightarrow 1 \leq 2 + \cos x \leq 3$
$\Rightarrow f'(x) > 0, \ \forall x \in R$
$\Rightarrow f(x)$ is strictly increasing and hence one-one
Also as $x \to \infty, f(x) \to \infty$ and $x \to -\infty, f(x) \to -\infty$
$\therefore$ Range of $f(x) = R = \text{domain of } f(x) \Rightarrow f(x)$ is onto.
Thus, $f(x)$ is one-one and onto.

22. (b) Given that $f: [0, \infty) \to [0, \infty)$
Such that $f(x) = \frac{x}{x + 1}$
Then $f'(x) = \frac{1 + x - x}{(1 + x)^2} = \frac{1}{(1 + x)^2} > 0 \forall x$
$\therefore f$ is an increasing function $\Rightarrow f$ is one-one.
Also, $D_f = [0, \infty)$
And for range let $\frac{x}{1 + x} = y \Rightarrow x = \frac{y}{1 - y}$
$x \geq 0 \Rightarrow 0 \leq y < 1$
$\therefore R_f = [0, 1) \neq \text{Co-domain}$
$\therefore f$ is not onto.

23. (a) For $f(x) = \sqrt{\sin^{-1}(2x) + \frac{\pi}{6}}$ to be defined and real
if $\sin^{-1}2x + \frac{\pi}{6} \geq 0$
$\Rightarrow \sin^{-1}2x \geq -\frac{\pi}{6}$ ... (1)
But we know that $-\frac{\pi}{2} \leq \sin^{-1}2x \leq \frac{\pi}{2}$
Combining (1) and (2), we get
$-\frac{\pi}{6} \leq \sin^{-1}2x \leq \frac{\pi}{6}$
$\Rightarrow \sin(-\pi/6) \leq 2x \leq \sin(\pi/2) \Rightarrow -1/2 \leq 2x \leq 1$
$\Rightarrow -1/4 \leq x \leq 1/2 \therefore D_f = \left[-\frac{1}{4}, \frac{1}{2}\right]$

24. (c) We have
$f(x) = \frac{x^2 + x + 2}{x^2 + x + 1} = \frac{(x^2 + x + 1) + 1}{x^2 + x + 1}$
$= 1 + \frac{1}{\left(x + \frac{1}{2}\right)^2 + \frac{3}{4}}$
$= 1 + \frac{1}{\left(x + \frac{1}{2}\right)^2 + \frac{3}{4}}$ is the min value of $f(x),$ i.e., $f_{\text{min}} = 1.$ Also $f(x)$ is max when
$\left(x + \frac{1}{2}\right)^2 + \frac{3}{4}$ is min which is so when $x = -\frac{1}{2}$
i.e. when $\left(x + \frac{1}{2}\right)^2 + \frac{3}{4} = \frac{3}{4}.$
$\therefore f_{\text{max}} = 1 + \frac{1}{\frac{3}{4}} = \frac{7}{3}$
$\therefore R_f = (1, 7/3]$}

25. (d) We have
$f(x) = x^2 + 2bx + 2c^2; g(x) = -x^2 - 2cx + b^2$
$\Rightarrow f(x) = (x + b)^2 + 2c^2 - b^2$
$\Rightarrow g(x) = -(x + c)^2 + b^2 + c^2$
$\Rightarrow f_{\text{max}} = 2c^2 - b^2$ and $g_{\text{max}} = b^2 + c^2$
For $f_{\text{min}} > g_{\text{max}} \Rightarrow 2c^2 - b^2 > b^2 + c^2$
$\Rightarrow c^2 > 2b^2 \Rightarrow |c| > |b| \sqrt{2}$

26. (b) $f(x) = \sin x + \cos x, g(x) = x^2 - 1$
$\Rightarrow g(f(x)) = (\sin x + \cos x)^2 - 1 = \sin 2x$
Clearly $g(f(x))$ is invertible in $-\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$
$[\therefore \sin 0 \text{ is invertible when } -\frac{\pi}{2} \leq x \leq \frac{\pi}{2}]
$\Rightarrow -\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$

27. (a) We are given that
$f: R \to R \text{ such that } f(x) = \begin{cases} 0, & x \in \text{rational} \\ x, & x \in \text{irrational} \end{cases}$
$g: R \to R \text{ such that } g(x) = \begin{cases} 0, & x \in \text{irrational} \\ x, & x \in \text{rational} \end{cases}$
$\therefore (f - g): R \to R \text{ such that }$
$(f - g)(x) = \begin{cases} -x, & x \in \text{rational} \\ x, & x \in \text{irrational} \end{cases}$
Since $f - g : R \to R$ for any $x$ there is only one value of $(f(x) - g(x))$ whether $x$ is rational or irrational. Moreover as $x \in R,$ $f(x) - g(x)$ also belongs to $R.$ Therefore, $(f - g)$ is one-one onto.
28. (d) Given that X and Y are two sets and \( f: X \rightarrow Y \).
\{ f(c) = y; c \in X, y \in Y \} and
\{ f^{-1}(d) = x; d \in Y, x \in X \}
The pictorial representation of given information is as shown:

Since \( f^{-1}(d) = x \Rightarrow f(x) = d \) Now if \( a \subset x \)
\( \Rightarrow f(a) \subset f(x) = d \Rightarrow f^{-1}[f(a)] = a \)
\( \therefore f^{-1}(f(a)) = a, a \subset x \) is the correct option.

29. (a) \( F(x) = \left( \frac{x}{2} \right)^2 + \left( \frac{g(x)}{2} \right)^2 \)
\( \Rightarrow F'(x) = 2f(x) \cdot f'(x) + 2g(x) \cdot g'(x) \cdot \frac{x}{2} \cdot \frac{1}{2} \)
\( = f(x) \cdot f'(x) + f(x) \cdot f'(x) \cdot f'(x) \cdot \frac{x}{2} \)
\[ \therefore g(x) = f'(x) \Rightarrow g'(x) = f''(x) \]
\( \Rightarrow f(x) \) is a constant function.
\( \therefore F(x) = F(5) = 5 \forall x \in R \Rightarrow F(10) = 5 \)

30. (a) Given \( f(x) = \frac{x}{(1+x^n)^{1/n}} \) for \( n \geq 2 \)
\( \therefore fof(x) = f[f(x)] = f \left( \frac{x}{(1+x^n)^{1/n}} \right) \)
\( = \frac{x}{(1+x^n)^{1/n}} \cdot \frac{1}{1+x^n} = \frac{x}{(1+x^n)^{1/n}} \cdot (1+x^n)^{1/n} \)
\( \therefore fofof(x) = \frac{x}{(1+3x^n)^{1/n}} \)
Proceeding in the similar manner, we get
\( g(x) = fofof \ldots \text{f}(x) = \frac{x}{(1+nx^n)^{1/n}} \)
\( (f \text{ occurs } n \text{ times}) \)

Now, \( \int x^{n-2} g(x) \, dx = \int \frac{x^{n-1}}{(1+nx^n)^{1/n}} \, dx \)
Let \( 1+nx^n = t \Rightarrow n^2 x^{n-1} \, dx = dt \)

31. (d) \( f(x) = e^{x^2} + e^{-x^2} \Rightarrow f'(x) = 2x(e^{x^2} - e^{-x^2}) \geq 0 \),
\( \forall x \in [0,1] \)
\( \therefore f(x) \) is an increasing function on \([0,1]\)
Hence \( f_{\text{max}} = f(1) = e + \frac{1}{e} = a \)
\( g(x) = xe^{x^2} + e^{-x^2} \)
\( \Rightarrow g'(x) = (2x^2 + 1)e^{x^2} - 2xe^{-x^2} \geq 0, \forall x \in [0,1] \)
\( \therefore g(x) \) is an increasing function on \([0,1]\)
\( \therefore g_{\text{max}} = g(1) = e + \frac{1}{e} = b \)
\( h(x) = x^2 e^{x^2} + e^{-x^2} \)
\( \Rightarrow h'(x) = 2x(e^{x^2} (1+x^2) - e^{-x^2}) \geq 0, \forall x \in [0,1] \)
\( \therefore h(x) \) is an increasing function on \([0,1]\)
\( \therefore h_{\text{max}} = h(1) = e + \frac{1}{e} = c \)
Hence \( a = b = c \).

32. (a) Given that \( f(x) = x^2 \) and \( g(x) = \sin x, \forall x \in R \)
Then \( (g\circ f)(x) = \sin x^2 \)
\( \Rightarrow (g\circ g\circ f)(x) = \sin (\sin x^2) \)
\( \Rightarrow (g\circ g\circ g)(x) = \sin^2 (\sin x^2) \)
As given that \( (g\circ g\circ g)(x) = (g\circ g)(x) \)
\( \Rightarrow \sin^2 (\sin x^2) = \sin (\sin x^2) \)
\( \Rightarrow \sin (\sin x^2) = 0, 1 \)
\( \Rightarrow \sin x^2 = n\pi \) or \( (4n+1)\frac{\pi}{2} \) where \( n \in Z \)
\( \Rightarrow \sin x^2 = 0 \therefore \sin x^2 \in [-1,1] \Rightarrow x^2 = n\pi \)
\( \Rightarrow x = \pm \sqrt{n\pi} \) where \( n \in W \)

33. (b) We have \( f(x) = 2x^3 - 15x^2 + 36x + 1 \)
\( \Rightarrow f'(x) = 6x^2 - 30x + 36 \)
\( = 6(x^2 - 5x + 6) \)
\( = 6(x-2)(x-3) \)
\( \therefore f'(x) > 0 \forall x \in [0,2] \) and \( f'(x) < 0 \forall x \in [2,3] \)
\( \therefore f(x) \) is increasing on \([0,2]\) and decreasing on \([2,3]\)
\( \therefore f(x) \) is many one on \([0,3]\)
Also \( f(0) = 1, f(2) = 29, f(3) = 28 \)
\( \therefore \) Global min = 1 and Global max = 29
i.e., Range of \( f = [1,29] \) is codomain
\( \therefore f \) is onto.
D. MCQs with ONE or MORE THAN ONE Correct

1. (a, d)

Given that \( f(x) = \frac{x + 2}{x - 1} \)

Let us check each option one by one.
(a) \( f(x) = \frac{x + 2}{x - 1} = y \Rightarrow x = f(y) \)
\( \therefore \) (a) is correct
(b) \( f(1) \neq 3 \) as function is not defined for \( x = 1 \)
\( \therefore \) (b) is not correct.
(c) \( f'(x) = \frac{x - 1 - x - 2}{(x - 1)^2} = \frac{-3}{(x - 1)^2} \)
\( \therefore \) (c) is correct.
(d) \( f(x) = \frac{x + 2}{x - 1} \), which is a rational function of \( x \).

5. (a)

Let us check each option one by one.
(a) \( f(x) = \sin^2 x \) and \( g(x) = \sqrt{x} \)

Now, \( f(g(x)) = f(\sqrt{x}) = \sin^2 \sqrt{x} = (\sin \sqrt{x})^2 \)
and \( g(f(x)) = g(\sin^2 x) = \sqrt{\sin^2 x} = |\sin x| \)
\( \therefore \) (a) is true.
(b) \( f(x) = \sin x, g(x) = x |x| \)
\( \therefore \) (b) is not true
(c) \( f(x) = x^2, g(x) = \sqrt{x} \)
\( \therefore \) (c) is false.
(d) \( f(x) = [g(x)] = f(\sqrt{x}) = \sin \sqrt{x} \)
\( \therefore \) (d) is correct.

6. (b, c)

As \((0, 0)\) and \((x, g(x))\) are two vertices of an equilateral triangle; therefore, length of the side of \( \Delta \) is
\[ = \sqrt{(x - 0)^2 + (g(x) - 0)^2} = \sqrt{x^2 + (g(x))^2} \]
\( \therefore \) The area of equilateral \( \Delta = \frac{\sqrt{3}}{4} (x^2 + (g(x))^2) \)

ATQ, this area \( = \frac{\sqrt{3}}{4} \)
\( \therefore \) We get \( \sqrt{3} = \frac{\sqrt{3}}{4} \)
\( \therefore (g(x))^2 = 1 - x^2 \Rightarrow g(x) = \pm \sqrt{1 - x^2} \)
\( \therefore \) (b, c) are the correct answers as (a) is not a function (\( \because \) image of \( x \) is not unique)

3. (a, c)

\( f(x) = \cos [\pi^2] x + \cos [-\pi^2] x \)
We know \( 9 < \pi^2 < 10 \) and \( -10 < -\pi^2 < -9 \)
\( \Rightarrow [\pi^2] = 9 \) and \([\pi^2] = -10 \)
\( \Rightarrow \) \( f(x) = \cos 9x + \cos (-10x) \)
\( f(x) = \cos 9x + \cos 10x \)
Let us check each option one by one.
(a) \( f\left(\frac{\pi}{2}\right) = \cos \frac{9\pi}{2} + \cos 5\pi = -1 \) (true)
(b) \( f(\pi) = \cos 9\pi + \cos 10\pi = -1 + 1 = 0 \) (false)
(c) \( f(-\pi) = \cos (-9\pi) + \cos (-10\pi) \)
\( = \cos 9\pi + \cos 10\pi = -1 + 1 = 0 \) (true)
(d) \( f\left(\frac{\pi}{4}\right) = \cos \frac{9\pi}{4} + \cos \frac{5\pi}{2} \)
\( = \cos \frac{9\pi}{4} + \cos \frac{5\pi}{2} = 0 + \frac{1}{\sqrt{2}} \) (false)

Thus (a) and (c) are the correct options.

4. (b)
\( f(x) = 3x - 5 \) (given), which is strictly increasing on \( R \), so \( f^{-1}(x) \) exists.
Let \( y = f(x) = 3x - 5 \)
\( \Rightarrow y + 5 = 3x \Rightarrow x = \frac{y + 5}{3} \) \( \ldots (1) \)
y = \( f(x) \) \( \Rightarrow x = f^{-1}(y) \) \( \ldots (2) \)

From (1) and (2),
\( f^{-1}(y) = \frac{y + 5}{3} = f^{-1}(x) = \frac{x + 5}{3} \)

7. (a, b)

Given \( f(\cos 4 \theta) = \frac{2}{2 - \sec^2 \theta} = \frac{2 \cos^2 \theta}{2 \cos^2 \theta - 1} \)
\( = \frac{1 - \cos 2\theta}{\cos 2\theta} = 1 + \frac{1}{\cos 2\theta} \)
\( \therefore f'(b) = \frac{1}{b^2 - 1} \) and \( f'(0) = b^2 - 1 \Rightarrow f'(b) = \frac{1}{f'(0)} \)

Hence a and b are the correct options.

8. (a)

Let \( \cos 4 \theta = \frac{1}{3} \Rightarrow 2 \cos^2 2\theta - 1 = \frac{1}{3} \Rightarrow \cos 2\theta = \pm \frac{\sqrt{2}}{3} \)
\( \therefore f(\cos 4 \theta) = 1 + \frac{\sqrt{3}}{2} \) or \( f\left(\frac{1}{3}\right) = 1 + \frac{\sqrt{3}}{2} \)
8. (a, b) For \( f(x) = 2|x| + |x + 2| - |x + 2| - 2|x| \) the critical points can be obtained by solving \( |x| = 0, |x + 2| = 0 \) and \( |x + 2| - 2|x| = 0 \) we get \( x = 0, -2, 2, \frac{-2}{3} \). 

Then we can write

\[
\begin{align*}
  f(x) & = \begin{cases} 
  -2x - 4, & x \leq -2 \\
  2x + 4, & -2 < x \leq -\frac{2}{3} \\
  -4x, & -\frac{2}{3} < x \leq 0 \\
  4x, & 0 < x \leq 2 \\
  2x + 4, & x > 2 
  \end{cases}
\end{align*}
\]

The graph of \( y = f(x) \) is as follows

From graph \( f(x) \) has local minimum at \(-2\) and \(0\) and local maximum at \(-\frac{2}{3}\).

9. (a, b, c) \( f: \left[ -\frac{\pi}{2}, \frac{\pi}{2} \right] \rightarrow R \)

\[
f(x) = \left[ \log(\sec x + \tan x) \right]^3
\]

\[
f(-x) = \left[ \log\left(\frac{1}{\sec x + \tan x}\right) \right]^3
\]

\[
= \left[ \log\left(\frac{1}{\sec x + \tan x}\right) \right]^3 = \left[ -\log(\sec x + \tan x) \right]^3
\]

\[
= -3[\log(\sec x + \tan x)]^2 - \frac{\sec x \tan x + \sec^2 x}{\sec x + \tan x}
\]

\[
= 3\sec x \left[ \log(\sec x + \tan x) \right]^2 > 0 \quad \forall x \in \left( -\frac{\pi}{2}, \frac{\pi}{2} \right)
\]

\[
\therefore f \text{ is increasing on } \left( -\frac{\pi}{2}, \frac{\pi}{2} \right)
\]

10. (b, d) \( f(x) = x^5 - 5x + a \)

\[
f(x) = 0 \Rightarrow x^5 - 5x + a = 0 \Rightarrow a = 5x - x^5 = g(x)
\]

\[
\Rightarrow g(x) = 0 \quad \text{when } x = 0, \quad 5^{1/4} - 5^{1/4}
\]

and \( g'(x) = 0 \Rightarrow x = 1, -1 \)

Also \( g(-1) = -4 \) and \( g(1) = 4 \)

\[
\therefore \text{ graph of } g(x) \text{ will be as shown below.}
\]

From graph

11. (a, b, c) \( f(x) = \sin\left(\frac{\pi}{6} \sin\left(\frac{\pi}{2} \sin x\right)\right) \)

\[
-1 \leq \sin x \leq 1 \Rightarrow -\frac{\pi}{2} \leq \frac{\pi}{2} \sin x \leq \frac{\pi}{2}
\]

\[
\Rightarrow -\frac{\pi}{2} \leq \sin\left(\frac{\pi}{2} \sin x\right) \leq \frac{\pi}{2}
\]

\[
\Rightarrow -\frac{\pi}{6} \leq \sin\left(\frac{\pi}{6} \sin\left(\frac{\pi}{2} \sin x\right)\right) \leq \frac{\pi}{6}
\]

\[
\therefore \text{ Range of } f = \left[ -\frac{\pi}{6}, \frac{\pi}{6} \right]
\]

\[
\text{ fog(x) } = \sin\left(\frac{\pi}{6} \sin\left(\frac{\pi}{2} \sin\left(\frac{\pi}{2} \sin x\right)\right)\right)
\]
E. Subjective Problems

1. Since \( f(x) \) is defined and real for all real values of \( x \), therefore domain of \( f \) is \( R \).

   Also \( \frac{x^2}{1+x^2} \geq 0 \), for all \( x \in R \)

   and \( \frac{x^2}{1+x^2} < 1 \) (\( x^2 < 1 + x^2 \)) for all \( x \in R \)

   :\( 0 \leq \frac{x^2}{1+x^2} < 1 \Rightarrow 0 \leq f(x) \Rightarrow \) Range of \( f = [0, 1) \)

   Also since \( f(1) = f(-1) = 1/2 \)

   :\( f \) is not one-to-one.

2. \( y = |x|^{1/2}, -1 \leq x \leq 1 \)

\( \Rightarrow y = -\sqrt{-x} \) if \(-1 \leq x \leq 0, y = \sqrt{x} \) if \(0 \leq x \leq 1 \)

\( y^2 = -x \) if \(-1 \leq x \leq 0 \) and \( y^2 = x \) if \(0 \leq x \leq 1 \)

[Here \( y \) should be taken always +ve, as by definition \( y \) is a +ve square root.]

Clearly \( y^2 = -x \) represents upper half of left handed parabola (upper half as \( y \) is +ve)

and \( y^2 = x \) represents upper half of right handed parabola.

Therefore the resulting graph is as shown below:

3. \( f(x) = x^2 - 6x^2 - 2x^2 + 12x^6 + x^4 - 7x^3 + 6x^2 + x - 3 \)

   Then \( f(6) = 6^9 - 6 \times 6^8 - 2 \times 6^7 + 12 \times 6^6 + 6^4 - 7 \times 6^3 + 6 \times 6^2 + 6 - 3 \)

   \[= 6^9 - 6^8 - 2 \times 6^7 + 12 \times 6^6 - 7 \times 6^3 + 6 \times 6^2 + 6 - 3 = 3 \]

4. \( R = \{(x, y) : x \in R, y \in R, x^2 + y^2 \leq 25\} \) which represents all the points inside and on the circle \( x^2 + y^2 = 25 \), with centre \((0, 0)\) and radius = 5

\[ R' = \{(x, y) : x \in R, y \in R, y \geq \frac{4-x^2}{9}\} \]

which represents all the points inside and on the upward parabola \( x^2 \leq \frac{9}{4} y \).

Thus \( R \cap R' = \) The set of all points in shaded region.

For domain of \( R \cap R' \):

\( x^2 + y^2 \leq 25 \)

\( \Rightarrow x^2 \leq 25 - y^2 \) \( \ldots(1) \)

and \( y \geq \frac{4-x^2}{9} \Rightarrow \frac{16x^4}{81} \leq y^2 \Rightarrow \frac{16x^4}{81} \geq -y^2 \)

\( \Rightarrow \frac{25-16x^4}{81} \geq 25 - y^2 \) \( \ldots(2) \)

.: Combining (1) and (2) \( x^2 \leq 25 - \frac{16x^4}{81} \)

\( \Rightarrow 16x^4 + 81x^2 - 2025 \leq 0 \)

.: Domain of \( R \cap R' = \{x : x \in R, 16x^4 + 81x^2 - 2025 \leq 0\} \) and range of \( R \cap R' = \{y : y \in R, y \geq \frac{4x^4}{9}, 16x^4 + 81x^2 - 2025 \leq 0\} \)

\( R \cap R' \) is not a function because image of an element is not unique, e.g., \((0, 1), (0, 2), (0, 3) \ldots \in R \cap R' \).

5. As there is an injective mapping from \( A \) to \( B \), each element of \( A \) has unique image in \( B \). Similarly as there is an injective mapping from \( B \) to \( A \), each element of \( B \) has unique image in \( A \). So we can conclude that each element of \( A \) has unique image in \( B \) and each element of \( B \) has unique image in \( A \) or in other words there is one to one mapping from \( A \) to \( B \). Thus there is bijective mapping from \( A \) to \( B \).

6. \( f \) is one one function,

\( D = \{x, y, z\} \); \( R = \{1, 2, 3\} \)

Exactly one of the following is true:

\( f(x) = 1, f(y) \neq 1, f(z) \neq 2 \)

To determine \( f^{-1} (1) \):

Case I: \( f(x) = 1 \) is true.

\( \Rightarrow f(y) \neq 1, f(z) \neq 2 \) are false.

\( \Rightarrow f(y) = 1, f(z) = 2 \) are true.

But \( f(x) = 1, f(y) = 1 \) are true, is not possible as \( f \) is one to one.
7. Since \( |f(x) - f(y)| \leq |x - y|^2 \) is true \( \forall x, y \in R \)

We have for \( x \neq y \),

\[
\lim_{y \to x} \left| \frac{f(x) - f(y)}{x - y} \right| \leq \lim_{y \to x} |x - y|^2
\]

\[
\Rightarrow \lim_{y \to x} \left| \frac{f(x) - f(y)}{x - y} \right| \leq 0
\]

\[
\Rightarrow |f'(x)| \leq 0 \Rightarrow f'(x) = 0
\]

\( f'(x) \) is a constant function. Hence Proved.

8. Given that \( f(x + y) = f(x)f(y) \) \( \forall x, y \in N \) and \( f(1) = 2 \)

To find ‘a’ such that,

\[
\sum_{k=1}^{n} f(a + k) = 16(2^n - 1)
\]

... (1)

For this we start with

\[
f(1) = 2
\]

... (2)

Then \( f(2) = f(1 + 1) = f(1)f(1) = f(2) = 2^2 \) (using (2))

Similarly we get, \( f(3) = 2^3, \)

\( f(4) = 2^4, \ldots, f(n) = 2^n \)

Now eq. (1) can be written as

\[
f(a + 1) + f(a + 2) + f(a + 3) + \ldots + f(a + n) = 16(2^n - 1)
\]

\[
\Rightarrow f(a)f(1) + f(a)f(2) + f(a)f(3) + \ldots + f(a)f(n)
\]

\[
= f(a)\left[ \frac{2(2^n - 1)}{2 - 1} \right] = 16(2^n - 1)
\]

\[
\Rightarrow f(a) = 8 = 2^3 = f(3) \Rightarrow a = 3
\]

9. Given that \( 4 \{x\} = x + \lfloor x \rfloor \)

Where \( \lfloor x \rfloor \) = greatest integer \( \leq x \)

\( \{x\} = \text{fractional part of } x \)

\( \Rightarrow x = \lfloor x \rfloor + \{x\} \) for any \( x \in R \)

\( \Rightarrow \) Given eq. above becomes

\[
4 \{x\} = \lfloor x \rfloor + \{x\} + \lfloor x \rfloor \Rightarrow 3 \{x\} = 2 \lfloor x \rfloor
\]

\[
\Rightarrow \{x\} = \frac{3}{2} \lfloor x \rfloor
\]

... (1)

Now \( -1 < \{x\} < 1 \)

\[
\Rightarrow -\frac{3}{2} < \{x\} < \frac{3}{2}
\]

[Using eqn (1)]

\[
\Rightarrow -\frac{3}{2} < [x] < \frac{3}{2}
\]

\[
\Rightarrow [x] = -1, 0, 1
\]

If \( [x] = -1 \)

\[
\Rightarrow -1 = \frac{3}{2} \{x\}
\]

[Using eqn (1)]

\[
\Rightarrow \{x\} = -\frac{2}{3}
\]

\( \therefore \)

\[
\Rightarrow \{x\} = \frac{2}{3}
\]

[Using eqn (2)]

\( \Rightarrow x = -1 + (-2/3) = -5/3 \)

If\( \{x\} = 0 \)

\[
\Rightarrow \frac{3}{2} \{x\} = 0
\]

[Using eqn (1)]

\[
\Rightarrow \{x\} = 0
\]

\( \therefore \)

\[
\Rightarrow x = 0 + 0 = 0
\]

If \( [x] = 1 \)

\[
\Rightarrow \frac{3}{2} \{x\} = 1
\]

[Using eqn (1)]

\[
\Rightarrow \{x\} = 2/3 \Rightarrow x = 1 + 2/3 = 5/3
\]

Thus, \( x = 5/3, 0, 5/3 \)

10. Let us put \( y = \frac{\alpha x^2 + 6x - 8}{\alpha + 6x - 8x^2} \)

\( \Rightarrow (\alpha + 6x - 8x^2)y = \alpha x^2 + 6x - 8 \)

\( \Rightarrow (\alpha + 8y)x^2 + 6(1 - y)x - (8 + \alpha y) = 0 \)

Since \( x \) is real, \( D \geq 0 \)

\[
36(1 - y)^2 + 4(\alpha + 8y)(8 + \alpha y) \geq 0
\]

\[
9(1 - 2y + y^2) + [8\alpha + (64 + \alpha^2)y + 8\alpha y^2] \geq 0
\]

\[
y^2(9 + 8\alpha) + y(46 + \alpha^2) + (9 + 8\alpha) \geq 0
\]

... (1)

For (1) to hold for each \( y \in R, 9 + 8\alpha > 0 \)

and \( (46 + \alpha^2)^2 - 4(9 + 8\alpha)^2 \leq 0 \Rightarrow \alpha > -9/8 \)

and \([46 + \alpha^2 - 2(9 + 8\alpha)][46 + \alpha^2 + 2(9 + 8\alpha)] \leq 0 \Rightarrow \alpha > -9/8 \)

and \((\alpha^2 - 16\alpha + 28)(\alpha^2 + 16\alpha + 64) \leq 0 \Rightarrow \alpha > -9/8 \)

and \((\alpha - 2)(\alpha - 14) \leq 0 \) \( \therefore (\alpha + 8)^2 \geq 0 \)

\( \Rightarrow \alpha > -9/8 \) and \( -13 \leq \alpha \leq 14 \) \( \Rightarrow 2 \leq \alpha \leq 14 \)

Thus, \( f(x) = \frac{\alpha x^2 + 6x - 8}{\alpha + 6x - 8x^2} \) will be onto if \( 2 \leq \alpha \leq 14 \).

When \( \alpha = 3 \)

\[
f(x) = \frac{3x^2 + 6x - 8}{3 + 6x - 8x^2}
\]

In this case \( f(x) = 0 \) implies, \( 3x^2 + 6x - 8 = 0 \)
\[ x = \frac{-6 \pm \sqrt{36 + 96}}{6} = \frac{-6 \pm \sqrt{132}}{6} = \frac{-6 \pm 2\sqrt{33}}{6} \]
\[ = \frac{1}{3} (-3 \pm \sqrt{33}) \]

This shows that

\[ f \left[ \frac{1}{3} (-3 + \sqrt{33}) \right] = f \left[ \frac{1}{3} (-3 - \sqrt{33}) \right] = 0 \]

Therefore, \( f \) is not one-to-one at \( \alpha = 3 \).

11. Suppose \( f(x) = Ax^2 + Bx + C \) is an integer whenever \( x \) is an integer.

\[ \therefore f(0), f(1), f(-1) \] are integers

\[ \Rightarrow C, A + B + C, A - B + C \] are integers.

\[ \Rightarrow C, A + B, A - B \] are integers

\[ \Rightarrow C, A + B, (A + B) + (A - B) = 2A \] are integers.

Conversely suppose \( 2A, A + B \) and \( C \) are integers.

Let \( x \) be any integer.

We have

\[ f(x) = Ax^2 + Bx + C \]

\[ = 2A \left[ \frac{x(x-1)}{2} \right] + (A + B)x + C \]

Since \( x \) is an integer, \( x(x-1)/2 \) is an integer.

Also \( 2A, A + B \) and \( C \) are integers.

We get \( f(x) \) is an integer for all integer \( x \).

F. Match the Following

1. (A) \( f(x) = 1 + 2x, D_f = (-\pi/2, \pi/2) \)
   The given function represents a straight line so it is one one.

   But \( f_{\min} = 1 - \pi = f \left( -\frac{\pi}{2} \right), f_{\max} = 1 + \pi = f \left( \frac{\pi}{2} \right) \)

   \[ \therefore \text{Range} f = (1 - \pi, 1 + \pi) \subseteq (-\infty, \infty) \]

   \[ \therefore f \text{ is not onto. Hence (A) \rightarrow (q)} \]

   (B) \( f(x) = \tan x \)
   It is an increasing function on \( (-\pi/2, \pi/2) \) and its range
   \( = (-\infty, \infty) = \text{co-domain of } f \).

   \[ \therefore f \text{ is one one onto.} \]

   \[ \therefore (B) \rightarrow r \]

2. We have \( f(x) = \frac{x^2 - 6x + 5}{x^2 - 5x + 6} = \frac{(x - 5)(x - 1)}{(x - 2)(x - 3)} \)

   \[ (A) \text{ If } -1 < x < 1 \text{ then } f(x) = \frac{(-ve)(-ve)}{(-ve)(-ve)} = +ve \]

   \[ \therefore f(x) > 0 \text{ (r)} \]

   Also \( f(x) - 1 = \frac{-x - 1}{x^2 - 5x + 6} = -\frac{(x + 1)}{(x - 2)(x - 3)} \)

   For \(-1 < x < 1, f(x) - 1 = \frac{-(+ve)}{(-ve)(-ve)} = -ve \)

   \[ \Rightarrow f(x) - 1 < 0 \Rightarrow f(x) < 1 \text{ (s)} \]

   \[ \therefore 0 < f(x) < 1 \text{ (p)} \]

(B) If \(-1 < x < 2 \text{ then } f(x) = \frac{(-ve)(+ve)}{(-ve)(-ve)} = -ve \)

\[ \therefore f(x) < 0 \text{ (q) and so } f(x) < 1 \text{ (s)} \]

(C) If \(3 < x < 5 \text{ then } f(x) = \frac{(-ve)(+ve)}{(+ve)(+ve)} = -ve \)

\[ \therefore f(x) < 0 \text{ (q) and so } f(x) < 1 \text{ (s)} \]

(D) For \(x > 5, f(x) > 0 \text{ (r)} \)

Also \( f(x) - 1 = -\frac{(x + 1)}{(x - 2)(x - 3)} < 0 \)

For \(x > 5, f(x) < 1 \text{ (s)} \)

\[ \therefore 0 < f(x) < 1 \text{ (p)} \]

I. Integer Value Correct Type

1. \( (3) \)

We have \( f : [0, 4\pi] \rightarrow [0, \pi] \)

\[ f(x) = \cos^{-1} (\cos x) \]

and \( g(x) = \frac{10 - x}{10} = 1 - \frac{x}{10} \)

The graph of \( y = f(x) \) and \( y = g(x) \) are as follows.

Clearly \( f(x) = g(x) \) has 3 solutions.
1. (a) \( f(x) = \sin^{-1}\left( \log_3 \frac{x}{3} \right) \) exists

if \(-1 \leq \log_3 \frac{x}{3} \leq 1 \Rightarrow 3^{-1} \leq \frac{x}{3} \leq 3^1 \)

\[ \Rightarrow 1 \leq x \leq 9 \text{ or } x \in [1, 9] \]

2. (c) \( f(x) = \log(x + \sqrt{x^2 + 1}) \)

\( f(-x) = \log\left(-x + \sqrt{x^2 + 1}\right) = \log\left(\frac{-x^2 + x^2 + 1}{x + \sqrt{x^2 + 1}}\right) \)

\[ = -\log(x + \sqrt{x^2 + 1}) = -f(x) \]

\( \Rightarrow f(x) \) is an odd function.

3. (a) \( f(x) = \frac{3}{4-x^2} + \log_{10}(x^3 - x) \)

\( 4 - x^2 \neq 0; x^3 - x > 0; \)

\( x \neq \pm\sqrt{4} \) and \(-1 < x < 0 \text{ or } 1 < x < \infty \)

- \( -1 \quad 0 \quad 1 \quad + \)

\[ \therefore D = (-1, 0) \cup (1, \infty) - \{\sqrt{4}\} \]

\( D = (-1, 0) \cup (1, 2) \cup (2, \infty). \)

4. (a) \( f(x + y) = f(x) + f(y) \).

Function should be \( f(x) = mx \)

\( f(1) = 7; \therefore m = 7, f(x) = 7x \)

\[ \sum_{r=1}^{n} f(r) = 7 \sum_{r=1}^{n} r = \frac{7n(n+1)}{2} \]

5. (d) We have \( f: N \rightarrow I \)

If \( x \) and \( y \) are two even natural numbers,

then \( f(x) = f(y) \Rightarrow \frac{x}{2} = \frac{y}{2} \Rightarrow x = y \)

Again if \( x \) and \( y \) are two odd natural numbers then

\( f(x) = f(y) \Rightarrow \frac{x-1}{2} = \frac{y-1}{2} \Rightarrow x = y \)

\( \therefore f \) is onto.

Also each negative integer is an image of even natural number and each positive integer is an image of odd natural number.

\( \therefore f \) is onto.

Hence \( f \) is one one and onto both.

6. (d) \( 7^{-x} P_{x-3} \) is defined if

\( 7 - x \geq 0, x - 3 \geq 0 \text{ and } 7 - x \geq x - 3 \)

\[ \Rightarrow 3 \leq x \leq 5 \text{ and } x \in I \]

\( \therefore x = 3, 4, 5 \)

\( \therefore f(3) = 7^{-3} P_{3-3} = 4 \quad P_0 = 1 \)

\( \therefore f(4) = 7^{-4} P_{4-3} = 3 \quad P_1 = 3 \)

\( \therefore f(5) = 7^{-5} P_{5-3} = 2 \quad P_2 = 2 \)

Hence range = \( \{1, 2, 3\} \)

7. (a) \( f(x) \) is onto \( \therefore S = \text{range of } f(x) \)

Now \( f(x) = \sin x - \sqrt{3} \cos x + 1 = 2 \sin \left(x - \frac{\pi}{3}\right) + 1 \)

\[ \therefore -1 \leq \sin \left(x - \frac{\pi}{3}\right) \leq 1 \]

\[ -1 \leq 2 \sin \left(x - \frac{\pi}{3}\right) + 1 \leq 3 \]

\( \therefore f(x) \in [-1, 3] = S \)

8. (b) Let us consider a graph symm. with respect to line \( x = 2 \) as shown in the figure.
Functions

From the figure
\[ f(x_1) = f(x_2) , \text{ where } x_1 = 2 - x \text{ and } x_2 = 2 + x \]
\[ \therefore f(2 - x) = f(2 + x) \]

9. (b) \( f(x) = \frac{\sin^{-1}(x - 3)}{\sqrt{9 - x^2}} \) is defined

if (i) \(-1 \leq x - 3 \leq 1 \Rightarrow 2 \leq x \leq 4 \)

and (ii) \( 9 - x^2 > 0 \Rightarrow -3 < x < 3 \)

Taking common solution of (i) and (ii),

we get \( 2 \leq x < 3 \) \( \therefore \) Domain = \( [2, 3) \)

10. (d) Given \( f(x) = \tan^{-1}\left( \frac{2x}{1-x^2} \right) = 2\tan^{-1}x \) for \( x \in (-1, 1) \)

If \( x \in (-1, 1) \Rightarrow \tan^{-1}x \in \left( -\frac{\pi}{4}, \frac{\pi}{4} \right) \)

\[ \Rightarrow 2\tan^{-1}x \in \left( -\frac{\pi}{2}, \frac{\pi}{2} \right) \]

Clearly, range of \( f(x) = \left( -\frac{\pi}{2}, \frac{\pi}{2} \right) \)

For \( f \) to be onto, codomain = range

\[ \therefore \text{Co-domain of function} = B = \left( -\frac{\pi}{2}, \frac{\pi}{2} \right) \]

11. (c) Clearly function \( f(x) = 3x^2 - 2x + 1 \) is increasing when \( f'(x) = 6x - 2 \geq 0 \Rightarrow x \in [1/3, \infty) \)

\[ \therefore f(x) \] is incorrectly matched with \( \left( -\infty, \frac{1}{3} \right) \)

12. (a) \( f(2a - x) = f(a - (x - a)) \)

\[ = f(a)f(x - a) - f(0)f(x) = f(a)f(x) - f(x) \]

\[ = -f(x) \]

\[ \therefore x = 0, y = 0, \ f(0) = f^2(0) - f^2(a) \]

\[ \Rightarrow f^2(a) = 0 \Rightarrow f(a) = 0 \]

\[ \Rightarrow f(2a - x) = -f(x) \]

13. (b) \( f(x) = 4x^2 + \cos^{-1}\left( \frac{x}{2} - 1 \right) + \log(\cos x) \)

\( f(x) \) is defined if \(-1 \leq \left( \frac{x}{2} - 1 \right) \leq 1 \) and \( \cos x > 0 \)

or \( 0 \leq \frac{x}{2} \leq 2 \) and \( -\frac{\pi}{2} < x < \frac{\pi}{2} \)

or \( 0 \leq x \leq 4 \) and \(-\frac{\pi}{2} < x < \frac{\pi}{2} \)

\[ \therefore x \in \left[ 0, \frac{\pi}{2} \right) \]

14. (d) Clearly \( f \) is one one and onto, so invertible

Also \( f(x) = 4x + 3 = y \Rightarrow x = \frac{y - 3}{4} \)

\[ \therefore g(y) = \frac{y - 3}{4} \]

15. (b) Given that \( f(x) = (x + 1)^2 - 1, \ x \geq -1 \)

Clearly \( D_f = [-\infty, \infty) \) but co-domain is not given. Therefore \( f(x) \) need not be necessarily onto.

But if \( f(x) \) is onto then as \( f(x) \) is one one also, \( (x + 1) \)

being something \( +ve, f^{-1}(x) \) will exist where \( (x + 1)^2 - 1 = y \)

\[ \Rightarrow x + 1 = \sqrt{y + 1} \quad (+ve \text{ square root as } x + 1 \geq 0) \]

\[ \Rightarrow x = -1 + \sqrt{y + 1} \Rightarrow f^{-1}(x) = \sqrt{x + 1} - 1 \]

Then \( f(x) = f^{-1}(x) \Rightarrow (x + 1)^2 - 1 = \sqrt{x + 1} - 1 \)

\[ \Rightarrow (x + 1)^2 = \sqrt{x + 1} \Rightarrow (x + 1)^4 = (x + 1) \]

\[ \Rightarrow (x + 1) \left( (x + 1)^3 - 1 \right) = 0 \Rightarrow x = -1, 0 \]

\( \therefore \) The statement-1 is correct but statement-2 is false.

16. (b) Given that \( f(x) = x^3 + 5x + 1 \)

\[ \therefore f'(x) = 3x^2 + 5 > 0, \ \forall x \in R \]

\[ \Rightarrow f(x) \text{ is strictly increasing on } R \]

\[ \Rightarrow f(x) \text{ is one one} \]

\( \therefore \) Being a polynomial \( f(x) \) is cont. and inc.

on \( R \) with \( \lim_{x \to -\infty} f(x) = -\infty \)

and \( \lim_{x \to \infty} f(x) = \infty \)

\[ \therefore \text{Range of } f = (-\infty, \infty) = R \]

Hence \( f \) is onto also. So, \( f \) is one one and onto \( R \).

17. (b) \( f(x) = \frac{1}{\sqrt{|x| - x}} \), define if \( |x| - x > 0 \)

\[ \Rightarrow |x| > x, \Rightarrow x < 0 \]

Hence domain of \( f(x) \) is \( (-\infty, 0) \)
Limits, Continuity and Differentiability

JEE Advanced/ IIT-JEE

A. Fill in the Blanks

1. Given \( f(x) = \begin{cases} (x-1)^2 \sin \frac{1}{x-1} & |x|, x \neq 1 \\ -1 & x = 1 \end{cases} \)

We know that \(|x|\) is not differentiable at \(x = 0\)

\[ (x-1)^2 \sin \frac{1}{x-1} - |x| \text{ is not differentiable at } x = 0. \]

At all other values of \(x\), \(f(x)\) is differentiable.

\[ \therefore \text{ The req. set of points is } \{0\}. \]

2. It will be continuous at \(x = 2\) if

\[ \lim_{x \to 2} f(x) = f(2) \Rightarrow \lim_{x \to 2} \frac{x^3 + x^2 - 16x + 20}{(x-2)^2} = k \]

\[ \Rightarrow k = \lim_{x \to 2} \frac{(x-2)^2(x+5)}{(x-2)^2} = \lim_{x \to 2} (x+5) = 7 \]

\[ \therefore k = 7 \]

3. \( f(x) = \sqrt{4-x^2} , -2 \leq x \leq 0 = -\sqrt{4-x^2} , 0 \leq x \leq 2 \)

By choosing any arcs of circle \(x^2 - y^2 = 4\), we can define a discontinuous function, one of which is

\[ f(x) = \begin{cases} \sqrt{4-x^2} & -2 \leq x \leq 0 \\ -\sqrt{4-x^2} & 0 \leq x \leq 2 \end{cases} \]

4. KEY CONCEPT

(L' Hospital rule)

\[ \lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f'(x)}{g'(x)} \]

if \( \frac{f(a)}{g(a)} \) is of the form \(0\) or \(-\infty\) or \(0 \times \infty\).

\[ \lim_{x \to 1} \frac{\pi x}{\cot(\pi x/2)} = \lim_{x \to 1} \frac{1-x}{\csc(\pi x/2)} \]

[form \(0 \times \infty\)]

\[ = \lim_{x \to 1} \frac{-1}{\csc(\pi x/2)} \]

[Applying L' Hospital's rule]

\[ = \frac{2}{\pi} \]

5. Given that,

\[ f(x) = \sin x, x \neq \pi, n = 0, \pm 1, \pm 2, \ldots = 2, \text{ otherwise} \]

And \( g(x) = x^2 + 1, x \neq 0 \)

\[ = 4, x = 0 = 5, \quad x = 2 \]

Then \( \lim_{x \to 0} g(f(x)) = \lim_{x \to 0} g(|x|) \Rightarrow \lim_{x \to 0} \frac{x^2 + 1}{1+|x|} = 1 \)

\[ \lim_{x \to \infty} \frac{x^4 \sin \left( \frac{1}{x} + \frac{1}{x^2} \right)}{(1 + |x|^3)} \]

6. \( \text{ Let } L = \lim_{x \to \infty} \frac{x^3}{1+|x|^3} \left[ x \sin \left( \frac{1}{x} + \frac{1}{x^3} \right) \right] \)

\[ = \lim_{x \to \infty} \frac{x^3}{|x|^3} \left[ \frac{1}{1+\frac{1}{|x|^3}} \right] x \sin \left( \frac{1}{x} + \frac{1}{x^3} \right) \]

\[ = \lim_{x \to \infty} \frac{x^3}{|x|^3} = 1 = \lim_{x \to \infty} \frac{x^3}{|x|^3} = -1 \]

7. \( \text{ Given that } f(9) = 9, f'(9) = 4 \)

Then,

\[ \lim_{x \to 9} \frac{f(x)-3}{\sqrt{x}-3} = \lim_{x \to 9} \frac{f(x)-3}{\sqrt{x}-3} = \lim_{x \to 9} \frac{f(x)-3}{\sqrt{x}+3} \]

\[ \lim_{x \to 9} \frac{f(x)+3}{\sqrt{x}+3} = \lim_{x \to 9} \frac{f(x)-9}{x-9} \left[ \frac{3+3}{3+3} \right] \]

\[ \lim_{x \to 9} \frac{f(x)-f(9)}{x-9} = f'(9) = 4 \]

8. In \( \Delta ABC, AB = AC \)

(\( D \) is mid pt of \( BC \))

Let \( r \) = radius of circumcircle

\[ \therefore OA = OB = OC = r \]

Now \( BD = \sqrt{BO^2 - OD^2} = \sqrt{r^2 - (h-r)^2} \)

\[ = \sqrt{2rh - h^2} \]

\[ \therefore BC = 2\sqrt{2rh - h^2} \]
Clearly RHL ≠ LHL. Hence the given function is not continuous for integral values of \( n \) \((n \neq 0, -1)\).

At \( x = 0, f(0) = 0 \),
\[
\lim_{h \to 0} f(0 + h) = \lim_{h \to 0} [h \sin \frac{\pi}{h+1}] = 0
\]
The function is not defined for \( x < 0 \). Hence we cannot find \( \lim f(0 - h) \). Thus \( f(x) \) is continuous at \( x = 0 \). Hence the points of discontinuity are given by \( I - \{0\} \) where \( I \) is set of integers \( n \) except \( n = -1 \)

12. **KEY CONCEPT**

\[
\lim_{x \to 0} [f(x)]^{g(x)} = e^{\lim_{x \to 0} g(x) \ln f(x)}
\]
\[
\lim_{x \to 0} \left( \frac{1 + 5x^2}{1 + 3x^2} \right)^{1/x^2} = e^{\lim_{x \to 0} \frac{\ln (1 + 5x^2)}{\ln (1 + 3x^2)}}
\]
\[
= e^{\lim_{x \to 0} \frac{5 \ln (1 + 5x^2) - 3 \ln (1 + 3x^2)}{3x^2}} = e^{5/3 - 2} = e^2
\]

13. Since \( f(x) \) is given continuous on the closed bounded interval \([1, 3]\), \( f(x) \) is bounded and assumes all the values lying in the interval \([m, M]\) where

\[
m = \min f(x) \text{ and } M = \max f(x)
\]

\[
1 \leq x \leq 3 \Rightarrow f(1) \leq f(x) \leq f(3)
\]

If \( m \leq M \), then \( f(x) \) must assume all the irrational values lying in the \([m, M]\). But since \( f(x) \) takes only rational values, we must have \( m = M \) i.e., \( f(x) \) must be a constant function.

As \( f(2) = 10 \), we get

\[
f(x) = 10 \quad \forall \ x \in [1, 3] \Rightarrow f(1.5) = 10
\]

**B. True/False**

1. Consider \( f(x) = \frac{|x - a|}{x - a}, g(x) = \frac{x - a}{|x - a|} \)

then \( \lim_{x \to a} f(x) g(x) \) exists but neither \( \lim_{x \to a} f(x) \) nor \( g(x) \) exists.

**C. MCQs with ONE Correct Answer**

1. (c) \( f(x) = \sqrt{\frac{x - \sin x}{x + \cos^2 x}} \)

\[
\Rightarrow \lim_{x \to \infty} f(x) = \lim_{x \to \infty} \sqrt{\frac{x - \sin x}{x + \cos^2 x}} = \sqrt{\frac{1 - 0}{1 + 0}} = 1
\]

2. (d) \( f(x) = \frac{\tan (\pi [x - \pi])}{1 + [x]^2} \)

By def. \( [x - \pi] \) is an integer whatever be the value of \( x \).
And so \( \pi [x - \pi] \) is an integral multiple of \( \pi \).
Consequently \( \tan (\pi [x - \pi]) = 0, \forall \ x \).

And since \( 1 + [x]^2 \neq 0 \) for any \( x \), we conclude that \( f(x) = 0 \).
Limits, Continuity and Differentiability

Thus \( f(x) \) is constant function and so, it is continuous and differentiable any no. of times, that is \( f'(x), f''(x), f'''(x), \ldots \) all exist for every \( x \), their value being \( 0 \) at every pt. \( x \). Hence, out of all the alternatives only (d) is correct.

3. \( a) \quad f(x) = e^{-x} \) is one such function.
   Here \( f(0) = 1, f'(0) = -1, f(x) > 0, \forall x. \)
   \( \therefore \ f''(x) > 0 \quad \forall x \)

4. \( d) \quad \lim_{x \to 1} \frac{-\sqrt{25-x^2} - (-\sqrt{24})}{x-1} \)
   \( = \lim_{x \to 1} \frac{\sqrt{24} - \sqrt{25-x^2} \times \sqrt{24} + \sqrt{25-x^2}}{x-1} \)
   \( = \lim_{x \to 1} \frac{x^2 - 1}{(x-1)[\sqrt{24} + \sqrt{25-x^2}]} \)
   \( = \lim_{x \to 1} \frac{x+1}{\sqrt{24} + \sqrt{25-x^2}} = \frac{2}{2\sqrt{24}} = \frac{1}{2\sqrt{6}} \)

5. \( c) \quad \lim_{x \to a} \frac{g(x)f(a) - g(a)f(x)}{x-a} \)
   \( = \lim_{h \to 0} \frac{g(a+h)f(a) - g(a)f(a) + g(a)f(a) - g(a)f(a+h)}{h} \)  [For \( x = a + h \)]
   \( = \lim_{h \to 0} f(a) \left[ \frac{g(a+h) - g(a)}{h} \right] - \lim_{h \to 0} g(a) \left[ \frac{f(a+h) - f(a)}{h} \right] \)
   \( = f(a) \left[ g'(a) \right] - g(a) \left[ f'(a) \right] \)

6. \( b) \quad \text{For} \ f(x) \ \text{to be continuous at} \ x = 0 \)
   \( f(0) = \lim_{x \to 0} f(x) \)
   \( = \lim_{x \to 0} \ln(1 + ax) - \ln(1 - bx) \)
   \( = a + b \)  [Using \( \lim_{x \to 0} \frac{\ln(1 + x)}{x} = 1 \)]

7. \( b) \quad \lim_{n \to \infty} \left( 1 - \frac{1}{n^2} + \frac{2}{1-n^2} + \ldots + \frac{n}{1-n^2} \right) \)
   \( = \lim_{n \to \infty} \frac{1+2+3+\ldots+n}{1-n^2} = \lim_{n \to \infty} \frac{n(n+1)}{2(1-n^2)} \)
   \( = \lim_{n \to \infty} \frac{1+1/n}{2 - 1/n^2} = -1/2 \)

8. \( d) \quad \text{The given function can be restated as} \)
   \( f(x) = \begin{cases} \sin[x], & \text{if} \ x \in (-\infty, 0) \cup [1, \infty] \\ [x], & \text{if} \ x \in [0,1] \end{cases} \)
   \( \therefore \ \lim_{x \to 0^+} f(x) = \lim_{h \to 0} \frac{\sin(-h)}{-h} \)
   \( = \lim_{x \to 0^-} \frac{\sin(-1)}{(-1)} = \sin1 \)

And \( \lim_{x \to 0^+} f(x) = 0 \)
\( \therefore \ \lim_{x \to 0} f(x) \neq 0 \)  [As \( \sin 1 \neq 0 \)]
\( \therefore \ \lim_{x \to 0} f(x) \) does not exist.

9. \( a) \quad \text{We have} f: R \to R, \text{a differentiable function and} \)
   \( f(1) = 4 \)

**NOTE THIS STEP**

\( \lim_{x \to 1} \int_0^x f(t) \frac{dt}{x-1} = \lim_{x \to 1} \frac{\int_0^x t^2 f(t) \frac{dt}{x-1}}{4} \)

\( = \lim_{x \to 1} \frac{(f(x))^2 - 16}{x-1} \)  [Using \( f(x) + 4 \)]

\( = f'(1) \cdot (f(1) + 4) = 8f'(1) \)  [Using \( f(1) = 4 \)]

10. \( b) \quad \text{We have} f(x) = [\tan^2 x] \)

\( \tan x \) is an increasing function for \( -\frac{\pi}{4} < x < \frac{\pi}{4} \)

\( \therefore \ \tan \left( -\frac{\pi}{4} \right) < \tan x < \tan \left( \frac{\pi}{4} \right) \)  **NOTE THIS STEP**

\( \Rightarrow -1 < \tan x < 1 \)  \( \Rightarrow > \tan^2 x < 1 \)  \( \Rightarrow \) \( [\tan^2 x] = 0 \)

Hence, \( \lim_{x \to 0} f(x) = \lim_{x \to 0} [\tan^2 x] = 0 \)

Also \( f(0) = 0 \)
\( \therefore \ f(x) \text{ is continuous at} \ x = 0 \)

11. \( c) \quad \text{When} \ x \text{ is not an integer, both the functions} [x] \text{ and} \)
    \( \cos \left( \frac{2x-1}{2} \right) \underline{\pi} \ \text{are continuous.} \)

\( \therefore \ f(x) \text{ is continuous on all non integral points.} \)

For \( x = a \in I \)

\( \lim_{x \to a} f(x) = \lim_{x \to a} [x] \cos \left( \frac{2x-1}{2} \right) \)

\( = (a-1) \cos \left( \frac{2(a-1)}{2} \right) \pi = 0 \)

\( \lim_{x \to a^-} f(x) = \lim_{x \to a^-} [x] \cos \left( \frac{2x-1}{2} \right) \pi \)

\( = n \cos \left( \frac{2n-1}{2} \right) \pi = 0 \)

\( \text{Also} \ f(n) = n \cos \left( \frac{2n-1}{2} \pi \right) = 0 \)

\( \therefore \ f \text{ is continuous at all integral pts as well.} \)

Thus, \( f \text{ is continuous everywhere.} \)

12. \( b) \quad \text{We have} \)

\( \lim_{n \to \infty} \sum_{r=1}^{2n} \frac{r}{n} \sqrt{\frac{a^2}{n^2} + r^2} \)

\( = \lim_{n \to \infty} \sum_{r=1}^{2n} \frac{r}{n} \sqrt{\frac{a^2}{n^2} + \frac{r^2}{n^2}} \)

\( = \int_0^2 \frac{x}{\sqrt{1+x^2}} \ dx \)

\( \left[ \frac{x}{2} \right] \sqrt{1+x^2} \]

\( = \left( \sqrt{1+x^2} \right) \left[ \frac{x}{2} \right] \)

\( = \left[ \frac{x}{2} \right] \sqrt{1+x^2} \)

\( = \left[ \frac{x}{2} \right] \sqrt{1+x^2} \)

\( = \frac{x}{2} \sqrt{1+x^2} \)
13. (d) We have \( f(x) = [x]^2 - [x^2] \)
At \( x = 0 \),
\[
\begin{align*}
\text{L.H.L.} &= \lim_{h \to 0} f(-h) = \lim_{h \to 0} [(-h)^2] - [(-h)^2] \\
&= \lim_{h \to 0} f(-1) - [h^2] = \lim_{h \to 0} 1 - 0 = 1 \\
\text{R.H.L.} &= \lim_{h \to 0} f(h) = \lim_{h \to 0} [h^2] - [h^2] \\
&= \lim_{h \to 0} 0 - 0 = 0
\end{align*}
\]
\[
\therefore \text{L.H.L.} \neq \text{R.H.L.}
\]
\[
\therefore \text{f(x) is not continuous at x = 0.}
\]
At \( x = 1 \)
\[
\begin{align*}
\text{L.H.L.} &= \lim_{h \to 0} f(1-h) = [1-h]^2 - [(1-h)^2] \\
&= \lim_{h \to 0} 0 - 0 = 0 \\
\text{R.H.L.} &= \lim_{h \to 0} f(1+h) = [1+h]^2 - [(1+h)^2] \\
&= \lim_{h \to 0} 1 - 1 = 0 \\
f(1) = [1]^2 - [1]^2 = 1 - 1 = 0
\end{align*}
\]
\[
\therefore \text{L.H.L.} = \text{R.H.L.} = f(1)
\]
\[
\therefore \text{f(x) is continuous at x = 1.}
\]
Clearly at other integral pts f(x) is not continuous.

14. (d) We have \( |x| = \begin{cases} \ -x & \text{if } x < 0 \\ \ x & \text{if } x \geq 0 \end{cases} \)
Also, \( |x^2 - 3x + 2| = |(x-1)(x-2)| \)
\[
\begin{align*}
&= \begin{cases} \ (1-x)(2-x) & \text{if } x < 1 \\ \ (x-1)(2-x) & \text{if } 1 \leq x < 2 \\ \ (x-1)(x-2) & \text{if } x \geq 2 \end{cases}
\end{align*}
\]
As \( \cos (-\theta) = \cos \theta \Rightarrow \cos |x| = \cos x \)
\[
\therefore \text{Given function can be written as}
\]
\[
\begin{align*}
f(x) &= \begin{cases} \ - (x^2 -1)(x-1)(x-2) + \cos x & \text{if } x \leq 1 \\ \ - (x^2 -1)(x-1)(x-2) + \cos x & \text{if } 1 \leq x < 2 \\ \ (x^2 -1)(x-1)(x-2) + \cos x & \text{if } x \geq 2 \end{cases}
\end{align*}
\]
This function is differentiable at all points except possibly at \( x = 1 \) and \( x = 2 \).
\[
L'f(1) = \left. \frac{d}{dx} [(x^2 -1)(x-1)(x-2) + \cos x] \right|_{x=1}
\]
\[
= - \sin 1
\]
\[
R'f(1) = \left. \frac{d}{dx} [-(x^2 -1)(x-1)(x-2) + \cos x] \right|_{x=1}
\]
\[
= - \sin 1
\]
\[
\therefore L'f(1) = R'f(1)
\]
\[
\therefore \text{f is differentiable at x = 1.}
\]
\[
L'f(2) = \left. \frac{d}{dx} [-(x^2 -1)(x-1)(x-2) + \cos x] \right|_{x=2}
\]
\[
= -3 - \sin 2
\]
\[
R'f(2) = \left. \frac{d}{dx} [(x^2 -1)(x-1)(x-2) + \cos x] \right|_{x=2}
\]
\[
= 3 - \sin 2
\]

15. (c) \[
\lim_{x \to 0} \frac{x \tan 2x - 2x \tan x}{(1 - \cos 2x)^2}
\]
\[
= \lim_{x \to 0} \left[ \frac{x^2 + \frac{8x^3}{3} + \frac{64x^5}{15} + \ldots}{2x + \frac{8x^3}{3} + \frac{64x^5}{15} + \ldots} \right]
\]
\[
= \lim_{x \to 0} \left[ \frac{8x^4}{3} + \text{terms containing higher positive powers of x} \right]
\]
\[
= \lim_{x \to 0} \frac{8x^4}{3} + \frac{2}{3} = 0
\]

16. (c) For \( x \in \mathbb{R} \),
\[
\lim_{x \to 0} \frac{(x - 3)^x}{x + 2} = \lim_{x \to 0} \left[ \frac{1 - \frac{5}{x+2}}{\frac{5}{x+2}} \right]
\]
\[
= \lim_{x \to 0} e^{-2} = e^{-5}
\]

17. (b) \[
\lim_{x \to 0} \frac{\sin (\pi \cos^2 x)}{x^2} = \lim_{x \to 0} \frac{\sin (\pi - \pi \sin^2 x)}{x^2}
\]
\[
= \lim_{x \to 0} \frac{\pi \sin^2 x}{x^2} \cdot \sin \theta
\]
\[
= \pi \sin \theta
\]

18. (a) At \( L.H.D = \lim_{x \to k} \frac{f(k) - f(k-h)}{h} \) (k = integer)
\[
= \lim_{h \to 0} \frac{[k] \sin k \pi - [k-h] \sin (k-h) \pi}{h}
\]
\[
= \lim_{h \to 0} \frac{-(k-1) \sin (k-h) \pi}{h}
\]
\[
= \lim_{h \to 0} \frac{-(k-1) \sin (k \pi - h \pi)}{h}
\]
\[
= \lim_{h \to 0} \frac{\sin (k \pi - \theta) = (-1)^k \sin \theta}{h}
\]
\[
= \lim_{h \to 0} \frac{-(k-1)(-1)^k \sin \pi \pi}{h}
\]
\[
= \pi (k-1)(-1)^k
\]

19. (d) \( f(x) = \max \{x, x^3\} \)
\[
= \begin{cases} \ x & \text{if } x < 1 \\ \ x^3 & \text{if } -1 \leq x \leq 0 \\ \ x^3 & \text{if } 0 \leq x \leq 1 \\ \ x^3 & \text{if } x \geq 1 \end{cases}
\]

**KEY CONCEPT**
A continuous function \( f(x) \) is not differentiable at \( x = a \) if graphically it takes a sharp turn at \( x = a \).
Graph of \( f(x) = \max \{x, x^3\} \) is as shown with solid lines.
20. (d) Let us test each of four options.

(a) \( f(x) = \cos |x| + |x| = \begin{cases} \cos x - x, & x < 0 \\ \cos x + x, & x \geq 0 \end{cases} \)

\( f'(x) = \begin{cases} -\sin x - 1, & x < 0 \\ -\sin x + 1, & x \geq 0 \end{cases} \)

At \( x = 0, LD = -1, RD = 1 \)

\( \therefore \) Not differentiable

(b) \( f(x) = \cos |x| - |x| = \begin{cases} \cos x + x, & x < 0 \\ \cos x - x, & x \geq 0 \end{cases} \)

\( \therefore \) Not differentiable at \( x = 0 \)

(c) \( f(x) = \sin |x| + |x| = \begin{cases} -\sin x - x, & x < 0 \\ \sin x - x, & x \geq 0 \end{cases} \)

\( \therefore \) Not differentiable at \( x = 0 \)

(d) \( f(x) = \sin |x| - |x| = \begin{cases} -\sin x + x, & x < 0 \\ \sin x + x, & x \geq 0 \end{cases} \)

\( f'(x) = \begin{cases} -\cos x + 1, & x < 0 \\ \cos x - 1, & x \geq 0 \end{cases} \)

At \( x = 0, LD = 0, RD = 0 \)

\( \therefore \) \( f \) is differentiable at \( x = 0 \).

21. (d) The given function is

\( f(x) = \begin{cases} \tan^{-1} x & \text{if } |x| \leq 1 \\ 1/(|x| - 1) & \text{if } |x| > 1 \end{cases} \)

\( f'(x) = \begin{cases} \frac{1}{2} \frac{1}{(-x-1)} & \text{if } x < -1 \\ \tan^{-1} x & \text{if } -1 \leq x \leq 1 \\ \frac{1}{2} \frac{1}{(x-1)} & \text{if } x > 1 \end{cases} \)

Clearly L.H.L. at \( x = -1 = \lim_{h \to 0} f(-1 - h) = 0 \)

R.H.L. at \( x = -1 = \lim_{h \to 0} f(-1 + h) = \lim_{h \to 0} \frac{1}{\tan^{-1}(-1 + h)} = \frac{3 \pi}{4} \)

\( \therefore \) L.H.L. \( \neq \) R.H.L. at \( x = -1 \)

\( \therefore \) \( f \) is discontinuous at \( x = -1 \)

Also we can prove in the same way, that \( f \) is discontinuous at \( x = 1 \)

\( \therefore \) \( f'' \) cannot be found for \( x = \pm 1 \) or domain of \( f'' \) = \( R - \{-1, 1\} \)

22. (c) Given that,

\[ \lim_{x \to 0} \frac{(\cos x - 1)(\cos x - e^x)}{x^n} = \text{finite non zero number} \]

\[ = \lim_{x \to 0} \frac{(1 - \cos x)(1 + \cos x)(e^x - \cos x)}{x^n(1 + \cos x)} \]

\[ = \lim_{x \to 0} \frac{\left( \sin^2 x \right) \left( \frac{e^x - \cos x}{x^{n-2}} \right) \left( \frac{1}{1 + \cos x} \right)}{x^n} \]

\[ = \lim_{x \to 0} \frac{e^x - \cos x}{x^{n-2}} \cdot \frac{1}{2} \]

\[ = \frac{1}{2} \lim_{x \to 0} \frac{e^x - \sin x}{x^{n-3}} \quad \text{[using L'Hopital's rule]} \]

For this limit to be finite, \( n - 3 = 0 \Rightarrow n = 3 \)

23. (c) Given that \( f; R \to R \) such that \( f(1) = 3 \) and \( f'(1) = 6 \)

Then \( \lim_{x \to 0} \left[ \frac{f(1 + x)}{f(1)} \right]^{1/x} \)

\[ = \lim_{x \to 0} \frac{1}{x} \left[ \log f(1 + x) - \log f(1) \right] \]

\[ = \lim_{x \to 0} \frac{1}{f(1 + x) - f(1)} \]

\[ = e^{f'(1)} = e^{6/3} = e^2 \]

24. (d) We are given that \( \lim_{x \to 0} \frac{(a - n)x - \tan x \sin nx}{x^2} = 0 \)

where \( n \) is non zero real number

\[ \Rightarrow \lim_{x \to 0} \frac{\sin nx}{nx} \left[ \left( (a - n)n - \frac{\tan x}{x} \right) \right] = 0 \]

\[ \Rightarrow \frac{1}{n} \cdot \frac{\sin nx}{nx} \left[ \left( (a - n)n - 1 \right) \right] = 0 \Rightarrow a = \frac{1}{n} + n \]

25. (d) Let \( L = \lim_{h \to 0} \frac{\frac{f(2h + 2 + h^2)}{f(h + 2 + h^2)} - f(2)}{f(h + h^2) - f(1)} \)

\[ = \frac{0}{0} \text{ form} \]

Applying L.Hospital's rule, we get

\[ L = \lim_{h \to 0} \frac{f'(2)(2 + h^2)(2 + 2h)}{f'(1) \cdot 4 \cdot 1} \]

\[ = f'(2) \cdot 2 \cdot 6 \cdot 2 \]

\[ = 4 \cdot 1 \times 3 = 3 \]

26. (c) Let \( L = \lim_{x \to 0} \frac{f(x^2) - f(x)}{f(x) - f(0)} \)

\[ = \lim_{x \to 0} \frac{f(x^2) - f(x)}{x^2} \quad \text{[\because \ f'(x) > 0, \ f \ being strictly increasing]} \]

Using L.H. Rule, we get

\[ L = \lim_{x \to 0} \frac{f(x^2) - f(x)}{x^2 - f'(x)} = \lim_{x \to 0} \frac{f(x^2) - f(x)}{x - f'(x)} \]

\[ = -1 \]
27. (a) Graph of \( y = |x| - 1 \) is as follows:

\[
\begin{align*}
Y & \quad \downarrow \quad X \\
(0, 1) & \\
(-1, 0) & \\
(1, 0) & \\
\end{align*}
\]

The graph has sharp turning at \( x = -1, 0, 1 \); and hence not differentiable at \( x = -1, 0, 1 \).

28. (b) Given that \( f(x) \) is a continuous and differentiable function and \( f\left(\frac{1}{x}\right) = 0, x = n, n \in I \)

\[
\therefore \quad f(0^+) = f\left(\frac{1}{\infty}\right) = 0
\]

Since R.H.L. = 0,

\[
\therefore \; f(0) = 0 \text{ for } f(x) \text{ to be continuous.}
\]

Also \( f'(0) = \lim_{h \to 0} \frac{f(h) - f(0)}{h} = \lim_{h \to 0} \frac{f(h)}{h} = 0 \)

\[
\text{[Using } f(0) = 0 \text{ and } f(0^+) = 0]\]

Hence \( f(0) = 0, f'(0) = 0 \)

29. (c) \( \lim_{x \to 0} [(\sin x)^{1/x} + (1/x)\tan x] \)

\[
= \lim_{x \to 0} [(\sin x)^{1/x}] + \lim_{x \to 0} \left(\frac{\sin x}{x}\right) = 0 + e^{\lim_{x \to 0} \frac{\sin x}{x}} = 0 + e^0 = 1
\]

30. (a) Given that \( f(x) \) is differentiable on \((0, \infty)\) with

\[
f(1) = 1 \text{ and } \lim_{t \to x} \frac{t^2 f(x) - x^2 f(t)}{t - x} = 1 \text{ for each } x > 0
\]

\[
\Rightarrow \quad \lim_{t \to x} \frac{2f(x) - x^2 f'(t)}{1} = 1 \quad \text{[Using L'Hospital rule]}
\]

\[
\Rightarrow \quad 2f(x) - x^2 f'(x) = 1 \Rightarrow f'(x) = \frac{2}{x} f(x) = -\frac{1}{x^2}
\]

[Linear differential equation]

Integrating factor

\[
\text{NOTE THIS STEP}
\]

\[
e^{-\frac{2}{x}dx} = e^{-2\log x} = e^\log 1/x^2 = \frac{1}{x^2}
\]

\[
\therefore \quad \text{Solution is } f(x) \times \frac{1}{x^2} = \int \left(-\frac{1}{x^2}\right) \times \frac{1}{x^2} dx
\]

\[
\Rightarrow \quad f(x) = Cx^2 + \frac{1}{3x}
\]

Also \( f(1) = 1 \)

\[
\Rightarrow \quad 1 = C + \frac{1}{3} \Rightarrow C = 2/3 \quad \therefore f(x) = \frac{2}{3} x^2 + \frac{1}{3x}
\]

31. (a) KEY CONCEPT

\[
\frac{d}{dx} \left[ \int_{g(x)}^{h(x)} f(t) dt \right] = f(h(x))h'(x) - f(g(x))g'(x)
\]

\[
= \frac{f(2) \times 2 \times 2 \times 1}{\frac{\pi}{4}} = \frac{8}{\pi} f(2)
\]

Let \( L = \lim_{x \to \frac{\pi}{4}} \frac{\int_{2}^{\sec^2 x} f(t) dt}{\frac{\pi}{4} \left(x^2 - \frac{\pi^2}{16}\right)} \quad \text{[0/0 form]}
\]

On applying L'Hospital's rule, we get

\[
L = \lim_{x \to \frac{\pi}{4}} \frac{d}{dx} \left[ \int_{2}^{\sec^2 x} f(t) dt \right]
\]

\[
L = \lim_{x \to \frac{\pi}{4}} \frac{d}{dx} \left( \frac{\sec^2 x \sec^2 x \tan x}{2x} \right)
\]

32. (c) As per question,

\( p = \text{left hand derivative of } |x-1| \text{ at } x = 1 \Rightarrow p = -1 \)

Also \( \lim_{x \to 1^+} g(x) = p \)

Where \( g(x) = \frac{(x-1)^n}{\log \cos^m(x-1)} \), \( 0 < x < 2 \),

\( m, n \) are integers, \( m \neq 0, n > 0 \)

\( \therefore \) we get,

\[
\lim_{x \to 1^+} \frac{(x-1)^n}{\log \cos^m(x-1)} = -1 \Rightarrow \lim_{h \to 0} \frac{h^n}{\log \cos^m h} = -1
\]

\[
\Rightarrow \quad \lim_{h \to 0} \frac{h^n}{m(\log \cos h)} = -1 \quad \text{[Using L'Hospital's rule]}
\]

\[
\Rightarrow \quad \lim_{h \to 0} \frac{n h^{n-1} \cos h}{m(-\sin h)} = -1 \quad \text{[Using L'Hospital's rule]}
\]

\[
\Rightarrow \quad \lim_{h \to 0} \frac{n h^{n-2} \cos h}{m(\sin h/\cos h)} = 1 \Rightarrow n = 2 \text{ and } m = 2
\]

33. (d) \( \lim_{x \to 0} \frac{1}{x} \left[ 1 + x \ln(1 + b^2) \right] \)

\[
= 2b \sin^2 \theta
\]

\[
\Rightarrow \quad \lim_{x \to 0} \frac{1}{x} \ln(x + (1 + b^2)) = 2b \sin^2 \theta
\]

\[
\Rightarrow \quad \lim_{x \to 0} \ln((x + 1 + b^2)) = 2b \sin^2 \theta
\]

\[
\Rightarrow \quad (x + 1 + b^2) = 2b \sin^2 \theta
\]

\[
\Rightarrow \quad x = 2b \sin^2 \theta - 1
\]

\[
\Rightarrow \quad 1 + b^2 = 2b \sin^2 \theta \Rightarrow 2 \sin^2 \theta = b + \frac{1}{b}
\]

We know that \( 2 \sin^2 \theta \leq 2 \) and \( b + \frac{1}{b} \geq 2 \) for \( b > 0 \)
\[ \therefore 2 \sin^2 \theta = b + \frac{1}{b} = 2 \Rightarrow \sin^2 \theta = 1 \]

As \( \theta \in (-\pi, \pi) \), \( \therefore \theta = \pm \frac{\pi}{2} \)

34. (b) Given: \[ \lim_{x \to \infty} \left( \frac{x^2 + x + 1}{x + 1} - ax - b \right) = 4 \]

\[ \Rightarrow \lim_{x \to \infty} \frac{x^2 + x + 1 - ax - bx - b}{x + 1} = 4 \]

\[ \Rightarrow \lim_{x \to \infty} \left( \frac{(1-a)x^2 + (1-a-b)x + (1-b)}{x + 1} \right) = 4 \]

For this limit to be finite \( 1-a = 0 \Rightarrow a = 1 \)

then given limit reduces to

\[ \lim_{x \to \infty} \frac{-bx + (1-b)}{x + 1} = 4 \Rightarrow \lim_{x \to \infty} \frac{-b + \frac{1-b}{x}}{1 + \frac{1}{x}} = 4 \]

\[ \Rightarrow -b = 4 \text{ or } b = -4 \]

Hence \( a = 1, b = -4 \)

35. (b) We have \( f'(0^+) = \lim_{h \to 0} \frac{f(0+h) - f(0)}{h} = \frac{h^2 \cos \frac{\pi}{h}}{h} = 0 \times \text{ some finite value} = 0 \)

Also, \( f'(0^-) = \lim_{h \to 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \to 0} \frac{h^2 \cos \frac{\pi}{h}}{-h} = \lim_{h \to 0} -h \left| \cos \frac{\pi}{h} \right| = 0 \times \text{ some finite value} = 0 \)

\( \therefore f'(0^+) = f'(0^-) \Rightarrow f \) is differentiable at \( x = 0 \)

Now \( f'(2^+) = \lim_{h \to 0} \frac{f(2+h) - f(2)}{h} = \frac{(2+h)^2 \cos \frac{\pi}{2+h} - 4 \cos \frac{\pi}{2}}{h} \)

\[ = \lim_{h \to 0} \frac{(2+h)^2}{h} \left( \cos \frac{\pi}{2+h} - 4 \cos \frac{\pi}{2} \right) \]

\[ = \lim_{h \to 0} \left( \frac{2+h}{h} \right)^2 \sin \left( \frac{\pi}{2} - \frac{\pi}{2+h} \right) \]

\[ = \lim_{h \to 0} \left( \frac{2+h}{h} \right)^2 \sin \frac{\pi h}{2(2+h)} \]

\[ = \lim_{h \to 0} \left( \frac{2+h}{h} \right)^2 \left( \frac{\pi h}{2(2+h)} \right) \sin \frac{\pi h}{2(2+h)} \times \frac{\pi h}{2(2+h)} = \pi \]

Also \( f'(2^-) = \lim_{h \to 0} \frac{f(2-h) - f(2)}{-h} = \frac{(2-h)^2 \cos \frac{\pi}{2-h} - 0}{-h} \)

\[ = \lim_{h \to 0} \frac{(2-h)^2 \cos \frac{\pi}{2-h}}{-h} \]

\[ = \lim_{h \to 0} \frac{(2-h)^2 \sin \left( \frac{\pi}{2} - \frac{\pi}{2-h} \right)}{h} \]

\[ = \lim_{h \to 0} \frac{(2-h)^2}{h} \times \frac{\sin \left( \frac{-\pi h}{2(2-h)} \right)}{\left( \frac{-\pi h}{2(2-h)} \right)} = -\pi \]

As \( f'(2^+) \neq f'(2^-) \Rightarrow f \) is not differentiable at \( x = 2 \)

36. (b) The given equation is

\( \left( \sqrt{2} + a - 1 \right) x^2 + \left( \sqrt{3} + a - 1 \right) x + \left( \sqrt{2} + a - 1 \right) = 0 \)

Let \( a + 1 = y \), then equation reduces to

\( (y^{1/3} - 1)x^2 + (y^{1/2} - 1)x + (y^{1/6} - 1) = 0 \)

Dividing both sides by \( y-1 \), we get

\( \left( \frac{y^{1/3} - 1}{y-1} \right)x^2 + \left( \frac{y^{1/2} - 1}{y-1} \right)x + \left( \frac{y^{1/6} - 1}{y-1} \right) = 0 \)

Taking limit as \( y \to 1 \) i.e. \( a \to 0 \) on both sides we get

\[ \frac{1}{3} x^2 + \frac{1}{2} x + \frac{1}{6} = 0 \Rightarrow 2x^2 + 3x + 1 = 0 \]

\[ \Rightarrow x = -1, -\frac{1}{2} \text{ (roots of the equation)} \]

Thus \( \lim_{a \to 0^+} \alpha(a) = -1, \lim_{a \to 0^-} \beta(a) = -\frac{1}{2} \)

D. MCQs with ONE or MORE THAN ONE Correct

1. (a, b, d) Given that \( x + |y| = 2y \)

If \( y < 0 \) then \( x - y = 2y \)

\( \Rightarrow y = \frac{x}{3} \Rightarrow x < 0 \)

If \( y = 0 \) then \( x = 0 \). If \( y > 0 \) then \( x + y = 2y \)

\( \Rightarrow y = x \Rightarrow x > 0 \)

Thus we can define \( f(x) = y = \begin{cases} \frac{x}{3}, & x < 0 \\ x, & x \geq 0 \end{cases} \)

Continuity at \( x = 0 \)

\( LL = \lim_{h \to 0^-} f(0-h) = \lim_{h \to 0^-} (-h/3) = 0 \)

\( RL = \lim_{h \to 0^+} f(0+h) = \lim_{h \to 0^+} h = 0 \)

\( f(0) = 0 \)

As \( LL = RL = f(0) \)

\( \therefore f(x) \) is continuous at \( x = 0 \)

Differentiability at \( x = 0 \)

\( Lf' = 1/3 ; Rf' = 1 \)
As \( Lf' \neq Rf' \Rightarrow f(x) \) is not differentiable at \( x = 0 \)

But for \( x < 0 \), \[ \frac{dy}{dx} = \frac{1}{3}. \]

2. (b) We have \( f(x) = x (\sqrt{x} - \sqrt{x+1}) \)
Let us check differentiability of \( f(x) \) at \( x = 0 \)
\[ Lf'(0) = \lim_{h \to 0} \frac{(0-h)(\sqrt{0-h} - \sqrt{0-h+1})}{-h} = \lim_{h \to 0} \frac{-h}{\sqrt{h} - \sqrt{h+1}} = 0 = -1 \]
\[ Rf'(0) = \lim_{h \to 0} \frac{(0+h)(\sqrt{0+h} - \sqrt{0+h+1})}{h} = \lim_{h \to 0} \frac{h}{\sqrt{h} - \sqrt{h+1}} = -1 \]
Since \( Lf'(0) = Rf'(0) \)
\[ \Rightarrow f \text{ is differentiable at } x = 0. \]

3. (b,c,d,e) The graph of \( f(x) = 1 + |\sin x| \) is as shown in the fig.

From graph it is clear that function is continuous everywhere but not differentiable at integral multiples of \( \pi \) (\( \ast \) at these points curve has sharp turnings)

4. (a,b,d) We have, for \( -1 \leq x \leq 1 \Rightarrow 0 \leq x \sin \pi x \leq 1/2 \)
\[ \Rightarrow f(x) = [x \sin \pi x] = 0 \]
Also \( x \sin \pi x \) becomes negative and numerically less than 1 when \( x \) is slightly greater than 1 and so by definition of \([ x ]\), \( f(x) = [x \sin \pi x] = 1 \) when \( 1 < x < 1 + h \)
Thus \( f(x) \) is constant and equal to 0 in the closed interval \([ -1, 1] \) and so \( f(x) \) is continuous and differentiable in the open interval \((-1, 1)\).
At \( x = 1, f(x) \) is clearly discontinuous, since \( f(1-0) = 0 \) and \( f(1+0) = -1 \) and \( f(x) \) is non-differentiable at \( x = 1 \).

5. (a) The given function is,
\[ f(x) = \frac{x}{1+|x|} = \begin{cases} \frac{x}{1-x}, & x < 0 \\ \frac{x}{1+x}, & x \geq 0 \end{cases} \]
For \( x < 0 \), \( f'(x) = \frac{1(1-x) - (-1)x}{(1-x)^2} \cdot \frac{1}{1-x} = \frac{1}{(1-x)^2} \),
For \( x > 0 \), \( f'(x) = \frac{1(1+x) - (1-x)}{(1-x)^2} \cdot \frac{1}{1+x} = \frac{1}{(1-x)^2} \).
For \( x = 0 \),
\[ Lf'(0) = \lim_{h \to 0} \frac{f(0+h) - f(0)}{-h} = \lim_{h \to 0} \frac{1}{1+h} = 1 \]

6. (a,b,c) \( f(x) = \begin{cases} x^2 + \frac{3x}{4} + \frac{13}{4}, & x < 1 \\ x^2 - \frac{3x}{4} + \frac{13}{4}, & x > 1 \end{cases} \)
\[ Lf'(1) = \frac{2x}{4} - \frac{3}{2} = -1 \]
\[ Rf'(1) = 1 \] Thus \( Lf'(1) = Rf'(1) \)
\[ \Rightarrow f \text{ is differentiable at } x = 1 \]

Again, \( Lf'(3) = -1 \) and \( Rf'(3) = 1 \)
\[ \Rightarrow Lf'(3) \neq Rf'(3) \]
\[ \Rightarrow f \text{ is not differentiable at } x = 3 \]
Let us now check the continuity at \( x = 3 \)
L.H.L. = \( \lim_{h \to 0} f(3-h) = \lim_{h \to 0} [3 - (3+h)] = 0 \)
R.H.L. = \( \lim_{h \to 0} f(3+h) = \lim_{h \to 0} [3 + h - 3] = 0 \)
\[ f(3) = 0 \]
\[ \Rightarrow f \text{ is continuous at } x = 3 \]

7. (b) We have, \( f(x) = \frac{x}{2} - 1 \)
\[ \Rightarrow [f(x)] = \frac{x}{2} - 1, \ 0 \leq x < 2 \]
\[ \tan[f(x)] = \tan(-1), 0 \leq x < 2 = 0, 0 \leq x \leq \pi \]
\[ \Rightarrow \text{The function } \tan[f(x)] \text{ is discontinuous at } x = 2. \]
Also the function \( f(x) = \frac{1}{x-1} = \frac{2}{x-2} \)
is discontinuous at \( x = 2 \).
Thus both the given functions \( \tan[f(x)] \) as well as \( f(x) \) are discontinuous on the interval \([0, \pi]\).
Also \( f^{-1}(x) = y \)
\[ \Rightarrow x = f(y) = \frac{y}{2} - 1 \leftrightarrow y = 2(x + 1) \]
\[ \Rightarrow f^{-1}(x) = 2(x + 1) \text{ is continuous on } [0, \pi] \]
\[ \lim_{x \to 0} \sqrt{\frac{1}{2} (1 - \cos 2x)} \]
\[ = \lim_{x \to 0} \sqrt{\frac{1}{2} 2 \sin^2 x} \]
\[ = \lim_{x \to 0} |\sin x|/x \]
9. (b,c) On $(0, \pi)$
   (a) $\tan x = f(x)$
       We know that $\tan x$ is discontinuous at $x = \pi/2$
   (b) $f(x) = \int_0^x t \sin \left( \frac{1}{x} \right) \, dt$

   **Note This Step**
   \[ f'(x) = x \sin \left( \frac{1}{x} \right) \] which exists on $(0, \pi)$
   \[ \therefore f(x), \text{ being differentiable, is continuous on (}0, \pi). \]

   (c) $f(x) = \begin{cases} 
   2x, & 0 < x \leq 3\pi/4 \\
   \frac{2}{9}, & 3\pi/4 < x < \pi 
   \end{cases}$
   Clearly, $f(x)$ is continuous on $(0, \pi)$ except possibly at $x = \frac{3\pi}{4}$, where,
   
   L.H.L. = $\lim_{h \to 0} f(\frac{3\pi}{4} - h) = \lim_{h \to 0} 1 = 1$
   
   R.H.L. = $\lim_{h \to 0} f(\frac{3\pi}{4} + h) = \lim_{h \to 0} 2\sin \left( \frac{3\pi}{9} + \frac{h}{9} \right)$
   
   $= \lim_{h \to 0} 2\sin \left( \frac{\pi}{6} + \frac{2h}{9} \right) = 2\sin \frac{\pi}{6} = 2 \cdot \frac{1}{2} = 1$
   
   Also, $f(\frac{3\pi}{4}) = 1$
   
   As L.H.L. = R.H.L. = $f\left( \frac{3\pi}{4} \right)$
   \[ \therefore f(x) \text{ is continuous on } (0, \pi) \]

   (d) $f(x) = \begin{cases} 
   \pi \sin x, & 0 < x \leq \pi/2 \\
   \frac{\pi}{2} \sin (\pi + x), & \pi/2 < x < \pi 
   \end{cases}$

   Here $f(x)$ will be continuous on $(0, \pi)$ if it is continuous at $x = \pi/2$.
   
   At $x = \pi/2$,
   
   L.H.L. = $\lim_{h \to 0} f\left( \frac{\pi}{2} - h \right)$
   
   $= \lim_{h \to 0} \left( \frac{\pi}{2} - h \right) \sin \left( \frac{\pi}{2} - h \right) = \frac{\pi}{2} \sin \frac{\pi}{2} = \frac{\pi}{2}$
   
   R.H.L. = $\lim_{h \to 0} f\left( \frac{\pi}{2} + h \right) = \lim_{h \to 0} \sin \left( \pi + \frac{\pi}{2} + h \right)$
   
   $= \frac{\pi}{2} \sin \left( \frac{\pi}{2} \right) = \frac{\pi}{2} \sin \frac{\pi}{2} = \frac{\pi}{2}$
   
   As L.H.L. = R.H.L.
   \[ \therefore f(x) \text{ is not continuous on } (0, \pi). \]

10. (b,c,d) $f(x) = \begin{cases} 
   0, & x < 0 \\
   x^2, & x \geq 0 
   \end{cases}$

   \[ \therefore f'(x) = \begin{cases} 
   0, & x < 0 \\
   2x, & x \geq 0 
   \end{cases} \]

   which exists $\forall x$ except possibly at $x = 0$.
   
   At $x = 0$, $f_+ = 0 = Rf^-$ \implies $f$ is differentiable.

11. (a, b) We have $g(x) = \begin{cases} 
   x^2 \sin \left( \frac{1}{x} \right), & x \neq 0 \\
   0, & x = 0 
   \end{cases}$

   If $x \neq 0$, $g'(x) = x^2 \cos \left( 1/x \right) \left( -\frac{1}{x^2} \right) + 2x \sin \frac{1}{x}$

   $= -\cos \left( \frac{1}{x} \right) + 2x \sin \frac{1}{x}$

   which exists for $\forall x \neq 0$.
   
   If $x = 0$,
   
   $g'(0) = \lim_{x \to 0} \frac{g(x) - g(0)}{x - 0}$

   $= \lim_{x \to 0} \frac{x^2 \sin(1/x) - 0}{x - 0} = \lim_{x \to 0} x \sin \left( \frac{1}{x} \right) = 0$

   \[ \therefore g'(x) = \begin{cases} 
   -\cos \left( \frac{1}{x} \right) + 2x \sin \frac{1}{x}, & x \neq 0 \\
   0, & x = 0 
   \end{cases} \]

   At $x = 0$, $\cos \left( \frac{1}{x} \right)$ is not continuous, therefore $g'(x)$ is not continuous at $x = 0$.
   
   At $x = 0$
   
   $\text{If} f' = \lim_{x \to 0} \frac{0 - (-x)\sin \left( -\frac{1}{x} \right)}{x} = -\sin \left( \frac{1}{x} \right)$

   which does not exist.
   \[ \therefore f \text{ is not differentiable at } x = 0. \]

12. (a, c) $f(x)$ is not differentiable at $x = 0$.

   From graph it is clear that $f(x)$ is continuous everywhere and also differentiable everywhere except at $x = 1$ and $-1$. 

   ![Graph showing discontinuity at x = 0](image-url)
13. (a, c, d) From the figure it is clear that

\[ h(x) = \begin{cases} 
  x, & \text{if } x \leq 0 \\
  x^2, & \text{if } 0 < x < 1 \\
  x & \text{if } x \geq 1
\end{cases} \]

From the graph it is clear that \( h \) is continuous for all \( x \in \mathbb{R} \), \( h'(x) = 1 \) for all \( x > 1 \) and \( h \) is not differentiable at \( x = 0 \) and 1.

14. (d) \(
L.H.L. = \lim_{x \to 1^-} \sqrt{1 - \cos[2(x-1)]} \\
= \lim_{x \to 1^-} \frac{\sqrt{2} \sin^2(x-1)}{x-1} = \sqrt{2} \lim_{x \to 1^-} \frac{\sin^2(x-1)}{x-1}
\)

\( = \sqrt{2} \lim_{x \to 1^-} \frac{|\sin(x-1)|}{x-1} = \sqrt{2} \lim_{h \to 0} \frac{|\sin(-h)|}{-h} \)

\( = \sqrt{2} \lim_{h \to 0} \frac{\sin h}{h} = -\sqrt{2} \)

Again,

\(R.H.L. = \lim_{x \to 1^+} \sqrt{1 - \cos(x-1)} = \lim_{x \to 1^+} \frac{\sqrt{2} |\sin(x-1)|}{x-1} \)

Put \( x = 1 + h, h > 0 \) for \( x \to 1^+, h \to 0 \).

\( = \lim_{h \to 0} \frac{\sqrt{2} |\sin h|}{h} = \lim_{h \to 0} \frac{\sqrt{2} |\sin h|}{h} = \sqrt{2} \)

L.H.L. \( \neq \) R.H.L. Therefore \( \lim_{x \to 1} f(x) \) does not exist.

15. (a, d) From graph, \( f(x) \) is continuous everywhere but not differentiable at \( x = 1 \).

16. (a, c) Given that \( L = \lim_{x \to 0} \frac{x}{\sqrt{a^2-x^2} - x^2/x^4} \), \( a > 0 \)

and \( L \) is finite.

\( \frac{x}{\sqrt{a^2-x^2} - x^2/x^4} \) (Using L'Hospital's rule)

\( \frac{1}{4x^2} \)

\( \frac{1}{\sqrt{a^2-x^2}} \)

\( \cdot \) \( L \) is finite, limiting value of numerator should be zero which is so when \( \frac{1}{\sqrt{a^2-x^2}} = 0 \)

i.e. \( a = 2 \) (\( \because a > 0 \))

Applying L'Hospital's rule again, we get

\( L = \lim_{x \to 0} \frac{a^2-x^2}{{8x}} = \lim_{x \to 0} \frac{1}{{8(a^2-x^2)^{3/2}}} \)

\( = \frac{1}{8 \times a^3} = \frac{1}{8 \times 8} \) (using \( a = 2 \))

\( = \frac{1}{64} \)

17. (b, c) \( \because f(x+y) = f(x) + f(y) \forall x, y \in \mathbb{R} \)

\( \therefore \) Putting \( x = y = 0 \), we get

\( f(0) = 0 \)

Also \( f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} \)

\( = \lim_{h \to 0} \frac{f(h)}{h} = f'(0) = k \) (say)

\( \Rightarrow f(x) = kx + c \)

But \( f(0) = 0 \) \( \Rightarrow c = 0 \)

\( \because f(x) = kx \)

Which is continuous and differentiable \( \forall x \in \mathbb{R} \).

\( \therefore \) b and c are the correct options.

18. (a, b, c, d)

At \( x = -\frac{\pi}{2} \)

\( L.H.L. = \lim_{x \to -\frac{\pi}{2}^-} x = 0 \)

\( R.H.L. = \lim_{x \to -\frac{\pi}{2}^+} \cos x = 0 \) and \( f\left(-\frac{\pi}{2}\right) = 0 \)

\( \therefore \) L.H.L. \( = \) R.H.L. \( = f\left(-\frac{\pi}{2}\right) \)

\( \Rightarrow f(x) \) is continuous at \( x = -\frac{\pi}{2} \)

Also at \( x = 0 \)

\( f'(0) = \sin 0 = 0; Rf'(0) = 1 - 0 = 1 \)

\( \therefore \) L.H.L. \( \neq Rf'(0) \)

\( \Rightarrow f \) is not differentiable at \( x = 0 \)

At \( x = 1 \)

\( Lf'(1) = Rf'(1) \Rightarrow f \) is differentiable at \( x = 1 \).

At \( x = -\frac{3}{2} \), \( f(x) = -\cos x \) which is differentiable.

\( \therefore \) All four options are correct.
19. (b, d)

We have \( f(x) = \begin{cases} a_n + \sin \pi x, & x \in [2n, 2n + 1] \\ b_n + \cos \pi x, & x \in (2n-1, 2n) \end{cases} \)

As \( f \) is continuous for all \( n \)
\[ \therefore \text{At } x = 2n, \text{ LHL = RHL = } f(2n) \]
\[ \Rightarrow b_n + \cos 2\pi n = a_n + \sin 2\pi n \]
\[ \Rightarrow b_n + 1 = a_n \Rightarrow a_n - b_n = 1 \]
\[ \therefore b \text{ is correct.} \]
Also at \( x = 2n + 1, \text{ LHL = RHL = } f(2n + 1) \)
\[ \Rightarrow \lim_{h \to 0} a_n + \sin \pi (2n + 1 - h) \]
\[ = \lim_{h \to 0} b_{n+1} + \cos \pi (2n + 1 - h) = a_n + \sin (2n + 1) \pi \]
\[ \Rightarrow a_n = b_{n+1} = 1 = a_n \Rightarrow a_n - b_{n+1} = 1 \]
\[ \therefore c \text{ is incorrect} \]
\[ \Rightarrow a_{n-1} - b_n = -1 \]
\[ \therefore d \text{ is correct.} \]

20. (b, d)

\[ \lim_{n \to \infty} \frac{1^n + 2^n + \cdots + n^n}{(n+1)^{a-1}[(na+1) + (na+2) + \cdots + (na+n)]} = \frac{1}{60} \]
\[ \Rightarrow \lim_{n \to \infty} \frac{n^a}{(n+1)^{a-1} \left[ \frac{1}{2} \sum_{r=1}^{n} \frac{r}{n} \right]^{a}} = \frac{1}{60} \]
\[ \Rightarrow \lim_{n \to \infty} \frac{n^{a-1}}{(n+1)^{a-1} \left[ \frac{1}{2} \sum_{r=1}^{n} \frac{1}{n} \right]^{a}} = \frac{1}{60} \]
\[ \Rightarrow \lim_{n \to \infty} \frac{n^{a-1}}{n} \left[ \frac{1}{2} \sum_{r=1}^{n} \frac{1}{n} \right]^{a} = \frac{1}{60} \]
\[ \Rightarrow \frac{1}{a+\frac{1}{2}} = \frac{1}{60} \]
\[ \Rightarrow a^2 + 3a - 119 = 0 \Rightarrow a = 7 \text{ or } -\frac{17}{2} \]

21. (a, c)

\( g(x) \) may be discontinuous at \( x = a \) or \( x = b \).

Let us check the continuity of \( g(x) \) at \( x = a \) and \( x = b \).

\[ \lim_{x \to a^+} g(x) = 0 \]
\[ \lim_{x \to a^-} g(x) = \lim_{x \to a^+} \int_a^x f(t) \, dt = \int_a^b f(t) \, dt = 0 \]
\[ g(a) = \int_a^b f(t) \, dt = 0 \]
\[ \therefore g(x) \text{ is continuous at } x = a \]

Also \( \lim_{x \to b^-} g(x) = \lim_{x \to b^-} \int_a^b f(t) \, dt = \int_a^b f(t) \, dt \)
\[ \lim_{x \to b^+} g(x) = \int_a^b f(t) \, dt \Rightarrow g(b) = \int_a^b f(t) \, dt \]
\[ \therefore g(x) \text{ is continuous at } x = b \]

Hence \( g(x) \) is continuous \( \forall x \in R \)

Now \( g'(x) = \begin{cases} f(x), & a \leq x \leq b \\ 0, & x > b \end{cases} \)
\[ g'(a-) = 0 \text{ and } g'(a^+) = f(a) \]
\[ g'(b-) = f(b) \text{ and } g'(b^+) = 0 \]

As \( f(a), f(b) \in [1, \infty) \); \( f(a), f(b) \neq 0 \)

Hence \( g'(a-) \neq g'(a^+) \) and \( g'(b-) \neq g'(b^+) \)
\[ \therefore g \text{ is not differentiable at } a \text{ and } b. \]

22. (a, d)

Let \( f \) and \( g \) be maximum at \( c_1 \) and \( c_2 \) respectively,
\( c_1, c_2 \in (0, 1) \)

Then, \( f(c_1) = g(c_2) \)

Let \( h(x) = f(x) - g(x) \)

Then, \( h(c_1) = f(c_1) - g(c_1) > 0 \)
\[ \text{and } h(c_2) = f(c_2) - g(c_2) < 0 \]
\[ \therefore h(x) = 0 \text{ has atleast one root in } (c_1, c_2) \]

\( C \in (c_1, c_2) \) i.e. for \( f(c) = g(c) \)

which shows that (a) and (d) are correct.

23. (a, d)

\[ f(x) = \begin{cases} \frac{x}{|x|} g(x), & x \neq 0 \\ 0, & x = 0 \end{cases} \]
\[ f'(x) = \begin{cases} g'(x), & x < 0 \\ 0, & x = 0 \\ g'(x), & x > 0 \end{cases} \]
\[ f''(0) = -g'(0) = 0 \]
\[ Rf'(0) = g'(0) = 0 \]
\[ \therefore f \text{ is differentiable at } x = 0 \]
\[ h(x) = e^{ix} = \begin{cases} e^{-x}, & x < 0 \\ e^x, & x \geq 0 \end{cases} \]
\[ h'(x) = \begin{cases} -e^{-x}, & x < 0 \\ e^x, & x \geq 0 \end{cases} \]
\[ \Rightarrow Lh(0) = -1, Rh(0) = 1 \]
\[ \therefore h \text{ is not differentiable at } x = 0 \]
\[ f \circ h(x) = f(h(x)) = g(e^{ix}) \text{ as } e^{ix} > 0 \]
24. \((a, b)\) \(f(x) = a \cos(x) + b \sin(x)\)
(a) If \(a = 0, b = 1\)
\[ f(x) = b \sin(x) \]
which is differentiable everywhere.
(b), (c) If \(a = 1, b = 0\) \(f(x) = \cos(x)\)
which is differentiable everywhere.
(d) When \(a = 1, b = 1\), \(f(x) = \cos(x) + x \sin(x)\)
which is differentiable at \(x = 1\).
\[ \therefore \text{Only } a \text{ and } b \text{ are the correct options.} \]

25. \((b, c)\) \(f(x) = [x^2 - 3]\) is discontinuous at all integral points in \([-1, 2, 2]^T\).
Which happens when \(x = 1, \sqrt{2}, \sqrt{3}, 2\).
\[ \therefore \text{f is discontinuous exactly at four points in } [-1, 2, 2]^T \]
Also \(g(x) = (|x| + 4x - 7) f(x)\)
Here \(f\) is not differentiable at \(x = 1, \sqrt{2}, \sqrt{3} \in [-1, 2, 2]^T\)
and \(|x| + 4x - 7\) is not differentiable at 0 and \(\frac{7}{4}\).
But \(f(x) = 0, \forall x \in \sqrt{3}, 2\]
\[ \therefore \text{g(x) becomes differentiable at } x = \frac{7}{4} \]
Hence \(g(x)\) is non-differentiable at four points i.e., \(0, 1, \sqrt{2}, \sqrt{3}\)

3. \[ \lim_{x \to 0} \frac{\sqrt{a + 2x} - \sqrt{3x}}{\sqrt{3a + x - 2\sqrt{x}}} = \lim_{x \to 0} \frac{\sqrt{a + 2x} - \sqrt{3x}}{\sqrt{3a + x - 2\sqrt{x}}} \]
\[ = \lim_{x \to 0} \frac{(a + 2x - 3x)(\sqrt{a + 2x} + \sqrt{3x})(\sqrt{3a + x} + 2\sqrt{x})}{(a + 2x - 3x)(\sqrt{3a + x} + 2\sqrt{x})} \]
\[ = \lim_{x \to 0} \frac{(a - x)(\sqrt{3a} + x + 2\sqrt{x})}{(a + 2x)(\sqrt{3a} + x + 2\sqrt{x})} \]
\[ = \lim_{x \to 0} \frac{(\sqrt{3a} + x + 2\sqrt{x})}{3(\sqrt{3a} + x + 2\sqrt{x})} \]
\[ = \frac{4\sqrt{a}}{3\sqrt{3a}} = \frac{2}{3\sqrt{3}} \]

\text{NOTE: The given limit is of the form } 0/0. \text{ Hence limit of the function can also be found out by using L’Hospital’s Rule.}
\[ f(x) = \int \frac{2 \sin x - \sin 2x}{x^3} \, dx, x \neq 0 \]
\[ \therefore \text{f}(x) = \frac{2 \sin x - \sin 2x}{x^3} \]
\[ \therefore \lim_{x \to 0} f'(x) = \lim_{x \to 0} \frac{2 \sin x - \sin 2x}{x^3} \]
\[ = \lim_{x \to 0} \frac{2 \sin x(1 - \cos x)(1 + \cos x)}{x^3 (1 + \cos x)} \]
\[ = \lim_{x \to 0} \frac{2 \sin^2 x}{x^3} \cdot \frac{1}{1 + \cos x} \]
\[ = 2 \times (1)^3 \times \frac{1}{2} \]
\[ \therefore \lim_{x \to 0} \frac{a + h)^2 \sin(a + h) - a^2 \sin a}{h} \]
\[ \therefore \lim_{h \to 0} \frac{a^2 \sin(a + h) - a^2 \sin a}{h} + 2ah \sin(a + h) + h^2 \sin(a + h) \]
\[ \therefore \lim_{h \to 0} \frac{2 \cos(a + h/2) \sin h}{h} + 2a \sin(a + h) \]
\[ \therefore \lim_{h \to 0} \frac{a^2 \cos a + 2a \sin a}{2} \]

As \(f(x)\) is continuous at \(x = 0\), we have
\( \lim_{h \to 0} f(0 - h) = \lim_{h \to 0} f(0 + h) = f(0) \)
\[ \Rightarrow \lim_{h \to 0} f(-h) + \lim_{h \to 0} f(h) = f(0) \]
\[ \Rightarrow f(0) + \lim_{h \to 0} f(-h) = f(0) + \lim_{h \to 0} f(h) = f(0) \]
\[ \text{[Using the given property } f(x + y) = f(x) + f(y)] \]
\[ \Rightarrow \lim_{h \to 0} f(-h) = \lim_{h \to 0} f(h) = 0 \]
Limits, Continuity and Differentiability

Now let \( x = a \) be any arbitrary point, then at \( x = a, \)
\[
\lim_{h \to 0} f(a - h) = \lim_{h \to 0} [f(a) + f(-h)]
\]
[Using, \( f(x + y) = f(x) + f(y) \)]
\[
= f(a) + \lim_{h \to 0} f(-h) = f(a) \quad \text{[using eqn(1)]}
\]
Similarly, R.H.L. = \( \lim_{h \to 0} f(a + h) = f(a) \)

Thus, we get
\[
\lim_{h \to 0} f(a - h) = \lim_{h \to 0} f(a + h) = f(a)
\]
\( \Rightarrow f \) is continuous at \( x = a. \) But \( a \) is any arbitrary point.
\( \therefore f \) is continuous \( \forall x \in R. \)

\[
\lim_{x \to 0} \frac{2^x - 1}{\sqrt{1 + x - 1}} = \lim_{x \to 0} \frac{2^x - 1}{\sqrt{1 + x - 1}} \times \frac{\sqrt{1 + x + 1}}{\sqrt{1 + x + 1}}
\]
\[
= \lim_{x \to 0} \frac{2^x - 1}{1 + x - 1}
\]
\[
= \lim_{x \to 0} \frac{2^x - 1}{1 + x - 1} \cdot \lim_{x \to 0} \left( \frac{\sqrt{1 + x + 1}}{\sqrt{1 + x + 1}} \right)
\]
\[
= \ln 2 \cdot (1 + 1) = 2 \ln 2.
\]

5. 
Graph of \( f(f(x)) \) is

![Graph of f(f(x))](image)

Clearly \( f(f(x)) \) is discontinuous at \( x = 1 \) and 2.

7. 
We have \( f(x) = \frac{x^2}{2}, 0 \leq x < 1 = 2x^2 - 3x + \frac{3}{2}, 1 \leq x \leq 2 \)
Here \( f(x) \) is continuous everywhere except possibly at \( x = 1 \)
\( \Rightarrow \) At \( x = 1, \) \( Lf' = \frac{2}{2} \times 1 = 1, \) \( Rf' = 4 \times 1 - 3 = 1 \)
\( \Rightarrow f \) is differentiable and hence continuous at \( x = 1 \)
\( \therefore f(x) \) is continuous on \( [0, 2] \)
\( f'(x) = x, \) \( 0 \leq x < 1 \)
\( = 4x - 3, \) \( 1 \leq x \leq 2 \)
\[\text{At } x = 1, \]
\[
\lim_{x \to 1^-} f'(x) = \lim_{h \to 0} f'(1 - h) = \lim_{h \to 0} (1 - h) = 1
\]
\[
\lim_{x \to 1^+} f'(x) = \lim_{h \to 0} f'(1 + h) = \lim_{h \to 0} 4(1 + h) - 3 = 1
\]
\( f'(1) = 4 - 3 = 1 \)
\( \therefore f' \) is continuous at \( x = 1 \)

8. 
\( f' \) is continuous on \([0, 2]\)
\( f''(x) = \begin{cases} 
2, & 0 \leq x < 1 \\
4, & 1 \leq x \leq 2
\end{cases} \)

Clearly \( f''(x) \) is discontinuous at \( x = 1, \)
\( \therefore f''(x) \) is discontinuous on \([0, 2]\).

9. 
Given \( f(x) = x^3 - x^2 + x + 1 \)
\( \therefore f'(x) = 3x^2 - 2x + 1 = 3 \left( x - \frac{1}{3} \right)^2 - \frac{1}{9} + \frac{1}{3} \)
\( = 3 \left( \frac{x - \frac{1}{3}}{3} \right)^2 + \frac{2}{9} > 0 \forall x \in R. \)

Hence \( f(x) \) is an increasing function of \( x \) for all real values of \( x. \)
Now \( \max \{ f(t) : 0 \leq t \leq x \} \) means the greatest value of \( f(t) \) in \( 0 \leq t \leq x \) which is obtained at \( t = x, \) since \( f(t) \) is increasing for all \( t. \)
\( \therefore \) \( \max \{ f(t) : 0 \leq t \leq x \} = x^3 - x^2 + x + 1 \)

Hence the function \( g(x) \) is defined as follows:
\( g(x) = x^3 - x^2 + x + 1 \) when \( 0 \leq x \leq 1 \)
\( = 3 - x \) when \( 1 < x \leq 2 \)
Now it is sufficient to discuss the continuity and differentiability of \( g(x) \) at \( x = 1. \) Since for all other values of \( x, \) \( g(x) \) is clearly continuous and differentiable, being a polynomial function of \( x. \)
We have, \( g(1) = 2 \)
\( g(1-0) = \lim_{h \to 0} (1-h)^3 - (1-h)^2 + (1-h) + 1 = 2 \)
\( g(1+0) = \lim_{h \to 0} [3-(1+h)] = 2 \)
Hence \( g(x) \) is continuous at \( x = 1 \)
Now,
\( Lg'(1) = \lim_{h \to 0} \frac{(1-h)^3 - (1-h)^2 + (1-h) + 1}{-h} = \lim_{h \to 0} \frac{-(1-3h+3h^2-h^3)-(1-2h-h^2+1-h+1)}{h} = \lim_{h \to 0} \frac{-3+3h-3h^2+3h^3}{h} = \lim_{h \to 0} (3h^2 + 3h - 3) = 2 \)
\( Rg'(1) = \lim_{h \to 0} \frac{3-(1+h)-2}{h} = \lim_{h \to 0} \frac{-h}{h} = -1 \)
Since \( Lg'(1) \neq Rg'(1), \) the function \( g(x) \) is not differentiable at \( x = 1 \)
Hence \( g(x) \) is continuous on \((0, 2).\) It is also differentiable on \((0, 2)\) except at \( x = 1. \)
We have \( f(x) = -1, \) \( -2 \leq x \leq 0 \)
\( = x - 1, \) \( 0 < x \leq 2 \)
and \( g(x) = f(|x| + |f(x)|) \)
Hence \( g(x) \) involves \(|x| \) and \(|x-1| \) or \(|-1| = 1 \)
Therefore we should divide the given interval \((-2, 2)\) into the following intervals.
\[ \begin{align*}
I_1 &= [-2, 2] = [-2, 0) \cup [0, 1) \cup [1, 2] \\
I_2 &= [-2, 0) \\
I_3 &= [0, 1) \\
\frac{x}{|x|} &= \begin{cases} 
+ve & \text{if } x > 0 \\
-ve & \text{if } x < 0 
\end{cases}
\end{align*} \]
\[
\lim_{x \to \frac{\pi}{4}^-} f(x) = f\left(\frac{\pi}{4}\right)
\]
\[
\lim_{h \to 0} f\left(\frac{\pi}{4} - h\right) = \frac{2\pi}{4} \coth\left(\frac{\pi}{4}\right) + b
\]
\[
\lim_{h \to 0} \left[\pi - h\right] + a\sqrt{2}\sin\left[\pi - h\right] = \frac{\pi}{2} + b
\]
\[
\Rightarrow \quad a + b = \frac{\pi}{4}
\]
\[
\Rightarrow \quad a - b = \frac{\pi}{4} \quad \text{(1)}
\]

Also,
\[
\lim_{x \to \frac{\pi}{2}^+} f(x) = f\left(\frac{\pi}{2}\right)
\]
\[
\lim_{h \to 0} f\left(\frac{\pi}{2} + h\right) = 2\frac{\pi}{2} \coth\left(\frac{\pi}{2}\right) + b
\]
\[
\Rightarrow \quad \lim_{h \to 0} a\cos\left(\frac{\pi}{2} + h\right) - b\sin\left(\frac{\pi}{2} + h\right) = b
\]
\[
\Rightarrow \quad a\cos\pi - b\sin\frac{\pi}{2} = b
\]
\[
\Rightarrow \quad a - b = b
\]
\[
\Rightarrow \quad a + 2b = 0 \quad \text{(2)}
\]

Solving (1) and (2), we get \( a = \frac{\pi}{6} \) and \( b = \frac{-\pi}{12} \).

We have, \( [x] + |1 - x|, -1 \leq x \leq 3 \).

**NOTE THIS STEP**

\[
\begin{array}{c|c|c|c}
\text{or } y &= & 0 + 1 - x & , 0 \leq x < 1 \\
& & 1 - x & , 0 \leq x < 1 \\
& & 1 + x & , 2 \leq x < 3 \\
& & 2 + x & , x = 3 \\
\end{array}
\]

From graph we can say that given functions is not differentiable at \( x = 0, 1, 2, 3 \).
14. We are given that,
\[
\begin{align*}
f(x) &= \begin{cases} 
\frac{1 - \cos 4x}{x^2}, & x < 0 \\
\frac{1}{\sqrt{x}}, & x = 0 \\
\frac{\sqrt{x}}{1 + \sqrt{x} - 4}, & x > 0
\end{cases}
\]

Here L.H.L at \(x = 0\)
\[
\lim_{h \to 0} \frac{1 - \cos 4(0 - h)}{(0 - h)^2} = \lim_{h \to 0} \frac{1 - \cos 4h}{h^2} = \frac{2}{4} = 2
\]

R.H.L at \(x = 0\)
\[
\lim_{h \to 0} \frac{\sqrt{0 + h}}{\sqrt{1 + \sqrt{0 + h} + 4}} = \lim_{h \to 0} \frac{\sqrt{h(16 + h + 4)}}{16 + h - 16 + 4} = 8
\]

For continuity of function \(f(x)\), we must have
L.H.L. = R.H.L. = \(f(0)\)
\[
\Rightarrow f(0) = 8 \Rightarrow a = 8
\]

15. We are given
\[
f(x + y) = f(x) f(y), \quad \forall \ x, y \in R
\]

\(f(x) \neq 0\), for any \(x\)

\(f(x)\) is differentiable at \(x = 0, f'(0) = 2\)

To prove that \(f'(x) = \frac{f(0)}{x}, \quad \forall \ x \in R\) and to find \(f(x)\).

We have \(f(x + y) = 2f(x), \quad \forall \ x \in R\) and to find \(f(x)\).

\[
\Rightarrow f(0) = f(0)^2 \Rightarrow f(0) = 1
\]

Again \(f'(0) \neq 2\)

\[
\lim_{h \to 0} \frac{f(0 + h) - f(0)}{h} = 2 \Rightarrow \lim_{h \to 0} \frac{f(0) f(h) - f(0)}{h} = 2
\]

\[
\Rightarrow \lim_{h \to 0} \frac{f(0) f(h) - f(0)}{h} \frac{f(h)}{h} = 2
\]

\[
\Rightarrow \lim_{h \to 0} \frac{f(h) - 1}{h} = 2 \quad (1) \quad \text{[Using } f(0) = 1]\]

Now, \(f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h}\)

\[
= \lim_{h \to 0} \frac{f(x) f(h) - f(x)}{h} = \lim_{h \to 0} f(x) \left( \frac{f(h) - 1}{h} \right)
\]

\[= f(x) \frac{1}{2} \quad \text{[Using eq. (1)]}
\]

\[= f(x)^2 \]

Also, \(f'(x) = 2\)

Integrating on both sides with respect to \(x\), we get
\[
\log |f(x)| = 2x + C
\]

At \(x = 0\), \(\log f(0) = C \Rightarrow C = \log 1 = 0\)

\[
\Rightarrow \log |f(x)| = 2x \Rightarrow f(x) = e^{2x}
\]

16. \[
\lim_{x \to 0} \left[ \tan \left( \frac{\pi}{4} + x \right) \right] = \lim_{x \to 0} \left[ \frac{\tan \left( \frac{\pi}{4} + x \right)}{x} \right] = e^{x \to 0} \left( \frac{x}{\tan x} \right)
\]

[Using \(\lim f(x) = e^{x \to 0} \left( \frac{x}{\tan x} \right)\)]

\[
\lim_{x \to a} \frac{\log \tan \left( \frac{\pi}{4} + x \right)}{x} = \frac{0}{0} \quad \text{[form ]}
\]

\[
\lim_{x \to \pi} \frac{\sec^2 \left( \frac{\pi}{4} + x \right)}{\tan \left( \frac{\pi}{4} + x \right)}
\]

[Using L’Hospital’s rule]
\[= e^{2} \]

\[
=e^{1} = e^{2}
\]

17. Given that \(f(x) = \begin{cases} 
\frac{a}{(1 + |\sin x|) |\sin x|}, & x < \frac{\pi}{6} \\
b \cdot \frac{6}{x}, & x = 0 \\
e^{\tan 3x}, & 0 < x < \frac{\pi}{6}
\end{cases}
\]

is continuous at \(x = 0\)

\[
\lim_{h \to 0} f(0 - h) = f(0) = \lim_{h \to 0} f(0 + h)
\]

We have,
\[
\lim_{h \to 0} f(0 - h) = \lim_{h \to 0} |\sin(-h)| |\sin(-h)| = \frac{a}{h} \quad \text{[Using eq. (1)]}
\]

\[
\lim_{h \to 0} \frac{\sin h}{h} = a
\]

\[
\lim_{h \to 0} \frac{-a \log(1 + \sin h)}{h} = e^a
\]

and \(f(0) = b\)
\[
\Rightarrow e^a = b \quad (2)
\]

Also \(\lim_{h \to 0} f(0 + h) = \lim_{h \to 0} e^{\tan 3h}
\]

\[
= \lim_{h \to 0} \frac{\tan 2h + 3h}{2h} \cdot \frac{3h}{3h} = e^3
\]

\[
\Rightarrow e^a = b = e^3 \quad \text{[Using eq. (1)]}
\]

From (1) and (2)
\[
e^a = b = e^3 \Rightarrow a = e^3 \text{ and } b = e^3
\]

18. \[
f \left( \frac{x + y}{2} \right) = \frac{f(x) + f(y)}{2}
\]

Putting \(y = 0\) and \(f(0) = 1\) in (1), we get
\[
f \left( \frac{x}{2} \right) = \frac{1}{2} \left( f(x) + 1 \right)
\]
\[
\Rightarrow f(x) = 2f \left( \frac{x}{2} \right) - 1 \quad (2)
\]

Now, \(f(x) = L_{h \to 0} \frac{f(x + h) - f(x)}{h}\)
\[
\begin{align*}
L_h \frac{f(2x)+f(2h)-f(x)}{2} & \quad \text{by (1)} \\
& = L_h \frac{2f(x)-1}{1} \frac{2f(h)-1}{2} - f(x), \quad \text{by (2)} \\
& = L_h \frac{f(h)-f(0)}{h} = f'(0) = -1 \\
\end{align*}
\]
Hence \(f'(x) = -1\), integrating, we get \(f(x) = -x + c\). Putting \(x = 0\), we get \(f(0) = c = 1\) by (1) \(\therefore f(x) = 1 - x\)
\(f(2) = 1 - 2 = -1\)

**19.**

By the given definition it is clear that the function \(f\) is continuous and differentiable at all points except possible at \(x = 1\) and \(x = 2\).

Continuity at \(x = 1\)

\[
L.H.L. = \lim_{h \to 0} [1 - (1-h)] = \lim_{h \to 0} h = 0
\]

R.H.L. = \lim_{h \to 0} [1 - (1+h)][2 - (1+h)]

\(= \lim_{h \to 0} (-h(1-h)) = 0\)

Also, \(f(1) = 0\)

\(\therefore\) L.H.L. = R.H.L. = \(f(1) = 0\)

Therefore, \(f\) is continuous at \(x = 1\)

Now, differentiability at \(x = 1\)

\[
L_f'(1) = \lim_{h \to 0} \frac{f(1+h)-f(1)}{h}, h > 0
\]

\(= \lim_{h \to 0} \frac{(1-h)-0}{h} = \lim_{h \to 0} \left( \frac{h}{-h} \right) = -1\)

and \(R_f'(1) = \lim_{h \to 0} \frac{f(1+h)-f(1)}{h}\)

\(= \lim_{h \to 0} \frac{[1-(1-h)](2-1-h)}{h}\)

\(= \lim_{h \to 0} \frac{-h(1-h)}{h} = \lim_{h \to 0} (h-1) = -1\)

Since \(L_f'(1) = R_f'(1)\)

Hence, \(f\) is differentiable at \(x = 1\)

Continuous at \(x = 2\)

\[
L.H.L. = \lim_{h \to 0} [1 - (2-h)][2 - (2-h)]
\]

\(= \lim_{h \to 0} [1-h][2-h] = 0\)

and R.H.L. = \lim_{h \to 0} [3 - (2+h)] = \lim_{h \to 0} (1-h) = 1

Since L.H.L. \(\neq\) R.H.L., therefore \(f\) is not continuous at \(x = 2\). As such \(f\) cannot be differentiable at \(x = 2\). Hence \(f\) is continuous and differentiable at all points except at \(x = 2\).

**20.**

Given that, \(F(x) = \int_0^x f(t)dt\)

**NOTE THIS STEP**

\(\therefore\) \(F'(x) = f(x).1 - f(0)0\)

[Using Leibnitz theorem]

**21. (I)**

\(g\) is continuous at \(\alpha\) and \(f(x) - f(\alpha) = g(x)(x-\alpha), \forall x \in \mathbb{R}\)

\(\Rightarrow\) Since \(g\) is continuous at \(x = \alpha\)

\[g(x) = \frac{f(x) - f(\alpha)}{x-\alpha}\]

We should have, \(\lim_{x \to \alpha} g(x) = g(\alpha) \Rightarrow f'(\alpha) = g(\alpha)\)

\(\Rightarrow f'(\alpha) exists and is equal to g(\alpha).\)

\(\therefore f(x)\) is differentiable at \(x = \alpha\)

\(\therefore\) \(\lim_{x \to \alpha} \frac{f(x) - f(\alpha)}{x-\alpha} = f'(\alpha)\)

exists and is finite.
Let us define,
\[ g(x) = \begin{cases} \frac{f(x) - f(\alpha)}{x - \alpha}, & x \neq \alpha \\ f(\alpha), & x = \alpha \end{cases} \]
Then, \( f(x) - f(\alpha) = (x - \alpha) g(x), \forall x \neq \alpha \).
Now for continuity of \( g(x) \) at \( x = \alpha \)
\[ \lim_{x \to \alpha} g(x) = \lim_{x \to \alpha} \frac{f(x) - f(\alpha)}{x - \alpha} = f'(\alpha) = g(\alpha) \]
\[ \therefore g \text{ is continuous at } x = \alpha. \]

22.
Given that
\[ f(x) = \begin{cases} x + a, & \text{if } x < 0 \\ |x - 1|, & \text{if } x \geq 0 \end{cases} = \begin{cases} x + a, & \text{if } x < 0 \\ 1 - x, & \text{if } 0 \leq x < 1 \\ x - 1, & \text{if } x \geq 1 \end{cases} \]
and \( g(x) = \begin{cases} (x + 1), & \text{if } x < 0 \\ (x - 1)^2 + b, & \text{if } x \geq 0 \end{cases} \)
where \( a, b \geq 0 \)
Then \( g(f(x)) = g[f(x)] \)

NOTE THIS STEP
\[ = \begin{cases} f(x) + 1, & \text{if } f(x) < 0 \\ [(f(x)) - 1] + b, & \text{if } f(x) \geq 0 \end{cases} \]
(Using definition of \( g(x) \))
Now, \( f(x) < 0 \) when \( x + a < 0 \) i.e. \( x < -a \)
\( f(x) = 0 \) when \( x = -a \) or \( x = 1 \)
\( f(x) > 0 \) when \( -a < x < 1 \) or \( x > 1 \)
\[ g(f(x)) = \begin{cases} (f(x) + 1), & \text{if } f(x) < 0 \\ [(f(x)) - 1] + b, & \text{if } f(x) \geq 0 \end{cases} \]
[Keeping in mind that \( x = 0 \) and \( 1 \) are also the breaking points because of definition of \( f(x) \)]
\[ \therefore g[f(x)] = \begin{cases} x + a + 1, & \text{if } x < -a \\ (x + a - 1)^2 + b, & \text{if } -a \leq x < 0 \\ (1 + x - 1)^2 + b, & \text{if } 0 \leq x \leq 1 \end{cases} \]
\[ (x - 1 - 1)^2 + b, & \text{if } x > 1 \]
Substituting the value of \( f(x) \) under different conditions,
\[ g[f(x)] = \begin{cases} x + a + 1, & \text{if } x < -a \\ (x + a - 1)^2 + b, & \text{if } -a \leq x < 0 = F(x)(\text{say}) \\ x^2 + b, & \text{if } 0 \leq x \leq 1 \\ (x - 2)^2 + b, & \text{if } x > 1 \end{cases} \]
Now given that \( g[f(x)] = F(x) \) is continuous for all real numbers, therefore it will be continuous at \( -a \)
\[ \therefore \text{L.H.S} = \text{R.H.S} = f(-a) \]
\[ \lim_{h \to 0} F(-a - h) = \lim_{h \to 0} F(-a + h) = f(-a) \]
Now, \( \lim_{h \to 0} F(-a - h) = \lim_{h \to 0} (-a - h + a + 1) = 1 \)
\[ \lim_{h \to 0} F(-a + h) = \lim_{h \to 0} (-a + h + a - 1)^2 + b = 1 + b \]
\[ F(-a) = 1 + b \]
Thus we should have \( 1 = 1 + b \Rightarrow b = 0. \)
Again for continuity at \( x = 0 \)
\[ \text{L.H.S} = f(0) \]
\[ \Rightarrow \lim_{h \to 0} f(0 - h) = f(0) \]
\[ \Rightarrow \lim_{h \to 0} f(-h + a - 1)^2 + b = b = (a - 1)^2 = 0 \Rightarrow a = 1 \]
For \( a = 1 \) and \( b = 0 \), \( gof \) becomes
\[ g(f(x)) = \begin{cases} x + 2, & \text{if } x < -1 \\ x^2, & \text{if } -1 \leq x \leq 1 \\ (x - 2)^2 & \text{if } x > 1 \end{cases} \]
Now to check differentiability of \( gof(x) \) at \( x = 0 \)
We see, \( gof(x) = x^2 = F(x) \)
\[ \Rightarrow F'(x) = 2x \text{ which exists clearly at } x = 0. \]
gof is differentiable at \( x = 0 \)
Given that \( f: [-2a, 2a] \to R \)
f is an odd function.
\[ Lf' \text{ at } x = a \text{ is } 0. \]
\[ \Rightarrow \lim_{h \to 0} \frac{f(a - h) - f(a)}{-h} = 0 \]
\[ \Rightarrow \lim_{h \to 0} \frac{f(a - h) - f(a)}{h} = 0 \]
To find \( Lf' \) at \( x = -a \) which is given by
\[ \lim_{h \to 0} \frac{f(a - h) - f(-a)}{-h} = \lim_{h \to 0} \frac{f(a + h) + f(a)}{-h} \]
\[ = \lim_{h \to 0} \frac{f(a + h) - f(a)}{h} \]
Again for \( x \in [a, 2a] \)
\[ f(x) = f(2a - x) \]
\[ \therefore f(a + h) = f(2a - a - h) = f(a - h) \]
Substituting this values in last expression we get
\[ Lf'(-a) = \lim_{h \to 0} \frac{f(a - h) - f(a)}{h} = 0 \] [Using equation (1)]
Hence \( Lf'(-a) = 0 \)
To find,
\[ \lim_{n \to \infty} \left[ \frac{(n + 1)}{n} \frac{1}{n} \tan^{-1} \left( \frac{1}{n} \right) - n \right] = \lim_{n \to \infty} n f'(\frac{1}{n}) \]
where \( f(x) = \left[ (1+x) \frac{2}{\pi} \cos^{-1} x - 1 \right] \) such that

\[
f(0) = \left[ (1+0) \frac{2}{\pi} \cos^{-1} 0 - 1 \right] = \frac{2}{\pi} \frac{2}{\pi} - 1 = 0
\]

\[
\therefore \text{ Using given relation as } \lim_{n \to \infty} n f\left(\frac{1}{n}\right) = f'(0)
\]

then given limit becomes

\[
f'(0) = \frac{d}{dx} \left[ (1+x) \frac{2}{\pi} \cos^{-1} x - 1 \right] \bigg|_{x=0}
\]

\[
= \frac{2}{\pi} \left[ \cos^{-1} x - \frac{1-x}{\sqrt{1-x^2}} \right] \bigg|_{x=0}
\]

\[
= \frac{2}{\pi} \left( \frac{2}{\pi} - 1 \right) = 1 - \frac{2}{\pi} \frac{2}{\pi} = \frac{2}{\pi} \frac{2}{\pi}
\]

25. Given that \( f(x) \) is differentiable at \( x = 0 \).

Hence, \( f(x) \) will also be continuous at \( x = 0 \)

\[
\Rightarrow \lim_{h \to 0} f(0+h) = f(0) \Rightarrow \lim_{h \to 0} \frac{ah}{e^2} - 1 = \frac{1}{2}
\]

\[
\Rightarrow \lim_{h \to 0} \frac{ah}{e} = \frac{a}{2} = \frac{1}{2} \Rightarrow a = 1
\]

Also differentiability of \( f(x) \) at \( x = 0 \), gives

\[
L_f'(0) = R_f'(0)
\]

\[
\Rightarrow \lim_{h \to 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \to 0} \frac{f(0+h) - f(0)}{h}
\]

\[
\Rightarrow \lim_{h \to 0} \frac{b \sin^{-1} \left( \frac{c-h}{2} \right) - 1}{2} = \lim_{h \to 0} \frac{ah}{e^2} - 1 = \frac{1}{2}
\]

\[
= \lim_{h \to 0} \frac{2e^2 - 2 - h}{2h^2} \quad \text{[form} \frac{0}{0}\text{]}
\]

\[
\lim_{h \to 0} \left[ 1 - \left( \frac{c-h}{2} \right)^2 \right] \quad \text{[Using L Hospital's rule]}
\]

\[
= \lim_{h \to 0} \frac{ah}{2h} = \lim_{h \to 0} \frac{h}{8} \left( \frac{h}{2} \right) \quad \text{[Putting} a = 1\text{]}
\]

\[
\Rightarrow \frac{b}{\sqrt{\frac{c^2}{4} - \frac{1}{4}}} = 1 \Rightarrow 4b = \sqrt{1 - \frac{c^2}{4}} \Rightarrow 16b^2 = 4 - \frac{c^2}{4}
\]

\[
\Rightarrow 64b^2 = 4 - c^2 \quad \text{Hence proved.}
\]

26. Given that,

\[
f(x-y) = f(x)g(y) - f(y)g(x) \quad \ldots(i)
\]

\[
g(x-y) = g(x)g(y) + f(x)f(y) \quad \ldots(ii)
\]

**F. Match the Following**

1. (A) \( \sin(\pi[x]) = 0, \forall \ x \in R \)

   \( \therefore \text{ Differentiable everywhere.} \)

   \( \therefore \text{ (A) } \rightarrow \text{ (p) } \)

   (B) \( \sin(\pi(x-[x])) = f(x) \)

   We know that

   \[
   \begin{align*}
   x - [x] &= x, \text{ if } 0 \leq x < 1 \\
   x - [x] &= x - 1, \text{ if } 1 \leq x < 2 \\
   x - [x] &= x - 2, \text{ if } 2 \leq x < 3
   \end{align*}
   \]

   It's graph is, as shown in figure which is discontinuous at \( \forall \ x \in \mathbb{R} \). Clearly \( x - [x] \) and hence \( \sin(\pi(x-[x])) \) is not differentiable \( \forall \ x \in \mathbb{R} \)

   \( \text{(B) } \rightarrow \text{ r} \)

2. (A) \( y = x \mid \frac{x}{x} = \begin{cases} 
-\frac{x^2}{2} & \text{if } x < 0 \\
\frac{x^2}{2} & \text{if } x \geq 0
\end{cases} \)

   \( \text{We know that} \)

   \[
   \begin{align*}
   x^2 &= x^2 \\
   \sqrt{c^2} &= \frac{c^2}{4}
   \end{align*}
   \]

   \( \Rightarrow \frac{b}{\sqrt{\frac{c^2}{4} - \frac{1}{4}}} = 1 \Rightarrow 4b = \sqrt{1 - \frac{c^2}{4}} \Rightarrow 16b^2 = 4 - \frac{c^2}{4}
\]
Limits, Continuity and Differentiability

Graph is as follows:

From graph, \( y = x \cdot |x| \) is continuous in \((-1, 1)\) \((p)\)
differentiable in \((-1, 1)\) \((q)\)
Strictly increasing in \((-1, 1)\) \((r)\)

\(y = \sqrt{|x|} = \begin{cases} \sqrt{-x} & \text{if } x < 0 \\ \sqrt{x} & \text{if } x \geq 0 \end{cases}\)

\(\Rightarrow y^2 = -x, \ x < 0\)

\{where \(y\) can take only +ve values\}

and \(y^2 = x, \ x \geq 0\)

\(\therefore\) Graph is as follows:

From graph, \(y = \sqrt{|x|}\) is continuous in \((-1, 1)\) \((p)\)
not differentiable at \(x = 0\) \((s)\)

\(\textbf{NOTE THIS STEP}\)

\[y = x + \lfloor x \rfloor = \begin{cases} x - 1, & -1 \leq x < 0 \\ x, & 0 \leq x < 1 \\ x + 1, & 1 \leq x < 2 \end{cases}\]

\(\therefore\) Graph of \(y = x + \lfloor x \rfloor\) is as follows:

Also it is strictly increasing in \((-1, 1)\) \((r)\)

\(y = |x - 1| + |x + 1| = \begin{cases} -2x, & x < -1 \\ 2, & -1 \leq x < 1 \\ 2x, & x \geq 1 \end{cases}\)

Graph of function is as follows:

From graph, \(y = f(x)\) is continuous \((p)\) and differentiable \((q)\) in \((-1, 1)\) but not strictly increasing in \((-1, 1)\).

3. \(\text{(d)}\) \(P(1): f_4(x) = \begin{cases} x^2, & x < 0 \\ e^{2x} - 1, & x \geq 0 \end{cases}\)

Range of \(f_4 = [0, \infty)\)

\(\therefore f_4\) is onto

From graph \(f_4\) is not one one.

\(Q(3): f_3(x) = \begin{cases} \sin x, & x < 0 \\ x, & x \geq 0 \end{cases}\)

From graph \(f\) is differentiable but not one one.

\(R(2): f_2 \circ f_1(x) = \begin{cases} x^2, & x < 0 \\ e^{2x}, & x \geq 0 \end{cases}\)
1. **Integer Value Correct Type**

3. \( f(x) = |x| + 1 = \begin{cases} 
  x + 1, & x \geq 0 \\
  -x + 1, & x < 0 
\end{cases} \)

\[ g(x) = x^2 + 1 \]

From graph there are 3 points at which \( h(x) \) is not differentiable.

4. \( \lim_{{\alpha \to 0}} \frac{e^{\cos \alpha^n} - e}{\alpha^m} = \frac{-e}{2} \)

\[ \Rightarrow \lim_{{\alpha \to 0}} \frac{e^{\cos \alpha^n - 1} - 1}{\cos \alpha^n - 1} \times \frac{\cos \alpha^n - 1}{\alpha^m} = \frac{-e}{2} \]

\[ \Rightarrow e \lim_{{\alpha \to 0}} \left( \frac{\cos \frac{\alpha^n}{2}}{\alpha^m} \right) = \frac{-e}{2} \]

\[ \Rightarrow \frac{-e}{2} \alpha^{2n - m} = \frac{-e}{2} \text{ or } \alpha^{2n - m} = 1 \]

\[ \Rightarrow 2n - m = 0 \Rightarrow m = 2 \]

5. \( \lim_{{x \to 0}} \frac{x^2 \sin x}{ax - \sin x} = 1 \)

\[ \Rightarrow \lim_{{x \to 0}} \frac{x^3 \beta}{ax - \sin x} = 1 \]

\[ \Rightarrow \lim_{{x \to 0}} \frac{x^3 \beta}{(\alpha - 1)x + \frac{x^3}{3!} - \frac{x^5}{5!} + \ldots} = 1 \]

For above to be possible, we should have \( \alpha - 1 = 0 \) and \( \beta = \frac{1}{3!} \)

\[ \Rightarrow \alpha = 1 \text{ and } \beta = \frac{1}{6} \]

\[ \therefore 6(\alpha + \beta) = 6\left(1 + \frac{1}{6}\right) = 7 \]
Section-B

1. (d) \[ \lim_{x \to 0} \frac{\sqrt{1 - \cos 2x}}{\sqrt{2x}} = \lim_{x \to 0} \frac{\sqrt{1 - (1 - 2 \sin^2 x)}}{\sqrt{2x}} = \lim_{x \to 0} \frac{\sin x}{\sqrt{2x}} \approx \lim_{x \to 0} \frac{|\sin x|}{x} \]

The limit of above does not exist as LHS = -1 ≠ RHS = 1

2. (a) \[ \lim_{x \to \infty} \left( \frac{x^2 + 5x + 3}{x^2 + x + 2} \right)^x = \lim_{x \to \infty} \left( 1 + \frac{4x + 1}{x^2 + x + 2} \right)^x \]

\[ = \lim_{x \to \infty} \left[ \left( 1 + \frac{4x + 1}{x^2 + x + 2} \right)^{\frac{(4x+1)x}{4x+1}} \right] \]

\[ = \lim_{x \to \infty} e^{\lim_{x \to \infty} \left( 1 + \frac{4x + 1}{x^2 + x + 2} \right)^x} \]

\[ = e^{\lim_{x \to \infty} \left( 1 + \frac{4x + 1}{x^2 + x + 2} \right)^x} \]

\[ = e^{\lim_{x \to \infty} \frac{4x + 1}{x^2 + x + 2}} = e^{\lim_{x \to \infty} \frac{4}{x^2}} = e^{4} \]

3. (c) Apply L H Rule

We have, \[ \lim_{x \to \infty} \frac{xf(2) - 2f(x)}{x - 2} = \lim_{x \to \infty} \frac{f(2) - 2f'(x)}{1} = -4 \]

4. (a) We have \[ \lim_{n \to \infty} \frac{1 + \frac{2^n}{n} + \ldots + \frac{n^n}{n^{p+1}}}{n^{p+1}} \]

5. (d) Since \[ \lim_{n \to \infty} \frac{f(x) - 1}{\sqrt{x} - 1} \]

6. (a) \[ \lim_{x \to 1} \frac{\sqrt{f(x)} - 1}{\sqrt{x} - 1} \]

7. (b) Let a is a rational number other than 0, in [-5, 5], then

\[ f(a) = a \text{ and } \lim_{x \to a} f(x) = -a \]

[As in the immediate neighbourhood of a rational number, we find irrational numbers]

8. (d) \[ f''(x) - g''(x) = 0 \]

Integrating, \[ f'(x) = g'(x) = c; \]

\[ \Rightarrow f'(1) - g'(1) = c = c \Rightarrow c = 2. \]

\[ f'(x) - g'(x) = 2; \]

Integrating, \[ f(x) - g(x) = 2x + C_1 \]

\[ \Rightarrow f(2) - g(2) = 4 + C_1 \Rightarrow 10 = 4 + C_1; \]

\[ C_1 = 2 \quad \therefore f(x) - g(x) = 2x + 2 \]

At x = 3/2, \[ f(x) - g(x) = 3 + 2 = 5. \]

9. (c) \[ f(x + y) = f(x) \times f(y) \]

Differentiate with respect to x, treating y as constant

\[ f'(x + y) = f'(x)f(y) \]

Putting x = 0 and y = x, we get \[ f'(x) = f'(0)f(x) \Rightarrow f'(5) = f(5) = 3 \times 5 = 15. \]

10. (a) The given expression can be written as

\[ \lim_{n \to \infty} \frac{\log(3 + x) - \log(3 - x)}{x} = \frac{1}{3} \quad \text{(by L'Hospital rule)} \]

\[ \frac{1}{3 + x} - \frac{1}{3 - x} = K \quad \therefore \frac{2}{3} = K \]

11. (d) \[ \lim_{x \to 0} \frac{x^2}{(\sin x)^2} = \lim_{x \to 0} \frac{\sec^2 x \cdot 2x}{\cos x} \]

\[ = \frac{2 \sec^2 x}{\cos x} \quad \text{(by L'Hospital rule)} \]

12. (d) \[ \lim_{x \to 0} \frac{\sec^2 x}{\cos x} = \lim_{x \to 0} \frac{\sec^2 x}{\cos x} \]

\[ = \frac{2 \sec^2 x}{1 + 1} = 1 \]

13. (b) \[ \lim_{x \to a} \frac{f(a)g(x) - g(a)f(x)}{g(x) - f'(x)} = 4 \]

[By L'Hospital rule]
14. (d) \[ \lim_{x \to \pi \over 2} \frac{\tan \left( \frac{\pi - x}{4} \right) (1 - \sin x)}{(\pi - 2x)^3} \]

Let \( x = \pi \frac{y}{2} \); \( y \to 0 \)

\[ \lim_{y \to 0} \frac{\tan \left( \frac{y}{2} \right) (1 - \cos y)}{(-2y)^3} = \lim_{y \to 0} \frac{-\tan \frac{y}{2} \sin^2 \frac{y}{2}}{(-8) \frac{y^3}{8}} = 1 \]

\[ \lim_{y \to 0} \frac{\tan \frac{y}{2}}{32} \left[ \frac{\sin \frac{y}{2}}{\frac{y}{2}} \right]^2 = \frac{1}{32} \]

15. (c) \( f(0) = 0 \); \( f(x) = xe^{-x} \)

R.H.L. \( \lim_{h \to 0} (0 + h)e^{-2/h} = \lim_{h \to 0} e^{h/2} h = 0 \)

L.H.L. \( \lim_{h \to 0} (0 - h)e^{-2/h} = \lim_{h \to 0} e^{-h/2} h = 0 \)

therefore, \( f(x) \) is continuous.

R.H.D. = \( \lim_{h \to 0} \frac{(0 + h)e^{-2/h} - 0}{h} = 0 \)

L.H.D. = \( \lim_{h \to 0} \frac{(0 - h)e^{-2/h} - 0}{-h} = 0 \)

therefore, L.H.D. = R.H.D.

\( f(x) \) is not differentiable at \( x = 0 \).

16. (b) We know that \( \lim_{x \to \infty} \frac{1}{1 + x} x = e \)

\[ \lim_{x \to \infty} \left( 1 + \frac{a + b}{x} \right)^{2x} = e^2 \]

\[ \lim_{x \to \infty} \left[ 1 + \frac{a + b}{x} \right]^{2x} \left( \frac{a + b}{x} \right)^{2x} = e^2 \]

\[ \lim_{x \to \infty} \frac{a + b}{x} = e^2 \Rightarrow e^{2a} = e^2 \Rightarrow a = 1 \text{ and } b \in R \]

17. (e) \( f(x) = \frac{1 - \tan x}{4x - \pi} \) is continuous in \( \left[ 0, \frac{\pi}{2} \right] \)

\[ f\left( \frac{\pi}{4} \right) = \lim_{x \to \pi \frac{\pi}{4} \to \pi} f(x) = \lim_{x \to \pi \frac{\pi}{4} \to \pi} f\left( \frac{\pi}{4} + h \right) \]

\[ = \lim_{h \to 0} \frac{1 - \tan \left( \frac{\pi}{4} + h \right)}{4 \left( \frac{\pi}{4} + h \right) - \pi}, h > 0 \]

18. (d) \[ \lim_{n \to \infty} \frac{1}{n^2} \left( \frac{1}{n^2} + \frac{2}{n^2} + \frac{4}{n^2} + \frac{3}{n^2} \right) + \ldots + \frac{1}{n^2} \]

\[ = \lim_{n \to \infty} \frac{1}{n^2} \sec^2 \frac{r^2}{n^2} \sec^2 r^2 \]

\[ \Rightarrow \text{ Given limit is equal to value of integral} \]

\[ \frac{1}{2} \int_0^x e^{x^2} x^2 dx \]

\[ \Rightarrow \frac{1}{2} \int_0^1 x^2 dx = \frac{1}{2} \int_0^x \sec^2 t dt \quad \text{[put } x^2 = t \]}

\[ = \frac{1}{2}(\tan t)_0^1 = \frac{1}{2} \tan 1. \]

19. (a) Given limit = \[ \lim_{x \to \alpha} \frac{1 - \cos a(x - \alpha)(x - \beta)}{(x - \alpha)^2} \]

\[ = \lim_{x \to \alpha} \frac{2 \sin^2 \left( \frac{a(x - \alpha)(x - \beta)}{2} \right)}{(x - \alpha)^2} \]

\[ = \lim_{x \to \alpha} \frac{2 \sin^2 \left( \frac{a(x - \alpha)(x - \beta)}{2} \right)}{4} \times \frac{a^2(x - \alpha)^2(x - \beta)^2}{4} \]

\[ = \frac{a^2(\beta - \alpha)^2}{2} \]

20. (c) \[ f'(1) = \lim_{h \to 0} \frac{f(1 + h) - f(1)}{h} \]

As function is differentiable so it is continuous as it is given that \( \lim_{h \to 0} \frac{f(1 + h)}{h} = 5 \) and hence \( f(1) = 0 \)

Hence \( f'(1) = \lim_{h \to 0} \frac{f(1 + h)}{h} = 5 \)

21. (a) \( As f(x) = -2 \land f'(x) \geq 2 \forall x \in [1, 6] \)

Applying Lagrange’s mean value theorem \( \frac{f(6) - f(1)}{5} = f(c) \geq 2 \Rightarrow f(6) \geq 10 + f(1) \)

\( \Rightarrow f(6) \geq 10 - 2 \Rightarrow f(6) \geq 8. \)

22. (b) \[ f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} \]

\[ |f'(x)| = \lim_{h \to 0} \left| \frac{f(x + h) - f(x)}{h} \right| \leq \lim_{h \to 0} \left| \frac{h^2}{h} \right| \]

\[ \Rightarrow |f'(x)| \leq 0 \Rightarrow f'(x) = 0 \]

\[ \Rightarrow f(x) = \text{constant} \]

As \( f(0) = 0 \Rightarrow f(1) = 0 \)
23. (a) \( f(x) = \min \{ x + 1, |x| + 1 \} \Rightarrow f(x) = x + 1 \quad \forall x \in R \)

\[
\begin{align*}
\text{Hence, } f(x) \text{ is differentiable everywhere for all } x \in R.
\end{align*}
\]

24. (b) Given, 
\[ f(x) = \frac{1}{x} - \frac{2}{e^{2x} - 1} \Rightarrow f(0) = \lim_{x \to 0} \frac{1}{x} - \frac{2}{e^{2x} - 1} \]

\[
\begin{align*}
&= \lim_{x \to 0} \frac{e^{2x} - 1 - 2e^{2x}}{x(e^{2x} - 1)} \\
&= \lim_{x \to 0} \frac{0}{0} \quad \text{(form)} \\
&= \lim_{x \to 0} \frac{4e^{2x}}{4xe^{2x} + 2e^{2x} + 2e^{2x}} \\
&= \lim_{x \to 0} \frac{4e^{2x}}{4xe^{2x} + 4e^{2x}} \\
&= \lim_{x \to 0} \frac{4e^{x}}{4xe^{2x} + 4e^{2x}} \\
&= \frac{4e^{0}}{4e^{0}} = 1
\end{align*}
\]

\[ \therefore \text{ using, L'Hospital rule} \]

25. (c) We have 
\[ f(x) = \begin{cases} 
(x-1) \sin \left( \frac{1}{x-1} \right), & \text{if } x \neq 1 \\
0, & \text{if } x = 1
\end{cases} \]

\[
\begin{align*}
\text{Rf'}(l) = \lim_{h \to 0} \frac{f(l+h) - f(l)}{h} \\
= \lim_{h \to 0} \frac{h \sin \frac{1}{h} - 0}{h} = \lim_{h \to 0} \frac{1}{h} = \text{a finite number}
\end{align*}
\]

Let this finite number be \( l \)

\[
\begin{align*}
\text{L f' }(l) = \lim_{h \to 0} \frac{f(l-h) - f(l)}{-h} \\
= \lim_{h \to 0} \frac{-h \sin \left( \frac{1}{h} \right) \frac{1}{h} \sin \left( \frac{1}{h} \right)}{-h} \\
= \lim_{h \to 0} \frac{\sin \left( \frac{1}{-h} \right) \frac{1}{h} \sin \left( \frac{1}{h} \right)}{h} \\
= -\lim_{h \to 0} \sin \left( \frac{1}{h} \right) = -(\text{a finite number}) = -l
\end{align*}
\]

Thus \( \text{Rf'}(l) \neq \text{Lf'}(l) \)

26. (d) \( f(x) \) is a positive increasing function.

\[ 0 < f(x) < f(2x) < f(3x) \]

\[ \Rightarrow 0 < \frac{f(2x)}{f(x)} < \frac{f(3x)}{f(x)} \]

\[ \Rightarrow \lim_{x \to 0} 1 \leq \lim_{x \to 0} \frac{f(2x)}{f(x)} \leq \lim_{x \to 0} \frac{f(3x)}{f(x)} \]

By Sandwich Theorem.

\[ \Rightarrow \lim_{x \to 0} \frac{f(2x)}{f(x)} = 1 \]

27. (d) \( \lim_{x \to 2} \frac{\sqrt{1 - \cos (2(x-2))}}{x-2} = \lim_{x \to 2} \frac{\sqrt{2} \sin(x-2)}{x-2} \)

L.H.L. = \( \lim_{x \to 2^+} \frac{\sqrt{2} \sin(x-2)}{(x-2)} = -\sqrt{2} \)

R.H.L. = \( \lim_{x \to 2^-} \frac{\sqrt{2} \sin(x-2)}{(x-2)} = \sqrt{2} \)

Thus L.H.L. \( \neq \) R.H.L.

Hence, \( \lim_{x \to 2} \frac{\sqrt{1 - \cos (2(x-2))}}{x-2} \) does not exist.

28. (b) \( \text{L.H.L.} = \lim_{h \to 0^-} f(x) = \lim_{h \to 0^+} \frac{\sin \left( \frac{p+1}{h} \right) - \sin(-h)}{-h} \]

\[
\begin{align*}
&= \lim_{h \to 0^-} \frac{-\sin(p+1)h + \sin(-h)}{-h} \\
&= p + 1 + 1 = p + 2
\end{align*}
\]

\( \text{R.H.L.} = \lim_{h \to 0^+} f(x) = \lim_{h \to 0^+} \frac{\sqrt{1 + h - 1}}{h} \]

\[
\begin{align*}
&= \lim_{h \to 0} \frac{1}{\sqrt{1 + h + 1}} = \frac{1}{2}
\end{align*}
\]

and \( f(0) = q \Rightarrow p = \frac{-3}{2}, q = \frac{1}{2} \)

29. (d) \( \lim_{x \to 5} \frac{(f(x))^2 - 9}{\sqrt{|x - 5|}} = 0 \)

\[ \lim_{x \to 5} [(f(x))^2 - 9] = 0 \Rightarrow \lim_{x \to 5} f(x) = 3 \]
30. (a) Let \( f(x) = [x] \cos \left( \frac{2x-1}{2} \right) \)

Doubtful points are \( x = n, n \in \mathbb{N} \)

L.H.L = \( \lim_{x \to n^-} [x] \cos \left( \frac{2x-1}{2} \right) \pi = (n-1) \cos \left( \frac{2n-1}{2} \right) \pi = 0 \)

(\( \because \ [x] \) is the greatest integer function)

R.H.L = \( \lim_{x \to n^+} [x] \cos \left( \frac{2x-1}{2} \right) \pi = n \cos \left( \frac{2n-1}{2} \right) \pi = 0 \)

Now, value of the function at \( x = n \) is \( f(n) = 0 \)

Since, L.H.L = R.H.L. = \( f(n) \)

\( \therefore \ f(x) = [x] \cos \left( \frac{2x-1}{2} \right) \) is continuous for every real \( x \).

31. (c) \( f(x) = |x - 2| = \begin{cases} x - 2, & x - 2 \geq 0 \\ 2 - x, & x - 2 \leq 0 \end{cases} = \begin{cases} x - 2, & x \geq 2 \\ 2 - x, & x \leq 2 \end{cases} \)

Similarly, \( f(x) = |x - 5| = \begin{cases} x - 5, & x \geq 5 \\ 5 - x, & x \leq 5 \end{cases} \)

\( \therefore \ f(x) = |x - 2| + |x - 5| = \{x - 2 + 5 - x = 3, 2 \leq x \leq 5\} \)

Thus \( f(x) = 3, 2 \leq x \leq 5 \)

\( f'(x) = 0, 2 < x < 5 \)

\( f'(4) = 0 \)

\( \therefore \) statement 1 is true.

32. (d) Multiply and divide by \( x \) in the given expression, we get

\( = 2.4 \lim_{x \to 0} \frac{4x}{4 \tan 4x} = 2.4 \frac{1}{4} = 2 \)

33. (b) Consider \( \lim_{x \to 0} \frac{\sin(\pi \cos^2 x)}{x^2} \)

\( = \lim_{x \to 0} \frac{\sin(\pi(1 - \sin^2 x))}{x^2} \)

\( = \lim_{x \to 0} \frac{\sin(\pi - \sin^2 x)}{x^2} \)

\( = \lim_{x \to 0} \frac{\pi \sin^2 x}{x^2} \cdot \frac{\sin^2 x}{x^2} \)

\( = \lim_{x \to 0} \pi \sin^2 x = 0 \)

\( \therefore \ sin(\pi - \theta) = \sin \theta \)

\( = \lim_{x \to 0} \frac{\pi \sin^2 x}{x^2} = \frac{\pi}{x^2} \)

\( = \lim_{x \to 0} \pi \sin^2 x = \pi \)

34. (a) Multiply and divide by \( x \) in the given expression, we get

\( = \lim_{x \to 0} \frac{(1 - \cos 2x)(3 + \cos x)}{x^2 \cdot 1 \cdot \tan 4x} \)

\( = \lim_{x \to 0} \frac{2 \sin^2 x \cdot 3 + \cos x \cdot x}{x^2 \cdot 1 \cdot \tan 4x} \)

\( = 2 \lim_{x \to 0} \frac{\sin^2 x}{x^2} \cdot \lim_{x \to 0} \frac{3 + \cos x \cdot x}{x^2 \cdot \tan 4x} \)

\( = 2.4 \lim_{x \to 0} \frac{4x}{4 \tan 4x} = 2.4 \frac{1}{4} = 2 \)

35. (c) Since \( g(x) \) is differentiable, it will be continuous at \( x = 3 \)

\( \therefore \lim_{x \to 3} g(x) = \lim_{x \to 3} g(x) \)

\( 2k = 5m + 2 \)

(1)

Also \( g(x) \) is differentiable at \( x = 0 \)

\( \therefore \lim_{x \to 3} g'(x) = \lim_{x \to 3} g'(x) \)

\( \frac{K}{2 \sqrt{3 + 1}} = m \)

\( k = 4m \)

(2)

Solving (1) and (2), we get

\( m = \frac{2}{5}, \ k = \frac{8}{5} \)

\( \therefore \ k + m = 2 \)

36. (d) \( g(x) = f(f(x)) \)

In the neighbourhood of \( x = 0 \),

\( f(x) = |\log 2 - \sin x| = (\log 2 - \sin x) \)

\( \therefore \ g(x) = |\log 2 - \sin \log 2 - \sin x|| \)

\( = (\log 2 - \sin(\log 2 - \sin x)) \)

\( \therefore \ g(x) \) is differentiable and \( g'(x) = -\cos(\log 2 - \sin x)(-\cos x) \)

\( \Rightarrow g'(0) = \cos(\log 2) \)
37. (d) \[ y = \lim_{n \to \infty} \left( \frac{(n+1)(n+2)\ldots 3n}{n^{2n}} \right)^{\frac{1}{n}} \]

\[ \ln y = \lim_{n \to \infty} \frac{1}{n} \ln \left[ \left(1 + \frac{1}{n}\right) \left(1 + \frac{2}{n}\right) \ldots \left(1 + \frac{2n}{n}\right) \right] \]

\[ \ln y = \lim_{n \to \infty} \frac{1}{n} \left[ \ln \left(1 + \frac{1}{n}\right) + \ln \left(1 + \frac{2}{n}\right) + \ldots + \ln \left(1 + \frac{2n}{n}\right) \right] \]

\[ = \lim_{n \to \infty} \frac{1}{n} \sum_{r=1}^{2n} \ln \left(1 + \frac{r}{n}\right) \]

\[ = \int_{0}^{2} \ln(1+x) \, dx \]

Let \( 1 + x = t \) \( \implies dx = dt \)

when \( x = 0, \) \( t = 1 \)

when \( x = 2, \) \( t = 3 \)

\[ \ln y = \int_{1}^{3} \ln t \, dt \]

\[ = \left[ t \ln t - t \right]_{1}^{3} = \ln \left( \frac{3}{e^{2}} \right) = \ln \left( \frac{27}{e^{2}} \right) \]

\[ \Rightarrow y = \frac{27}{e^{2}} \]

38. (a) \[ \ln P = \lim_{x \to 0^+} \frac{1}{2x} \ln(1 + \tan^2 \sqrt{x}) \]

Applying L'Hospital's rule:

\[ \lim_{x \to 0^+} \frac{\ln(\sec \sqrt{x})}{x} \]

\[ = \lim_{x \to 0^+} \frac{\sec \sqrt{x} \tan \sqrt{x}}{\sec \sqrt{x} \cdot 2\sqrt{x}} \]

\[ = \lim_{x \to 0^+} \frac{\tan \sqrt{x}}{2\sqrt{x}} \]

\[ = \frac{1}{2} \]

A. Fill in the Blanks

1. \( \frac{2+2x-2x^2}{(x^2+1)^2} \sin \left( \frac{2x-1}{x^2+1} \right)^2 \)

   Given: \( y = f \left( \frac{2x-1}{x^2+1} \right); f'(x) = \sin x^2 \)

   \( \Rightarrow \frac{dy}{dx} = f' \left( \frac{2x-1}{x^2+1} \right) \cdot \frac{d}{dx} \left( \frac{2x-1}{x^2+1} \right) \)

   \( = \sin \left( \frac{2x-1}{x^2+1} \right)^2 \cdot 2(x^2+1) - 2x(2x-1) \)

   \( = \frac{2+2x-2x^2}{(x^2+1)^2} \sin \left( \frac{2x-1}{x^2+1} \right)^2 \)

2. Given that \( F(x) = \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ g_1(x) & g_2(x) & g_3(x) \\ h_1(x) & h_2(x) & h_3(x) \end{vmatrix} \) \( \ldots (1) \)

   \[ F'(x) = \begin{vmatrix} f_1'(x) & f_2'(x) & f_3'(x) \\ g_1(x) & g_2(x) & g_3(x) \\ h_1(x) & h_2(x) & h_3(x) \end{vmatrix} \]

   \[ + \begin{vmatrix} f_1'(x) & f_2(x) & f_3'(x) \\ g_1'(x) & g_2'(x) & g_3'(x) \\ h_1(x) & h_2'(x) & h_3'(x) \end{vmatrix} \]

   \[ + \begin{vmatrix} f_1'(x) & f_2'(x) & f_3(x) \\ g_1(x) & g_2'(x) & g_3(x) \\ h_1(x) & h_2(x) & h_3'(x) \end{vmatrix} \]

   \( \Rightarrow F'(a) = \begin{vmatrix} f_1'(a) & f_2'(a) & f_3'(a) \\ g_1(a) & g_2(a) & g_3(a) \\ h_1(a) & h_2(a) & h_3(a) \end{vmatrix} \) \( \ldots (2) \)

Where \( f_i(x), g_i(x), h_i(x), r = 1, 2, 3, \) are polynomials in \( x \) and hence differentiable and

\[ f_i'(a) = g_i(a) = h_i(a), r = 1, 2, 3 \]

Differentiating eq. (1) with respect to \( x \), we get

\[ F'(x) = \begin{vmatrix} f_1''(x) & f_2''(x) & f_3''(x) \\ g_1(x) & g_2(x) & g_3(x) \\ h_1(x) & h_2(x) & h_3(x) \end{vmatrix} \]

\[ + \begin{vmatrix} f_1'(x) & f_2'(x) & f_3'(x) \\ g_1'(x) & g_2'(x) & g_3'(x) \\ h_1(x) & h_2'(x) & h_3(x) \end{vmatrix} \]

\[ + \begin{vmatrix} f_1'(x) & f_2(x) & f_3'(x) \\ g_1'(x) & g_2(x) & g_3(x) \\ h_1(x) & h_2(x) & h_3'(x) \end{vmatrix} \]
Differentiation

\[
\begin{vmatrix}
    f_1(a) & f_2(a) & f_3(a) \\
    g_1(a) & g_2(a) & g_3(a) \\
    h_1(a) & h_2(a) & h_3(a)
\end{vmatrix}
\]
\[
F'(a) = D_1 + D_2 + D_3
\]
Using eq. (2) we get \(D_1 = D_2 = D_3 = 0\) [By the property of determinants that \(D = 0\) if two rows in \(D\) are identical]
\[
\therefore F'(a) = 0.
\]

3. Given that
\[
f(x) = \log_e (ln x) = \frac{\log_e (\log_e x)}{(\log_e x)}
\]
\[
f'(x) = \frac{1}{\log_e x} \times \frac{1}{x} \times \frac{\log_e x - 1}{x} \log_e (\log_e x)
\]
\[
= \frac{1}{x} \left[ \frac{1 - \log_e (\log_e x)}{\log_e x} \right]
\]
\[
f'(e) = e \frac{1}{\log_e e} \frac{1 - \log_e 1}{(\log_e e)²} = \frac{1}{e} (1 - 1) = \frac{1}{e}.
\]

4. Let \(u = sec^{-1}\left(\frac{1}{2x^2 - 1}\right); v = \sqrt{1 - x^2}\)

Then to find \(\frac{du}{dv}\), we have
\[
u = \cos^{-1}(2x^2 - 1) = 2 \cos^{-1} x
\]
\[
\therefore \frac{du}{dx} = -\frac{2}{\sqrt{1 - x^2}} \quad \text{and} \quad v = \sqrt{1 - x^2}
\]
\[
\therefore \frac{dv}{dx} = -\frac{x}{\sqrt{1 - x^2}} \quad \therefore \frac{du}{dv} = \frac{-\frac{2}{\sqrt{1 - x^2}}}{-\frac{x}{\sqrt{1 - x^2}}} = \frac{2}{x}
\]
\[
\therefore \frac{du}{dx}\bigg|_{x=\frac{1}{2}} = 4
\]

5. \(f(x) = |x - 2|\)
\[
\Rightarrow g(x) = f(f(x)) = |f(x) - 2| \quad \text{as} \ x > 20
\]
\[
= |x - 2| - 2 \quad |x - 2 - 2| \quad \text{as} \ x > 20
\]
\[
= |x - 4| = x - 4 \quad \text{as} \ x > 20
\]
\[
\therefore g'(x) = 1
\]

6. Given: \(y = x^2 + 2x + c\)

Differentiating both sides w.r.t. \(x\), we get
\[
e^{xy} \cdot 1 + xe^{xy} \left( y + x \frac{dy}{dx} \right) = \frac{dy}{dx} + 2 \sin x \cos x
\]
\[
\text{Put} \ x = 0 \Rightarrow \ 1 + 0 = \frac{dy}{dx} + 0 \Rightarrow \frac{dy}{dx} = 1
\]

B. True/False

1. Consider \(f(x) = \frac{f(x) + f(-x)}{2}\), which is an even function.

Now, \(\psi(x) = \phi(x) = \frac{f'(x) - f'(-x)}{2}\)
\[
\psi(-x) = \frac{f'(-x) - f'(x)}{2} = -\psi(x) \quad \therefore \psi \text{ is odd.}
\]

C. MCQs with ONE Correct Answer

1. (c) We have \(y^2 = P(x)\), where \(P(x)\) is a polynomial of degree 3 and hence thrice differentiable. Differentiating (1) w.r.t. \(x\), we get
\[
2y \frac{dy}{dx} = P'(x) \quad \text{(2)}
\]

Again differentiating with respect to \(x\), we get
\[
2 \left( \frac{dy}{dx} \right)^2 + 2y \frac{d^2y}{dx^2} = P''(x)
\]
\[
\Rightarrow \frac{[P'(x)]^2}{2y^2} + 2y \frac{d^2y}{dx^2} = P''(x) \quad \text{[Using (2)]}
\]
\[
\Rightarrow 4y^3 \frac{d^2y}{dx^2} = 2y^2 P''(x) - [P'(x)]^2
\]
\[
\Rightarrow 4y^3 \frac{d^2y}{dx^2} = 2P(x)P''(x) - [P'(x)]^2 \quad \text{[Using (1)]}
\]
\[
\Rightarrow 2y^3 \frac{d^2y}{dx^2} = P(x)P''(x) - \frac{1}{2}[P'(x)]^2
\]

Again differentiating w.r.t. \(x\), we get
\[
2 \frac{d}{dx} \left( \frac{y^3 d^2y}{dx^2} \right)
\]
\[
= P''(x)P(x) + P'(x)P''(x) - P'(x)P'(x) = P''(x)P(x)
\]

2. (b) Let \(f(x) = ax^2 + bx + c\)

As given that \(f(x) > 0\), \(\forall x \in R\)
\[
\therefore a > 0 \text{ and } D < 0
\]
\[
\Rightarrow a > 0 \text{ and } b^2 - 4ac < 0 \quad \text{... (1)}
\]

Now, \(g(x) = f(x) + f'(x) + f''(x)\)
\[
= ax^2 + bx + c + 2ax + b + 2a
\]
\[
= ax^2 + (2a + b)x + (2a + b + c)
\]
Here, \(D = (2a + b)^2 - 4(2a + b + c)\)
\[
= 4a^2 + b^2 - 4ab - 8a^2 - 4ab - 4ac
\]
\[
= b^2 - 4a^2 - 4ac = -4a^2 - 4b^2 + 4ac
\]
\[
= (-ve) + (+ve) = -ve \quad \text{[Using eq. (1)]}
\]

Also \(a > 0\) from (1),
\[
\therefore g(x) > 0, \quad \forall x \in R
\]

3. (a) \(y = \sin x \tan x \Rightarrow \log y = \tan x \log \sin x\)

Differentiating w.r.t. \(x\),
\[
\frac{1}{y} \frac{dy}{dx} = \sec^2 x \log \sin x + \tan x \cdot \frac{1}{\sin^2 x} \cos x
\]
\[
\Rightarrow \frac{dy}{dx} = \sin x \tan x \left( 1 + \sec^2 x \log \sin x \right)
\]

4. (b) \(x^2 + y^2 = 1 \Rightarrow 2x + 2yy' = 0 \Rightarrow x + yy' = 0\)
\[
\Rightarrow 1 + yy'' + (y')^2 = 0 \Rightarrow yy'' + (y')^2 + 1 = 0\]
5. (c) \( F(x) = \int_0^x f(t)dt \) and \( F(x^2) = x^2(1+x) \)
\[ F'(x) = f(x) \]
But \( F'(x^2) \cdot 2x = 2x + 3x^2 \)
\[ \Rightarrow F'(x^2) = \frac{2 + 3x}{2} \Rightarrow f(x^2) = \frac{2 + 3x}{2} \]
\[ \Rightarrow f(4) = \frac{2 + 3 \times 2}{2} = \frac{8}{2} = 4 \]

6. (a) \( \log(x+y) = 2xy \) when \( x = 0 \) then \( y = 1 \)
Differentiating w.r.t. \( x \)
\[ \frac{1}{x+y} + \frac{dy}{dx} = 2y + \frac{2xdy}{dx} \]
\[ \Rightarrow \frac{dy}{dx} = \frac{2y}{2x-y} = \frac{y'}{x+y} \Rightarrow y'(0) = 0 - \frac{2}{1} = -1 \]

7. (d) Let us consider the function \( g(x) = f(x) - x^2 \)
so that
\[ g(1) = f(1) - 1^2 = 1 - 1 = 0 \]
\[ g(2) = f(2) - 2^2 = 4 - 4 = 0 \]
\[ g(3) = f(3) - 3^2 = 9 - 9 = 0 \]
Since \( f(x) \) is twice differentiable we can say \( g(x) \) is continuous and differentiable everywhere and
\[ g(1) = g(2) = g(3) = 0 \]
\[ \therefore \text{By Rolle's theorem, } g'(c) = 0 \text{ for some } c \in (1,2) \]
and \( g'(d) = 0 \) for some \( d \in (2,3) \)
Again by Rolle's theorem,
\[ g''(e) = 0 \text{ for some } e \in (c,d) \Rightarrow e \in (1,3) \]
\[ \Rightarrow f''(e) - 2 = 0 \text{ or } f''(e) = 2 \text{ for some } x \in (1,3) \]
\[ f''(x) = 2 \text{ for some } x \in (1,3) \]

8. (d) \[ \frac{d^2x}{dy^2} = \frac{d^2x}{dy} \cdot \frac{dy}{dx} = \frac{d}{dx} \left( \frac{dy}{dx} \right) \cdot \frac{dx}{dy} \]
\[ = \left( \frac{d}{dx} \left( \frac{1}{dy} \right) \right) \times \frac{1}{dy} = -\frac{1}{(dy/dx)^2} \times \frac{d^2y}{dx^2} \times \frac{1}{dy} \]
\[ = -\left( \frac{dy}{dx} \right)^{-3} \frac{d^2y}{dx^2} \]

9. (a) Given that \( g(x) = \log(x) \Rightarrow g(x+1) = \log(x+1) \)
\[ \Rightarrow g'(x+1) = \frac{x}{x+1} \]
\[ \Rightarrow g'(x) = \frac{x}{x+1} \]
\[ \Rightarrow g''(x) = \frac{1}{x} \]
Putting, \( x = x - \frac{1}{2} \), we get

\[ \Rightarrow g''((x+1)) - g''(x) = -\frac{1}{x^2} \]

D. MCQs with ONE or MORE than one Correct

1. (b, c) \( f(x) = x^3 + 3x + 2 \Rightarrow f'(x) = 3x^2 + 3 \)
Also \( f(0) = 2, f(1) = 6, f(2) = 16, f(3) = 38, f(6) = 236 \)
And \( g(f(x)) = x \Rightarrow g(2) = 0, g(6) = 1, g(16) = 2, g(38) = 3, g(236) = 6 \)
(a) \( g(f(0)) = x \Rightarrow g'(f(0)) \cdot f'(0) = 1 \)
For \( g'(2) = 2 \Rightarrow \Rightarrow x = 0 \)
\[ \therefore \text{Putting } x = 0, \text{ we get } g'(f(0)) f'(0) = 1 \]
\[ \Rightarrow g'(2) = \frac{1}{3} \]
(b) \( h(g(g(x))) = x \Rightarrow h'(g(g(x))) \cdot g'(g(x)) \cdot g'(x) = 1 \)
For \( h'(1) = 1, \) we need \( g'(g(x)) = 1 \)
\[ \Rightarrow g(x) = 6 \Rightarrow x = 236 \]
\[ \therefore \text{Putting } x = 236, \text{ we get } \]
h'[g(g(236))] = \frac{1}{g'(g(236))g'(236)}
\Rightarrow h'(g(6)) = \frac{1}{g'(6)g'(236)}
\Rightarrow h'(1) = \frac{1}{g'(f(1))g'(f(6))} = \frac{f'(1)f'(6)}{g'(6)}
= 6 \times 111 = 666
(c) h[g(g(x))] = x
For h(0), g(g(x)) = 0 \Rightarrow g(x) = 2 \Rightarrow x = 16
\therefore Putting x = 16, we get h(g(g(16))) = 16
\Rightarrow h(0) = 16
\Rightarrow h(g(x)) = x
For h(g(3)), we need g(x) = 3 \Rightarrow x = 38
\therefore Putting x = 38, we get h[g(g(38))] = 38 \Rightarrow h(g(3)) = 38

E. Subjective Problems

1. Let f(x) = \sin(x^2 + 1) then
\[ f'(x) = \lim_{\delta x \to 0} \frac{\sin((x + \delta x)^2 + 1) - \sin(x^2 + 1)}{\delta x} \]
\Rightarrow f'(x) = \lim_{\delta x \to 0} \frac{2\cos\left(\left(x^2 + (\delta x)^2 + 2x\delta x + 1 + x^2 + 1\right)\right) \cdot \sin\left(\frac{(x^2 + (\delta x)^2 + 2x\delta x + 1 - x^2 - 1)}{2}\right)}{\delta x}
\approx \frac{2\cos(x^2 + 1)x\delta x + \left((\delta x)^2 + 2x\delta x\right) \cdot \sin\left(\frac{(\delta x)^2 + 2x\delta x}{2}\right)}{\delta x + 2x}\times \left(\frac{\delta x + 2x}{2}\right)
\Rightarrow f'(x) = 2\cos(x^2 + 1) \lim_{\delta x \to 0} \frac{\sin\left(\frac{(\delta x)^2 + 2x\delta x}{2}\right)}{\frac{(\delta x)^2 + 2x\delta x}{2}} \times \frac{\delta x + 2x}{2}
\Rightarrow f'(x) = 2\cos(x^2 + 1) \times 1 \times \frac{2x}{2} = 2x\cos(x^2 + 1)

2. f(x) = \begin{cases} 
\frac{x - 1}{2x^2 - 7x + 5}, & x \neq 1 \\
\frac{1}{3}, & x = 1 
\end{cases}
\therefore f'(x)_{x=1} = \lim_{h \to 0} \frac{f(1 + h) - f(1)}{h}

= \lim_{h \to 0} \frac{1 + h - 1}{2(1 + h)^2 - 7(1 + h) + 5 + \frac{1}{3}} \times \frac{1}{h}
= \lim_{h \to 0} \frac{h}{2h^2 - 3h + \frac{1}{3}}
= \lim_{h \to 0} \frac{2h - 3}{h} \times \frac{3}{3h(2h - 3)}
= \frac{2}{3h}

3. We have, \( y = \frac{5x}{3(1-x)} + \cos^2(2x + 1) \)
(Clearly y is not defined at x = 1)
\Rightarrow y = \begin{cases} 
\frac{5x}{3(1-x)} + \cos^2(2x + 1), & x < 1 \\
\frac{5}{3} + \cos^2(2x + 1), & x > 1
\end{cases}
\Rightarrow \frac{dy}{dx} = \begin{cases} 
\frac{\frac{5}{3} - (1-x)}{3(1-x)^2} - 2\sin(4x + 2), & x < 1 \\
\frac{5}{3} - (1-x)^2 - 2\sin(4x + 2), & x > 1
\end{cases}
\Rightarrow \frac{dy}{dx} = \frac{\frac{5}{3} - (1-x)^2 - 2\sin(4x + 2), & x < 1}{\frac{5}{3} - (1-x)^2 - 2\sin(4x + 2), & x > 1}
\Rightarrow \frac{dy}{dx} = \frac{5}{3(1-x)^2} - 2\sin(4x + 2), & x < 1
\Rightarrow \frac{dy}{dx} = \frac{5}{3(1-x)^2} - 2\sin(4x + 2), & x > 1

4. We are given \( y = e^{x\sin x^3} + (\tan x)^x \)
Here y is the sum of two functions and in the second function base as well as power are functions of x. Therefore we will use logarithmic differentiation here.
Let \( y = u + v \)
where \( u = e^{x\sin x^3} \quad ...(1) \)
and \( v = (\tan x)^x \quad ...(2) \)
\therefore \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx} \quad ...(3)

Differentiating (1) with respect to x, we get
\[ \frac{du}{dx} = e^{x\sin x^3} \cdot \frac{d}{dx} (x \sin x^3) \]
= \( e^{x\sin x^3} \cdot [3x^2 \cdot \cos x^3 + \sin x^3] \)
Taking log on both sides on equa\( u \) (2), we get
\[ \log v = x \log \tan x \]
Differentiating the above with respect to x, we get
\[ \frac{1}{v} \frac{dv}{dx} = 1 \cdot \frac{1}{\tan x} - \sec^2 x \cdot 1 \cdot \log \tan x \]
\therefore \frac{dv}{dx} = (\tan x)^x \left[ \frac{2x}{\sin 2x} + \log \tan x \right]
Substituting the value of \( \frac{du}{dx} \) and \( \frac{dy}{dx} \) in eqn (3), we get
\[
\frac{dy}{dx} = e^{x \sin x} [\sin x^3 + 3x^3 \cos x^3]
+ (\tan x)^x \left[ \frac{2x}{\sin 2x} + \log \tan x \right]
\]

5. Given that \( f \) is twice differentiable such that
\[
f''(x) = -f(x)\quad \text{and}\quad f'(x) = g(x)
\]
\[
h(x) = (f'(x))^2 + [g(x)]^2
\]
To find \( h(10) \) when \( h(5) = 11 \).
Consider \( h'(x) = 2f'f'' + 2f'g + 2f(x)g(x) + 2g(x)f''(x) \)
\[
\Rightarrow h' = 0, \quad h = k
\]
\[
\Rightarrow h(10) = 11 \Rightarrow h(5) = 11.
\]

6. Let \( F(x) = \left| \begin{array}{ccc} A(x) & B(x) & C(x) \\ A(\alpha) & B(\alpha) & C(\alpha) \\ A'(\alpha) & B'(\alpha) & C'(\alpha) \end{array} \right| \)

Given that \( \alpha \) is a repeated root of a quadratic equation
\[
f(x) = 0
\]
.
We must have \( f(x) = k(x - \alpha)^2 \); where \( k \) is a non-zero
real no.
If we put \( x = \alpha \) on both sides of eq. (1); we get
\[
F(\alpha) = \left| \begin{array}{ccc} A(\alpha) & B(\alpha) & C(\alpha) \\ A(\alpha) & B(\alpha) & C(\alpha) \\ A'(\alpha) & B'(\alpha) & C'(\alpha) \end{array} \right| = 0
\]
\[
[\because R_1 \text{ and } R_2 \text{ are identical}]
\]
\[
\Rightarrow F(\alpha) = 0
\]
Hence \( (x - \alpha) \) is a factor of \( F(x) \)
Differentiating eq. (1) w.r.t. \( x \), we get
\[
F'(x) = \left| \begin{array}{ccc} A'(x) & B'(x) & C'(x) \\ A(\alpha) & B(\alpha) & C(\alpha) \\ A'(\alpha) & B'(\alpha) & C'(\alpha) \end{array} \right|
\]
Putting \( x = \alpha \) on both sides, we get
\[
F'(\alpha) = \left| \begin{array}{ccc} A'(\alpha) & B'(\alpha) & C'(\alpha) \\ A(\alpha) & B(\alpha) & C(\alpha) \\ A'(\alpha) & B'(\alpha) & C'(\alpha) \end{array} \right| = 0
\]
\[
[\text{as } R_1 \text{ and } R_2 \text{ are identical}]
\]
\[
\Rightarrow (x - \alpha) \text{ is a factor of } F'(x) \text{ also. Or we can say}
\]
\[
(x - \alpha)^2 \text{ is a factor of } F(x).
\]
\[
\Rightarrow F(x) \text{ is divisible by } f(x).
\]

7. We have, \( x = \sec \theta - \cos \theta, y = \sec^n \theta - \cos^n \theta \)
\[
\Rightarrow \frac{dx}{d\theta} = \sec \theta \tan \theta + \sin \theta
\]
\[
= \sec \theta \tan \theta + \tan \theta \cos \theta = \tan \theta (\sec \theta + \cos \theta)
\]
and \( \frac{dy}{d\theta} = n \sec^{n-1} \theta \sec \theta \tan \theta - n \cos^{n-1} \theta (-\sin \theta) \)

\[
= n \sec^n \theta \tan \theta + n \tan \theta \cos^n \theta = n \tan \theta (\sec^n \theta + \cos^n \theta)
\]
\[
\therefore \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{n \tan \theta (\sec^n \theta + \cos^n \theta)}{\tan \theta (\sec \theta + \cos \theta)}
\]
or \( \frac{dy}{dx} = n \sec^n \theta + \cos^n \theta \)
\[
\frac{dx}{d\theta} = \frac{1}{\sec \theta + \cos \theta}
\]
Also \( x^2 + 4 = (\sec \theta - \cos \theta)^2 + 4
\]
\[
= \sec^2 \theta + \cos^2 \theta - 2 \sec \theta \cos \theta + 4
\]
\[
= \sec^2 \theta + \cos^2 \theta + 2
\]
\[
= (\sec \theta + \cos \theta)^2
\]
\[
\text{and } y^2 + 4 = \sec^n \theta - \cos^n \theta + 4
\]
\[
= \sec^{2n} \theta + \cos^{2n} \theta - 2 \sec^n \theta \cos^n \theta + 4
\]
\[
= \sec^{2n} \theta + \cos^{2n} \theta + 2
\]
\[
= (\sec^n \theta + \cos^n \theta)^2
\]
Now we have to prove
\[
\left( x^2 + 4 \right)^2 \left( \frac{dy}{dx} \right)^2 = n^2 (y^2 + 4)
\]
\[
\text{LHS } = (\sec \theta + \cos \theta)^2 \cdot \frac{n^2 (\sec^n \theta + \cos^n \theta)^2}{(\sec \theta + \cos \theta)^2}
\]
\[
= n^2 (\sec^n \theta + \cos^n \theta)^2
[\text{Using (1) and (2)}]
\]
\[
= n^2 (\sec^n \theta + \cos^n \theta)^2
[\text{From eq. (3)}]
\]
\[
= \text{RHS}
\]

8. We have given the function
\[
\sin y \frac{\sin \left( \frac{\pi x}{2} \right)}{2} + \frac{\sqrt{3}}{2} \sec^{-1} (2x) + 2 \tan [\ln (x + 2)] = 0
\]
\[
\text{...(1)}
\]
For \( x = -1 \), we have
\[
\sin y \frac{\sin \left( \frac{-\pi}{2} \right)}{2} + \frac{\sqrt{3}}{2} \sec^{-1} (-2) + 2 \tan [\ln (-1 + 2)] = 0
\]
\[
\Rightarrow (\sin y)^{-1} + \frac{\sqrt{3}}{2} \left( \frac{2\pi}{3} \right) + \frac{1}{2} \tan 0 = 0 \Rightarrow \frac{1}{\sin y} = -\frac{\pi}{\sqrt{3}}
\]
\[
\Rightarrow \sin y = -\frac{\sqrt{3}}{\pi}, \text{ when } x = -1 \text{ ...(2)}
\]
Now Let \( u = \sin y \frac{\sin \left( \frac{\pi x}{2} \right)}{2} \)
Taking \( \text{ln on both sides; we get} \)
\[
\ln u = \sin \left( \frac{\pi x}{2} \right) \ln \sin y
\]
Differentiating both sides with respect to \( x \), we get
\[
\frac{1}{u} \frac{du}{dx} = \frac{\pi}{2} \cos \left( \frac{\pi x}{2} \right) \ln \sin y + \cot y \frac{dy}{dx} \sin \left( \frac{\pi x}{2} \right)
\]
\[ \frac{du}{dx} = (\sin y) \left[ \frac{\pi}{2} \cos \left( \frac{\pi x}{2} \right) \ln y + \sin \left( \frac{\pi x}{2} \right) \cot y \frac{dy}{dx} \right] \quad \text{(3)} \]

Now differentiating eq. (1), we get

\[ \frac{d}{dx} \left[ (\sin y) \left( \frac{\pi}{2} \cos \left( \frac{\pi x}{2} \right) \ln y + \sin \left( \frac{\pi x}{2} \right) \cot y \frac{dy}{dx} \right) \right] = \frac{\sqrt{3}}{2x\sqrt{4x^2-1}} + \frac{1}{2x\sqrt{4x^2-1}} - \frac{2}{x+2} \ln(\ln(x+2)) \]

\[ + 2^x \sec^2 \left[ \ln(x+2) \right] \frac{1}{x+2} = 0 \]

\[ \Rightarrow (\sin y) \left( \frac{\pi}{2} \cos \left( \frac{\pi x}{2} \right) \ln y + \sin \left( \frac{\pi x}{2} \right) \cot y \frac{dy}{dx} \right) \]

\[ + \frac{\sqrt{3}}{2x\sqrt{4x^2-1}} + 2^x \ln(\ln(x+2)) \]

\[ + 2^x \sec^2 \left[ \ln(x+2) \right] = 0 \]

At \( x = -1 \) and \( \sin y = -\frac{\sqrt{3}}{\pi} \), we get

\[ \left( -\frac{\sqrt{3}}{\pi} \right)^{-1} \left[ 0 - (-1) \right] = \left[ \frac{\pi^2}{3} - 1 \right] \frac{dy}{dx} = 0 \]

\[ \Rightarrow -\frac{\pi^2}{3\sqrt{3}} \frac{dy}{dx} \bigg|_{x=-1} - \frac{1}{2} + 2^{-1} = 0 \Rightarrow \frac{dy}{dx} \bigg|_{x=-1} = 0 \]

9. \[ y = \frac{ax^2}{(x-a)(x-b)(x-c)} + \frac{bx}{(x-b)(x-c)} + \frac{c}{x-c} + 1 \]

\[ = \frac{ax^2}{(x-a)(x-b)(x-c)} + \frac{bx}{(x-b)(x-c)} + \frac{x}{x-c} \]

\[ = \frac{ax^2}{(x-a)(x-b)(x-c)} + \frac{b}{x-b} + \frac{x}{x-c} \]

\[ = \frac{ax^2}{(x-a)(x-b)(x-c)} + \frac{x^2}{x-c} \]

\[ = \frac{a}{x-a} + \frac{1}{(x-b)(x-c)} \]

\[ \Rightarrow \log y = 3 \log(x-a) - \log(x-b) - \log(x-c) \]

\[ \Rightarrow y' = \frac{3}{x} \frac{1}{x-a} - \frac{1}{x-b} - \frac{1}{x-c} \]

\[ = \left( \frac{1}{x} - \frac{1}{x-a} \right) + \left( \frac{1}{x} - \frac{1}{x-b} \right) + \left( \frac{1}{x} - \frac{1}{x-c} \right) \]

\[ \Rightarrow \frac{d}{dx} \left[ \frac{\pi}{2} \cos \left( \frac{\pi x}{2} \right) \ln y + \sin \left( \frac{\pi x}{2} \right) \cot y \frac{dy}{dx} \right] = \frac{a}{x(a-x)} + \frac{b}{x(b-x)} + \frac{c}{x(c-x)} \]

\[ = \frac{1}{x} \left[ \frac{a}{a-x} + \frac{b}{b-x} + \frac{c}{c-x} \right] \]

**H. Assertion & Reason Type Questions**

1. (b) Given that \( f(x) = 2 + \cos x \) which is continuous and differentiable everywhere.
   Also, \( f'(-x) = -\sin x \Rightarrow f'(x) = 0 \Rightarrow x = n\pi \)
   \( \Rightarrow \) There exists \( c \in [1, t + \pi] \) for \( t \in R \)
   Such that \( f'(c) = 0 \)
   \( \therefore \) Statement-1 is true.
   Also \( f(x) \) being periodic of period \( 2\pi \), statement-2 is true, but statement-2 is not a correct explanation of statement-1.

2. (a) We have \( f(x) = g(x) \sin x \)
   \( \Rightarrow f'(x) = g'(x) \sin x + g(x) \cos x \)
   \( \Rightarrow f'(0) = g(0) \cdot 0 + g(0) = g(0) \quad \because g'(0) = 0 \)
   \( \therefore \) Statement 2 is correct.

   Also \( f''(0) = \lim_{x \to 0} \frac{f'(x) - f'(0)}{x} \)

\[ = \lim_{x \to 0} \frac{g(x) \cos x + g'(x) \sin x - g(0)}{x} \]

\[ = \lim_{x \to 0} g(x) \cos x \]

\[ = \lim_{x \to 0} \frac{g(x) \cos x - g(0)}{x} + \lim_{x \to 0} g'(x) \sin x \]

\[ = \lim_{x \to 0} g(x) \cos x \]

\[ = \lim_{x \to 0} \frac{g(x) \cos x - g(0)}{x} + \lim_{x \to 0} g'(x) \]

\[ = \lim_{x \to 0} g(x) \cos x \]

\[ = \lim_{x \to 0} \left[ g(x) \cot(x) - g(0) \csc x \right] + 0 \]

\[ = \lim_{x \to 0} g(x) \cot x - g(0) \csc x \]

\( \therefore \) Statement 1 is also true and is a correct explanation for statement 2.

**I. Integer Value Correct Type**

1. (2) Given that \( f(x) = x^3 + e^{x/2} \) and \( g(x) = f^{-1}(x) \)
   then we should have \( \text{gof}(x) = x \)
   \( \Rightarrow \text{gof}(x) = x \Rightarrow (x^3 + e^{x/2}) = x \)

   Differentiating both sides with respect to \( x \), we get

\[ g'(x^3 + e^{x/2}) \left( 3x^2 + e^{x/2} \cdot \frac{1}{2} \right) = 1 \]

\[ \Rightarrow g'(x^3 + e^{x/2}) = \frac{1}{3x^2 + e^{x/2} \cdot \frac{1}{2}} \]

For \( x = 0 \), we get \( g'(1) = \frac{1}{1/2} = 2 \)
2. \( f(\theta) = \sin \left( \tan^{-1} \left( \frac{\sin \theta}{\sqrt{\cos 2\theta}} \right) \right) \)
\[= \sin \left[ \sin^{-1} \left( \frac{\sin \theta}{\sqrt{\sin^2 \theta + \cos^2 2\theta}} \right) \right] \left( \because \tan^{-1} \frac{x}{y} = \sin^{-1} \frac{x}{\sqrt{x^2 + y^2}} \right) \]
\[= \sin \left[ \sin^{-1} \left( \frac{\sin \theta}{\cos \theta} \right) \right] = \tan \theta \]
\[\therefore \frac{d}{d\theta} f(\theta) = 1.\]

### Section-B

1. (a) \( y = (x + \sqrt{1 + x^2})^n \)
\[
\frac{dy}{dx} = n(x + \sqrt{1 + x^2})^{n-1} \left(1 + \frac{1}{2}(1 + x^2)^{-1/2}.2x\right); \]
\[
\frac{dy}{dx} = n(x + \sqrt{1 + x^2})^{n-1} \frac{\sqrt{1 + x^2} + x}{\sqrt{1 + x^2}} \]
\[
= \frac{n(\sqrt{1 + x^2} + x)^n}{\sqrt{1 + x^2}} \]
or \( \sqrt{1 + x^2} \frac{dy}{dx} = ny \) or \( \sqrt{1 + x^2} y_1 = ny \)

\[y_1 = \frac{dy}{dx}\] Squaring, \((1 + x^2)y_1^2 = n^2 y^2\)

Differentiating, \((1 + x^2)2y_1y_2 + y_1^2 . 2x = n^2 . 2y_2y_1\)
or \((1 + x^2)y_2 + xy_1 = n^2 y\)

2. (c) \( F(t) = \int_0^t f(t - y)g(y)dy \)
\[
= \int_0^t e^{-y} ydy = e^t \int_0^t e^{-y} ydy \]
\[
= e^t \left[-ye^{-y} - e^{-y}\right]_0 = -e^t \left[ye^{-y} + e^{-y}\right]_0 \]
\[= -e^t \left[te^{-t} + e^{-t} - 0 - 1\right] = -e^t \left[t + 1 - e^t\right] \]
\[= e^t - (1 + t) \]

3. (d) \( f(x) = x^n \Rightarrow f'(x) = nx^{n-1} \)
\( f'(x) = nx^{n-1} \Rightarrow f'(1) = n \)
f'\(x) = n(n-1)x^{n-2} \Rightarrow f''(1) = n(n-1) \)

\[
\frac{d}{dx} \frac{d}{dx} f(x) = \frac{d}{dx} \frac{d}{dx} \left( x^n \right) = \frac{d}{dx} \left( nx^{n-1} \right) = \frac{d}{dx} \left( n(n-1)x^{n-2} \right) = \frac{d}{dx} \left( n(n-1)x^{n-2} \right) = n(n-1)(n-2)x^{n-3} \]
\[
= n(n-1)(n-2)(n-3)x^{n-4} + \cdots + (-1)^n n! \]
\[
= n! \sum_{r=0}^{n} \frac{(-1)^r}{r!} \]
\[
= n! \left( 1 - \frac{n}{1!} + \frac{n(n-1)}{2!} - \frac{n(n-1)(n-2)}{3!} + \cdots + (-1)^n n! \right) \]
\[
= n! \left( 1 - \frac{n}{1!} + \frac{n(n-1)}{2!} - \frac{n(n-1)(n-2)}{3!} + \cdots + (-1)^n n! \right) \]
\[
= n! \left( 1 - \frac{n}{1!} + \frac{n(n-1)}{2!} - \frac{n(n-1)(n-2)}{3!} + \cdots + (-1)^n n! \right) \]
\[
= n! \left( 1 - \frac{n}{1!} + \frac{n(n-1)}{2!} - \frac{n(n-1)(n-2)}{3!} + \cdots + (-1)^n n! \right) \]
\[
= n! \left( 1 - \frac{n}{1!} + \frac{n(n-1)}{2!} - \frac{n(n-1)(n-2)}{3!} + \cdots + (-1)^n n! \right) \]

4. (b) \( f(x) = ax^2 + bx + c \)
\( f(1) = f(-1) \Rightarrow a + b + c = a - b + c \) or \( b = 0 \)
\( \therefore f(x) = ax^2 + c \) or \( f'(x) = 2ax \)

Now \( f'(a); f'(b); \) and \( f'(c) \) are \( 2a(a); 2a(b); 2a(c) \)
i.e. \( 2a^2, 2ab, 2ac \).

\( \Rightarrow \) If \( a, b, c \) are in A.P. then \( f'(a); f'(b) \) and \( f'(c) \) are also in A.P.

5. (c) \( x = e^{y+x} - \cdots \Rightarrow x = e^{y+x} \)
Taking log.
\[
\log x = y + x \Rightarrow \frac{1}{x} = \frac{dy}{dx} + 1 \Rightarrow \frac{dy}{dx} = \frac{1}{x - 1} = \frac{1-x}{x} \]

6. (a) \( x^2 - (a-2)x - a - 1 = 0 \)
\( \Rightarrow \alpha + \beta = a - 2; \alpha \beta = -(a+1) \)
\( \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha \beta = a^2 - 2a + 6 = (a-1)^2 + 5 \)
For min. value of \( \alpha^2 + \beta^2 \) where \( \alpha \) is an integer
\( \Rightarrow a = 1. \)

7. (d) Let \( \alpha, \alpha + 1 \) be roots.
Then \( \alpha + \alpha + 1 = \beta = \text{sum of roots} \alpha (\alpha + 1) = c \)
= product of roots
\( \therefore b^2 - 4c = (2\alpha + 1)^2 - 4\alpha(\alpha + 1) = 1. \)
Differentiation

8. (d) \[ \lim_{x \to 2} \frac{\int_{0}^{4t^3} f(x) \, dt}{x-2} = \lim_{x \to 0} \frac{\int_{0}^{4t^3} f(x) \, dt}{x-2} \]

Applying L’Hospital rule

\[ \lim_{x \to 2} \frac{4f(x)^3 f'(x)}{1} = 4(f(2))^3 f'(2) = 4 \times 6^3 \times \frac{1}{48} = 18 \]

9. (c) \( f(x) = \begin{cases} \frac{x}{1-x}, & x < 0 \\ \frac{x}{1+x}, & x \geq 0 \end{cases} \)

\[ f'(x) = \begin{cases} \frac{1}{(1-x)^2}, & x < 0 \\ \frac{1}{(1+x)^2}, & x \geq 0 \end{cases} \]

\[ \therefore f'(x) \text{ exist at everywhere.} \]

10. (a) \( x^m y^n = (x+y)^{m+n} \)

\[ \Rightarrow \ln x + n \ln y = (m+n) \ln(x+y) \]

Differentiating both sides.

\[ \frac{m}{x} \frac{dy}{dx} + \frac{n}{y} \frac{dy}{dx} = (m+n) \frac{1}{x+y} \frac{dy}{dx} \]

\[ \Rightarrow \left( \frac{m}{x} - \frac{m+n}{x+y} \right) \frac{dy}{dx} = \frac{y}{x(x+y)} \frac{dy}{dx} \]

\[ \Rightarrow \frac{m-x}{y} \frac{dy}{dx} = \frac{y}{x} \frac{dy}{dx} \]

11. (d) \( x^2 - 2x \cot y - 1 = 0 \)

\[ \Rightarrow 2 \cot y = x^2 - \frac{1}{x^2} \Rightarrow 2 \cot y = u - \frac{1}{u} \text{ where } u = x^2 \]

Differentiating both sides with respect to \( x \), we get

\[ -2 \csc^2 y \frac{dy}{dx} = \left(1 + \frac{1}{u^2} \right) \frac{du}{dx} \]

where \( u = x^2 \Rightarrow \log u = \log x \)

\[ \Rightarrow \frac{1}{u} \frac{du}{dx} = 1 + \log x \Rightarrow \frac{du}{dx} = x^2 (1 + \log x) \]

\[ \therefore \text{ we get } -2 \csc^2 y \frac{dy}{dx} = \left(1 + \frac{1}{u^2} \right) \frac{du}{dx} \]

\[ \Rightarrow \frac{dy}{dx} = \frac{x^2 (1 + \log x)}{-2(1 + \cot^2 y)} \text{ ... (i)} \]

Now when \( x = 1, x^2 - 2x \cot y - 1 = 0 \), gives \( 1 - 2 \cot y = 0 \Rightarrow \cot y = 0 \)

\[ \therefore \text{ from equation (i), at } x = 1 \text{ and } \cot y = 0, \text{ we get } \]

\[ y'(1) = \frac{(1+1)(1+0)}{-2(1+0)} = -1 \]

12. (a) \[ g'(x) = 2(f'(2f(x) + 2) \left( \frac{d}{dx} (f(2f(x) + 2)) \right) \]

\[ = 2f'(2f(x) + 2) f'(2f(x) + 2) \left( \frac{d}{dx} (f(2f(x) + 2)) \right) \]

\[ \Rightarrow g'(0) = 2f(2f(0) + 2) f'(2f(0) + 2) \left( \frac{d}{dx} (f(2f(0) + 2)) \right) \]

\[ = 4(-1)(1)^2 = -4 \]

13. (c) \[ \frac{dy}{dx} - \frac{d}{dy} \left( \frac{dy}{dx} \right) \frac{dy}{dx} = \frac{d}{dx} \left( \frac{dy}{dx} \right) \frac{dy}{dx} \]

\[ = \frac{d}{dx} \left( \frac{1}{dx/dy} \right) \frac{dy}{dx} = -\left( \frac{dy}{dx} \right)^2 \frac{d^2 y}{dx^2} \]

\[ = -\frac{1}{\frac{dy}{dx}^3} \frac{d^2 y}{dx^2} \]

14. (a) Let \( y = \sec^{-1} x \) and \( \tan^{-1} x = \theta \).

\[ \Rightarrow x = \tan \theta \]

Thus, we have \( y = \sec \theta \)

\[ \Rightarrow y = \sqrt{1 + x^2} \]

\[ (\because \sec^2 \theta = 1 + \tan^2 \theta) \]

\[ \Rightarrow \frac{dy}{dx} = \frac{1}{2\sqrt{1+x^2}} \cdot 2x \]

At \( x = 1, \frac{dy}{dx} = \frac{1}{\sqrt{2}} \).

15. (b) Since \( f(x) \) and \( g(x) \) are inverse of each other

\[ \therefore g'(f(x)) = \frac{1}{f'(x)} \]

\[ \Rightarrow g'(f(x)) = 1 + x^5 \quad (\because f'(x) = \frac{1}{1 + x^5}) \]

Here \( x = g(y) \)

\[ \therefore g'(y) = 1 + \{g(y)\}^5 \]

\[ \Rightarrow g'(x) = 1 + \{g(x)\}^5 \]

16. (a) Let \( f(x) = \alpha \log |x| + \beta \sqrt{x^2 + x} \)

Differentiating both sides,

\[ f'(x) = \frac{\alpha}{x} + 2\beta x + 1 \]

Since \( x = -1 \) and \( x = 2 \) are extreme points therefore \( f'(x) = 0 \) at these points.

Put \( x = -1 \) and \( x = 2 \) in \( f'(x) \), we get

\[ -\alpha - 2\beta + 1 = 0 \Rightarrow \alpha + 2\beta = 1 \quad \ldots (i) \]

\[ \alpha^2 + 4\beta + 1 = 0 \Rightarrow \alpha + 8\beta = -2 \quad \ldots (ii) \]

On solving (i) and (ii), we get

\[ 6\beta = -3 \Rightarrow \beta = -\frac{1}{2} \quad \therefore \alpha = 2 \]
Properties of Triangle

10. \( (b) \)  

**Section-A**

**JEE Advanced/ IIT-JEE**

**A. Fill in the Blanks**

1. We know that altitude from right vertex to hypotenuse in right angled triangle divides it into two triangles each being similar to the original triangle.  
   \( \therefore \) \( \triangle BDA \sim \triangle BAC \)  
   \( \Rightarrow \frac{BD}{BA} = \frac{AB}{BC} \)

2. In \( \triangle APQ \) and \( \triangle ACB \)  
   \( \angle A = \angle A \) (common)  
   \( \angle AQP = \angle ABC \) (given)  
   \( \therefore \) \( \triangle APQ \sim \triangle ACB \) fig is with (iii) (by AA similarity)  
   \( \Rightarrow \frac{Ar(\triangle APQ)}{Ar(\triangle ACB)} = \frac{AP^2}{AC^2} \)
3. We have \( \angle BAE = \angle CAE \) and \( \angle ADB = \angle ADC = 90^\circ \) (given). \( \angle DAE = \angle BAE - \angle BAC \) and \( \angle ADC = \angle DAE + \angle BAC \) (given).

Now

\[
\angle DAE = \angle BAE - \angle BAC = \angle CAE - (90^\circ - \angle B) = (\angle CAD - \angle DAE) - 90^\circ + \angle B = (90^\circ - \angle C) - \angle DAE - 90^\circ + \angle B
\]

\[\Rightarrow 2 \angle DAE = \angle B - \angle C \Rightarrow \angle DAE = \frac{1}{2}(\angle B - \angle C)\]

4. If \( a^2 + 2a, 2a + 3, a^2 + 3a + 8 \) are sides of a triangle, then the sum of any two sides is greater than the third side.

Let \( x = a^2 + 2a, \ y = 2a + 3, \ z = a^2 + 3a + 8 \)

Then \( x + y > z \Rightarrow a^2 + 4a + 3 > a^2 + 3a + 8 \)

\[\Rightarrow a > 5\] \( \cdots (1) \)

\[y + z > x \Rightarrow a^2 + 5a + 11 > a^2 + 2a \Rightarrow 3a > -11 \]

\[a > -\frac{11}{3}\] \( \cdots (2) \)

\[z + x > y \Rightarrow 2a^2 + 5a + 8 > 2a + 3 \Rightarrow 2a^2 + 3a + 5 > 0 \]

Here coeff. of \( a^2 > 0 \) and \( D = 9 - 40 = -ve \)

\[\therefore \text{it is true for all values of } a\]. Therefore, identity.

Combining (1) and (2), we get \( a > 5 \).

\[\therefore a \in (5, \infty)\]

5. \( \cot A, \cot B, \cot C \) are in A.P.

\[\cot B - \cot A = \cot C - \cot B\]

\[\Rightarrow \frac{\sin(A-B)}{\sin B} = \frac{\sin(B-C)}{\sin C}\]

\[\Rightarrow \sin A \sin B = \sin B \sin C\]

\[\Rightarrow \sin(A-B) \sin(A+B) = \sin(B+C) \sin(B-C)\]

\[\Rightarrow \sin^2 A - \sin^2 B = \sin^2 B - \sin^2 C\]

\[\Rightarrow a^2 - b^2 = b^2 - c^2 \Rightarrow a^2, b^2, c^2 \] are in A.P.

6. Let \( AB = 2 \) units be one of the sides of the polygon.

Then \( \angle AOB = 2\pi/9 \) where \( O \) is the centre of the circle.

If \( OL \perp AB \), then \( AL = 1 \) and \( \angle ALO = \pi/9 \)

\[\therefore \text{Radius of the circle} \]

\[= OA = AL \csc \pi/9 = \csc \pi/9\]

7. 

\[\tan 30^\circ = \frac{h}{\sqrt{3} + 1 - h} = \frac{1}{\sqrt{3}}\]

\[\therefore \text{area of square} = a^2/6 \text{ sq. units}\]
11. Let \( a = 4k \), \( b = 5k \), \( c = 6k \)
\[
\begin{align*}
 s &= \frac{15}{2}k, \quad s-a = \frac{7}{2}k, \quad s-b = \frac{5}{2}k, \quad s-c = \frac{3}{2}k \\
 S &= \frac{15 \times 7 \times 5 \times 3}{2} \left( \frac{k}{2} \right)^4 \Rightarrow S = 15\sqrt{7} \left( \frac{k}{2} \right)^2 \\
r &= \frac{S}{s} = 15\sqrt{7} \left( \frac{k}{2} \right)^4 + \frac{15}{2}k = \frac{\sqrt{7}k}{2} \quad R = \frac{abc}{4S} \\
= \frac{4.5.6k^3}{4.15\sqrt{7}k^2} = \frac{8}{\sqrt{7}k}.
\end{align*}
\]
\[
\therefore \quad \frac{R}{r} = \frac{8}{\sqrt{7}} = \frac{16}{7}.
\]

**C. MCQs with ONE Correct Answer**

1. (c) \( OS: SR = PQ: PR \) (as bisector of an angle, in a triangle, divides the opposite side in the same ratio as the sides containing the angle.)

2. (b) \( \tan 15^\circ = \frac{60}{x} \)
\[
\Rightarrow x = 60 \cot 15^\circ
\]
\[
= 60 \left[ \frac{\sqrt{3} + 1}{\sqrt{3} - 1} \right]
\]

3. (c) Given that \( A > B \)
and \( 3 \sin x - 4 \sin^3 x - k = 0 \), \( 0 < k < 1 \)
\[
\Rightarrow \sin 3x = k
\]
As \( A \) and \( B \) satisfy above eq. (given)
\[
\therefore \sin 3A = k, \quad \sin 3B = k
\]
\[
\Rightarrow \sin 3A - \sin 3B = 0
\]
\[
\Rightarrow 2 \cos \frac{3A + 3B}{2} \sin \frac{3A - 3B}{2} = 0
\]
\[
\Rightarrow \cos \left( \frac{3A + 3B}{2} \right) = 0 \quad \text{or} \quad \sin \left( \frac{3A - 3B}{2} \right) = 0
\]
\[
\Rightarrow \frac{3A + 3B}{2} = 90^\circ \quad \text{or} \quad \frac{3A - 3B}{2} = 0
\]
\[
\Rightarrow A + B = 60^\circ \quad \text{or} \quad A = B
\]
But given that \( A > B \), \( \therefore A \neq B \)
Thus,
\[
A + B = 60^\circ
\]
But \( A + B + C = 180^\circ \)
\[
\Rightarrow C = 180^\circ - 60^\circ = 120^\circ
\]
\[
\therefore \quad C = 2\pi/3
\]

4. (e) Let \( a = 3, b = 5, c = 7 \) then the largest \( \angle \) is opp. to the longest side, i.e., \( \angle C \)
\[
\therefore \cos C = \frac{a^2 + b^2 - c^2}{2ab} = \frac{9 + 25 - 49}{2 \times 3 \times 5} = \frac{-1}{2}
\]
\[
\Rightarrow \quad C = 2\pi/3
\]

5. (a)

**Topic-wise Solved Papers - MATHEMATICS**

In \( \triangle ABD \), applying Sine law we get
\[
\frac{AD}{\sin \pi/3} = \frac{x}{\sin \alpha}
\]
\[
\Rightarrow \quad AD = \frac{\sqrt{3}x}{2\sin \alpha} \quad \ldots (1)
\]
In \( \triangle ACD \), applying Sine law, we get
\[
\frac{AD}{\sin \pi/4} = \frac{3x}{\sin \beta}
\]
\[
\Rightarrow \quad AD = \frac{3x}{2\sqrt{2}\sin \beta} \quad \ldots (2)
\]
From (i) and (ii)
\[
\frac{\sqrt{3}x}{2\sin \alpha} = \frac{3x}{2\sqrt{2}\sin \beta}
\]
\[
\Rightarrow \quad \frac{\sin \alpha}{\sin \beta} = \frac{1}{\sqrt{6}}
\]

6. (b) We know that \( A + B + C = 180^\circ \)
\[
\Rightarrow \quad A + C - B = 180^\circ - 2B
\]
Now
\[
2ac \sin \left[ \frac{1}{2}(A - B + C) \right] = 2ac \sin (90^\circ - B)
\]
\[
= 2ac \cos B = 2ac \left( a^2 + c^2 - b^2 \right) = a^2 + c^2 - b^2
\]

7. (a) We know by Sine rule
\[
\frac{c}{\sin C} = 2R \Rightarrow C = 2R \sin C
\]
\[
\Rightarrow \quad C = 2R \quad (\because \angle C = 90^\circ)
\]
Also
\[
\tan \frac{C}{2} = \frac{r}{s-c}
\]
\[
\Rightarrow \quad r = s-c \quad (\because \angle C = 90^\circ)
\]
\[
\Rightarrow \quad a+b-c = 2r
\]
or
\[
2r + c = a+b
\]
or
\[
2r + 2r = a+b \quad \text{(Using C = 2R)}
\]

8. (b)

Let \( OP = \text{Pole} \),
\( \angle PAO = \angle PBO = \angle PQC = \alpha \)
\[
\frac{OP}{OB} = \tan \alpha \Rightarrow OB = OP \cot \alpha \quad \ldots (1)
\]
Similarly
\[
OA = OP \cot \alpha \quad \ldots (2)
\]
Similarly
\[
OC = OP \cot \alpha \quad \ldots (3)
\]
From (1), (2) and (3), \( OA = OB = OC \) \( \Rightarrow \) \( O \) is the point of circumcentre of the triangle \( ABC \).
9. (b) In \( \triangle CBD \), \( \tan 60^\circ = \frac{100}{x} \Rightarrow x = \frac{100}{\sqrt{3}} \)

In \( \triangle ACB \), \( \tan 30^\circ = \frac{100}{x+d} \Rightarrow x + d = 100 \sqrt{3} \)

\( \Rightarrow d = 100 \sqrt{3} - \frac{100}{\sqrt{3}} = \frac{200 \sqrt{3}}{3} m \)

10. (d) We know by Sine law in \( \triangle ABC \) as

\[ \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = 2R \]

\[ \Rightarrow \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin (A + B)} = 2R \]

(a) If we know \( a, \sin A, \sin B \) we can find \( b, c \); values of \( \angle A, \angle B \) and \( \angle C \) all.
(b) Using \( a, b, c \) we can find \( \angle A, \angle B, \angle C \) using cosine law.
(c) \( a, \sin B, R \) are given then \( \sin A, b \) and hence \( \sin (A + B) \) and then \( C \) can be found.
(d) If we know \( a, \sin A, R \) then we know only the ratio \( \frac{b}{\sin B} = \frac{c}{\sin (A + B)} \); we cannot determine the values of \( b, c, \sin B, \sin C \) separately.

\( \therefore \) \( \Delta \) cannot be determined in this case.

11. (a) Given that \( A : B : C = 4 : 1 : 1 \)

Let \( A = 4x, B = x, C = x \)

But \( A + B + C = 180^\circ \)

\( \Rightarrow 4x + x + x = 180^\circ \Rightarrow x = 30^\circ \)

\( \therefore A = 120^\circ, B = 30^\circ, C = 30^\circ \)

By sine law,

\[ \frac{a}{\sin 120^\circ} = \frac{b}{\sin 30^\circ} = \frac{c}{\sin 30^\circ} \]

\[ \Rightarrow a = \frac{b}{\sqrt{3}/2} = \frac{c}{1/2} \Rightarrow a : b : c = \sqrt{3} : 1 : 1 \]

\( \therefore \) Ratio of longest side to the perimeter

\[ = \sqrt{3} : 1 + 1 + \sqrt{3} = \sqrt{3} : 2 + \sqrt{3} \]

12. (d) Sides are in the Ratio \( 1 : \sqrt{3} : 2 \)

Let \( a = k, b = \sqrt{3} k \) and \( c = 2k \)

\[ \cos A = \frac{b^2 + c^2 - a^2}{2bc} = \frac{3k^2 - k^2}{2 \sqrt{3} k^2} \Rightarrow A = \frac{\pi}{6} \]

\[ \cos B = \frac{c^2 + a^2 - b^2}{2ac} = \frac{1}{2} \Rightarrow B = \frac{\pi}{3} \]

\[ \Rightarrow C = \pi - (A + B) = \frac{\pi}{2} \Rightarrow A : B : C = 1 : 2 : 3 \]

13. (b) The situation is as shown in the figure. For circle with centre \( C_2 \), \( BP \) and \( B'P \) are two tangents from \( B \) to circle, therefore \( BC_2 \) must be the bisector of \( \angle B \). But \( \angle B = 60^\circ \) \( \therefore \) \( \triangle ABC \) is an equilateral \( \Delta \)

\[ \therefore \angle C_2 BP = 30^\circ \]

\[ \therefore \tan 30^\circ = \frac{1}{x} \Rightarrow x = \sqrt{3} \]

\[ \therefore BC = BP + PQ + QC = x + 2 + x = 2 + 2 \sqrt{3} \]

\[ \therefore \text{Area of } \triangle ABC = \frac{\sqrt{3}}{4} \times (2 + 2 \sqrt{3})^2 \]

\[ = 4 \sqrt{3} + 6 \text{ sq. units.} \]

14. (b) Let us consider \( \frac{b-c}{a} \), which is involved in each of the these options.

\[ \frac{b-c}{a} = \frac{\sin B - \sin C}{\sin A} = \frac{2 \cos \frac{B+C}{2} \sin \frac{B-C}{2}}{2 \sin A/2 \cos A/2} \]

\[ = \frac{\sin \frac{B-C}{2}}{\sin A/2} \cos A/2 \]

\[ \therefore \quad (b-c) \cos A/2 = a \sin \frac{B-C}{2} \]

15. (c) By Sine law in \( \triangle ABC \)

\[ \frac{x}{\sin 120^\circ} = \frac{a}{\sin 120^\circ} \Rightarrow x = a \sqrt{3} \]

\[ \therefore \Delta = \frac{1}{2} x \times x \times \sin 120^\circ = \frac{\sqrt{3}}{4} x^2 \]

Also, \( \sqrt{3} = \frac{\Delta}{s} \Rightarrow \frac{(2x+a)}{2} \sqrt{3} = \frac{\sqrt{3}}{4} x^2 \]

\[ \Rightarrow \quad x = 2 + \sqrt{3} \Rightarrow \Delta = \frac{\sqrt{3}}{4} \times 4(4 + 3 + 4 \sqrt{3}) \]

\[ \therefore \Delta = 7 \sqrt{3} + 12 \text{ sq. units.} \]
16. (b) Given $AB \parallel CD$, $CD = 2AB$ Let $AB = a$ then $CD = 2a$
Let radius of circle be $r$. Let circle touches $AB$ at $P$, $BC$ at $Q$, $AD$ at $R$ and $CD$ at $S$.
Then $AR = AP = r$, $BP = BQ = a - r$
$DR = DS = r$ and $CQ = CS = 2a - r$ In $\triangle BEC$
$BC^2 = BE^2 + EC^2 \Rightarrow (a - r + 2a - r)^2 = (2r)^2 + (a)^2$
$\Rightarrow 9a^2 + 4r^2 - 12ar = 4r^2 + a^2$
$\Rightarrow a = \frac{3}{2}r$ ...(1)
Also $Ar(quad. ABCD) = 18$
\[ \text{Diagram showing circle and circle touching lines.} \]

19. (b) Let two sides of $\triangle$ be $a$ and $b$.
Then $a + b = x$ and $ab = y$.
Also given $x^2 - c^2 = y$, where $c$ is the third side of $\triangle$.
$\Rightarrow (a + b)^2 - c^2 = ab \Rightarrow a^2 + b^2 - c^2 = -ab$
$\Rightarrow \frac{a^2 + b^2 - c^2}{2ab} = -\frac{1}{2} \Rightarrow \cos c = -\frac{1}{2} \Rightarrow c = 120^\circ$
\[ \text{Diagram showing circle and circle touching lines.} \]

\[ \frac{r}{R} = \frac{\Delta}{s} \times \frac{4\Delta}{abc} \quad \text{where} \Delta = \text{area of triangle} \]
$\Rightarrow \frac{r}{R} = \frac{4\Delta^2}{(a+b+c)abc} = \frac{8 \times \left(\frac{1}{2}ab\sin c\right)^2}{(a+b+c)abc}$
$\Rightarrow 2a^2b^2\sin^2\angle B = \frac{2ab \times \frac{3}{4}}{(a+b+c)bc} = \frac{3y}{2c(x+c)}$

D. MCQs with ONE or More THAN One Correct

1. (a, d) We have
$\frac{\sin A}{a} = \frac{\sin B}{b} \Rightarrow a \sin B = b \sin A$
(a) $b \sin A = a \Rightarrow a \sin B = a \Rightarrow \sin B = 1 \Rightarrow B = \pi/2$
Since $A < \pi/2$, the $\triangle ABC$ is possible.
(b) $b \sin A > a \Rightarrow a \sin B > a \Rightarrow \sin B > 1$
Which is impossible. Hence the possibility (b) is ruled out.
Similarly (c) can be shown to be impossible.
(d) $b \sin A < a \Rightarrow a \sin B < a \Rightarrow \sin B < 1$ so value of $\angle B$
exists.
Now, $b > a \Rightarrow B > A$. Since $A < \pi/2$
The $\Delta ABC$ is possible when $B > \pi/2$.
(c) Since $b = a$, we have $B = A$. But $A > \pi/2$
\[ \Rightarrow B > \pi/2. \text{But this is not possible for any triangle.} \]

2. (a, d) Since the angles of triangle are in A.P., Let $\angle A = x - d$, $\angle B = x$, $\angle C = x + d$
Then by $\angle$ sum property of triangle, we have
$\angle A + \angle B + \angle C = 180^\circ$
$\Rightarrow x - d + x + x + d = 180^\circ$
$\Rightarrow 3x = 180^\circ \Rightarrow x = 60^\circ$
$\Rightarrow \angle B = 60^\circ$
Using cosine formula $\cos B = \frac{a^2 + c^2 - b^2}{2ac}$
We get $\cos 60^\circ = \frac{100 + c^2 - 81}{2 \times 10 \times c}$
Thus by symmetry $A_0A_4 = \sqrt{3}$
\[\therefore A_0A_1A_0A_2A_3A_4 = 1 \cdot \sqrt{3} \cdot \sqrt{3} = 3\]
\[\therefore (c)\ is\ the\ correct\ option.\]

5. \((a,b,c,d)\) By simple geometry in $\triangle AFE$, $AF = AE$
\[\therefore \triangle AFE\ is\ an\ isosceles \triangle\]
Now $Ar(\triangle ABC) = Ar(\triangle ABD) + Ar(\triangle AEC)$
\[\Rightarrow \frac{1}{2}bc \sin A = \frac{1}{2}cAD \sin \frac{A}{2} + \frac{1}{2}bAD \sin \frac{A}{2}\]
\[\Rightarrow \quad AD = \frac{2bc \cos A}{b + c}\]

Also $AD = AE \cos \frac{A}{2}$
\[\Rightarrow \quad AE = \frac{2bc}{b + c} = HM\ of\ b\ and\ c.\]

Again $EF = 2DE = 2. AD\ tan \frac{A}{2} = \frac{4bcsin \frac{A}{2}}{b + c}$

6. \((b)\) Given that $a = x^2 + x + 1$, $b = x^2 - 1$, $c = 2x + 1$ and $\angle C = \pi/6$

Using $\cos C = \frac{a^2 + b^2 - c^2}{2ab}$

we get $\cos \frac{\pi}{6} = \frac{(x^2 + x + 1)^2 + (x^2 - 1)^2 - (2x + 1)^2}{2(x^2 + x + 1)(x^2 - 1)}$
\[\Rightarrow \quad \frac{\sqrt{3}}{2} = \frac{(x^2 + 3x + 2)(x^2 - x) + (x^2 - 1)^2}{2(x^2 + x + 1)(x^2 - 1)}\]
\[\Rightarrow \quad \sqrt{3}(x^2 + x + 1)(x + 1)(x - 1) = x(x - 1)(x + 1)(x^2 + x + 1) + (x + 1)(x - 1)^2\]
\[\Rightarrow \quad (x + 1)(x - 1)\left[\sqrt{3}(x^2 + x + 1) - x(x + 2) - (x + 1)(x - 1)\right] = 0\]
\[\Rightarrow \quad (x + 1)(x - 1)\left[\sqrt{3} - 2\right]x^2 + \left[\sqrt{3} - 2\right]x + \left(\sqrt{3} + 1\right) = 0\]
\[\Rightarrow \quad x = -1, l, \left(\sqrt{3} + 1\right), -\left(\sqrt{3} + 2\right)\]

Now for $x = -1$ and $1$, $b = 0$ which is not possible
Also for $x = \left(2 + \sqrt{3}\right)$, $c = -4 - 2\sqrt{3} + 1 < 0$ which is not possible
\[\therefore \quad x = \sqrt{3} + 1\]
7. (b, d) Let \( PN = x, QL = x + 2, RM = x + 4 \) where \( x \) is an even integer.

Then \( PM = PN = x, QN = QL = x + 2 \)
and \( RL = RM = x + 4 \)
So that \( PQ = 2x + 2, QR = 2x + 6, PR = 2x + 4 \)

Now \( \cos P = \frac{1}{3} \Rightarrow \frac{PQ^2 + PR^2 - QR^2}{2PQ \cdot PR} = \frac{1}{3} \)

\[
= \frac{(2x+2)^2 + (2x+4)^2 - (2x+6)^2}{2(2x+2)(2x+4)} = \frac{1}{3}
\]

\( \Rightarrow \frac{3[(x+1)^2 + (x+2)^2 - (x+3)^2]}{2(x+1)(x+2)} = 2(x+1)(x+2) \)
\( \Rightarrow 3(x^2 - 4) = 2(x+1)(x+2) \Rightarrow 3x - 6 = 2x + 2 \Rightarrow x = 8 \)
\( \therefore \) \( PQ = 18, QR = 22, PR = 20 \)

8. (a, c, d) \[
\frac{s-x}{4} = \frac{s-y}{3} = \frac{s-z}{2} = \frac{s-x+s-y+s-z}{4+3+2} = \frac{s}{9}
\]

\( \therefore x = \frac{5s}{9}, y = \frac{6s}{9}, z = \frac{7s}{9} \)

Area of incircle \( = \pi r^2 = \pi \frac{\Delta^2}{s^2} = \frac{8\pi}{3} \)

\( \Rightarrow \frac{s(s-x)(s-y)(s-z)}{s^2} = \frac{8}{3} \)

\( \Rightarrow \frac{4 \times 3 \times 2s^3}{9 \times 9 \times 9s} = \frac{8}{3} \) or \( s = 9 \)

\( \therefore x = 5, y = 6, z = 7 \)

(a) Area of \( \Delta XYZ = \sqrt{s(s-x)(s-y)(s-z)} \)

\( = \sqrt{9 \times 4 \times 3 \times 2} = 6\sqrt{6} \)

(b) radius of circumcircle, \( R = \frac{xyz}{4\Delta} \)

\( = \frac{5 \times 6 \times 7}{4 \times 6 \sqrt{6}} = \frac{35\sqrt{6}}{24} \)

(c) \( r = 4R \sin \frac{X}{2} \sin \frac{Y}{2} \sin \frac{Z}{2} \Rightarrow \sin \frac{X}{2} \sin \frac{Y}{2} \sin \frac{Z}{2} = \frac{r}{4R} \)

\( = \frac{2\sqrt{2} \times 24}{\sqrt{3} \times 4 \times 3\sqrt{6}} = \frac{4}{35} \)

(d) \( \sin^2 \frac{X+Y}{2} = \cos^2 \frac{Z}{2} \)

\( = \frac{s(s-z)}{xy} = \frac{9 \times 2}{5 \times 6} = \frac{3}{5} \)

\( \text{Toprove:} \)
\( AB \times AC = AE \times AD \)

\( \text{Construction: Join BE} \)

\( \text{Proof:} \quad \angle ABE = 90^\circ \) (in a semi circle)

Now in \( \Delta's \ ABE \) and \( ADC \)
Properties of Triangle

\[ \angle ABE = \angle ADC \quad \text{(each 90°)} \]
\[ \angle AEB = \angle ACD \quad \text{('s in the same segment)} \]
\[ \therefore \quad \triangle ABE \sim \triangle ADC \quad \text{(by AA similarity)} \]

\[ \Rightarrow \quad \frac{AB}{AE} = \frac{AD}{AC} \]
\[ \Rightarrow \quad AB \times AC = AD \times AE \quad \text{(Proved)} \]

3. By exterior angle theorem, in the adjacent fig.

\[ \angle APB = \angle BPC = \alpha \]
Also in \( \triangle ABP \), \( \angle BAP = \angle APB = \alpha \)
\[ \Rightarrow \quad AB = PB = a \]
Applying sine law in \( \triangle PBC \), we get
\[ \frac{a}{\sin (180° - 3\alpha)} = \frac{b}{\sin \alpha} = \frac{PC}{\sin 2\alpha} \quad \ldots (1) \]
\[ \Rightarrow \quad \frac{a}{3\sin \alpha - 4\sin^3 \alpha} = \frac{b}{\sin \alpha} = \frac{PC}{2\sin \alpha \cos \alpha} \]
\[ \Rightarrow \quad \frac{a}{3 - 4\sin^2 \alpha} = \frac{b}{\sin \alpha} = \frac{PC}{2\cos \alpha} \]
\[ \Rightarrow \quad 3 - 4\sin^2 \alpha = \frac{a}{b} \quad \Rightarrow \quad \sin^2 \alpha = \frac{3b - a}{4b} \]
\[ \Rightarrow \quad \cos^2 \alpha = \frac{b + a}{4b} \]
\[ \Rightarrow \quad \cos \alpha = \frac{1}{2} \sqrt{\frac{b + a}{b}} \]
Also \( PC = 2b \cos \alpha = \sqrt{b(a + b)} \)

Now in \( \triangle PCQ \)
\[ \sin 3\alpha = \frac{h}{PC} \quad \Rightarrow \quad h = PC \cdot \left( \frac{a \sin \alpha}{b} \right) \quad \text{[Using eqn. (1)]} \]
\[ \Rightarrow \quad h = \sqrt{b(a + b)} \cdot \frac{a}{b} \cdot \frac{3b - a}{4b} \]
\[ \Rightarrow \quad h = \frac{a}{2b} \cdot \sqrt{(a + b)(3b - a)} \]
(b) \[ \therefore \quad \angle ACB = 22 \frac{1}{2}° \]
\[ \therefore \quad \angle AOB = 45° \]
\[ r = 10 \text{ cm} \]

Area of the segment \( APB \) = Area of the sector \( AOB \) - area of \( \triangle AOB \)
\[ \frac{1}{8} \pi r^2 - \frac{1}{2} \times 10 \times 10 \sin 45° \quad \text{(Using, } \Delta = \frac{1}{2} bc \sin A) \]
\[ = \frac{3.14 \times 100}{8} - \frac{50}{\sqrt{2}} = 3.91 \text{ sq. cm.} \]

4. In \( \triangle ACD \), \( \cos C = \frac{b}{a/2} = \frac{2b}{a} \) \quad \ldots (1)

In \( \triangle ABC \), \( \cos C = \frac{a^2 + b^2 - c^2}{2ab} \) \quad \ldots (2)

From (1) and (2),
\[ \frac{2b}{a} = \frac{a^2 + b^2 - c^2}{2ab} \quad \Rightarrow \quad b^2 = \frac{1}{3} (a^2 - c^2) \] \quad \ldots (3)

Also \( \cos A = \frac{b^2 + c^2 - a^2}{2bc} \)
\[ \therefore \quad \cos A \cos C = \frac{b^2 + c^2 - a^2}{2bc} \times \frac{2b}{a} = \frac{b^2 + c^2 - a^2}{ac} \]
\[ = \frac{1}{3} (a^2 - c^2) + \frac{1}{3} (c^2 - a^2) = \frac{2(c^2 - a^2)}{3ac} \]

5. Given that \( AB = AC \)
\[ \therefore \quad \angle 1 = \angle 2 \] \quad \ldots (1)

But \( AB \parallel DF \) (given) and \( BC \) is transversal
\[ \therefore \quad \angle 1 = \angle 3 \] \quad \ldots (2)
From equations (1) and (2)
\[\angle 2 = \angle 3\]
\[\Rightarrow DF = CF\] ....(3)
Similarly we can prove \(DE = BE\)
Now, \(DF + FA + AE + ED = CF + FA + AE + BE\)
\[= AC + AB\] [using equation (3) and (4)]

6. (i) Let \(h\) be the height of tower \(PQ\).

In \(\triangle APQ\) \(\tan \theta = \frac{h}{AP} \Rightarrow AP = \frac{h}{\tan \theta}\)

Similarly in \(\triangle BPQ\) and \(\triangle CPQ\) we obtain
\[BP = \frac{h}{\tan \theta} = CP\]
\[\therefore AP = BP = CP\]
\[\Rightarrow P\] is the circumcentre of \(\triangle ABC\) with circum radius \(R = AP = \frac{abc}{4\Delta}\)

\[\therefore h = AP \tan \theta = \frac{abc \tan \theta}{4\Delta}\]

(ii) Given \(AP = AB \times n\)
\[\Rightarrow \frac{AP}{AB} = \frac{1}{n} = \tan \theta\]
\[\therefore \tan \theta = \frac{1}{n}\]

Also \(\tan (\theta - \beta) = \frac{AC}{AP} = \frac{1}{2} \Rightarrow \frac{1}{2} = \frac{1}{2n}\)
\[\Rightarrow \tan \theta - \tan \beta = \frac{1}{2n} \Rightarrow \frac{1}{1 + \tan \theta \tan \beta} = \frac{1}{2n}\]
\[\Rightarrow 2n - 2n^2 \tan \beta = n + \tan \beta\]
\[\Rightarrow (2n^2 + 1) \tan \beta = n \Rightarrow \tan \beta = \frac{n}{2n^2 + 1}\]

7. As the angles \(A, B, C\) of \(\triangle ABC\) are in \(AP\)
\[\therefore \text{Let } A = x - d, B = x, C = x + d\]
But \(A + B + C = 180^\circ\) \(\text{ (Sum prop. of } \triangle)\)
\[\Rightarrow x - d + x + x + d = 180^\circ\]
\[\Rightarrow 3x = 180^\circ \Rightarrow x = 60^\circ \Rightarrow \angle B = 60^\circ\]
Now by sine law in \(\triangle ABC\), we have
\[\frac{b}{\sin B} = \frac{c}{\sin C} \Rightarrow \frac{b}{c} = \frac{\sin B}{\sin C}\]
\[\Rightarrow \sqrt{\frac{3}{2}} = \sin 60^\circ \Rightarrow \frac{\sqrt{3}}{2} = \sin C\]
\[\Rightarrow \sqrt{\frac{3}{2}} = \sqrt{\frac{3}{2}} \Rightarrow \sin C = \frac{1}{2} = \sin 45^\circ\]
\[\therefore \angle C = 45^\circ \Rightarrow \angle A = 180^\circ - (\angle B + \angle C)\]
\[= 180^\circ - (60^\circ + 45^\circ) = 75^\circ\]

8. Let ht. of pole \(PQ\) be \(h\).

In \(\triangle APQ\), \(\tan \alpha = \frac{h}{AQ}\)
\[\Rightarrow AQ = \frac{h}{\tan \alpha}\] ....(1)

In \(\triangle BPQ\), \(\tan \beta = \frac{h}{BQ} \Rightarrow BQ = \frac{h}{\tan \beta}\) ....(2)

In \(\triangle ABQ\), \(\cos \gamma = \frac{AQ^2 + BQ^2 - AB^2}{2AQ \cdot BQ}\)
\[\therefore \cos \gamma = \frac{h^2 \cot^2 \alpha + h^2 \cot^2 \beta - d^2}{2h^2 \cot \alpha \cot \beta} \Rightarrow -2h^2 \cot \alpha \cot \beta \cos \gamma + h^2 \cot^2 \alpha + h^2 \cot^2 \beta = d^2\]
\[\Rightarrow h = \frac{d}{\sqrt{\cot^2 \alpha + \cot^2 \beta - 2 \cot \alpha \cot \beta \cos \gamma}}\]

9. According to question figure is as follows

Here, \(\angle BDC = 90^\circ, BD = 2\text{ km}\)
\(\angle BDA = 40^\circ, \Rightarrow \angle ADC = 130^\circ\)
\(\therefore \angle DCA = 180^\circ - (25^\circ + 130^\circ) = 25^\circ\)
From the figure, in \(\triangle ABD\), using sine law
\[\frac{AD}{\sin 115^\circ} = \frac{BD}{\sin 25^\circ} \Rightarrow AD \cdot \sin 115^\circ = BD \cdot \sin 25^\circ\]
\[\Rightarrow AD = \frac{2 \sin (90^\circ + 25^\circ)}{\sin 25^\circ} = \frac{2 \cos 25^\circ}{\sin 25^\circ}\]
\[\Rightarrow AD = 2 \cot 25^\circ\]
\[= 2 \sqrt{\frac{1}{\sin^2 25^\circ} - 1} = 2 \sqrt{\frac{1}{(0.433)^2} - 1} = 4.28 \text{ km}\]
10. **KEY CONCEPT:**

Ex-radii of \( \triangle ABC \) are \( r_1 = \frac{\Delta}{s-a}, r_2 = \frac{\Delta}{s-b} \)

\[ r_3 = \frac{\Delta}{s-c} \]  
As \( r_1, r_2, r_3 \) are in HP. \( \Rightarrow \frac{1}{r_1} \neq \frac{1}{r_2} \neq \frac{1}{r_3} \) are in AP

\[ \Rightarrow \frac{s-a}{\Delta}, \frac{s-b}{\Delta}, \frac{s-c}{\Delta} \] are in AP

\[ \Rightarrow s-a, s-b, s-c \] are in AP

\[ \Rightarrow -a, -b, -c \] are in AP.

\[ \Rightarrow a, b, c \] are in A.P.

11. Given that \( \cos A + \cos B + \cos C = \frac{3}{2} \) in \( \triangle ABC \)

\[ \Rightarrow \cos \left( \frac{A-B}{2} \right) = \frac{1}{2} \cos C \]

\[ \Rightarrow \cos \left( \frac{A-B}{2} \right) = \frac{1}{2} \cos C \]

\[ \Rightarrow \cos \left( \frac{A-B}{2} \right) = \frac{1}{2} \cos C \]

\[ \Rightarrow \cos \left( \frac{A-B}{2} \right) = \frac{1}{2} \cos C \]

Which is possible only when

\[ 1 - 2 \sin C/2 = 0 \Rightarrow \sin C/2 = 1/2 \]

\[ \Rightarrow C/2 = 30^\circ \Rightarrow C = 60^\circ \]

Also then \( \cos \frac{A-B}{2} = 1 \Rightarrow \frac{A-B}{2} = 0 \Rightarrow A-B = 0 \) ...(1)

and \( A + B = 180^\circ - 60^\circ = 120^\circ \) \( A + B = 120^\circ \) ...(2)

From (1) and (2), \( A = B = 60^\circ \)

Thus we get \( A = B = C = 60^\circ \). \( \therefore \triangle ABC \) is an equilateral \( \Delta \).

12. Given that, in \( \triangle ABC \),

\[ \frac{b+c}{11} = \frac{c+a}{12} = \frac{a+b}{13} \]

where \( a, b, c \) are the lengths of sides \( BC, CA \) and \( AB \) respectively.

Let \( \frac{b+c}{11} = \frac{c+a}{12} = \frac{a+b}{13} = k \)

\[ \Rightarrow \frac{b+c}{11} = k \]

\[ \Rightarrow \frac{c+a}{12} = k \]

\[ \Rightarrow \frac{a+b}{13} = k \]

Adding the above three eqs. we get

\[ 2(a+b+c) = 36k \]

\[ \Rightarrow a+b+c = 18k \] ...(4)

Solving each of (1), (2) and (3) with (4), we get

Now, \( \cos A = \frac{b^2 + c^2 - a^2}{2bc} \)

\[ = \frac{36k^2 + 25k^2 - 49k^2}{2 \times 6k \times 5k} = \frac{12k^2}{60k^2} = \frac{1}{5} \]

\[ \cos B = \frac{c^2 + a^2 - b^2}{2ca} = \frac{25k^2 + 49k^2 - 36k^2}{2 \times 5k \times 7k} = \frac{38k^2}{70k^2} = \frac{19}{35} \]

\[ \cos C = \frac{a^2 + b^2 - c^2}{2ab} = \frac{49k^2 + 36k^2 - 25k^2}{2 \times 7k \times 6k} = \frac{60k^2}{84k^2} = \frac{5}{7} \]

\[ \therefore \frac{\cos A}{1/5} = \frac{\cos B}{19/35} = \frac{\cos C}{5/7} \]

\[ \Rightarrow \cos A = \frac{1}{5}, \cos B = \frac{19}{35}, \cos C = \frac{5}{7} \]

\[ \Rightarrow \cos A = \frac{7/35} = 19/35 \]

\[ \Rightarrow \cos A = \frac{19}{25}, \cos C = \frac{25}{35} \]

\[ \Rightarrow \cos A = \frac{7}{19}, \cos C = \frac{25}{19} \]

13. Let \( \ell \) be the length of the ladder, then

In \( \triangle OQB \), \( \cos \beta = \frac{OB}{BQ} \)

\[ \Rightarrow OB = \ell \cos \beta \] ...(1)

Similarly in \( \triangle OPA \), \( \cos \alpha = \frac{OA}{PA} \)

\[ \Rightarrow OA = \ell \cos \alpha \] ...(2)

Now \( a = OB - OA = \ell (\cos \beta - \cos \alpha) \) ...(3)

Also from \( \triangle OAP \), \( OP = \ell \sin \alpha \)

And in \( \triangle OQB \), \( OQ = \ell \sin \beta \)

\[ \Rightarrow OB = \ell \sin \alpha, OQ = \ell \sin \beta \] ...(4)

Dividing eq. (3) by (4) we get

\[ \frac{a}{b} = \frac{2 \sin \left( \frac{\alpha + \beta}{2} \right) \sin \left( \frac{\alpha - \beta}{2} \right)}{2 \cos \left( \frac{\alpha + \beta}{2} \right) - \sin \left( \frac{\alpha - \beta}{2} \right)} \]

\[ \Rightarrow \frac{a}{b} = \tan \left( \frac{\alpha + \beta}{2} \right) \]

Thus, \( a = b \tan \left( \frac{\alpha + \beta}{2} \right) \) is proved.
14. Let $AD$ be the median in $\triangle ABC$.
Let $\angle B = \theta$ then $\angle C = 105^\circ - \theta$
In $\triangle ABD$, using sine law, we get

\[
\frac{BD}{\sin 30^\circ} = \frac{AD}{\sin \theta} \Rightarrow BD = \frac{AD}{2 \sin \theta}
\]

In $\triangle ACD$, using sine law, we get

\[
\frac{DC}{\sin 45^\circ} = \frac{AD}{\sin (105^\circ - \theta)} \Rightarrow DC = \frac{AD}{\sqrt{2} \sin (105^\circ - \theta)}
\]

As $BD = DC$

\[
\Rightarrow \frac{AD}{2 \sin \theta} = \frac{AD}{\sqrt{2} \sin (105^\circ - \theta)}
\]

\[
\Rightarrow \sin (90^\circ + 15^\circ - \theta) = \sqrt{2} \sin \theta
\]

\[
\Rightarrow \cos 15^\circ \cos \theta + \sin 15^\circ \sin \theta = \sqrt{2} \sin \theta
\]

\[
\Rightarrow \cot \theta = \frac{\sqrt{2} - \sin 15^\circ}{\cos 15^\circ} = \frac{5 - \sqrt{3}}{\sqrt{3} + 1} = 3\sqrt{3} - 4
\]

\[
\Rightarrow \cosec \theta = \sqrt{1 + \cot^2 \theta} = \sqrt{1 + 27 + 16 - 24\sqrt{3}}
\]

\[
\Rightarrow \cosec \theta = 2\sqrt{11 - 6\sqrt{3}}
\]

\[
\therefore \quad BD = \frac{AD}{2 \sin \theta} = \frac{1}{\sqrt{11 - 6\sqrt{3}}} \times \frac{2\sqrt{11 - 6\sqrt{3}}}{2} = 1
\]

\[
\therefore \quad BC = 2 \cdot BD = 2 \text{ units}
\]

15. We are given that in $\triangle ABC$ cos $A$ cos $B$ + sin $A$ sin $B$ sin $C = 1$

\[
\Rightarrow \sin A \sin B \sin C = 1 - \cos A \cos B
\]

\[
\Rightarrow \cos C = \frac{1 - \cos A \cos B}{\sin A \sin B}
\]

\[
\Rightarrow \frac{1 - \cos A \cos B}{\sin A \sin B} \leq 1 \quad \text{[} \because \sin C \leq 1\]

\[
\Rightarrow 1 - \cos A \cos B \leq \sin A \sin B
\]

\[
\Rightarrow 1 - \cos A \cos B \leq \sin A \sin B
\]

\[
\Rightarrow 1 - \cos A \cos B + \sin A \sin B
\]

\[
\Rightarrow 1 \leq \cos (A - B) \Rightarrow 1 \leq \cos (A - B)
\]

But we know cos $(A - B) \leq 1$

\[
\therefore \quad \text{We must have} \quad \cos (A - B) = 1
\]

\[
\Rightarrow \quad A = B
\]

\[
\therefore \quad \cos A \cos A + \sin A \sin A \sin A = 1 \quad [\text{For} \ A = B]
\]

\[
\Rightarrow \quad \cos^2 A + \sin^2 A \sin A = 1
\]

\[
\Rightarrow \quad sin^2 A \sin C = 1 - \cos^2 A
\]

16. Let $ABC$ be the isosceles triangular sign board with $BC$ horizontal. $DE$ be the pole of height $h$. Let the man be standing at $P$ such that $PE = d$

Also ATQ, $\angle APE = \beta$

$\angle CPF = \alpha$

Let $AD = x$ be altitude of $\triangle ABC$.

As $\triangle ABC$ is isosceles with $AB = AC$

\[
\therefore \quad D \text{ is mid pt of } AB
\]

Hence $BC = 2y$.

Now in $\triangle APE$,

\[
\tan \beta = \frac{h + x}{d} \Rightarrow x = d \tan \beta - h \quad \text{...(1)}
\]

In $\triangle CPF$,

\[
\tan \alpha = \frac{h}{PF} \Rightarrow \tan \alpha = \frac{h}{\sqrt{d^2 + y^2}}
\]

\[
\Rightarrow \quad y^2 + d^2 = h^2 \cot^2 \alpha
\]

\[
\Rightarrow \quad y = \sqrt{h^2 \cot^2 \alpha - d^2} \quad \text{...(2)}
\]

Now area of $\triangle ABC = \frac{1}{2} \times BC \times AD$

\[
= \frac{1}{2} \times 2y \times x = xy
\]

\[
= (d \tan \beta - h) \sqrt{h^2 \cot^2 \alpha - d^2}
\]

[Using (1) and (2)]
17. Let \( AQB \) be the triangular region with \( AB = AC = 100 \text{ m} \). Let \( M \) be the mid pt. of \( BC \) at which tower \( LM \) stands. As \( \triangle ABC \) is isosceles and \( M \) is mid pt. of \( BC \)
\[ \therefore \quad AM \perp BC. \]
Let \( LM = h \) be the ht. of tower.

In \( \triangle ALM \), \[ \tan 45^\circ = \frac{LM}{MA} \Rightarrow LM = MA \]
\[ \therefore \quad MA = h \]
Also in \( \triangle BLM \), \[ \tan 60^\circ = \frac{LM}{BM} \]
\[ \Rightarrow \quad \sqrt{3} = \frac{h}{BM} \Rightarrow BM = \frac{h}{\sqrt{3}} \]
Now in \( \triangle AMB \), we have,
\[ AB^2 = AM^2 + BM^2 \]
\[ \Rightarrow \quad (100)^2 = h^2 + \frac{h^2}{3} \Rightarrow 4h^2 = \frac{10000}{3} \]
\[ \Rightarrow \quad h = 50 \sqrt{3} \text{ m}. \]

18. Let \( PQ = h \)
As \( A \) and \( B \) are located to the south and east of \( P \) respectively,
\[ \therefore \quad \angle APB = 90^\circ. \]
\( M \) is mid pt. of \( AB \). \( PAM \) is an equilateral \( \triangle \)

\[ \therefore \quad \angle APN = 60^\circ. \]
Also \( PN \perp AB \), therefore \( AN = NM = 20 \text{ m} \)
\[ \Rightarrow \quad AP = 40 \text{ m} \]
Let angles of elevation of top of the tower from \( A, N \) and \( B \) be \( \alpha, \theta \) and \( \beta \) respectively. \( \therefore \quad \alpha + \beta = 90^\circ \)

In \( \triangle PQN \)
\[ \tan \theta = \frac{PQ}{PN} \]
\[ \Rightarrow \quad 2 = \frac{h}{PN} \Rightarrow PN = h/2 \quad \cdots(1) \]
Also in \( \triangle APM \), \( \angle APM = 60^\circ \) (being equilateral \( \triangle \)) and \( PN \) is altitude \[ \therefore \quad \angle APN = 30^\circ \] (as in equilateral \( \triangle \) altitude bisects the vertical angle.

\[ \therefore \quad \text{In } \triangle APN \tan \angle APN = \frac{AN}{PN} \]
\[ \Rightarrow \quad \tan 30^\circ = \frac{20}{h/2} \quad \text{[Using eq. (1)]} \]
\[ \Rightarrow \quad \frac{h}{2\sqrt{3}} = 20 \Rightarrow h = 40\sqrt{3} \text{ m}. \]

In \( \triangle APQ \) \[ \tan \alpha = \frac{h}{AP} \Rightarrow \tan \alpha = \frac{40\sqrt{3}}{40} = \sqrt{3} \]
\[ \Rightarrow \quad \alpha = 60^\circ \] Also in \( \triangle ABQ \) \[ \tan \beta = h/\text{PB} \]
But in \( \triangle APB \)
\[ PB = \sqrt{PN^2 + NB^2} = \sqrt{(20\sqrt{3})^2 + (60)^2} \]
\[ \Rightarrow \quad PB = \sqrt{1200 + 3600} = \sqrt{4800} = 40 \sqrt{3} \]
\[ \therefore \quad \tan \beta = \frac{40\sqrt{3}}{40\sqrt{3}} \Rightarrow \tan \beta = 1 \Rightarrow \beta = 45^\circ \]
Thus \( h = 40 \sqrt{3} \text{ m} \); \( \angle \)'s of elevation are \( 60^\circ, 45^\circ \).

19. Let the sides of \( \triangle \) be \( n, n + 1, n + 2 \) where \( n \in \mathbb{N} \).
Let \( a = n, b = n + 1, c = n + 2 \)

Let the smallest angle \( \angle A = \theta \) then the greatest \( \angle C = 20 \)

In \( \triangle ABC \) by applying Sine Law we get,
\[ \frac{\sin \theta}{n} = \frac{\sin 2\theta}{n + 2} \]
\[ \Rightarrow \quad \frac{\sin \theta}{n} = \frac{2 \sin \theta \cos \theta}{n + 2} \Rightarrow \frac{1}{n} = \frac{2 \cos \theta}{n + 2} \quad \text{(as } \sin \theta \neq 0) \]
\[ \Rightarrow \quad \cos \theta = \frac{n + 2}{2n} \quad \cdots(1) \]

In \( \triangle ABC \) by Cosine Law, we get
\[ \cos \theta = \frac{(n + 1)^2 + (n + 2)^2 - n^2}{2(n + 1)(n + 2)} \quad \cdots(2) \]
Comparing the values of \( \cos \theta \) from (1) and (2), we get
\[ \frac{(n + 1)^2 + (n + 2)^2 - n^2}{2(n + 1)(n + 2)} = \frac{n + 2}{2n} \]
\[ \Rightarrow \quad (n + 2)^2 (n + 1) = n(n + 2)^2 + (n + 1)^2 - n^3 \]
\[ \Rightarrow \quad n(n + 2)^2 + (n + 1)^2 = n(n + 2)^2 + (n + 1)^2 - n^3 \]
\[ \Rightarrow \quad n^3 + 4n + 4 = n^3 + 2n^2 + n - n^3 \]
\[ \Rightarrow \quad n^2 - 3n - 4 = 0 \Rightarrow (n + 1)(n - 4) = 0 \]
\[ \Rightarrow \quad n = 4 \quad \text{(as } n \neq -1) \]
\[ \therefore \quad \text{Sides of } \triangle \text{ are } 4, 4 + 1, 4 + 2, \text{i.e. } 4, 5, 6. \]
20. Given that, In \( \triangle ABC \), base = \( a \)
and \( \frac{c}{b} = r \)
To find altitude, \( h \).
We have, in \( \triangle ABD \),
\( h = c \sin B = \frac{c \sin B}{a} \)
\( \frac{c k \sin A \sin B}{k \sin A} = \frac{c k \sin A \sin B}{\sin (B + C)} \)
\( = \frac{c \sin A \sin B (B - C)}{\sin (B + C) \sin (B - C)} = \frac{c \sin A \sin B (B - C)}{\sin^2 B - \sin^2 C} \)
\( \Rightarrow \frac{a b c \sin (B - C)}{b^2 - c^2} \)
\( \Rightarrow \frac{a \left( \frac{c}{b} \right) \sin (B - C)}{1 - \left( \frac{c}{b} \right)^2} \leq \frac{a r}{1 - r^2} \)
\( [\because \sin (B - C) \leq 1] \therefore h = \frac{ar}{1 - r^2} \) Hence Proved.

21. Let the man initially be standing at 'A' and 'B' be the position after walking a distance 'c', so total distance becomes 2c and the objects being observed are at 'C' and 'D'.

Now we have \( OA = c, AB = 2c \)
Let \( CO = x \) and \( CD = d \)
Let \( \angle CAD = \alpha \) and \( \angle CBD = \beta \)
\( \angle ACO = \theta \) and \( \angle ADC = \phi \)
\( \angle BCD = \psi \) and \( \angle BCO = \theta_1 \)
In \( \triangle ACO \), \( \tan \theta = \frac{AO}{CO} \Rightarrow \tan \theta = \frac{c}{x} \) \( \ldots (1) \)
In \( \triangle ADO \), \( \tan \phi = \frac{c}{x + d} \) \( \ldots (2) \)
Now, \( \theta = \alpha + \phi \) (Using ext. \( \angle \) thm.)
\( \Rightarrow \alpha = \theta - \phi \Rightarrow \tan \alpha = \tan (\theta - \phi) \Rightarrow \frac{\tan \theta - \tan \phi}{1 + \tan \theta \tan \phi} \)

\[ \frac{c}{x + d} = \frac{c \cdot c}{x \cdot x + d} \] (Using equations (1) and (2))
\[ \Rightarrow \tan \alpha = \frac{cx + cd - cx}{x^2 + ax + c^2} \]
\[ \Rightarrow x^2 + c^2 + xd = cd \cot \alpha \] \( \ldots (3) \)
Again in \( \triangle ADO \)
\[ \tan \psi = \frac{3c}{x + d} \] \( \ldots (4) \)
\[ \tan \theta_1 = \frac{3c}{x} \] \( \ldots (5) \)
But \( \theta_1 = \psi + \beta \) (by ext. \( \angle \) thrm.)
\( \Rightarrow \beta = \theta_1 - \psi \)
\[ \Rightarrow \tan \beta = \tan (\theta_1 - \psi) = \frac{\tan \theta_1 - \tan \psi}{1 + \tan \theta_1 \tan \psi} \]
\[ \Rightarrow \tan \beta = \frac{ \frac{3c}{x + d} - \frac{3c}{x} }{1 + \frac{3c}{x + d} \cdot \frac{3c}{x}} \] \[ \Rightarrow \tan \beta = \frac{3cd}{x^2 + xd + 9c^2} \]
\[ \Rightarrow x^2 + xd + 9c^2 = 3cd \cot \beta \] \( \ldots (6) \)
From (3) and (6), we get
\( 8c^2 = 3cd \cot \beta - cd \cot \alpha \)
\( \Rightarrow d = \frac{8c}{3 \cot \beta - \cot \alpha} \) Hence Proved.

22. Let us consider three circles with centres at \( A, B \) and \( C \) and with radii \( r_1, r_2 \), and \( r_3 \) respectively which touch each other externally at \( P, Q \) and \( R \). Let the common tangents at \( P, Q \) and \( R \) meet each other at \( O \). Then \( OP = OQ = OR = 4 \) (given) (lengths of tangents from a pt to a circle are equal).
Also \( OP \perp AB, OQ \perp AC, OR \perp BC \).

\[ \Rightarrow O \] is the incentre of the \( \triangle ABC \)
Thus for \( \triangle ABC \), \( s = \frac{(r_1 + r_2) + (r_2 + r_3) + (r_3 + r_1)}{2} \)
i.e. \( s = (r_1 + r_2 + r_3) \)
\[ \therefore \Delta = \sqrt{(r_1 + r_2 + r_3) \cdot r_1 \cdot r_2 \cdot r_3} \] (Heron's formula)
Properties of Triangle

Now \( r = \frac{\Delta}{s} \)

**NOTE THIS STEP:**

\[
\Rightarrow 4 = \sqrt{\left(\beta + \gamma + \delta\right) \gamma \beta \delta} = \frac{\sqrt{\gamma \beta \delta}}{\gamma + \beta + \delta}
\]

\[
\Rightarrow \frac{\gamma \beta \delta}{\gamma + \beta + \delta} = \frac{16}{1} \Rightarrow r_1, r_2, r_3 : r_1 + r_2 + r_3 = 16 : 1
\]

23. Let \( PQ \) be the tower of height \( h \). \( A \) is in the north of \( O \) and \( P \) is towards east of \( A \).

\[
\therefore \quad \angle OAP = 90^\circ; \quad \angle QOP = 30^\circ; \quad \angle QAP = \phi
\]

\[
\angle OAP = \alpha \quad \text{s.t.} \quad \tan \alpha = \frac{1}{\sqrt{2}}
\]

Now in \( \triangle OAP \), tan \( 30^\circ = \frac{h}{OP} \Rightarrow OP = h\sqrt{3} \quad \ldots(1)

In \( \triangle APQ \), tan \( \phi = \frac{h}{AP} \Rightarrow AP = h \cot \phi \quad \ldots(2)

Given that, \( \tan \alpha = \frac{1}{\sqrt{2}} \Rightarrow \sin \alpha = \frac{\tan \alpha}{\sqrt{1 + \tan^2 \alpha}} = \frac{1}{3} \)

Now in \( \triangle AOP \), sin \( \alpha = \frac{AP}{OP} \Rightarrow \frac{1}{\sqrt{3}} = \frac{h \cot \phi}{h/\sqrt{3}} \quad \text{[Using (1) and (2)]}

\[
\Rightarrow \cot \phi = 1 \Rightarrow \phi = 45^\circ
\]

Again in \( \triangle OAP \), using Pythagoras thm, we get

\[
OP^2 = OA^2 + AP^2
\]

\[
\Rightarrow 3h^2 = 90000 + h^2 \cot^2 45^\circ \Rightarrow h = 150 \sqrt{2}m
\]

24. Let \( AB \) be the tower leaning towards west making an angle \( \alpha \) with vertical

At \( C \), \( \angle \) of elevation of \( B \) is \( \beta \) and at \( D \) the \( \angle \) of elevation of \( B \) is \( \gamma \)

\( CA = AD = d \)

**KEY CONCEPT:**

\( m:n \) theorem: In \( \triangle ABC \) where point \( D \) divides \( BC \) in the ratio \( m:n \), and \( \angle ADC = \theta \)

(i) \( (m+n) \cot \theta = n \cot B - m \cot C \)

(ii) \( (m+n) \cot \theta = m \cot \alpha - n \cot \beta \)

In \( \triangle ABC \), \( A \) divides \( CD \) in the ratio \( 1:1 \) where base \( \angle \)'s are \( \beta \) and \( \gamma \) and \( \angle BAD = 90^\circ + \alpha \)

\[
\therefore \quad \text{By applying \( m:n \) theorem we get}
\]

\[
(1+1)(\cot (90^\circ + \alpha)) = 1.(\cot \beta - 1. \cot \gamma)
\]

\[
\Rightarrow -2 \tan \alpha = \cot \beta - \cot \gamma
\]

\[
\Rightarrow 2 \tan \alpha = \cot \gamma - \cot \beta
\]

Hence Proved.

25. Let \( a \) be the side of \( n \) sided regular polygon \( A_1A_2A_3A_4 \ldots A_n \)

\[
\therefore \quad \text{\( \angle \) subtended by each side at centre} = \frac{2\pi}{n}
\]

Let \( OL \perp A_1A_2 \)

Then \( \angle A_1OL = 90^\circ \), \( \angle A_1OL = \pi/n \quad (\because OA_1 = OA_2) \)

\[
\therefore \quad \text{In} \quad \triangle OA_1L, \quad \sin \frac{\pi}{n} = \frac{A_1L}{O A_1} \Rightarrow \sin \frac{\pi}{n} = \frac{a/2}{OA_1}
\]

\[
\Rightarrow \quad OA_1 = \frac{a/2}{\sin \pi/n} \quad \ldots(1)
\]

Again by geometry it can be proved that \( OM \perp A_1A_3 \)

In \( \triangle OA_1M \), \( \sin \frac{2\pi}{n} = \frac{A_1M}{OA_1} \Rightarrow A_1M = OA_1 \sin 2\pi/n \)

\[
\Rightarrow \quad A_1A_3 = \frac{2a \sin \frac{2\pi}{n}}{2 \sin \pi/n} \quad \text{[Using eqn (1)]}
\]

Also if \( ON \perp A_1A_4 \), then \( ON \) bisects angle \( A_1O \)

\[
\therefore \quad \angle A_1ON = \frac{3\pi}{n}
\]

\[
\therefore \quad \text{In} \quad \triangle OA_1N, \quad \sin \frac{3\pi}{2} = \frac{\frac{A_1N}{OA_1}}{\frac{A_1N}{OA_1}} \Rightarrow \quad \frac{A_1N}{OA_1} = \frac{2a \sin \frac{3\pi}{n}}{2 \sin \pi/n}
\]

But given that

\[
\frac{1}{A_1A_2} = \frac{1}{A_1A_3} + \frac{1}{A_1A_4}
\]

\[
\Rightarrow \quad \frac{1}{a} = \frac{1}{a \sin \frac{2\pi}{n}} + \frac{1}{a \sin \frac{3\pi}{n}} \quad \frac{\sin \pi/n}{\sin \pi/n}
\]

\[
\Rightarrow \quad \sin \frac{3\pi}{n} \sin \frac{2\pi}{n} = (\sin \frac{3\pi}{n} + \sin \frac{2\pi}{n}) \sin \pi/n
\]
27. Let \( A, B \) and \( C \) be the projections of the pts. \( P, Q \) and \( M \) on the ground.
ATQ, \( \angle PQA = 60^\circ, \angle QOB = 30^\circ, \angle DOM = \theta \)
Let \( h \) be the ht of circle from ground, then
\[ AP = CM = BQ = h \]
Let \( OA = x \) and \( AB = d \) (diameter of the projection of the
circle on ground with \( C_1 \) as centre).

Now in \( \triangle POA \),
\[ \tan 60^\circ = \frac{h}{x} \Rightarrow x = \frac{h}{\sqrt{3}} \quad \ldots (1) \]

In \( \triangle QBO \),
\[ \tan 30^\circ = \frac{h}{x+d} \Rightarrow x + d = h\sqrt{3} \]
\[ \Rightarrow \quad d = h\sqrt{3} - \frac{h}{\sqrt{3}} = \frac{2h}{\sqrt{3}} \quad \ldots (2) \]

In \( \triangle OMC \),
\[ \tan \theta = \frac{h}{OC} \]
\[ \Rightarrow \tan^2 \theta = \frac{h^2}{OC^2} = \frac{h^2}{OC_1^2 + C_1C^2} = \frac{h^2}{\left(\frac{x+d}{2}\right)^2 + \left(\frac{d}{2}\right)^2} \]
\[ = \frac{h^2}{\left(\frac{h}{\sqrt{3}} + \frac{h}{\sqrt{3}}\right)^2 + \left(\frac{h}{\sqrt{3}}\right)^2} \quad \text{[Using (1) and (2)]} \]
\[ = \frac{h^2}{\frac{4h^2}{3} + \frac{h^2}{3}} = \frac{3}{5} \]

28. Let \( ABC \) is an equilateral \( \Delta \) then
\( A = B = C = 60^\circ \)
\[ \Rightarrow \tan A + \tan B + \tan C = 3\sqrt{3} \]
Conversely, suppose
\[ \tan A + \tan B + \tan C = 3\sqrt{3} \quad \ldots (1) \]
Now using A.M. \( \geq \) G.M. (equality occurs when no’s are equal)
For \( \tan A, \tan B, \tan C \), we get
\[ \tan A + \tan B + \tan C \geq (\tan A \tan B \tan C)^{1/3} \]
But in any \( \triangle ABC \), we know that
\[ \tan A + \tan B + \tan C = \tan A \tan B \tan C \]
\[ \Rightarrow \quad \text{Last inequality becomes} \]
\[ \frac{\tan A + \tan B + \tan C}{3} \geq (\tan A + \tan B + \tan C)^{1/3} \]
Properties of Triangle

⇒ \((\tan A + \tan B + \tan C)^{2/3} \geq 3\)
⇒ \(\tan A + \tan B + \tan C \geq 3\sqrt{3}\)
where equality occurs when \(\tan A, \tan B, \tan C\) are equal, i.e., \(A = B = C\)
⇒ \(\Delta ABC\) is equilateral.

29. In \(\Delta ABC\), \(O\) and \(I\) are circumcentre and incentre of \(\Delta\) respectively and \(R\) and \(r\) are the respective radii of circumcircle and incircle.
To prove \((IO)^2 = R^2 - 2Rr\)
First of all we will find \(IO\). Using cosine law in \(\Delta AOI\)
\[
\cos \angle AOI = \frac{OA^2 + AI^2 - OI^2}{2 \cdot OA \cdot AI}
\]
where \(OA = R\)
\[\text{In } \Delta AID, \ \sin A/2 = \frac{r}{AI}\]
\[A = \frac{r}{\sin A/2}\]
\[AI = 4R \sin B/2 \sin C/2\]  
[Using \(r = 4R \sin A/2 \sin B/2 \sin C/2\)]
Also, \(\angle OAI = \angle IAE - \angle OAE\)
\[= \frac{A}{2} - (90^\circ - \angle AOE)\]
\[= \frac{A}{2} - 90^\circ + \frac{1}{2} \angle AOC\]
\[= \frac{A}{2} - 90^\circ + \frac{1}{2} \cdot 2B \quad (\because O \text{ is circumcentre})\]
\[= \frac{A}{2} + B - \frac{A + B + C}{2}\]
\[= \frac{B - C}{2}\]
Substituting all these values in equation (1) we get
\[\cos \frac{B - C}{2} = \frac{R^2 + 16R^2 \sin^2 B/2 \sin^2 C/2 - OI^2}{2 \cdot 2R \cdot 4R \sin B/2 \sin C/2}\]
\[= \frac{R^2}{2} \left[1 + \sin B/2 \sin C/2 \left(2 \sin B/2 \sin C/2 - \cos \frac{B - C}{2} \right)\right]\]
\[= \frac{R^2}{2} \left[1 + 8 \sin B/2 \sin C/2 \left(2 \sin B/2 \sin C/2 - \cos \frac{B}{2} \cos \frac{C}{2} \right) - \sin B/2 \sin C/2\right]\]
\[= \frac{R^2}{2} \left[1 + 8 \sin B/2 \sin C/2 \left(2 \sin B/2 \sin C/2 - \cos \frac{B + C}{2}\right)\right]\]
\[= \frac{R^2}{2} \left[1 - 8 \sin B/2 \sin C/2 \cos \frac{B + C}{2}\right]\]
\[= \frac{R^2}{2} \left[1 - 8 \sin \frac{A}{2} \sin B/2 \sin C/2\right]\]
\[= \frac{R^2}{2} - 2R \cdot 4R \sin A/2 \sin B/2 \sin C/2\]
\[= \frac{R^2}{2} - 2Rt\]
Again if \(\Delta OIB\) is right \(\angle O\) then
\[\Rightarrow OB^2 = OP^2 + IB^2\]
\[
\Rightarrow R^2 = R^2 - 2Rr + \frac{r^2}{\sin^2 B/2} \left[\theta \text{ in } \Delta OBD, \sin B/2 = \frac{r}{IB}\right]
\]
\[= 2R \sin^2 B/2 = r\]
\[\Rightarrow \frac{2}{\Delta} \frac{abc}{s} = \frac{(s-a)(s-b)(s-c)}{s} \]
\[= \frac{b(s-a)(s-c)}{s} = 2(s-a)(s-b)(s-c) \]
\[\Rightarrow b = 2s - 2b \Rightarrow b = a + c - b\]
\[\Rightarrow(a + c = 2b \Rightarrow a, b, c \text{ are in A.P.})\]
\[\Rightarrow \text{ is A.M. between } a \text{ and } c. \text{ Hence Proved.}\]

30. Let \(MN = r_3 = MP = MQ, ID = r\)
\[\Rightarrow IP = r - r_3\]
Clearly \(IP\) and \(IQ\) are tangents to circle with centre \(M\).
\[\Rightarrow IM = \angle bisector \text{ of } \angle PQI\]
\[\Rightarrow \angle PIM = \angle QIM = \theta_1\]
Also from \(\Delta IPM\), \(\tan \theta_1 = \frac{r_3}{r - r_3}\)
\[
\frac{r_3}{r - r_3} = \frac{MP}{IP}
\]

Here \(DI = r\)
Similarly, in other quadrilaterals, we get
\[\tan \theta_2 = \frac{r_2}{r - r_2} \text{ and } \tan \theta_3 = \frac{r}{r - r}\]
Also \(2\theta_1 + 2\theta_2 + 2\theta_3 = 2\pi \Rightarrow \theta_1 + \theta_2 + \theta_3 = \pi \Rightarrow \tan \theta_1 + \tan \theta_2 + \tan \theta_3 = \tan \theta_1 \cdot \tan \theta_2 \cdot \tan \theta_3 \Rightarrow \frac{r}{r - r} + \frac{r_2}{r - r_2} + \frac{r_3}{r - r_3} \Rightarrow \frac{n_2r_3}{r - r} \left(r - r_2\right)\left(r - r_3\right)\]

31. We know, \(\Delta = \sqrt{s(s-a)(s-b)(s-c)}\)
\[
= \sqrt{\frac{s}{8} \left(b+c-a\right) \left(c+a-b\right) \left(a+b-c\right)}
\]
Since sum of two sides is always greater than third side;
\[\because b + c - a, c + a - b, a + b - c > 0\]
\[\Rightarrow \left(s-a\right) \left(s-b\right) \left(s-c\right) > 0\]
Let \(s = a = x, s = b = y, s = c = z\)
Now, \(x + y = 2s = a + b + c\)
Simiarly, \(y + z = a\) and \(z + x = b\)
Since \(AM \geq GM\)
\[\Rightarrow \frac{x + y}{2} \geq \sqrt{xy} \Rightarrow 2\sqrt{xy} \leq a \Rightarrow \frac{y + z}{2} \geq \sqrt{yz} \Rightarrow 2\sqrt{yz} \leq b\]
\[\Rightarrow \frac{z + x}{2} \geq \sqrt{zx} \Rightarrow 2\sqrt{zx} \leq c \Rightarrow 8xyz \leq abc\]
\[\Rightarrow \left(s-a\right) \left(s-b\right) \left(s-c\right) \leq \frac{1}{8} abc\]
\( s(s-a)(s-b)(s-c) \leq \frac{sabc}{8} \)

\[ \Rightarrow \left( \frac{1}{16} \right)(a+b+c)abc \Rightarrow \Delta \leq \frac{1}{4}\sqrt{abc(a+b+c)} \]

and equality holds when \( x = y = z \Rightarrow a = b = c \)

32. Let \( OAB \) be one triangle out of \( n \) of a \( n \) sided polygon inscribed in a circle of radius 1.

Then \( \angle AOB = \frac{2\pi}{n} \)
\[ OA = OB = 1 \]

\[ \therefore \text{ Using Area of isosceles } \Delta \text{ with vertical } \angle \theta \text{ and equal sides as } \]
\[ r = \frac{1}{2}r^2\sin \theta = \frac{1}{2}\sin \frac{2\pi}{n} \]

\[ \therefore I_n = \frac{n}{2}\sin \frac{2\pi}{n} \quad \ldots \quad (1) \]

Further consider the \( n \) sided polygon subscribing on the circle.

\( A'MB' \) is the tangent of the circle at \( M \).
\[ \Rightarrow A'MB' \perp OM \]
\[ \Rightarrow A'MO \text{ is right angled triangle, right angle at } M. \]
\[ A'M = \tan \frac{\pi}{n} \]

Area of \( \Delta A'MO = \frac{1}{2} \times 1 \times \tan \frac{\pi}{n} \n\]

\[ \therefore \text{ Area of } \Delta A'B'O = \tan \frac{\pi}{n} \]

So, \( O_n = n\tan \frac{\pi}{n} \quad \ldots \quad (2) \)

Now, we have to prove
\[ I_n = \frac{O_n}{2} \left( 1 + \sqrt{1 - \left( \frac{2I_n}{n} \right)^2} \right) \quad \lor \quad \frac{2I_n}{O_n} - 1 = \sqrt{1 - \left( \frac{2I_n}{n} \right)^2} \]

LHS = \( \frac{2I_n}{O_n} - 1 = \frac{n\sin \frac{2\pi}{n}}{n\tan \frac{\pi}{n}} - 1 \) (From (1) and (2))

= \( 2\cos^2 \frac{\pi}{n} - 1 = \cos \frac{2\pi}{n} \)

RHS = \[ \sqrt{1 - \left( \frac{2I_n}{n} \right)^2} = \sqrt{1 - \sin^2 \frac{2\pi}{n}} \] (From (1))

\[ = \cos \left( \frac{2\pi}{n} \right) \]
\[ \text{Hence Proved.} \]

1. (4) Let \( \angle ACC' = \theta \), then \( \angle AC'C = 0 \) (\( \therefore AC = AC' \)) and \( \angle AC'B = 180 - \theta \).

\[ \frac{4}{\sin(180 - \theta)} = \frac{2\sqrt{2}}{\sin 30^\circ} \Rightarrow \sin \theta = \frac{1}{\sqrt{2}} \Rightarrow \theta = 45^\circ \]

\[ \therefore \angle CAC' = 90^\circ \]

So, the required area = \( ar(\Delta ABC) - ar(\Delta ABC') \)

\[ = ar(\Delta ACC') = \frac{1}{2} \times AC \times AC' \]

\[ = \frac{1}{2} \times 2\sqrt{2} \times 2\sqrt{2} = 4 \text{ sq. units.} \]

2. (3)

We know that area of \( \Delta = \frac{1}{2}ab \sin C \)

\[ \Rightarrow \frac{1}{2} \times 6 \times 10 \times \sin C = 15\sqrt{3} \]

\[ \Rightarrow \sin C = \frac{\sqrt{3}}{2} \]

\[ \Rightarrow C = 120^\circ \text{ as } C \text{ is obtuse angle.} \]

Now using \( \cos C = \frac{a^2 + b^2 - c^2}{2ab} \),

we get \( \cos 120^\circ = \frac{36 + 100 - c^2}{120} \)

\[ \Rightarrow c^2 = 196 \text{ or } c = 14 \]

\[ \therefore s = \frac{a + b + c}{2} = 15 \]

There radius of incircle, \( r = \frac{\Delta}{s} = \frac{15\sqrt{3}}{15} = \sqrt{3} \)

\[ \therefore r^2 = 3 \]
1. (b) Let \(a = 3x + 4y, \ b = 4x + 3y\) and \(c = 5x + 5y\) as \(x, y > 0, \ c = 5x + 5y\) is the largest side. 
\[ \therefore C \text{ is the largest angle}. \]
\[ \therefore \cos C = \frac{(3x + 4y)^2 + (4x + 3y)^2 - (5x + 5y)^2}{2(3x + 4y)(4x + 3y)} \]
\[ = \frac{-2xy}{2(3x + 4y)(4x + 3y)} < 0 \]
\[ \therefore C \text{ is obtuse angle} \Rightarrow \Delta ABC \text{ is obtuse angled} \]

2. (a) 
\[ r_1 > r_2 > r_3 \Rightarrow \frac{\Delta}{a} > \frac{\Delta}{b} > \frac{\Delta}{c}; \]
\[ \Rightarrow s - a < s - b < s - c \Rightarrow -a < -b < -c \Rightarrow a > b > c \]

3. (c) 
\[ \tan \left( \frac{\pi}{n} \right) = \frac{a}{2r}; \ \sin \left( \frac{\pi}{n} \right) = \frac{a}{2R} \]
\[ r + R = \frac{a}{2} \left[ \cot \frac{\pi}{n} + \cos ec \frac{\pi}{n} \right] \]

4. (d) 
\[ \cos \frac{\pi}{n} + 1 = \frac{2 \cos \frac{\pi}{2n}}{2 \sin \frac{\pi}{2n} \cos \frac{\pi}{2n}} = \frac{a}{2} \cot \frac{\pi}{2n} \]

5. (b) If \(a \cos^2 \left( \frac{C}{2} \right) + c \cos^2 \left( \frac{A}{2} \right) = \frac{3b}{2} \)
\[ a \cos \Delta + 1 + c \cos \Delta = 3b \]
\[ a + c + b = 3b \text{ or } a + c = 2b \text{ or } a, b, c \text{ are in A.P.} \]

6. (c) Let \(a = \sin \alpha, b = \cos \alpha\) and \(c = \sqrt{1 + \sin \alpha \cos \alpha}\). 
Clearly a and b < 1 but c > 1 as \(\sin \alpha > 0\) and \(\cos \alpha > 0\). 
\[ \therefore c \text{ is the greatest side and greatest angle is C} \]
\[ \therefore \cos C = \frac{a^2 + b^2 - c^2}{2ab} \]
\[ = \frac{\sin^2 \alpha + \cos^2 \alpha - 1 - \sin \alpha \cos \alpha}{2 \sin \alpha \cos \alpha} = \frac{1}{2} \]
\[ \therefore C = 120^\circ \]

7. (d) 
From the figure 
\[ \tan 60^\circ = \frac{y}{x} \Rightarrow y = \sqrt{3}x \] (1) 
\[ \tan 30^\circ = \frac{y}{x + 40} \Rightarrow y = \frac{x + 40}{\sqrt{3}} \] (2) 
From (1) and (2), \(\sqrt{3}x = \frac{x + 40}{\sqrt{3}} \Rightarrow x = 20m \)

8. (b) We know by sine rule \(\frac{c}{\sin C} = 2R \Rightarrow c = 2R \sin C \)
\[ \therefore c = 2R \] \(\because\ C = 90^\circ \)

Also \(\tan \frac{C}{2} = \frac{r}{s - c} \)
\[ \Rightarrow \tan \frac{\pi}{4} = \frac{r}{s - c} \] \(\because\ C = 90^\circ \)
\[ \Rightarrow r = s - c = \frac{a + b - c}{2} \]
\[ \Rightarrow 2r + c = a + b \Rightarrow 2r + 2R = a + b \text{ (using c = 2R)} \]
9. \( \Delta = \frac{1}{2} p_1 a = \frac{1}{2} p_2 b = \frac{1}{2} p_3 c \)

\( p_1, p_2, p_3 \) are in H.P.

\( \Rightarrow \frac{2a}{a}, \frac{2b}{b}, \frac{2c}{c} \) are in H.P. \( \Rightarrow \frac{1}{a}, \frac{1}{b}, \frac{1}{c} \) are in H.P.

\( \Rightarrow a, b, c \) are in A.P.

\( \Rightarrow K \sin A, K \sin B, K \sin C \) are in AP

\( \Rightarrow \sin A, \sin B, \sin C \) are in A.P.

10. (a) In the \( \Delta AOB, \angle AOB = 60^\circ \), and \( \angle OBA = \angle OAB \) (since \( OA = OB = AB \) radius of same circle). \( \therefore \) \( \Delta AOB \) is an equilateral triangle. Let the height of tower is \( h \)

\( m \). Given distance between two points \( A & B \) lie on boundary of circular park, subtends an angle of \( 60^\circ \) at the foot of the tower is \( AB \) i.e. \( AB = a \). A tower \( OC \) stands at the centre of a circular park. Angle of elevation of the top of the tower from \( A \) and \( B \) is \( 30^\circ \).

In \( \Delta OAC \) \( \tan 30^\circ = \frac{h}{a} \Rightarrow \frac{1}{\sqrt{3}} = \frac{h}{a} \Rightarrow h = \frac{a}{\sqrt{3}} \)

11. (b) In \( \Delta ABC \)

\( \frac{h}{x} = \tan 60^\circ = \sqrt{3} \)

\( \Rightarrow x = \frac{h}{\sqrt{3}} \)

In \( \Delta ABD \) \( \frac{h}{x + 7} = \tan 45^\circ = 1 \)

\( \Rightarrow h = x + 7 \Rightarrow h - \frac{h}{\sqrt{3}} = 7 \)

\( \Rightarrow h = \frac{7\sqrt{3}}{\sqrt{3} - 1} \times \frac{\sqrt{3} + 1}{\sqrt{3} + 1} \Rightarrow h = \frac{7\sqrt{3}}{2} (\sqrt{3} + 1) m \)

12. (b) If \( O \) is centre of polygon and \( AB \) is one of the side, then by figure

\( \cos \frac{\pi}{n} = \frac{r}{n} \)

\( \Rightarrow \frac{r}{R} = \frac{1}{2}, \frac{1}{\sqrt{2}}, \frac{1}{2} \) for \( n = 3, 4, 6 \) respectively.

13. (b) Let the speed be \( y \) m/sec.

Let \( AC \) be the vertical pole of height 20 m.

Let \( O \) be the point on the ground such that \( \angle AOC = 45^\circ \)

Let \( OC = x \)

Time \( t = 1 \) s

From \( \Delta AOC \), \( \tan 45^\circ = \frac{20}{x} \) ... (i)

and from \( \Delta BOD \), \( \tan 30^\circ = \frac{20}{x + y} \) ... (ii)

From (i) and (ii), we have \( x = 20 \) and \( \frac{1}{\sqrt{3}} = \frac{20}{x + y} \)

\( \Rightarrow \frac{1}{\sqrt{3}} = \frac{20}{20 + y} \Rightarrow 20 + y = 20\sqrt{3} \)

So, \( y = 20(\sqrt{3} - 1) \) i.e., speed = \( 20(\sqrt{3} - 1) \) m/s

14. (c) \( \therefore \) \( PB \) bisects \( \angle APC \), therefore \( AB : BC = PA : PC \)

Also in \( \Delta APQ \), \( \sin 30^\circ = \frac{h}{PA} \Rightarrow PA = 2h \)

and in \( \Delta CPQ \), \( \sin 60^\circ = \frac{h}{PC} \Rightarrow PC = \frac{2h}{\sqrt{3}} \)

\( \therefore AB : BC = 2h : \frac{2h}{\sqrt{3}} = \sqrt{3} : 1 \)
Inverse Trigonometric Functions

Section-A  JEE Advanced/ IIT-JEE

A. Fill in the Blanks

1. Let \(a + b + c = u\), then

\[
\theta = \tan^{-1} \left( \frac{au}{bc} \right) + \tan^{-1} \left( \frac{bu}{ca} \right) + \tan^{-1} \left( \frac{cu}{ab} \right)
\]

Now we know that

\[
\tan^{-1} x + \tan^{-1} y = \pi + \tan^{-1} \left( \frac{x+y}{1-xy} \right) \text{ when } xy > 1
\]

\[
\frac{au}{bc} \times \frac{bu}{ca} = \frac{u}{c} = \frac{a+b+c}{c} > 1; \, a, b, c
\]

being +ve real nos.

\[
\therefore \theta = \pi + \tan^{-1} \left[ \frac{au}{bc} \right] + \tan^{-1} \left[ \frac{bu}{ca} \right] + \tan^{-1} \left[ \frac{cu}{ab} \right]
\]

[Using \(\tan^{-1} (-x) = -\tan^{-1} x\) or \(\pi\)]

\[
\therefore \theta = \tan \pi = 0
\]

2. \(\tan \left( 2 \tan^{-1} \left( \frac{1}{5} \right) \right) = \tan \left[ \tan^{-1} \left( \frac{2/5}{1-(1/5)^2} \right) - \tan^{-1} (1) \right]
\]

\[
= \tan \left[ \tan^{-1} \left( \frac{5}{12} \right) - \tan^{-1} (1) \right] = \tan \left[ \tan^{-1} \left( \frac{5/12-1}{1+5/12} \right) \right]
\]

\[
= \tan \left( \tan^{-1} \left( -7/17 \right) \right) = -7/17
\]

3. We have

\[
A = 2 \tan^{-1} (2\sqrt{2} - 1) = 2 \tan^{-1} (2 \times 1.414 - 1) = 2 \tan^{-1} (1.828) > 2 \tan^{-1} \sqrt{3} = 2\pi/3
\]

\[
\Rightarrow A > 2\pi/3 \quad \text{(1)}
\]

Also \(B = 3 \sin^{-1} (1/3) + \sin^{-1} (3/5)
\]

\[
= \sin^{-1} \left( \frac{3 \times \frac{1}{3} - 4 \times \frac{1}{27}}{\sqrt{3/2}} \right) + \sin^{-1} (3/5)
\]

\[
= \sin^{-1} \left( \frac{23}{27} \right) + \sin^{-1} (0.6) = \sin^{-1} (0.852) + \sin^{-1} (0.6)
\]

\[
< \sin^{-1} (\sqrt{3}/2) + \sin^{-1} (\sqrt{3}/2) = 2\pi/3
\]

\[
\Rightarrow B < 2\pi/3 \quad \text{(2)}
\]

From (1) and (2) we conclude \(A > B\).
C. MCQs with ONE Correct Answer

1. (d) \[ \tan \left[ \cos^{-1} \left( \frac{4}{5} \right) + \tan^{-1} \left( \frac{2}{3} \right) \right] \]
   \[ = \tan \left[ \tan^{-1} \frac{3}{4} + \tan^{-1} \frac{2}{3} \right] \]
   \[ = \tan \left[ \tan^{-1} \left( \frac{3/4 + 2/3}{1 - 3/4 \times 2/3} \right) \right] = \frac{17 \times 12}{12} = \frac{17}{6} \]

2. (d) \[ \tan \left[ \cos^{-1} \left( \frac{1}{5 \sqrt{2}} \right) - \sin^{-1} \frac{4}{\sqrt{17}} \right] \]
   \[ = \tan \left[ \tan^{-1} \frac{7}{\tan^{-1} 4} \right] \]
   \[ = \tan \left( \tan^{-1} \frac{3}{29} \right) = \frac{3}{29} \]

3. (c) \[ \tan^{-1} \sqrt{(x(x+1))} = \pi / 2 - \sin^{-1} \sqrt{(x^2 + x + 1)} \]
   \[ \Rightarrow \tan^{-1} \sqrt{x(x+1)} = \cos^{-1} \sqrt{x^2 + x + 1} \]
   \[ \Rightarrow \cos^{-1} \frac{1}{\sqrt{x^2 + x + 1}} = \cos^{-1} \sqrt{x^2 + x + 1} \]
   \[ \Rightarrow x^2 + x + 1 = 1 \Rightarrow x(x+1) = 0 \]
   \[ \Rightarrow x = 0, -1 \text{ are the only real solutions.} \]

4. (b) \[ \sin^{-1} \left( x - \frac{x^2}{2} + \frac{x^3}{3} \ldots \right) + \cos^{-1} \left( x^2 - \frac{x^4}{2} + \frac{x^6}{4} \ldots \right) = \frac{\pi}{2} \]
   \[ \Rightarrow \cos^{-1} \left( x^2 - \frac{x^4}{2} + \frac{x^6}{4} \ldots \right) = \frac{\pi}{2} - \sin^{-1} \left( x - \frac{x^2}{2} + \frac{x^3}{3} \ldots \right) \]
   \[ \Rightarrow \cos^{-1} \left( x^2 - \frac{x^4}{2} + \frac{x^6}{4} \ldots \right) = \cos^{-1} \left( x - \frac{x^2}{2} + \frac{x^3}{3} \ldots \right) \]
   \[ \Rightarrow x^2 - \frac{x^4}{2} + \frac{x^6}{4} \ldots = x - \frac{x^2}{2} + \frac{x^3}{3} \ldots \]
   On both sides we have G.P. of infinite terms.
   \[ \therefore \frac{x^2}{1 - \frac{x^2}{2}} = \frac{x}{1 - \frac{x}{2}} \Rightarrow \frac{2x^2}{2 + x^2} = \frac{2x}{2 + x} \]
   \[ \Rightarrow 2x + x^2 = 2x^2 + x^3 \Rightarrow x(x+1) = 0 \]
   \[ \Rightarrow x = 0, 1 \text{ but } 0 < |x| < \sqrt{2} \Rightarrow x = 1. \]

5. (d) \[ \sin \left[ \cot^{-1} (1+x) \right] = \cos (\tan^{-1} x) \]
   \[ \Rightarrow \sin \left[ \sin^{-1} \left( \frac{1}{\sqrt{1+(1+x)^2}} \right) \right] = \cos \left[ \cos^{-1} \left( \frac{1}{\sqrt{1+x^2}} \right) \right] \]
   \[ \Rightarrow \frac{1}{\sqrt{1+(1+x)^2}} = \frac{1}{\sqrt{1+x^2}} \]
   \[ \Rightarrow 1 + 1 + 2x + x^2 = 1 + x^2 \Rightarrow 2x + 1 = 0 \Rightarrow x = -\frac{1}{2} \]

6. (c) \[ \sqrt{1 + x^2} \left[ \{x \cos (\cot^{-1} x) + \sin (\cot^{-1} x)\}^2 - 1 \right]^{1/2} \]
   \[ = \sqrt{1 + x^2} \left[ \cos \left( \cos^{-1} \left( \frac{x}{\sqrt{1+x^2}} \right) \right) \right] \]
   \[ + \sin \left( \sin^{-1} \left( \frac{1}{\sqrt{1+x^2}} \right) \right) \left( -1 \right)^{1/2} \]
   \[ = \sqrt{1 + x^2} \left[ \left( x \frac{x}{\sqrt{1+x^2}} + \frac{1}{\sqrt{1+x^2}} \right) - 1 \right] \]
   \[ = \sqrt{1 + x^2} \left[ \left( \frac{x^2}{\sqrt{1+x^2}} + \frac{1}{\sqrt{1+x^2}} \right)^2 - 1 \right] \]
   \[ = \sqrt{1 + x^2} \left[ \frac{x^2}{\sqrt{1+x^2}^2} - 1 \right] = x \sqrt{1 + x^2} \]

7. (b) \[ \cot^{-1} \left[ 1 + \sum_{k=1}^{n} 2k \right] = \cot^{-1} [1 + n(n+1)] \]
   \[ = \tan^{-1} \left[ \frac{(n+1) - n}{1 + n(n+1)} \right] = \tan^{-1} (n+1) - \tan^{-1} n \]
   \[ \therefore \sum_{n=1}^{23} \tan^{-1} (n+1) - \tan^{-1} n = \tan^{-1} 24 - \tan^{-1} 1 = \tan^{-1} \frac{23}{25} \]
   \[ \therefore \cot \left[ \sum_{n=1}^{23} \cot^{-1} \left[ 1 + \sum_{k=1}^{n} 2k \right] \right] = \cot \left[ \tan^{-1} \frac{23}{25} \right] = \frac{25}{23} \]

D. MCQs with ONE or MORE THAN ONE Correct

1. (d) The principal value of \[ \sin^{-1} \left( \sin \frac{2\pi}{3} \right) = \sin^{-1} \left( \sin \left( \frac{\pi}{3} \right) \right) \]
   \[ = \sin^{-1} (\sin \pi/3) = \pi/3 \therefore (d) \text{ is the correct answer.} \]

2. (b, c, d)
   \[ \alpha = 3 \sin^{-1} \frac{6}{11} > 3 \sin^{-1} \frac{1}{2} \text{ or } \alpha > \frac{\pi}{2} \]
   \[ \therefore \cos \alpha < 0 \]
   \[ \beta = 3 \cos^{-1} \frac{4}{9} > 3 \cos^{-1} \frac{1}{2} \text{ or } \beta > \pi \]
   \[ \therefore \cos \beta < 0 \text{ and } \sin \beta < 0 \]
   Also \[ \alpha + \beta > \frac{3\pi}{2} \therefore \cos (\alpha + \beta) > 0. \]
E. SUBJECTIVE PROBLEMS

1. We have \( \cos(2 \cos^{-1} x + \sin^{-1} x) \)
   \[
   \begin{align*}
   &= \cos(\cos^{-1} x + \cos^{-1} x + \sin^{-1} x) \\
   &= \cos(\cos^{-1} x + \pi/2) \\
   &= \sin(\cos^{-1} x) \\
   &= \sqrt{1 - \cos^2(\cos^{-1} x)} \\
   &= \sqrt{1 - x^2} \\
   &= \sqrt{1 - 1/25} \\
   &= \sqrt{24}/5 = -2\sqrt{6}/5 \\
   \end{align*}
   \]
   \( \text{Using } \cos^{-1} x + \sin^{-1} x = \pi/2 \)

2. Given eq. is,
   \[4 \cos^2 x \sin x - 2 \sin^2 x = 3 \sin x\]
   \[4 \cos^2 x \sin x - 2 \sin^2 x - 3 \sin x = 0\]
   \[4(1 - \sin^2 x) \sin x - 2 \sin^2 x - 3 \sin x = 0\]
   \[\sin x \left[ 4 \sin^2 x + 2 \sin x - 1 = 0 \right]\]
   \[\text{either } \sin x = 0 \text{ or } 4 \sin^2 x + 2 \sin x - 1 = 0\]
   \[\text{If } \sin x = 0 \Rightarrow x = n\pi\]
   \[\Rightarrow 4 \sin^2 x + 2 \sin x - 1 = 0 \Rightarrow \sin x = \frac{-1 \pm \sqrt{5}}{4}\]
   If \( \sin x = \frac{-1 + \sqrt{5}}{4} = \sin 18^\circ = \sin \frac{\pi}{10} \)
   \[\Rightarrow x = nx + (\mp 1)^n \frac{\pi}{10}\]
   \[\text{If } \sin x = \frac{-1 - \sqrt{5}}{4} = \sin 102^\circ = \sin \left( \frac{3\pi}{10} \right)\]
   \[\Rightarrow x = nx + (\mp 1)^n \frac{3\pi}{10}\]
   \[\text{Hence, } x = n\pi, \ n\pi + (\mp 1)^n \frac{\pi}{10} \text{ or } \ n\pi + (-1)^n \frac{3\pi}{10}\]
   \[\text{where } n \text{ is some integer}\]

3. To prove that \( \cos \tan^{-1} \sin \cot^{-1} x = \sqrt{x^2 + 1}/\sqrt{x^2 + 2} \).
   L.H.S. = \[\cos \left[ \tan^{-1} \left( \sin \left( \cot^{-1} x \right) \right) \right] \]
   \[= \cos \left[ \tan^{-1} \left( \sin \left( \frac{1}{\sqrt{1 + x^2}} \right) \right) \right] \text{ if } x > 0\]
   and \[\cos \left[ \tan^{-1} \left( \sin \left( \pi - \sin^{-1} \frac{1}{\sqrt{1 + x^2}} \right) \right) \right] \text{ if } x < 0\]
   In each case,
   \[= \cos \left[ \tan^{-1} \frac{1}{\sqrt{1 + x^2}} \right] = \cos \left[ \cos^{-1} \frac{1 + x^2}{2 + x^2} \right] \]
   \[= \sqrt{\frac{x^2 + 1}{x^2 + 2}} = \text{R.H.S.} \]
   \[\text{Hence Proved.}\]

F. MATCH THE FOLLOWING

1. (A) \( \rightarrow (p); (B) \rightarrow (r); (C) \rightarrow (q) \)
   \[A) \ t = \sum_{i=1}^{\infty} \frac{1}{2i^2} = \sum_{i=1}^{\infty} \frac{1}{2i^2} - (2i-1) \]
   \[= \sum_{i=1}^{\infty} \left[ \tan^{-1} (2i+1) - \tan^{-1} (2i-1) \right] \]
   \[t = \tan^{-1} 3 - \tan^{-1} 1 + \tan^{-1} 5 - \tan^{-1} 3 + \ldots
   \[\Rightarrow t = \lim_{n \to \infty} [\tan^{-1} (2n+1) - \tan^{-1} (2n-1)] \]
   \[= \lim_{n \to \infty} \frac{2n}{1 + (2n+1)} = \lim_{n \to \infty} \frac{1}{1 + 1/n} \]
   \[\Rightarrow t = \tan^{-1} (1) = \frac{\pi}{4} \Rightarrow \tan t = 1, \ (A) \rightarrow (p) \]
   \[B) \ a, b, c \text{ are in AP} \Rightarrow 2b = a + c\]
   \[\cos \theta_1 = \frac{a}{b+c}\]
   \[\Rightarrow \frac{1 - \tan^2 \theta_1/2}{1 + \tan^2 \theta_1/2} = \frac{a}{b+c} \Rightarrow \tan^2 \theta_1/2 = \frac{b+c-a}{2(b+c+a)}\]
   \[\Rightarrow \tan^2 \theta_2 = \frac{a+b-c}{a+b+c}\]
   \[\Rightarrow \tan \frac{\theta_1}{2} + \tan^2 \theta_2 = \frac{2b}{a+b+c} = \frac{2b}{3b} = \frac{2}{3}, \ (B) \rightarrow (r) \]
   \[C) \ \text{Equation of line through } (0, 1, 0) \text{ and perpendicular to} \]
   \[x + 2y + 2z = 0 \text{ is } x = \frac{y-1}{2} = \frac{z}{2} = \lambda \]
   \[\text{For some value of } \lambda, \text{ the foot of perpendicular from origin to line is } (\lambda, 2\lambda+1, 2\lambda) \]
   \[\text{Dr's of this } \perp \text{ from origin are } \lambda, 2\lambda+1, 2\lambda \]
   \[\therefore 1.\lambda + 2(2\lambda+1) + 2.2\lambda = 0 \Rightarrow \lambda = \frac{2}{9}\]
   \[\therefore \text{Foot of perpendicular is } \left( \frac{2}{9}, \frac{5}{9}, \frac{4}{9} \right) \]
   \[\therefore \text{Required distance} \]
   \[= \sqrt{\frac{4}{81} + \frac{25}{81} + \frac{16}{81}} = \frac{45}{3} = \frac{3}{\sqrt{5}} \quad (C) \rightarrow (q) \]

2. (A) \( \rightarrow p, (B) \rightarrow q, (C) \rightarrow p, (D) \rightarrow s \)
   \[\sin^{-1} (ax) + \cos^{-1} y + \cos^{-1} (bxy) = \frac{\pi}{2}\]
   \[\Rightarrow \cos^{-1} y + \cos^{-1} (bxy) = \frac{\pi}{2} - \sin^{-1} (ax) = \cos^{-1} (ax)\]
   \[\text{Let } \cos^{-1} y = \alpha, \cos^{-1} (bxy) = \beta, \cos^{-1} (ax) = \gamma\]
\[ y = \cos \alpha, \; bxy = \cos \beta, \; ax = \cos \gamma \]
\[ \therefore \quad \text{We get } \alpha + \beta = \gamma \text{ and } \cos \beta = bxy \]
\[ \Rightarrow \quad \cos (\gamma - \alpha) = bxy \]
\[ \Rightarrow \quad \cos y \cos \alpha + \sin y \sin \alpha = bxy \]
\[ \Rightarrow \quad axy + \sin y \sin \alpha = bxy \quad \Rightarrow \quad (a - b)xy = -\sin \alpha \sin y \]
\[ \Rightarrow \quad (a - b)^2 x^2 y^2 = -\sin^2 \alpha \sin^2 y \]
\[ = (1 - \cos^2 \alpha)(1 - \cos^2 y) \]
\[ \Rightarrow \quad (a - b)^2 x^2 y^2 = (1 - a^2 x^2)(1 - y^2) \quad \ldots (1) \]

(A) For \( a = 1, \; b = 0 \), equation (1) reduces to
\[ x^2 y^2 = (1 - x^2)(1 - y^2) \Rightarrow x^2 + y^2 = 1 \]

(B) For \( a = 1, \; b = 1 \) equation (1) becomes
\[ (1 - x^2)(1 - y^2) = 0 \Rightarrow (x^2 - 1)(y^2 - 1) = 0 \]

(C) For \( a = 1, \; b = 2 \) equation (1) reduces to
\[ x^2 y^2 = (1 - x^2)(1 - y^2) \Rightarrow x^2 + y^2 = 1 \]

(D) For \( a = 2, \; b = 2 \) equation (1) reduces to
\[ 0 = (1 - 4x^2)(1 - y^2) \Rightarrow (4x^2 - 1)(y^2 - 1) = 0 \]

3. (b)

\[ \text{(P)} \quad \left[ \frac{1}{y^2} \left( \frac{\cos (\tan^{-1} y) + y \sin (\tan^{-1} y)}{\cot (\sin^{-1} y) + \tan (\sin^{-1} y)} \right)^2 + y^4 \right]^{\frac{1}{2}} \]
\[ \quad = \left[ \frac{\cos \left( \cos^{-1} \frac{1}{\sqrt{1+y^2}} \right) + y \sin \left( \sin^{-1} \frac{y}{\sqrt{1+y^2}} \right)}{\cot \left( \cot^{-1} \frac{1}{y} \right) + \tan \left( \tan^{-1} \frac{y}{\sqrt{1+y^2}} \right)} \right]^2 + y^4 \]
\[ \quad = \left[ \frac{\sqrt{1+y^2}}{y(\sqrt{1-y^2})} \right]^2 + y^4 \]
\[ = \left( 1 - y^4 + y^4 \right)^{\frac{1}{2}} = 1 \quad \therefore \quad \text{(P) } \rightarrow (4) \]

(Q) We have \( \cos x + \cos y = -\cos z \)
\[ \sin x + \sin y = -\sin z \]
Squaring and adding we get

\[ \text{Topic-wise Solved Papers - MATHEMATICS} \]
\[ \cos (x + y) + \cos (x + z) = \cos^2 \frac{y}{2} \quad \text{or} \quad \cos \frac{x - y}{2} = \frac{1}{2} \]
\[ \Rightarrow \quad 4 \cos^2 \frac{x - y}{2} = 1 \]
\[ \therefore \quad Q \rightarrow (3) \]

(R) We have
\[ \cos \left( \frac{\pi}{4} - x \right) \cos 2x + \sin x \sec x \]
\[ = \cos x \sin 2x \sec x + \cos \left( \frac{\pi}{4} + x \right) \cos 2x \]
\[ \Rightarrow \quad \cos 2x \left[ \cos \left( \frac{\pi}{4} - x \right) - \cos \left( \frac{\pi}{4} + x \right) \right] \]
\[ = \sin 2x \sec x \left( \cos x - \sin x \right) \]
\[ \Rightarrow \quad 2 \sin \frac{\pi}{4} \sin x \cos 2x = 2 \sin x (\cos x - \sin x) \]
\[ \Rightarrow \quad 2 \sin x \left[ \frac{1}{\sqrt{2}} (\cos^2 x - \sin^2 x) - (\cos x - \sin x) \right] = 0 \]
\[ \Rightarrow \quad 2 \sin x (\cos x - \sin x) \left[ \frac{\cos x + \sin x}{\sqrt{2}} - 1 \right] = 0 \]
\[ \Rightarrow \quad \sin x = 0 \text{ or } \tan x = 1 \text{ or } \cos \left( x - \frac{\pi}{4} \right) = 1 \]
\[ \therefore \quad x = 0, \; \frac{\pi}{4} \Rightarrow \sec x = 1 \text{ or } \sqrt{2} \]
\[ \therefore \quad (R) \rightarrow (2) \]

(S) \[ \cos \left( \sin^{-1} \sqrt{1-x^2} \right) = \sin \left( \tan^{-1} x \sqrt{6} \right) \]
\[ \Rightarrow \quad \frac{x}{\sqrt{1-x^2}} = \frac{x \sqrt{6}}{\sqrt{1+6x^2}} \Rightarrow x = \pm \frac{5}{2\sqrt{3}} \]
\[ \therefore \quad (S) \rightarrow (1) \]
Hence \( (P) \rightarrow (4), \; (Q) \rightarrow (3), \; (R) \rightarrow (2), \; (S) \rightarrow (1) \)
1. (a) \( \cot^{-1} \left( \sqrt{\cos \alpha} \right) - \tan^{-1} \left( \sqrt{\cos \alpha} \right) = x \)
\[ \tan^{-1} \left( \frac{1}{\sqrt{\cos \alpha}} \right) - \tan^{-1} \left( \sqrt{\cos \alpha} \right) = x \]
\[ \Rightarrow \tan^{-1} \left( \frac{1}{\sqrt{\cos \alpha}} - \sqrt{\cos \alpha} \right) = x \]
\[ \Rightarrow \tan^{-1} \left( \frac{1 - \cos \alpha}{2\sqrt{\cos \alpha}} \right) = x \]
\[ \Rightarrow \tan x = \frac{1 - \cos \alpha}{2\sqrt{\cos \alpha}} \text{ or } \cot x = \frac{2\sqrt{\cos \alpha}}{1 - \cos \alpha} \]
\[ \Rightarrow \sin x = \frac{1 - \cos \alpha}{1 + \cos \alpha} = 1 - (1 - 2 \sin^2 \alpha / 2) / 1 + 2 \cos^2 \alpha / 2 - 1 \]
\[ \text{or } \sin x = \tan^2 \frac{\alpha}{2} \]

2. (None) \( \sin^{-1} x = 2 \sin^{-1} a \)
\[-\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2}; \quad \Rightarrow -\frac{\pi}{2} \leq 2 \sin^{-1} a \leq \frac{\pi}{2} \]
\[-\frac{\pi}{4} \leq \sin^{-1} a \leq \frac{\pi}{4} \quad \text{or} \quad -\frac{1}{\sqrt{2}} \leq a \leq \frac{1}{\sqrt{2}} \]
\[ \therefore |a| \leq \frac{1}{\sqrt{2}} \]
Out of given four options none is absolutely correct

3. (c) \( \cos^{-1} x - \cos^{-1} \frac{y}{2} = \alpha \)
\[ \cos^{-1} \left( \frac{xy}{2} + \sqrt{\left(1 - x^2\right)\left(1 - \frac{y^2}{4}\right)} \right) = \alpha \]
\[ \cos^{-1} \left( \frac{xy + \sqrt{4y^2 - 4x^2 + x^2y^2}}{2} \right) = \alpha \]
\[ \Rightarrow 4 - y^2 - 4x^2 + x^2y^2 = 4 \cos^2 \alpha + x^2y^2 - 4xy \cos \alpha \]
\[ \Rightarrow 4x^2 + y^2 - 4xy \cos \alpha = 4 \sin^2 \alpha \]

4. (d) \( \sin^{-1} \left( \frac{x}{5} \right) + \cosec^{-1} \left( \frac{5}{4} \right) = \frac{\pi}{2} \)
\[ \Rightarrow \sin^{-1} \left( \frac{x}{5} \right) = \frac{\pi}{2} - \cosec^{-1} \left( \frac{5}{4} \right) \]
\[ \Rightarrow \sin^{-1} \left( \frac{x}{5} \right) = \frac{\pi}{2} - \sin^{-1} \left( \frac{4}{5} \right) \]
\[ \text{[}\because \sin^{-1} x + \cos^{-1} x = \pi/2\text{] } \]
\[ \Rightarrow \sin^{-1} \left( \frac{x}{5} \right) = \cos^{-1} \left( \frac{4}{5} \right) \]
\[ \Rightarrow \sin^{-1} \left( \frac{x}{5} \right) = \sin^{-1} \left( \frac{3}{5} \right) \Rightarrow \frac{x}{5} = \frac{3}{5} \Rightarrow x = 3 \]

5. (a) \( \cot \left( \cosec^{-1} \frac{5}{3} + \tan^{-1} \frac{2}{3} \right) = \cot \left[ \tan^{-1} \left( \frac{3}{4} \right) \right] \]
\[ = \cot \left[ \tan^{-1} \left( \frac{\frac{3}{4} + \frac{2}{3}}{1 - \frac{3}{4} \times \frac{2}{3}} \right) \right] = \cot \left[ \tan^{-1} \frac{17}{10} \right] \]
\[ = \cot \left( \cot^{-1} \frac{6}{17} \right) = \frac{6}{17} \]

6. (a) Since, \( x, y, z \) are in A.P. \( \Rightarrow 2y = x + z \)
Also, we have, \( 2 \tan^{-1} y = \tan^{-1} x + \tan^{-1} (z) \)
\[ \Rightarrow \tan^{-1} \left( \frac{2y}{1 - y^2} \right) = \tan^{-1} \left( \frac{x + z}{1 - xz} \right) \]
\[ \Rightarrow \frac{x + z}{1 - y^2} = \frac{x + z}{1 - xz} \quad (\because \ 2y = x + z) \]
\[ \Rightarrow y^2 = xz \text{ or } x + z = 0 \Rightarrow x = y = z \]

7. (c) \( \tan^{-1} y = \tan^{-1} x + \tan^{-1} \left[ \frac{2x}{1 - x^2} \right] \)
\[ = \tan^{-1} x + 2 \tan^{-1} x = 3 \tan^{-1} x \]
\[ \tan^{-1} y = \tan^{-1} \left[ \frac{3x - x^3}{1 - 3x^2} \right] \Rightarrow y = \frac{3x - x^3}{1 - 3x^2} \]

Section-A : JEE Advanced/ IIT-JEE

A. Fill in the Blanks

1. As given equation is an identity in \( \lambda \), it must be true for all values of \( \lambda \).

\[
\begin{vmatrix}
0 & 1 & 2 & 3 \\
1 & 0 & -4 & 0 \\
-3 & 4 & 0 & 0
\end{vmatrix} = 0
\]

\( \therefore \) For \( \lambda = 0 \) also. Putting \( \lambda = 0 \) we get \( t = 1 \).

2. Given equation is, \[
\begin{vmatrix}
1 & 4 & 20 \\
1 & -2 & 5 \\
1 & 2x & 5x^2
\end{vmatrix} = 0
\]

Clearly on expanding the det. we will get a quadratic equation in \( x \).

\( \therefore \) It has 2 roots. We observe that \( R_3 \) becomes identical to \( R_1 \) if \( x = 2 \), thus at \( x = 2 \Rightarrow \Delta = 0 \).

\( \therefore \) \( x = 2 \) is a root of given eq. Similarly \( R_3 \) becomes identical to \( R_2 \) if \( x = -1 \).

Thus at \( x = -1 \Rightarrow \Delta = 0 \).

\( \therefore \) \( x = -1 \) is a root of given eq.

Hence equation has roots as \(-1 \) and 2.

3. With 0 and 1 as elements there are \( 2 \times 2 \times 2 = 16 \) determinants of order \( 2 \times 2 \) out of which only

\[
\begin{vmatrix}
1 & 0 & 1 & 1 & 0 \\
0 & 1 & 1 & 0 & 1
\end{vmatrix}
\]

are the three det whose value is +ve.

\( \therefore \) Req. prob. = \( 3/16 \)
4. \[ \begin{vmatrix} x & 3 & 7 \\ 2 & x & 2 \\ 7 & 6 & x \end{vmatrix} = 0 \]

Operating \( R_1 \rightarrow R_1 + R_2 + R_3 \) we get

\[ \begin{vmatrix} x + 9 & x + 9 & x + 9 \\ 2 & x & 2 \\ 7 & 6 & x \end{vmatrix} = 0 \]

\[ \Rightarrow (x+9) \begin{vmatrix} 1 & 1 & 1 \\ 2 & x - 2 & 0 \\ 7 & -1 & x - 7 \end{vmatrix} = 0 \]

Expanding along \( R_1 \)

\[ \Rightarrow (x+9)(x-2)(x-7) = 0 \]

\[ \Rightarrow x = -9, 2, 7 \]

\[ \therefore \text{ Other roots are 2 and 7.} \]

5. The given homogeneous system of equations will have non-zero solution if \( D = 0 \)

\[ \begin{vmatrix} \lambda & 1 & 1 \\ -1 & \lambda & 1 \\ -1 & -1 & \lambda \end{vmatrix} = 0 \]

\[ \Rightarrow \lambda (\lambda^2 + 1) - 1(\lambda + 1) + 1(1 + \lambda) = 0 \]

\[ \Rightarrow \lambda (\lambda^2 + 3) = 0, \text{ but } \lambda^2 + 3 \neq 0 \text{ for real } \lambda \Rightarrow \lambda = 0 \]

6. \[ \begin{vmatrix} 1 & a & a^2 - bc \\ 1 & b & b^2 - ca \\ 1 & c & c^2 - ab \end{vmatrix} \]

Operating \( R_1 \rightarrow R_1 - R_2, \ R_2 \rightarrow R_2 - R_3 \)

\[ \begin{vmatrix} 0 & a - b & (a - b)(a + b + c) \\ 0 & b - c & (b - c)(a + b + c) \\ 1 & c & c^2 - a b \end{vmatrix} \]

\[ = (a - b)(b - c) \begin{vmatrix} 0 & 1 & a+b+c \\ 0 & 1 & a+b+c \\ 1 & c & c^2 - ab \end{vmatrix} = 0 \]

7. Given \( x, y, z \) and \( +ve \) numbers, then value of

\[ D = \begin{vmatrix} 1 & \log x & \log z \\ \log y & \log x & 1 \\ \log x & \log y & 1 \end{vmatrix} \]

Taking \( \frac{1}{\log x}, \frac{1}{\log y}, \text{ and } \frac{1}{\log z} \) common from \( R_1, R_2, \text{ and } R_3 \) respectively

\[ D = \begin{vmatrix} \log x & \log y & \log z \\ \log y & \log x & 1 \\ \log x & \log y & 1 \end{vmatrix} = 0 \]

\[ \because \log b = \frac{\log a}{\log b} \]

B. True/False

1. \[ \begin{vmatrix} a & a^2 & abc \\ b & b^2 & abc \\ c & c^2 & abc \end{vmatrix} = \begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \end{vmatrix} \]

2. (i) \[ \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \begin{vmatrix} a_1 & b_1 & 1 \\ a_2 & b_2 & 1 \end{vmatrix} \]

\[ \Rightarrow \begin{vmatrix} x_1 & y_1 \end{vmatrix} = \begin{vmatrix} a_1 & b_1 \end{vmatrix} \]

\[ \Rightarrow \begin{vmatrix} x_2 & y_2 \end{vmatrix} = \begin{vmatrix} a_2 & b_2 \end{vmatrix} \]

\[ \Rightarrow \begin{vmatrix} x_3 & y_3 \end{vmatrix} = \begin{vmatrix} a_3 & b_3 \end{vmatrix} \]

\[ Ar(\Delta_1) = Ar(\Delta_2) \]

Where \( \Delta_1 \) is the area of triangle with vertices \((x_1, y_1), (x_2, y_2)\) and \((x_3, y_3)\); and \( \Delta_2 \) is the area of triangle with vertices \((a_1, b_1), (a_2, b_2)\) and \((a_3, b_3)\). But two \( \Delta \)'s of same area may not be congruent.

\[ \therefore \text{ Given statement is false.} \]

C. MCQs with ONE Correct Answer

1. (b) For every ‘det, with value 1’ \(( \in B)\) we can find a det. with value – 1 by changing the sign of one entry of ‘1’. Hence there are equal number of elements in B and C. \( \therefore \) (b) is the correct option

\[ \begin{vmatrix} 1 & 1+i+\omega^2 & \omega^2 \\ 1-i & -1 & \omega^2-1 \\ -i & -i+\omega-1 & -1 \end{vmatrix} \]

Operating \( R_1 \rightarrow R_1 - R_2 + R_3 \)
Expanding along $C_1$, we get
\[ \Delta = (1 + a^2 - 2a \cos dx) \sin (p + dx) \]
\[ \Rightarrow \Delta = (1 + a^2 - 2a \cos dx) \sin (p + dx) \]
which is independent of $p$.

6. (a)
\[ f(x) = \begin{vmatrix} 1 & x & x + 1 \\ 2x & x(x-1) & (x+1)x \\ 3x(x-1) & x(x-1)(x-2) & (x+1)x(x-1) \end{vmatrix} \]
\[ = \begin{vmatrix} x+1 & x & x+1 \\ (x+1)x & x(x-1) & (x+1)x \\ (x+1)x(x-1) & x(x-1)(x-2) & (x+1)x(x-1) \end{vmatrix} \]
\[ = 0 \] (since $C_1$ and $C_2$ are identical)
which is true for all values of $x$. Therefore, at $x = 100, f(x) = 0$, i.e., $f(100) = 0$

7. (d) For the given homogeneous system to have a non-zero solution, determinant of coefficient matrix should be zero; i.e.,
\[ \begin{vmatrix} 1 & -k & -1 \\ k & -1 & -1 \\ -1 & 1 & 1 \end{vmatrix} = 0 \]
\[ \Rightarrow k^2 + k - 1 = 0 \Rightarrow k = \frac{-1 \pm \sqrt{5}}{2} \]

8. (b) Given that $\omega = -1 - i\sqrt{3}$, $\omega^2 = \frac{-1 - \sqrt{3}}{2}$
Also $1 + \omega + \omega^2 = 0$ and $\omega^3 = 1$

Now given det. is
\[ \begin{vmatrix} 1 & 1 & 1 \\ -1 & -\omega^2 & \omega^2 \\ 1 & \omega & \omega^2 \end{vmatrix} \]
\[ = \begin{vmatrix} 1 & 1 & 1 \\ -1 & -\omega^2 & \omega^2 \\ 1 & \omega & \omega^2 \end{vmatrix} \]

Operating $C_1 \rightarrow C_1 + C_2$ and $B = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$

Expanding along $C_1$, we get
\[ 3(\omega^2 - \omega^3) = 3(\omega^2 - \omega) = 3(\omega^2 - 1) \]

9. (b) For infinitely many solutions the two equations become identical
\[ \Rightarrow \frac{k+1}{k} = \frac{8}{3k-1} \Rightarrow k = 1 \]

10. (d) Given that $A = \begin{bmatrix} \alpha & 0 \\ 0 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 0 \\ 5 & 1 \end{bmatrix}$
and $A^2 = B$
\[ \Rightarrow \begin{bmatrix} \alpha & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} \alpha & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 5 & 1 \end{bmatrix} \]
\[ \Rightarrow \alpha^2 = 1 \text{ and } \alpha + 1 = 5 \Rightarrow \alpha = \pm 1 \text{ and } \alpha = 4 \]
\[ \Rightarrow \text{ There is no common value} \]
\[ \Rightarrow \text{ There is no real value of } \alpha \text{ for which } A^2 = B \]
11. (a) The given system is, \( x + ay = 0 \)
\[
\begin{align*}
2z + y &= 0 \\
ax + z &= 0
\end{align*}
\]
It is system of homogeneous equations therefore, it will have infinite many solutions if determinant of coefficient matrix is zero. i.e.,
\[
\begin{vmatrix}
1 & a & 0 \\
0 & 1 & a \\
a & 0 & 1
\end{vmatrix} = 0
\]
\[
\Rightarrow (1 - a^2)(1 - a^2) - a^2 = 0 \Rightarrow 1 + a^2 = 0
\]
\[
\Rightarrow a^2 = -1 \Rightarrow a = -1
\]
12. (b) Since the system has no solution, \( \Delta = 0 \) and any one amongst \( \Delta_x, \Delta_y, \Delta_z \) is non-zero.
\[
\begin{vmatrix}
2 & -1 & 2 \\
1 & -2 & 1 \\
1 & 1 & \lambda
\end{vmatrix} = 0 \Rightarrow \lambda = 1
\]
Also, \( \Delta_z = \begin{vmatrix} 2 & -1 & 2 \\ 1 & -2 & -4 \\ 1 & 1 & 1 \end{vmatrix} = 6 \neq 0 \)

13. (c) \( A = \begin{bmatrix} \alpha & 2 \\ 2 & \alpha \end{bmatrix} \) and \( |A^3| = 125 \Rightarrow |A|^3 = 125 \)

Now, \( |A| = \alpha^2 - 4 \)
\[
\Rightarrow (\alpha^2 - 4)^3 = 125 \Rightarrow \alpha^2 - 4 = 5 \Rightarrow \alpha = \pm 3
\]

14. (c) Given \( A = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & -2 & 4 \end{bmatrix} \)

\( \therefore \) Characteristic eqn of above matrix A is given by
\[
|A - \lambda I| = 0 \Rightarrow \begin{vmatrix} 1 - \lambda & 0 & 0 \\ 0 & 1 - \lambda & 1 \\ 0 & -2 & 4 - \lambda \end{vmatrix} = 0
\]
\[
\Rightarrow (1 - \lambda)(4 - 5\lambda + \lambda^2 + 2) = 0 \Rightarrow \lambda^3 - \lambda^2 - 6\lambda - 6 = 0
\]
Also by Cayley Hamilton thm (every square matrix satisfies its characteristic equation) we obtain
\( A^3 - 6A^2 + 11A - 6I = 0 \)

Multiplying by \( A^{-1} \) we get
\[
A^2 - 6A + 11I - 6A^{-1} = 0 \Rightarrow A^{-1} = \frac{1}{6} (A^2 - 6A + 11I)
\]

Comparing it with given relation,
\[
A^{-1} = \frac{1}{6} (A^2 - cA + dI)
\]
we get \( c = -6 \) and \( d = 11 \)

15. (a) Given that, \( P = \begin{bmatrix} \sqrt{3} & 1 \\ 2 & 2 \\ -1 & \sqrt{3} \\ 2 & 2 \end{bmatrix} \)
\[
A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \] and \( Q = PA \ P^T \) and \( X = P^T \ Q^{2005} \ P \)

We observe that \( Q = PA \ P^T \)
\[
\Rightarrow Q^2 = (PA \ P^T)(PA \ P^T)
\]
\[
= PA (P^T \ P) A \ P^T = PA (I \ A) \ P^T
\]
\[
= P \ A^2 \ P^T
\]
Proceeding in the same way, we get
\[
Q^{2005} = PA^{2005} \ P^T
\]
Also \( A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \)
\[
A^2 = \begin{bmatrix} 1 & 2 \\ 0 & 1 \end{bmatrix}
\]
and proceeding in the same way \( A^{2005} = \begin{bmatrix} 1 & 2005 \\ 0 & 1 \end{bmatrix} \)

Now, \( X = P^T \ Q^{2005} \ P = P^T \ (P^T \ P) \ A^{2005} \ (P^T \ P) \)
\[
= IA^{2005} \ I = A^{2005} = \begin{bmatrix} 1 & 2005 \\ 0 & 1 \end{bmatrix}
\]

16. (d) The given points are \( P(\sin(\beta - \alpha), -\cos \beta) \)
\[
Q(\cos(\beta - \alpha), \sin \beta)
\]
\[
R(\cos(\beta - \alpha + \theta), \sin(\beta - \theta))
\]
Where \( 0 < \alpha, \beta, \theta < \frac{\pi}{4} \)
\[
\begin{bmatrix} 1 & 1 & 1 \\ \sin(\beta - \alpha) & \cos(\beta - \alpha) & \cos(\beta - \alpha + \theta) \\ -\cos \beta & \sin \beta & \sin(\beta - \theta) \end{bmatrix}
\]
\[
\therefore \Delta = \begin{vmatrix} 1 & 1 & 1 \\ \sin(\beta - \alpha) & \cos(\beta - \alpha) & \cos(\beta - \alpha + \theta) \\ -\cos \beta & \sin \beta & \sin(\beta - \theta) \end{vmatrix}
\]
\[
\Rightarrow \Delta = [1 - \sin(\theta - \cos \theta)] \cos(2\beta - \alpha)
\]
\[
\therefore 0 < \alpha, \beta, \theta < \frac{\pi}{4} \therefore \sin(\theta + \cos \theta) \neq 1
\]
Also \( 2\beta - \alpha < \frac{\pi}{4} \Rightarrow \cos(2\beta - \alpha) \neq 0 \)
\[
\therefore \Delta \neq 0 \Rightarrow \text{the three points are non collinear.}
\]

17. (a) Let \( A = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \)
where \( a_1, b_1, c_1 \) have values 0 or 1 for \( i = 1, 2, 3. \)

Then the given system is equivalent to
\[
a_1x + b_1y + c_1z = 1,
\]
\[
a_2x + b_2y + c_2z = 0,
\]
\[
a_3x + b_3y + c_3z = 0
\]
Which represents three distinct planes. But three planes can not intersect at two distinct points, therefore no such system exists.
18. (a) For the given matrix to be non-singular
\[
\begin{bmatrix}
1 & a & b \\
\omega & 1 & c \\
\omega^2 & \omega & 1
\end{bmatrix}
\]
\[\Rightarrow 1 - (a + c) \omega + a \omega^2 \neq 0 \Rightarrow (1 - \omega)(1 - \omega^2) \neq 0\]
\[\Rightarrow a \neq \omega \text{ and } c \neq \omega^2 \text{ where } \omega \text{ is complex cube root of unity.}\]
As \(a, b\) and \(c\) are complex cube roots of unity
\[\therefore a\text{ and } c\text{ can take only one value i.e. } \omega \text{ while } b \text{ can take 2 values i.e. } \omega \text{ and } \omega^2.\]
\[\therefore \text{ Total number of distinct matrices } = 1 \times 1 \times 2 = 2\]

19. (d) We have
\[|Q| = \begin{vmatrix}
2^2a_{11} & 2^3a_{12} & 2^4a_{13} \\
2^3a_{21} & 2^4a_{22} & 2^5a_{23} \\
2^4a_{31} & 2^5a_{32} & 2^6a_{33}
\end{vmatrix}
\]
\[= 2^2 \cdot 2^3 \cdot 2^4 \begin{vmatrix}
a_{11} & a_{12} & a_{13} \\
a_{21} & a_{22} & a_{23} \\
a_{31} & a_{32} & a_{33}
\end{vmatrix}
\]
\[= 2^9 \cdot 2^2 \cdot 2^2 \begin{vmatrix}
a_{11} & a_{12} & a_{13} \\
a_{21} & a_{22} & a_{23} \\
a_{31} & a_{32} & a_{33}
\end{vmatrix}
\]
\[= 2^{12} \times |P| = 2^{12} \times 2 = 2^{13}\]

20. (d) We have \(P^T = 2P + I\)
\[\Rightarrow P = 2P^T + I \Rightarrow P = 2(2P + I) + I \]
\[\Rightarrow P = 4P + 3I \Rightarrow P + I = 0 \]
\[\Rightarrow PX + X = 0 \Rightarrow PX = -X\]

21. (b) \(P = \begin{bmatrix} 1 & 0 & 0 \\ 4 & 1 & 0 \\ 16 & 4 & 1 \end{bmatrix} = 1+ \begin{bmatrix} 0 & 0 & 0 \\ 4 & 0 & 0 \\ 16 & 4 & 0 \end{bmatrix} = 1+A\)
\[A^2 = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 16 & 0 & 0 \end{bmatrix} \text{ and } A^3 = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}\]
\[\therefore A^n = O, \forall n \geq 3\]
Now \(P^n = (1+A)^n = \sum_{r=0}^{n} A^r = I + 50A + 25 \times 49A^2\).
\[\Rightarrow q_{31} = 50 \times 4 = 200 \Rightarrow q_{31} = 50 \times 16 + 25 \times 49 \times 16 = 20400\]
\[q_{32} = 50 \times 4 = 200\]
\[\therefore \frac{q_{31} + q_{32}}{q_{21}} = \frac{20600}{200} = 103\]

D. MCQs with ONE or MORE THAN ONE Correct

1. (b, e) \(ATQ\)
\[
\begin{bmatrix}
a & b & a\alpha + b \\
b & c & b\alpha + c \\
\alpha \alpha + b & \alpha \alpha + c & 0
\end{bmatrix} = 0
\]
Operating \(C_3 \rightarrow C_3 - C_1\), \(\alpha - C_2\), we get

\[
\begin{vmatrix}
a & b & 0 \\
b & c & 0 \\
\alpha \alpha + b & \alpha \alpha + c & 0
\end{vmatrix} = 0
\]
\[\Rightarrow (\alpha \alpha + b) \alpha \alpha + c = (\alpha \alpha + b) \alpha \alpha + c \]
\[\Rightarrow (\alpha \alpha^2 + b\alpha + c) = (\alpha \alpha + b) \alpha \alpha + c \]
\[\Rightarrow (\alpha \alpha + b) \alpha \alpha + c = 0 \]
\[\Rightarrow \text{ either } \alpha \alpha + b = 0 \text{ or } \alpha \alpha^2 + b\alpha + c = 0 \]
\[\Rightarrow \text{ either } \alpha, b, c \text{ are in G.P. or } (x-\alpha) \text{ is a factor of } \alpha x^2 + 2bx + c \]
\[\Rightarrow (b) \text{ and (e)} \text{ are the correct answers.}\]

2. (d) \(4 \ 3i \ -1 = x + iy \text{ (given)}\
\[\begin{bmatrix} 6i & -3i & 1 \\
20 & 3 & i \\
\end{bmatrix}
\]
\[\Rightarrow -3i \ 4 \ -1 \ -1 = 0\]
\[\Rightarrow \begin{bmatrix} 6i & 1 & 1 \\
20 & i & i \\
\end{bmatrix}\]
\[\Rightarrow x + iy = 0 \Rightarrow x = 0, y = 0\]
\[\Rightarrow C_2 \text{ and } C_3 \text{ are identical}\]

3. (c) [As a skew symmetric matrix of order 3 cannot be non singular, therefore the data given in the question is inconsistent.]
We have
\[M^2N^2 (M^T)^{-1} (MN - N^T)^T = M^2N^2N^{-1} (M^T)^{-1} (N^{-1})^T M^T\]
\[= M^2 N (M^T)^{-1} (N^{-1})^T M^T = -M^2NM^{-1}N^{-1}M\]
\[\Rightarrow M = -M, M^T = -N \text{ and } (N^{-1})^T = (N^T)^{-1} = -M (NM) (NM)^{-1}M \text{ (i.e.: } MN = NM)\]
\[= -MM = -M^2\]

4. (a, d) We know for a third order matrix \(P\), \(|\text{Adj } P| = |P|^2\)
Where \(|\text{Adj } P| = 1 (3-7) - 4 (6-7) + 4 (2-1) = 4\)
\[|P|^2 = 4 \Rightarrow |P| = 2 \text{ or } 2\]

5. (c, d) (a) \((N^M N') = (MN)N' = NM'N' = NM'N\text{ or } -NM'N\)
According as \(M\) is symm. or skew symm. \(\therefore \) correct.
(b) \((MN - NM') = (MN) - (NM') = NM' - M'N\text{ or } -MN - NM\)
\[\Rightarrow MN = -MN \text{ or } MN = -MN \text{ (i.e. skew symmetric)}\]
\[\therefore \text{ it is skew symmetric. Statement } B \text{ is also correct.}\]
(c) \((MN') = NM' \neq MN\text{ (i.e. skew symmetric)}\]
\[\Rightarrow \text{ Statement } C \text{ is incorrect.}\]
(d) \((adj M) = adj (MN) \text{ is incorrect.}\]

6. (b, c, d) For \(n = 3, P = \begin{bmatrix} w^2 & w^3 & w^4 \\
w^3 & w^4 & w^5 \\
w^4 & w^5 & w^6 \end{bmatrix}\text{ and } P^2 = \begin{bmatrix} 0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0 \end{bmatrix}\]
\[\text{It shows } P^2 = 0 \text{ if } n \text{ is a multiple of } 3.\]
So for \(P^2 \neq 0, n \text{ should not be a multiple of } 3 \text{ i.e. } n \text{ can take values } 55, 58, 56\]
7. (c, d) Let \( M = \begin{bmatrix} a & b \\ b & c \end{bmatrix} \) where \( a, b, c \) are integers.

\( M \) is invertible if \( \begin{vmatrix} a & b \\ b & c \end{vmatrix} \neq 0 \Rightarrow ac \neq b^2 \)

Then \( \begin{bmatrix} a \\ b \\ c \end{bmatrix} = \begin{bmatrix} b \\ c \end{bmatrix} \Rightarrow a = b = c \Rightarrow ac = b^2 \).

\( \therefore \) (a) is not correct.

If \( \begin{bmatrix} b \\ c \end{bmatrix} = \begin{bmatrix} a \\ b \end{bmatrix} \Rightarrow b = a = c \Rightarrow ac = b^2 \)

\( \therefore \) (b) is not correct.

If \( M = \begin{bmatrix} a & 0 \\ 0 & c \end{bmatrix} \), then \( |M| = ac \neq 0 \)

\( \therefore \) \( M \) is invertible.

(c) is correct.

As \( ac \neq (\text{integer})^2 \Rightarrow ac \neq b^2 \)

\( \therefore \) (d) is correct.

8. (a, b) Given \( MN = NM, M \neq N^2 \) and \( M^2 = N^4 \).

Then \( M^2 = N^4 \Rightarrow (M + N^2)(M - N^2) = 0 \)

\( \Rightarrow \)

(i) \( M + N^2 = 0 \) and \( M - N^2 = 0 \)

(ii) \( M + N^2 = 0 \) and \( M - N^2 = 0 \)

In each case \( |M + N^2| = 0 \)

\( \therefore \) \( |M^2 + MN^2| = |M| |M + N^2| = 0 \)

\( \therefore \) (a) is correct and (c) is not correct.

Also we know if \( |A| = 0 \), then there can be many matrices \( U \), such that \( AU = 0 \)

\( \therefore \) \( (M^2 + MN^2)U = 0 \) will be true for many values of \( U \).

Hence (b) is correct.

Again if \( AX = 0 \) and \( |A| = 0 \), then \( X \) can be non-zero.

\( \therefore \) (d) is not correct.

9. (b, c)

\[
\begin{align*}
R_2 - R_1, & \quad R_3 - R_2 \\
(1 + \alpha)^2 & \quad (1 + 2\alpha)^2 \\
2\alpha + 3 & \quad 4\alpha + 3 \\
2\alpha + 5 & \quad 4\alpha + 5 \\
2\alpha + 3 & \quad 4\alpha + 5 \\
1 & \quad 1 \\
6\alpha + 3 & \quad 6\alpha + 5 \\
6\alpha + 3 & \quad 6\alpha + 5 \\
C_2 - C_1, & \quad C_3 - C_2 \\
(1 + \alpha)^2 & \quad (1 + 3\alpha)^2 \\
\alpha(3\alpha + 2) & \quad \alpha(5\alpha + 2) \\
2\alpha + 3 & \quad 2\alpha \\
1 & \quad 0 \\
2\alpha & \quad 2\alpha \\
1 & \quad 0 \\
\alpha(5\alpha + 2) & \quad \alpha(5\alpha + 2) \\
= & \quad = \\
-324\alpha & \quad -324\alpha \\
= & \quad = \\
-648\alpha & \quad -648\alpha \\
\Rightarrow & \quad \Rightarrow \\
2\alpha^2 - 2\alpha & \quad = -324\alpha \Rightarrow \alpha^2 - 81\alpha = 0 \Rightarrow \alpha = 0, 9, -9 \\
\end{align*}
\]

10. (c, d)

\( X' = -X, Y' = -Y, Z' = Z \)

\( (Y^3Z^4 - Z^4Y^3) = (Z^4)(Y^3)' - (Y^3)(Z^4)' \)

\( = (Z^4)'(Y^3)' - (Y^3)'(Z^4)' \)

\( = -Z^4Y^3 + Y^3Z^4 = Y^3Z^4 - Z^4Y^3 \)

\( \therefore \) Symmetric matrix.

Similarly \( X'^4 + Y'^4 \) is symmetric matrix and \( X'^4Z^3 - Z^3X'^4 \)

and \( X'^3 + Y'^3 \) are skew symmetric matrices.

11. (b, c)

\[
\begin{align*}
PQ = kI & \Rightarrow \frac{PQ}{k} = I \Rightarrow P^{-1} = \frac{Q}{k} \\
\text{Also } |P| = 12\alpha + 20 \\
\text{Comparing the third elements of } 2^{nd} \text{ row on both sides, we get } \\
\frac{3\alpha + 4}{12\alpha + 20} & = \frac{1}{k} \times \frac{-k}{8} \Rightarrow 24\alpha + 32 = 12\alpha + 20 \Rightarrow \alpha = -1 \\
\therefore |P| & = 8 \\
\text{Also } PQ = kI \Rightarrow |P| |Q| = k^3 \\
\Rightarrow 8 \times \frac{k^2}{2} & = k^3 \Rightarrow k = 4 \Rightarrow |Q| = \frac{k^2}{2} = 8 \\
\text{(b) } 4\alpha - k + 8 = 4 \times (-1) - 4 + 8 = 0 \\
\text{(c) Now det } (P \text{ adj } Q) & = |P| \text{ adj } Q \\
& = |P| |Q|^2 = 8 \times \frac{8}{2} = 2^9 \\
\text{(d) } |Q| \text{ adj } P & = |Q| |P|^2 = 2^9 \\
\end{align*}
\]

12. (b, c, d)

\( ax + 2y = \lambda \)

\( 3x - 2y = \mu \)

For unique solution, \( a \neq \frac{2}{-2} \Rightarrow a \neq -3 \)

\( \therefore \) (b) is the correct option.

For infinite many solutions and \( a = -3 \)

\( \frac{-3}{3} = \frac{2}{-2} = \frac{\lambda}{\mu} \therefore \lambda + \mu = 0 \)

\( \therefore \) (c) is the correct option.

Also if \( \lambda + \mu \neq 0 \), then \( \frac{-3}{3} = \frac{2}{-2} \neq \frac{\lambda}{\mu} \)

\( \Rightarrow \) system has no solution.

\( \therefore \) (d) is the correct option.

E. Subjective Problems

1. We should have,

\[
\begin{bmatrix}
1 & k & 3 \\
3 & k & -2 \\
2 & 3 & -4
\end{bmatrix} = 0
\]

\( \Rightarrow 1(-4k + 6) - k(-12 + 4) + 3(9 - 2k) = 0 \)

\( \Rightarrow -2k + 33 = 0 \Rightarrow k = \frac{33}{2} \)

Substituting \( k = \frac{33}{2} \) and putting \( x = b \), where \( b \in Q \), we get

the system as

\[
\begin{align*}
33y + 6z & = -2b \quad \ldots (1) \\
33y - 4z & = -6b \quad \ldots (2) \\
3y - 4z & = -2b \quad \ldots (3)
\end{align*}
\]

\( 1 - (2) \Rightarrow 10z = 4b \Rightarrow z = \frac{2}{5} b \)

\( 1 \Rightarrow 33y = -2b - \frac{12b}{5} = \frac{-22b}{5} \Rightarrow y = \frac{-2b}{15} \)

\( \therefore \) The solution is \( x = b, y = \frac{-2b}{15}, z = \frac{2b}{5} \)
2. The given det, on expanding along $R_1$, we get:

\[
\begin{vmatrix}
  a & b & c \\
  b & c & a \\
  c & a & b \\
\end{vmatrix} = a(bc - a^2) - b(b^2 - ac) + c(ab - c^2) \\
= 3abc - a^3 - b^3 - c^3 = -(a^3 + b^3 + c^3 - 3abc) \\
= -(a + b + c) \left[ a^2 + b^2 + c^2 - ab - bc - ca \right] \\
= -\frac{1}{2} (a + b + c) \left[ 2a^2 + 2b^2 + 2c^2 - 2ab - 2bc - 2ca \right] \\
= -\frac{1}{2} (a + b + c) \left[ (a-b)^2 + (b-c)^2 + (c-a)^2 \right]
\]

As $a, b, c > 0$
\[\therefore \quad a + b + c > 0\]
Also $a \neq b \neq c$
\[\therefore \quad (a-b)^2 + (b-c)^2 + (c-a)^2 > 0\]

Hence the given determinant is - ve.

3. \[
\begin{vmatrix}
  x^2 + x & x + 1 & x - 2 \\
  2x^2 + 3x - 1 & 3x & 3x - 3 \\
  x^2 + 2x + 3 & 2x - 1 & 2x - 1 \\
\end{vmatrix} = xA + B
\]
L.H.S. = \[
\begin{vmatrix}
  x^2 + x & x + 1 & x - 2 \\
  2x^2 + 3x - 1 & 3x & x - 3 \\
  x^2 + 2x + 3 & 2x - 1 & 2x - 1 \\
\end{vmatrix}
\]

Operation $R_2 \rightarrow R_2 - 2R_1$ and $R_3 \rightarrow R_3 - R_1$

\[
\begin{vmatrix}
  x^2 + x & x + 1 & x - 2 \\
  x - 1 & x - 2 & x + 1 \\
  x + 3 & x - 2 & x + 1 \\
\end{vmatrix} = xA + B
\]
\[
\begin{vmatrix}
  x^2 & x + 1 & x - 2 \\
  0 & x - 2 & x + 1 \\
  0 & x - 2 & x + 1 \\
\end{vmatrix} + \begin{vmatrix}
  x & x + 1 & x - 2 \\
  x - 1 & x - 2 & x + 1 \\
  x + 3 & x - 2 & x + 1 \\
\end{vmatrix}
\]

= $0 + \begin{vmatrix}
  x & x + 1 & x - 2 \\
  x - 1 & x - 2 & x + 1 \\
  x + 3 & x - 2 & x + 1 \\
\end{vmatrix}$

Operating $R_3 \rightarrow R_3 - R_2$ and $R_2 \rightarrow R_2 - R_1$

\[
\begin{vmatrix}
  x & x + 1 & x - 2 \\
  x + 1 & x & 0 \\
  -3 & 3 & -1 \\
\end{vmatrix} = \begin{vmatrix}
  x & x & 0 \\
  x & 3 & -1 \\
  4 & 0 & 0 \\
\end{vmatrix}
\]

\[
\begin{vmatrix}
  1 & 1 & 1 \\
  1 & -3 & 3 \\
  4 & 0 & 0 \\
\end{vmatrix} = xA + B = \text{R.H.S.}
\]

Hence Proved.

4. On L.H.S. = $D$, applying operations $C_2 \rightarrow C_2 + C_1$ and $C_3 \rightarrow C_3 + C_2$ and using $\pi C_r + \pi C_{r+1} = \pi C_{r+1}$, we get

\[
\begin{vmatrix}
  x & x+1 & x+2 \\
  y & y+1 & y+2 \\
  z & z+1 & z+2 \\
\end{vmatrix}
\]

Operating $C_3 + C_2$ and using the same result, we get

\[
\begin{vmatrix}
  x & x+1 & x+2 \\
  y & y+1 & y+2 \\
  z & z+1 & z+2 \\
\end{vmatrix}
\]

\[
D = \begin{vmatrix}
  x & x+1 & x+2 \\
  y & y+1 & y+2 \\
  z & z+1 & z+2 \\
\end{vmatrix}
\]

Hence proved.

5. The system will have a non-trivial solution if

\[
\begin{vmatrix}
  \sin \theta & -1 & 1 \\
  \cos \theta & 4 & 3 \\
  2 & 7 & 7 \\
\end{vmatrix} = 0
\]

Expanding along $C_1$, we get

\[
(28 - 21) \sin \theta \cos \theta = 2(3 - 4) = 0
\]

\[
7 \sin \theta + 14 \cos \theta = 14 = 0
\]

\[
\sin \theta + 2 \cos \theta = 0
\]

\[
3 \sin \theta - 4 \sin^2 \theta = 2
\]

\[
4 \sin \theta - 4 \sin^2 \theta = 2
\]

\[
\sin \theta (2 \sin \theta - 1) = 0
\]

\[
\sin \theta = 0 \quad \text{or} \quad \sin \theta = 1/2 (\sin \theta = 3/2 \text{ not possible})
\]

\[
\theta = \pi n \quad \text{or} \quad \theta = \pi n + (1)^n \pi /6, n \in Z.
\]

6. We have

\[
\Delta a = \begin{vmatrix}
  (a-1) & n & 6 \\
  (a-1)^2 & 2n^2 & 4n-2 \\
  (a-1)^3 & 3n^3 & 3n^2 - 3n \\
\end{vmatrix}
\]

Then $\sum_{a=1}^{n} \Delta a = \begin{vmatrix}
  (1-1) & n & 6 \\
  (1-1)^2 & 2n^2 & 4n-2 \\
  (1-1)^3 & 3n^3 & 3n^2 - 3n \\
\end{vmatrix} + \begin{vmatrix}
  (2-1) & n & 6 \\
  (2-1)^2 & 2n^2 & 4n-2 \\
  (2-1)^3 & 3n^3 & 3n^2 - 3n \\
\end{vmatrix} + \ldots
\]

\[
\begin{vmatrix}
  (n-1) & n & 6 \\
  (n-1)^2 & 2n^2 & 4n-2 \\
  (n-1)^3 & 3n^3 & 3n^2 - 3n \\
\end{vmatrix}
\]

\[
\begin{vmatrix}
  12 + 2 + 3 + \ldots + (n-1) & n & 6 \\
  1^2 + 2^2 + 3^2 + \ldots + (n-1)^2 & 2n^2 & 4n-2 \\
  1^3 + 2^3 + 3^3 + \ldots + (n-1)^3 & 3n^3 & 3n^2 - 3n \\
\end{vmatrix}
\]
Matrices and Determinants

\[
\begin{vmatrix}
\frac{n(n-1)}{2} & n & 6 \\
n(n-1)(2n-1) & 2n^2 & 4n - 2 \\
\left(\frac{n(n-1)}{2}\right)^2 & 3n^3 & 3n^2 - 3n \\
\end{vmatrix}
\]

\[= \frac{n^2(n-1)}{12} \begin{vmatrix}
6 & 1 & 6 \\
2(2n-1) & 2n & 2(2n-1) \\
3(n-1) & 3n^2 & 3n(n-1) \\
\end{vmatrix}\]

(Taking \(\frac{n(n-1)}{2}\) common from \(C_1\) and \(n\) from \(C_2\))

Thus, \(\sum_{a=1}^{n} \Delta a = 0 \Rightarrow \sum_{a=1}^{n} \Delta a = c\) (a constant) where \(c = 0\)

7. Given that \(A, B, C\) are integers between 0 and 9 and the three digit numbers \(A28, 389\) and \(62C\) are divisible by a fixed integer \(k\).

\[
\text{Now, } D = \begin{vmatrix}
A & 3 & 6 \\
8 & 9 & C \\
2 & B & 2 \\
\end{vmatrix}
\]

On operating \(R_2 \rightarrow R_2 + 10 R_3 + 100 R_1\), we get

\[
\begin{vmatrix}
A & 3 & 6 \\
A28 & 389 & 62C \\
2 & B & 2 \\
\end{vmatrix} = \begin{vmatrix}
A & 3 & 6 \\
k_1 n_2 n_3 & 2 & 2 \\
\end{vmatrix}
\]

[As per question \(A28, 389\) and \(62C\) are divisible by \(k\), therefore,

\[A28 = kn_1, \quad 389 = kn_2, \quad 62C = kn_3\]

\[= k \begin{vmatrix}
A & 3 & 6 \\
1 & n_2 & n_3 \\
2 & B & 2 \\
\end{vmatrix} = k \times \text{some integral value.} \]

\[\Rightarrow D \text{ is divisible by } k.\]

8. Consider

\[
\begin{vmatrix}
p & b & c \\
a & q & c \\
a & b & r \\
\end{vmatrix} = 0
\]

Operating \(R_1 \rightarrow R_1 - R_2\) and \(R_2 \rightarrow R_2 - R_3\) we get

\[
\begin{vmatrix}
p - a & -(q-b) & c \\
0 & q-b & c-r \\
a & b & r \\
\end{vmatrix} = 0
\]

Taking \((-q), (q-b)\) and \((r-c)\) common from \(C_1, C_2\) and \(C_3\) resp, we get

\[
\Rightarrow (p-a)(q-b)(r-c) \begin{vmatrix}
1 & -1 & 0 \\
0 & 1 & -1 \\
\frac{a}{p-a} & \frac{b}{q-b} & \frac{r}{r-c} \\
\end{vmatrix} = 0
\]

Expanding along \(R_1\)

\[
\Rightarrow (p-a)(q-b)(r-c) \left[ \frac{1}{r-c} \cdot \frac{b}{q-b} + \frac{a}{p-a} \right] = 0
\]

As given that \(p \neq a, q \neq b, r \neq c\)

\[
\Rightarrow \frac{r}{r-c} + \frac{b}{q-b} + \frac{a}{p-a} = 0
\]

\[
\Rightarrow \frac{r}{r-c} + \frac{q-b}{p-a} = 0
\]

\[
\Rightarrow \frac{r}{r-c} + \frac{q-b}{p-a} + \frac{p}{p-a} = 0
\]

\[
\Rightarrow \frac{p}{p-a} + \frac{q-b}{p-a} + \frac{r}{r-c} = 2
\]

\[\text{9. } D = \begin{vmatrix}
n! & (n+1)! & (n+2)! \\
(n+1)! & (n+2)! & (n+3)! \\
(n+2)! & (n+3)! & (n+4)! \\
\end{vmatrix}
\]

\[= n! \begin{vmatrix}
n+1 & (n+2)(n+1)! \\
n+1 & (n+2)(n+1)! \\
n+1 & (n+2)(n+1)! \\
\end{vmatrix}
\]

\[\Rightarrow D = (n!)(n+1)^2(n+2) - 4 = 2(n^3 + 4n^2 + 5n + 2) - 4
\]

\[= 2(n^3 + 4n^2 + 5n + 2)
\]

\[\Rightarrow \frac{D}{(n!)}^3 = 2(n+1)^2(n+2)
\]

\[\Rightarrow \frac{D}{(n!)}^3 - 4 = 2(n+1)^2(n+2) - 4
\]

\[= 2(n^3 + 4n^2 + 5n) = 2n(n^2 + 4n + 5)
\]

\[\Rightarrow \frac{D}{(n!)}^3 - 4 \text{ is divisible by } n.
\]

10. Given that \(\lambda, \alpha \in R\) and system of linear equations

\[
\lambda x + (\sin \alpha) y + (\cos \alpha) z = 0
\]

\[
x + (\cos \alpha) y + (\sin \alpha) z = 0
\]

\[
x = (\sin \alpha) y - (\cos \alpha) z = 0
\]

has a non trivial solution, therefore \(D = 0\)

\[
\begin{vmatrix}
\lambda & \sin \alpha & \cos \alpha \\
1 & \cos \alpha & \sin \alpha \\
-1 & \sin \alpha & -\cos \alpha \\
\end{vmatrix} = 0
\]

\[
\Rightarrow \lambda (\cos^2 \alpha - \sin^2 \alpha) - \sin \alpha (\cos \alpha + \sin \alpha) + \cos \alpha (\sin \alpha + \cos \alpha) = 0
\]
11. L.H.S.

\[
\begin{vmatrix}
\cos A & \cos(\cos Q) & \cos(A - R) \\
\cos B & \cos(B - Q) & \cos(B - R) \\
\cos C & \cos(C - R) & \cos(C - R)
\end{vmatrix}
\]

Operating; \(C_2 \rightarrow C_2 - C_1(\cos Q); C_3 \rightarrow C_3 - (\sin Q)C_1\) and \(C_3 \rightarrow C_3 - (\sin R)C_1\) on second determinant and \(C_2 \rightarrow C_2 - (\sin Q)C_1\) on first determinant and \(C_2 \rightarrow C_2 - (\sin Q)C_1\) and \(C_3 \rightarrow C_3 - (\sin R)C_1\) on second determinant, we get

\[
\begin{vmatrix}
\cos A & \sin A & \sin R \\
\cos B & \sin B & \sin R \\
\cos C & \sin C & \sin R
\end{vmatrix}
\]

\[
= \cos P
\begin{vmatrix}
\sin A & \cos A & R \\
\sin B & \cos B & R \\
\sin C & \cos C & R
\end{vmatrix}
\]

12. Let us denote the given determinant by \(\Delta\). Taking \(1\) as common from

\[
\frac{1}{a(a + d)(a + 2d)}\quad \text{as from} \quad R_1, \quad \frac{1}{(a + d)(a + 2d)(a + 3d)} \quad \text{from} \quad R_2 \quad \text{and}
\]

\[
\frac{1}{(a + 2d)(a + 3d)(a + 4d)} \quad \text{from} \quad R_3, \quad \text{we get}
\]

\[
\Delta = \frac{1}{a(a + d)^2(a + 2d)^3(a + 3d)^2(a + 4d)} \Delta_1
\]

where

\[
\Delta_1 =
\begin{vmatrix}
(a + d)(a + 2d) & a + 2d & a \\
(a + 2d)(a + 3d) & a + 3d & a + d \\
(a + 3d)(a + 4d) & a + 4d & a + 2d
\end{vmatrix}
\]

Applying \(R_3 \rightarrow R_3 - R_2\) and \(R_2 \rightarrow R_2 - R_1\), we get

\[
\Delta_1 =
\begin{vmatrix}
(a + d)(a + 2d) & a + 2d & a \\
(a + 2d)(2d) & d & d \\
(a + 3d)(2d) & d & d
\end{vmatrix}
\]

Applying \(R_3 \rightarrow R_3 - R_2\), we get

\[
\Delta_1 =
\begin{vmatrix}
(a + d)(a + 2d) & a + 2d & a \\
(a + 2d)(2d) & d & d \\
2d^2 & 0 & 0
\end{vmatrix}
\]

Expanding along \(R_3\), we get

\[
\Delta_1 = (2d^2) \begin{vmatrix} a + 2d & a \\ d & d \end{vmatrix} = (2d^2)(d(a + 2d - a) = 4d^4
\]

Thus, \(\Delta = \frac{4d^4}{a(a + d)^2(a + 2d)^3(a + 3d)^2(a + 4d)}\)

13. \(R_2 \rightarrow R_2 + R_3\),

\[
\begin{vmatrix}
\sin \theta & \cos \theta & \sin 2\theta \\
2\sin \theta \cos \frac{2\pi}{2} & 2\cos \theta \cos \frac{2\pi}{3} & 2\sin 20 \cos \frac{4\pi}{3} \\
\sin \theta - 2\pi & \cos \theta - 2\pi & \sin 20 - 4\pi
\end{vmatrix} = 0
\]

14. Given that \(A^T A = I\)

\[
\Rightarrow |A^T A| = |A|^2 = |A| |A| = 1 \quad [\cdot \cdot \cdot |I| = I]
\]

\[
|A|^2 = 1
\]

15. From given matrix \(A =
\begin{bmatrix}
a & b & c \\
b & c & a \\
c & a & b
\end{bmatrix}
\]

\[
|A| =
\begin{vmatrix}
a & b & c \\
b & c & a \\
c & a & b
\end{vmatrix} = a^3 + b^3 + c^3 - 3abc
\]

\[
|A| =
\begin{vmatrix}
a & b & c \\
b & c & a \\
c & a & b
\end{vmatrix} = a^3 + b^3 + c^3 - 3abc
\]

\[
\therefore (a^3 + b^3 + c^3 - 3abc)^2 = 1 \quad \text{(From (1) and (2))}
\]

\[
\Rightarrow a^3 + b^3 + c^3 - 3abc = 1 \quad \text{or} \quad -1
\]

But for \(a^3, b^3, c^3 \text{ using } AM \geq GM\)

We get \(\frac{a^3 + b^3 + c^3}{3} \geq \frac{3}{4} \sqrt[3]{a^3 b^3 c^3} \Rightarrow a^3 + b^3 + c^3 - 3abc \geq 0\)

\[
\therefore \text{ We must have } a^3 + b^3 + c^3 = 3 \times 1 = 4 \quad [\text{Using } abc = 1] \]
15. We are given that $MM^T = I$ where $M$ is a square matrix of order 3 and det. $M = 1$.

Consider $\det (M - I) = \det (M - MM^T) \quad [\text{Given } MM^T = I]$

$= \det [M(I - M^T)]$

$= \det M \cdot \det (I - M^T)$

$= - (\det M) \cdot \det (MM^T - I)$

$= -1 \cdot \det (M^T - I)$ \quad [\therefore \text{det } (M^T - I) = 1]

$= - (\det M) \cdot \det (M - I)$ \quad [\therefore \text{det } (M^T - I) = \text{det } [(M - I)^T] = \text{det } (M - I)]

$\Rightarrow 2 \det (M - I) = 0$ \quad $\Rightarrow \det (M - I) = 0$

Hence Proved

16. Given that,

$$A = \begin{bmatrix} a & 1 & 0 \\ b & d & 0 \\ 1 & b & c \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}, U = \begin{bmatrix} f \\ g \\ h \end{bmatrix}$$

and $AX = U$ has infinite many solutions.

$\Rightarrow |A|^2 = |A_1| = |A_2| = |A_3|$

Now, $|A| = 0$

$$\Rightarrow \begin{vmatrix} a & 1 & 0 \\ b & d & 0 \\ 1 & b & c \end{vmatrix} = ab(c - d) - 1(c - d) = 0$$

$\Rightarrow ab = 1$ or $c = d$ \quad \ldots (1)

And $|A_1| = \begin{vmatrix} f & 1 & 0 \\ g & b & d \\ h & b & c \end{vmatrix} = 0$

$\Rightarrow f(bc - bd) - 1(gc - hd) = 0$

$\Rightarrow fb(c - d) = gc - hd$ \quad \ldots (2)

$|A_2| = \begin{vmatrix} a & 1 & f \\ 1 & b & g \\ 1 & b & h \end{vmatrix} = 0$

$\Rightarrow a(gc - hd) - f(c - d) = 0$ \quad $\Rightarrow a(gc - hd) = f(c - d)$

$|A_3| = \begin{vmatrix} a & 1 & f \\ 1 & b & g \\ 1 & b & h \end{vmatrix} = 0$

$\Rightarrow ab(h - bg) - 1(h - g) + f(b - b) = 0$

$\Rightarrow ab(h - g) - (h - g) = 0$

$\Rightarrow ab = 1$ or $h = g$ \quad \ldots (3)

Taking $c = d \Rightarrow h = g$ and $ab \neq 1$ (from (1), (2) and (3))

Now taking $BX = V$

where $B = \begin{bmatrix} a & 1 & 1 \\ 0 & d & c \\ f & g & h \end{bmatrix}, V = \begin{bmatrix} a^2 \\ 0 \\ 0 \end{bmatrix}$

Then $|B| = \begin{vmatrix} a & 1 & 1 \\ 0 & d & c \\ f & g & h \end{vmatrix} = 0$

$\Rightarrow BX = V$ has no unique solution

$\therefore |B_1| = \begin{vmatrix} a^2 & 1 & 1 \\ 0 & d & c \\ 0 & g & h \end{vmatrix} = 0$ (\therefore c = d, g = h)

$|B_2| = \begin{vmatrix} a & a^2 & 1 \\ 0 & 0 & c \\ f & 0 & h \end{vmatrix} = a^2cf = a^2df$ (\therefore c = d)

$|B_3| = \begin{vmatrix} a & 1 & a^2 \\ 0 & d & 0 \\ f & g & 0 \end{vmatrix} = a^2df$ (\therefore c = d)

$\Rightarrow$ If $adf \neq 0$ then $|B_2| = |B_3| \neq 0$

Hence no solution exist.

F. Match the Following

1. The given lines are

$L_1 : x + 3y - 5 = 0$

$L_2 : 3x - ky - 1 = 0$

$L_3 : 5x + 2y - 12 = 0$

(A) Three lines $L_1, L_2, L_3$ are concurrent if

$$\begin{vmatrix} 1 & 3 & 5 \\ 3 & -k & 1 \\ 5 & 2 & 12 \end{vmatrix} = 0 \Rightarrow 13k - 65 = 0 \Rightarrow k = 5$$

\therefore (A) $\rightarrow$ (s)

(B) For $L_1 \parallel L_2 \Rightarrow \frac{1}{3} = \frac{3}{k} \Rightarrow k = -9$

and $L_2 \parallel L_3 \Rightarrow \frac{3}{5} = \frac{k}{2} \Rightarrow k = -6$

\therefore (B) $\rightarrow$ (p), (q)

(C) Three lines $L_1, L_2, L_3$ will form a triangle if no two of them are parallel and no three are concurrent

\therefore $k \neq 5, -9, -6/5$ \quad (C) $\rightarrow$ r

(D) $L_1, L_2, L_3$ do not form a triangle if either any two of these are parallel or the three are concurrent i.e.

$k = 5, -9, -6/5$

\therefore (D) $\rightarrow$ (p), (q), (s)

2. (A) Let $y = \frac{x^2 + 2x + 4}{x+2} \Rightarrow \frac{dy}{dx} = \frac{x^2 + 4x}{(x+2)^2} = 0$

$\Rightarrow x = 0, -4$

$\frac{d^2y}{dx^2} = \frac{8}{(x+2)^3}$

At $x = 0, \frac{d^2y}{dx^2}$ is true

\therefore $y$ is min when $x = 0$, \therefore $y$ min = 2
(B) As A is symmetric and B is skew symmetric matrix, we should have
\[ A^T = A \text{ and } B^T = -B \] ...(1)
Also given that
\[ (A + B)(A - B) = (A - B)(A + B) \]
\[ \Rightarrow A^2 - AB + BA - B^2 = A^2 + AB - BA - B^2 \]
\[ \Rightarrow 2BA = 2AB \text{ or } AB = BA \] ...(2)
Now given that
\[ (AB)^T = (-1)^k AB \]
\[ \Rightarrow (BA)^T = (-1)^k AB \text{ (using equation (2))} \]
\[ \Rightarrow A^T B^T = (-1)^k AB \]
\[ \Rightarrow -AB = (-1)^k AB \text{ [using equation (1)]} \]
\[ \Rightarrow k \text{ should be an odd number} \]
\[ \therefore \text{ (B) } \rightarrow \text{ (q), (s)} \]

(C) Given that \[ a = \log_3 \log_3 2 \]
\[ \Rightarrow \log_3 2 = 3^a \Rightarrow \frac{1}{\log_2 3} = 3^a \text{ or } \log_3 2 = 3^{-a} \]
\[ \Rightarrow 3 = 2^{(3-a)} \] ...(1)
Now \[ 1 < 2^{(-k+3^{-a})} < 2 \Rightarrow 1 < 2^{-k}.2^{3^{-a}} < 2 \]
\[ \Rightarrow 1 < 2^{-k}.3 < 2 \text{ (using eq (1))} \]
\[ \Rightarrow \frac{1}{3} < 2^{-k} < \frac{2}{3} \Rightarrow \frac{2}{3} < 2^k < 3 \Rightarrow k = 1 \]
\[ \therefore k \text{ is less than 2 and 3} \]
\[ \therefore \text{ (C) } \rightarrow \text{ (r), (s)} \]

(D) Given that \[ \sin \theta = \cos \phi \Rightarrow \cos \left( \frac{\pi}{2} - \theta \right) = \cos \phi \]
\[ \Rightarrow \frac{\pi}{2} - \theta = 2n\pi \pm \phi, \ n \in Z \Rightarrow \theta + \phi = \frac{\pi}{2} = -2n\pi \]
\[ \Rightarrow \frac{1}{\pi} \left( \theta + \phi - \frac{\pi}{2} \right) = -2n \]
\[ \therefore \text{ Here possible values of } \frac{1}{\pi} \left( \theta + \phi - \frac{\pi}{2} \right) \text{ are } 0 \text{ and } 2 \text{ for } n = 0, -1. \]
\[ \therefore \text{ D } \rightarrow \text{ (p), (r)} \]

G. Comprehension Based Questions

1. (d) Let \[ U_1 = \begin{bmatrix} a \\ b \\ c \end{bmatrix} \text{ then } \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix} a = 0 \]
\[ \Rightarrow \begin{bmatrix} 2a + b \\ 3a + 2b + c \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \Rightarrow a = 1, b = -2, c = 1 \]
\[ \therefore U_1 = \begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix} \text{ Similarly, } U_2 = \begin{bmatrix} 2 \\ -1 \\ -4 \end{bmatrix}, U_3 = \begin{bmatrix} 2 \\ -1 \\ -3 \end{bmatrix} \]

2. (b) \[ U = \begin{bmatrix} 1 & 2 & 2 \\ -2 & -1 & -1 \\ 1 & -4 & -3 \end{bmatrix} \Rightarrow |U| = 3 \]
\[ U^{-1} = \frac{1}{3} \begin{bmatrix} -1 & -2 & 0 \\ -7 & -5 & -3 \\ 9 & 6 & 3 \end{bmatrix} \]
\[ \Rightarrow \text{ Sum of elements of } U^{-1} = \frac{1}{3}(0) = 0 \]

3. (a) \[ [3 \ 2 \ 0] \begin{bmatrix} 1 & 2 & 2 \\ -2 & -1 & -1 \\ 1 & -4 & -3 \end{bmatrix} = \begin{bmatrix} 7 \\ 0 \end{bmatrix} \]
\[ = 5 \]

4. (a) Each element of set \[ A \] is \( 3 \times 3 \) symmetric matrix with five of its entries as 1 and four of its entries as 0, we can keep in diagonal either 2 zero and one 1 or no zero and three 1 so that the left over zeros and one’s are even in number.
Hence taking 2 zeros and one 1 in diagonal the possible cases are \[ \frac{3! \times 2!}{2!} = 9 \]
and taking 3 ones in diagonal the possible cases are \[ 1 \times \frac{3!}{2!} = 3 \]
\[ \therefore \text{ Total elements } A \text{ can have } = 9 + 3 = 12 \]

5. (b) The given system will have unique solution if \[ |A| \neq 0 \]
which is so for the matrices.
\[ 1 \ 0 \ 1 \ 1 \ 1 \ 0 \]
\[ 0 \ 0 \ 1 \ 1 \ 0 \ 0 \]
\[ 1 \ 1 \ 0 \ 0 \ 1 \ 0 \]
\[ \begin{bmatrix} 0 & 0 & 1 \\ 1 & 0 & 1 \end{bmatrix} \text{ and } \begin{bmatrix} 1 & 1 \ 0 \end{bmatrix} \]

\[ \begin{bmatrix} 1 & 0 \ 1 \end{bmatrix} \text{ and } \begin{bmatrix} 0 & 1 \ 1 \end{bmatrix} \]

which are 6 in number.

6. (b) For the given system to be inconsistent \[ |A| = 0 \]. The matrices for which \[ |A| = 0 \] are
\[ \begin{bmatrix} 1 & 1 \ 0 & 1 \ 0 \end{bmatrix}, \begin{bmatrix} 1 & 1 & 1 \ 1 & 0 \ 0 \end{bmatrix} \]
\[ \begin{bmatrix} 0 & 1 \ 1 \ 1 \ 1 \end{bmatrix}, \begin{bmatrix} 0 & 1 \ 0 \ 1 \ 0 \end{bmatrix} \]

\[ \therefore \ \begin{bmatrix} 1 & 1 \ 1 \ 1 \end{bmatrix}, \begin{bmatrix} 0 & 1 \ 0 \ 1 \ 0 \end{bmatrix}, \begin{bmatrix} 0 & 1 \ 0 \ 1 \ 0 \end{bmatrix} \]
\[ \begin{bmatrix} 0 & 1 \ 1 \ 1 \end{bmatrix}, \begin{bmatrix} 0 & 1 \ 1 \ 1 \end{bmatrix} \]
Matrices and Determinants

On solving \[ \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \]

We find for \( A = (i) \)

By Cramer’s rule \( D_1 = 0 = D_2 = D_3 \)

\( \therefore \) infinite many solution

For \( A = (ii) \)

By Cramer’s rule \( D_1 \neq 0 \)

\( \Rightarrow \) no solution i.e. inconsistent.

Similarly we find the system as inconsistent in cases (iii), (v) and (vi).

Hence for four cases system is inconsistent.

7. (d) If \( A \) is symmetric then \( b=c \)

\( \Rightarrow |A| = a^2 - b^2 = (a + b)(a - b) \)

Which is divisible by \( p \) if \((a + b)\) is divisible by \( p \) or

\((a - b)\) is divisible by \( p \).

Now \((a + b)\) is divisible by \( p \) if \((a, b)\) can take values

\( (1, p - 1), (2, p - 2), (3, p - 3), \ldots, (p - 1, 1) \)

\( \therefore (p - 1) \) ways.

Also \((a - b)\) is divisible by \( p \) only when \( a = b = 0 \)

i.e. \( a = b \), then \((a, b)\) can take values \((0,0), (1, 1), (2, 2), \ldots, (p - 1, p - 2) \)

\( \Rightarrow p \) ways.

If \( A \) is skew symmetric, then \( a = 0 \) and \( b = -c \) or \( b + c = 0 \)

which gives \( |A| = 0 \) when \( b^2 \Rightarrow b = 0, c = 0 \)

But this possibility is already included when \( A \) is symmetric and \( (a, b) = (0, 0) \).

Again if \( A \) is both symmetric and skew symmetric, then clearly \( A \) is null matrix which case is already included.

Hence total number of ways \( = p + (p - 1) = 2p - 1 \)

8. (c) Trace \( A = a + a = 2a \) is not divisible by \( p \)

\( \Rightarrow a \) is not divisible by \( p \) \( \Rightarrow a \neq 0 \)

But \(|A|\) is divisible by \( p \) \( \Rightarrow a^2 - bc \) is divisible by \( p \)

It will be so if on dividing \( a^2 \) by \( p \) we suppose we get \( m \frac{l}{p} \)

then on dividing \( bc \) by \( p \) we should get \( n \frac{l}{p} \) for some

integral values of \( m, n \) and \( l \).

i.e. the remainder should be same in each case, so that

\( \frac{a^2 - bc}{p} = \left( m + \frac{l}{p} \right) - \left( n + \frac{l}{p} \right) = (m - n) = \) an integer

For this to happen \( a \) can take any value from \( 1 \) to \( p - 1 \),

also if \( b \) takes any value from \( 1 \) to \( p - 1 \) then \( c \) should take only that value corresponding to which the remainder is same.

\( \therefore \) No. of ways \( = (p - 1) \times (p - 1) \times 1 = (p - 1)^2 \).

9. (d) Total number of matrices

\( = \) total number of ways \( a, b, c \) can be selected

\( = p \times p \times p = p^3 \).

Number of ways when \( \text{det} (A) \) is divisible by \( p \) and

trace \( (A) \neq 0 \) are equal to number of ways \( \text{det} (A) \) is divisible by \( p \) and trace \( (A) \) is not divisible by \( p = (p - 1)^2 \)

Also number of ways when \( \text{det} (A) \) is divisible by \( p \)

and trace \( A = 0 \) are the ways when \( bc \) is multiple of \( p \)

\( \Rightarrow b = 0 \) or \( c = 0 \)

for \( b = 0, c \) can take values \( 0, 1, 2, \ldots, p - 1 \)

For \( c = 0, b \) can take values \( 0, 1, 2, \ldots, p - 1 \)

Here \( (b, c) = (0, 0) \) is coming twice.

\( \therefore \) Total ways of selecting \( b \) and \( c = p + p - 1 = 2p - 1 \)

\( \therefore \) Total number of ways when \( \text{det} (A) \) is divisible

by \( p = (p - 1)^2 + 2p - 1 = p^2 \)

Hence the number of ways when \( \text{det} (A) \) is not divisible

by \( p = p^3 - p^2 \).

10. (d) From equation (E), we get

\[ \begin{align*}
9a + 2b + 3c &= 0 \\
2a + 6b - 7c &= 0 \\
4c &= 0
\end{align*} \]

\( \begin{bmatrix} 1 & 8 & 7 \\
9 & 2 & 3 \\
1 & 1 & 1 \\
\end{bmatrix} \)

Therefore system has infinite many solutions.

Solving these, we get \( b = 6a \) and \( c = -7a \)

Now \((a, b, c)\) lies on \( 2x + y + z = 1 \) \( \Rightarrow b = 6, c = -7 \)

\( \Rightarrow 2a + 6a - 7a = 1 \) \( \Rightarrow a = 1 \)

\( \therefore 7a + b + c = 7 + 6 - 7 = 6 \Rightarrow b = 6, c = -7 \)

11. (a) If \( a = 2 \) then \( b = 12, c = -14 \)

\( \therefore \) \( \frac{3}{a^2} + \frac{1}{b^2} + \frac{3}{c^2} = \frac{3}{a^2} + \frac{1}{b^2} + \frac{3}{c^2} = \frac{3}{1^2} + \frac{1}{12^2} + \frac{3}{(-14)^2} = \frac{3}{1} + \frac{1}{144} + \frac{3}{196} = 3 + \frac{1}{144} + \frac{3}{196} \)

Hence \( 7a + b + c = 7 + 6 - 7 = 6 \Rightarrow b = 6, c = -7 \)

12. (b) If \( b = 6 \) then \( a = 1, c = -7 \)

\( \therefore \) Equation becomes \( x^2 + 6x - 7 = 0 \) or \((x + 7)(x - 1) = 0 \)

whose roots are \( 1 \) and \(-7 \).

Let \( \alpha = 1 \) and \( \beta = -7 \)

\( \therefore \) \( \sum_{n=0}^{\infty} \left( \frac{1}{7} \right)^n = \sum_{n=0}^{\infty} \left( \frac{6}{7} \right)^n = \frac{1}{1 - \frac{6}{7}} = 7 \)

H. Assertion & Reason Type Questions

1. (a) The given equations are

\[ \begin{align*}
x - 2y + 3z &= -1 \\
x - y - 2z &= k \\
x - 3y + 4z &= 1
\end{align*} \]

\( \begin{bmatrix} 1 & -2 & 3 \\
1 & 1 & -2 \\
1 & -3 & 4 \\
\end{bmatrix} \)

Here \( D = -1 \)

\( D_2 = -1 \)

and \( D_2 = -1 \)

\( k = 3 \neq 0 \) if \( k \neq 3 \)

\( \therefore \) If \( k \neq 3 \), the system has no solutions.

Hence statement-1 is true and statement-2 is a correct explanation for statement -1.
1. (0) We have $\omega = \cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3} = \frac{-1 + i\sqrt{3}}{2}$

$1 + \omega + \omega^2 = 0$ and $\omega^3 = 1$

Then $\begin{vmatrix} z + 1 & \omega & \omega^2 \\ \omega & z + \omega^2 & 1 \\ \omega^2 & 1 & z + \omega \end{vmatrix} = 0$

$C_1 \leftrightarrow C_1 + C_2 + C_3$

$\Rightarrow \begin{vmatrix} z + 1 + \omega + \omega^2 & \omega & \omega^2 \\ \omega & z + \omega^2 & 1 \\ \omega^2 & 1 & z + \omega \end{vmatrix} = 0$

$\Rightarrow \begin{vmatrix} 1 & \omega & \omega^2 \\ \omega & z + \omega^2 & 1 \\ 1 & 1 & z + \omega \end{vmatrix} = 0$

$\Rightarrow z \left[ (z^2 + z\omega + z\omega^2 + \omega^3 - 1) - \omega(z + \omega - 1) + \omega^2(1 - z - \omega^2) = 0 \right]$

$\Rightarrow z \left[ z^2 + z\omega + z\omega^2 - z\omega - \omega^2 + \omega + \omega^2 - z\omega^2 - \omega^4 \right] = 0$

$\Rightarrow z \left[ z^2 \right] = 0 \Rightarrow z^3 = 0 \Rightarrow z = 0$

$\therefore z = 0$ is the only solution.

2. (4) $|A| = \begin{vmatrix} 2k - 1 & 2\sqrt{k} & 2\sqrt{k} \\ 2\sqrt{k} & 1 & -2k \\ -2\sqrt{k} & 2k & -1 \end{vmatrix}$

$= \begin{vmatrix} 2\sqrt{k} & 1 + 2k & -2k \\ -2\sqrt{k} & 1 + 2k & -1 \end{vmatrix}, C_2 \rightarrow C_2 - C_3$

$= \begin{vmatrix} 2\sqrt{k} & 0 & 2\sqrt{k} \\ -2\sqrt{k} & 1 - 2k & 1 + 2k \end{vmatrix}$, $R_2 \rightarrow R_2 - R_3$

$= (1 + 2k)(8k - 4k + 4k^2 + 1) = (2k + 1)^3$

Also $|B| = 0$ as $B$ is skew symmetric of odd order.

$\therefore |\text{Adj } A| + |\text{Adj } B| = |A|^2 + |B|^2 = 10^6$

$\Rightarrow (2k + 1)^6 = 10^6 \Rightarrow 2k + 1 = 10 \Rightarrow k = 4.5$

$\therefore [k] = 4$

3. (9)

Let $M = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix}$

then $\begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} -1 \\ 2 \\ 3 \end{bmatrix} \Rightarrow b_1 = -1, b_2 = 2, b_3 = 3$

$\Rightarrow a_1 - b_1 = 1, a_2 - b_2 = 1, a_3 - b_3 = 1$

$\Rightarrow a_1 = 0, a_2 = 3, a_3 = 2$

$\Rightarrow \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 12 \end{bmatrix} \Rightarrow a_1 + b_2 + c_3 = 12 \Rightarrow c_3 = 7$

$\therefore \text{Sum of diagonal elements} = a_1 + b_2 + c_3 = 0 + 2 + 7 = 9$

4. (2)

$\begin{bmatrix} x & x^2 & 1 + x^3 \\ 2x & 4x^2 & 1 + 8x^3 \\ 3x & 9x^2 & 1 + 27x^3 \end{bmatrix}$

$= \begin{bmatrix} 1 & 1 & 1 \\ 2 & 4 & 1 + 8 \\ 3 & 9 & 1 + 27 \end{bmatrix} = 10$

$\Rightarrow x^3 \begin{bmatrix} 1 & 1 & 1 \\ 2 & 4 & 1 + 8 \\ 3 & 9 & 1 + 27 \end{bmatrix} = 10$

Operating $C_2 \rightarrow C_1, C_3 \rightarrow C_1$ for both the determinants, we get

$\Rightarrow x^3 \begin{bmatrix} 1 & 1 & 1 \\ 2 & 2 & 1 + 6 \\ 3 & 6 & 24 \end{bmatrix} = 10$

$\Rightarrow x^3(4 + 6) + 6(48 - 36) = 10$

$\Rightarrow 2x^3 + 12x^6 = 10 \Rightarrow 6x^6 + x^3 - 5 = 0$

$\Rightarrow (6x^3 - 5)(x^2 + 1) = 0 \Rightarrow x = \left( \frac{5}{6} \right)^{\frac{1}{3}}, -1$

5. (1)

$z = \frac{-1 + i\sqrt{3}}{2} \Rightarrow z^3 = 1$ and $1 + z + z^2 = 0$

$p^2 = \begin{bmatrix} (z)^2 & z^{2s} & (z^2)^r & z^{2r} \\ z^{2s} & z^2 & (z^{2s})^r & z^{2s} \\ (z^{2s})^r & z^{2s} & (z^2)^r & z^{2r} \\ z^{2r} & z^{2s} & (z)^2 & z^2 \end{bmatrix}$

For $p^2 = -1$ we should have

$z^{2r} + z^{4s} = -1$ and $z^{2s}((z)^r + z^2) = 0$

$\Rightarrow z^{2r} + z^{4s} = 0$ and $(z)^r + z^2 = 0$

$\Rightarrow r$ is odd and $s = r$ but not a multiple of 3. Which is possible when $s = r = 1$

$\therefore$ only one pair is there.
1. (c) We have
\[
\begin{vmatrix}
 a & b & ax+b \\
 b & c & bx+c \\
 ax+b & bx+c & 0
\end{vmatrix}
\]
By \( R_3 \rightarrow R_3 - (xR_1 + R_2) \),
\[
\begin{vmatrix}
 a & b & ax+b \\
 b & c & bx+c \\
 0 & 0 & -(ax^2 + 2bx + C)
\end{vmatrix}
\]
\( = (ax^2 + 2bx + c)(b^2 - ac) = (+)(-) = -ve. \)

2. (d) For homogeneous system of equations to have non zero solution, \( \Delta = 0 \)
\[
\begin{vmatrix}
 1 & 2a & a \\
 1 & 3b & b \\
 1 & 4c & c
\end{vmatrix} = 0 \]
\[
\begin{vmatrix}
 1 & 0 & a \\
 1 & b & b-a \\
 1 & 2c & c-b
\end{vmatrix} = 0
\]
\( b(c-b)-(b-a)(2c-b) = 0 \)
On simplification, \( \frac{2}{b} = \frac{1}{a} + \frac{1}{c} \)
\( \therefore a, b, c \) are in Harmonic Progression.

3. (b) \( \Delta = \begin{vmatrix}
 1 & \omega^n & \omega^{2n} \\
 \omega^n & \omega^{2n} & 1 \\
 \omega^{2n} & 1 & \omega^n
\end{vmatrix} = 1(\omega^{3n} - 1) - \omega^n(\omega^{2n} - \omega^{2n}) + \omega^{2n}(\omega^n - \omega^{4n}) = \omega^{3n} - 1 - 0 + \omega^{3n} - \omega^{6n} = 1 - 1 + 1 - 1 = 0 \) \( \therefore \omega^{3n} = 1 \)

4. (c) \( A^2 = \begin{bmatrix}
 \alpha & \beta \\
 \beta & \alpha
\end{bmatrix} = \begin{bmatrix}
 a & b \\
 b & a
\end{bmatrix} \begin{bmatrix}
 a & b \\
 b & a
\end{bmatrix} = \begin{bmatrix}
 a^2 + b^2 & 2ab \\
 2ab & a^2 + b^2
\end{bmatrix} \]
\( \alpha = a^2 + b^2, \beta = 2ab \)

5. (a) \( A = \begin{bmatrix}
 0 & 0 & -1 \\
 0 & -1 & 0 \\
 -1 & 0 & 0
\end{bmatrix} \)

6. (a) Given that \( 10B = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} \)
\( \Rightarrow B = \frac{1}{10} \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} \)
Also since, \( B = A^{-1} \Rightarrow AB = I \)
\( \Rightarrow \frac{1}{10} \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix} \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \)
\( \Rightarrow \frac{1}{10} \begin{bmatrix} 10 & 0 & 5-\alpha \\ 0 & 10 & 5+\alpha \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \)
\( \Rightarrow \frac{5-\alpha}{10} = \frac{5}{10} \Rightarrow \alpha = 5 \)

7. (d) Let \( r \) be the common ratio, then
\( \log a_n, \log a_{n+1}, \log a_{n+2} \)
\( \log a_{n+3}, \log a_{n+4}, \log a_{n+5} \)
\( \log a_{n+6}, \log a_{n+7}, \log a_{n+8} \)
\( \log a_r, \log a_{r+1}, \log a_{r+1} \)
\( \log a_{r+2}, \log a_{r+3}, \log a_{r+4} \)
\( \log a_{r+5}, \log a_{r+6}, \log a_{r+7} \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_{n-1}, \log a_{n+1}, \log a_{n+1} \)
\( = \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( = \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
\( \log a_1, \log a_2, \log a_3 \)
8. (d) Given \( A^2 - A + I = 0 \)
\[ A^{-1}A^2 - A^{-1}A + A^{-1}I = A^{-1}0 \]
(Multiplying \( A^{-1} \) on both sides)
\[ \Rightarrow A^{-1} + A^{-1} = 0 \text{ or } A^{-1} = -I. \]

9. (a) \[ ax + y + z = \alpha + 1 \]
\[ x + \alpha y + z = \alpha - 1; \]
\[ x + y + z = \alpha - 1 \]
\[ \alpha \]
\[ 1 \]
\[ 1 \]
\[ \Delta = \begin{vmatrix} 
\alpha & 1 & 1 \\
1 & \alpha & 1 \\
1 & 1 & \alpha 
\end{vmatrix} \]
\[ = \alpha(\alpha^2 - 1) - 1(\alpha - 1) + 1(\alpha - 1) \]
\[ = \alpha(\alpha - 1)(\alpha + 1) - (\alpha - 1) - (\alpha - 1) \]
For infinite solutions, \( \Delta = 0 \)
\[ \Rightarrow (\alpha - 1)[\alpha^2 + \alpha - 1 - 1] = 0 \]
\[ \Rightarrow (\alpha - 1)[\alpha^2 + \alpha - 2] = 0 \Rightarrow \alpha = -2, 1; \]
But \( \alpha \neq 1 \).
\[ \therefore \alpha = -2. \]

10. (d) Applying, \( C_1 \rightarrow C_1 + C_2 + C_3 \) we get
\[ f(x) = \begin{vmatrix} 
1 + (a^2 + b^2 + c^2 + 2)x & (1 + b^2)x & (1 + c^2)x \\
1 + (a^2 + b^2 + c^2 + 2)x & 1 + b^2x & (1 + c^2)x \\
1 + (a^2 + b^2 + c^2 + 2)x & (1 + b^2)x & 1 + c^2x 
\end{vmatrix} \]
\[ = \begin{vmatrix} 
1 & (1 + b^2)x & (1 + c^2)x \\
1 & 1 + b^2x & (1 + c^2)x \\
1 & (1 + b^2)x & 1 + c^2x 
\end{vmatrix} \]
\[ = (x - 1)^2 \quad \text{Hence degree = 2.} \]

11. (b) \( \therefore a_1, a_2, a_3, \ldots \ldots \) are in G.P.
\( \therefore \) Using \( a_n = ar^{n-1} \), we get the given determinant, as
\[ \begin{vmatrix} 
\log ar^{n-1} & \log ar^n & \log ar^{n+1} \\
\log ar^{n+2} & \log ar^{n+3} & \log ar^{n+4} \\
\log ar^{n+5} & \log ar^{n+6} & \log ar^{n+7} 
\end{vmatrix} \]
Operating \( C_3 - C_2 \) and \( C_2 - C_1 \) and using
\[ \log m - \log n = \log \frac{m}{n} \] we get

12. (b) \( A^2 - B^2 = (A - B)(A + B) \)
\[ A^2 - B^2 = A^2 + AB - BA - B^2 \Rightarrow AB = BA \]

13. (d) \[ A = \begin{bmatrix} 1 & 2 \\
3 & 4 
\end{bmatrix} \quad B = \begin{bmatrix} a & 0 \\
0 & b 
\end{bmatrix} \]
\[ AB = \begin{bmatrix} a & 2b \\
3a & 4b 
\end{bmatrix} \]
\[ BA = \begin{bmatrix} a & 0 \\
0 & b 
\end{bmatrix} \begin{bmatrix} 1 & 2 \\
3 & 4 
\end{bmatrix} = \begin{bmatrix} a & 2a \\
3b & 4b 
\end{bmatrix} \]
Hence, \( AB = BA \) only when \( a = b \)
\[ \therefore \text{There can be infinitely many } B's \text{ for which } AB = BA \]

14. (d) Given, \( D = \begin{vmatrix} 1 & 1 & 1 \\
1 & 1 & 1+y \\
1 & 1+y & 1 
\end{vmatrix} \]
Applying \( R_2 \rightarrow R_2 - R_1 \) and \( R \rightarrow R_3 - R_1 \)
\[ \therefore D = \begin{vmatrix} 1 & 1 & 1 \\
0 & x & 0 \\
0 & 0 & y 
\end{vmatrix} = xy \]
Hence, \( D \) is divisible by both \( x \) and \( y \)

15. (a) \[ |A^2| = 25 \Rightarrow |A|^2 = 25 \Rightarrow (25\alpha)^2 = 25 \Rightarrow |\alpha| = \frac{1}{5} \]

16. (d) Let \( A = \begin{bmatrix} a & b \\
c & d 
\end{bmatrix} \) then \( A^2 = 1 \)
\[ \Rightarrow a^2 + bc = 1 \quad ab + bd = 0 \\
ac + cd = 0 \quad bc + d^2 = 1 \]
From these four relations,
\[ a^2 + bc = bc + d^2 \Rightarrow a^2 = d^2 \]
and \( b(a + d) = 0 = c(a + d) \Rightarrow a = -d \)
We can take \( a = 1, b = 0, c = 0, d = -1 \) as one possible set of values, then \( A = \begin{bmatrix} 1 & 0 \\
0 & -1 
\end{bmatrix} \)

Clearly \( A \neq I \) and \( A \neq -I \) and \( \det A = -1 \)
\[ \therefore \text{Statement 1 is true.} \]
Also if \( A \neq I \) then \( tr(A) = 0 \)
\[ \therefore \text{Statement 2 is false.} \]

17. (d) The given equations are
\[ -x + cy + bz = 0 \]
\[ cx - y + az = 0 \]
\[ bx + ay - z = 0 \]
\[ \therefore x, y, z \text{ are not all zero} \]
\[ \therefore \text{The above system should not have unique (zero) solution} \]
Matrices and Determinants

\[ \Delta = 0 \Rightarrow \begin{vmatrix} -1 & c & b \\ c & -1 & a \\ b & a & -1 \end{vmatrix} = 0 \]

\[ \Rightarrow -1(1-a^2) - c(-c - ab) + b(ac + b) = 0 \]
\[ \Rightarrow -1 + a^2 + b^2 + c^2 + 2abc = 0 \]
\[ \Rightarrow a^2 + b^2 + c^2 + 2abc = 1 \]

18. (c) ∴ All entries of square matrix \( A \) are integers, therefore all cofactors should also be integers. If \( \det A = \pm 1 \) then \( A^{-1} \) exists. Also all entries of \( A^{-1} \) are integers.

19. (d) We know that \( |adj(adj A)| = |adj A|^{2-1} = |A|^{2-1} = |A| \)

∴ Both the statements are true and statement -2 is a correct explanation for statement-1.

\[ \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} = 0 \]

20. (b) \[
\begin{vmatrix} a+1 & b+1 & c-1 \\ a-1 & b-1 & c+1 \end{vmatrix} = (-1)^{n+2}a + (-1)^{n+1}b - (-1)^nc
\]

\[ \Rightarrow \begin{vmatrix} a+1 & a-1 & (-1)^{n+2}a \\ b+1 & b-1 & (-1)^{n+1}b \\ c-1 & c+1 & (-1)^nc
\end{vmatrix} = 0
\]

(Taking transpose of second determinant)

\[ C_1 \Rightarrow C_3 \]

21. (c) \[
\begin{vmatrix} 1 & \ldots & \ldots \\ \ldots & 1 & \ldots \\ \ldots & \ldots & 1 \end{vmatrix}
\]

are 6 non-singular matrices because 6
\[
\begin{vmatrix} \ldots & 1 \end{vmatrix}
\]

blanks will be filled by 5 zeros and 1 one.

Similarly, \[
\begin{vmatrix} \ldots & 1 & \ldots \\ 1 & \ldots & \ldots \\ \ldots & \ldots & \ldots \end{vmatrix}
\]

are 6 non-singular matrices. So, required cases are more than 7, non-singular \( 3 \times 3 \) matrices.

22. (b) Let \( A = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \) where \( a, b, c, d \neq 0 \)

\[ A^2 = \begin{pmatrix} a^2 + bc & ab + bd \\ ac + cd & bc + d^2 \end{pmatrix} \]

\[ \Rightarrow a^2 + bc = 1, bc + d^2 = 1 \]

\[ ab + bd = ac + cd = 0 \]

\[ c \neq 0 \text{ and } b \neq 0 \Rightarrow a + d = 0 \Rightarrow \text{Tr}(A) = 0 \]

\[ |A| = ad - bc = a^2 - bc = -1 \]

\[ D = \begin{pmatrix} 1 & 2 & 1 \\ 3 & 5 & 2 \end{pmatrix} = 0 \]

23. (c) \[ D = \begin{pmatrix} 3 & 2 & 1 \\ 3 & 3 & 1 \end{pmatrix} \neq 0 \]

∴ Given system, does not have any solution.

∴ No solution

\[ \begin{pmatrix} 4 & k & 2 \end{pmatrix} \]

\[ \Delta = 0 \Rightarrow k = 4, 1 = 0 \]

\[ 2 \begin{pmatrix} 2 \end{pmatrix} \]

\[ \Rightarrow 4(4 - 2) - k(k - 2) + 2(2k - 8) = 0 \]

\[ \Rightarrow 8 - k^2 + 2k + 4k - 16 = 0 \]

\[ \Rightarrow (k - 4)(k - 2) = 0, k = 4, 2 \]

25. (a) ∴ \( A' = A, B' = B \)

Now \( (A(BA))' = (BA)'A' = (A'B')A' = (A'B'A)A = (AB)A \)

Similarly \((AB)A)' = (AB)A \)

So, \( A(BA) \) and \( (AB)A \) are symmetric matrices.

Again \((AB)' = B'A' = BA \)

Now if \( BA = AB \), then \( AB \) is a symmetric matrix.

26. (d) Let \( Au_1 = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \) and \( Au_2 = \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} \)

Then, \( Au_1 + Au_2 = \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{pmatrix} \)

\[ \Rightarrow A(u_1 + u_2) = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \]

\[(1) \quad \ldots (I) \]
31. (a) \[ \begin{align*}
 2x_1 - 2x_2 + x_3 &= \lambda x_1 \\
 2x_1 - 3x_2 + 2x_3 &= \lambda x_2 \\
 -x_1 + 2x_2 &= \lambda x_3
\end{align*} \]

\[ \Rightarrow (2 - \lambda)x_1 - 2x_2 + x_3 = 0 \]
\[ 2x_1 - (3 + \lambda)x_2 + 2x_3 = 0 \]
\[ -x_1 + 2x_2 - \lambda x_3 = 0 \]

For non-trivial solution, \( \Delta = 0 \)

\[ \begin{vmatrix} 2 - \lambda & -2 & 1 \\
 2 & -(3 + \lambda) & 2 \\
 -1 & 2 & -\lambda \end{vmatrix} = 0 \]

\[ \Rightarrow (2 - \lambda)[\lambda(3 + \lambda) - 4] + 2[-2\lambda + 2] + 1[4 - (3 + \lambda)] = 0 \]
\[ \Rightarrow \lambda^3 + \lambda^2 - 5\lambda + 3 = 0 \Rightarrow \lambda = 1, 1, 3 \]

Hence, \( \lambda \) has 2 values.

32. (b) \[
\begin{vmatrix}
 1 & 2 & 2 \\
 2 & 1 & -2 \\
 a & 2 & b
\end{vmatrix}
= \begin{vmatrix}
 12 & a + 4 & 2a + 2b \\
 2a + 2b & 4a + 4b & 2a + 2b
\end{vmatrix}
= \begin{vmatrix}
 9 & 0 & 0 \\
 0 & 0 & 0
\end{vmatrix}
\]

\[ \begin{vmatrix} 1+4+4 & 2+2-4 & a+4+2b \\
 2+2-4 & 4+1+4 & 2a+2-2b \\
a+4+2b & 2a+2-2b & a^2+4+b^2
\end{vmatrix} = \begin{vmatrix} 9 & 0 & 0 \\
 0 & 0 & 0
\end{vmatrix}
\]

\[ \Rightarrow a + 4 + 2b = 0 \Rightarrow a + 2b = -4 \quad \ldots(i) \]
\[ 2a + 2 - 2b = 0 \Rightarrow 2a - 2b = -2 \]
\[ \Rightarrow a - b = -1 \quad \ldots(ii) \]

On solving (i) and (ii) we get

\[ b = -1 \text{ and } a = -2 \]

33. (b) For trivial solution,

\[ \begin{vmatrix} 1 & \lambda & -1 \\
 \lambda & -1 & -1 \\
 1 & 1 & -\lambda
\end{vmatrix} = 0 \]

\[ \Rightarrow -\lambda(\lambda + 1)(\lambda - 1) = 0 \]
\[ \Rightarrow \lambda = 0, +1, -1 \]

34. (d) \[ \Lambda(\text{adj } \Lambda) = \Lambda \Lambda^T \]

\[ \Rightarrow \Lambda^{-1}(\text{adj } \Lambda) = \Lambda^{-1}\Lambda \Lambda^T \]

\[ \text{adj } \Lambda = \Lambda^T \]

\[\begin{bmatrix} 2 & b \\ -3 & 5a \end{bmatrix} = \begin{bmatrix} 5a & 3 \\ -b & 2 \end{bmatrix} \]
\[ \Rightarrow a = \frac{2}{5} \text{ and } b = 3 \]
\[ \Rightarrow 5a + b = 5 \]

A. Fill in the Blanks

1. We have \( e^{-\pi/2} < 0 < \pi/2 \Rightarrow -\frac{\pi}{2} < \ln 0 < \ln \pi/2 \)
\( \Rightarrow \cos(-\pi/2) < \cos(\ln 0) < \cos(\ln \pi/2) \)
\( \Rightarrow \cos(\ln 0) > 0 \)
\( \Rightarrow -1 < \cos 0 < 1 \forall 0 \)
\( \Rightarrow \ln(\cos 0) \leq 0 \)
\( \Rightarrow \ln(0) > \ln(\cos 0) \)
\( \therefore \cos(\ln 0) \) is larger.

2. \( y = 2x^2 - \ln |x| \Rightarrow \frac{dy}{dx} = 4x - \frac{1}{x} = \frac{(2x+1)(2x-1)}{x} \)
Critical points are 0, 1/2, -1/2
Clearly \( f(x) \) is increasing on \( \left(-\frac{1}{2}, 0\right) \cup \left(\frac{1}{2}, \infty\right) \) and
\( f(x) \) is decreasing on \( (-\infty, -\frac{1}{2}) \cup (0, \frac{1}{2}) \).

3. Let \( f(x) = \log(1 + x) - x \) for \( x > -1 \)
\( f'(x) = \frac{1}{1 + x} - 1 = \frac{-x}{1 + x} \)
We observe that,
\( f'(x) > 0 \) if \( -1 < x < 0 \) and \( f'(x) < 0 \) if \( x > 0 \)
Therefore \( f(x) \) increases in \( (-1, 0) \) and decreases in \( (0, \infty) \).
Also \( f(0) = \log 1 - 0 = 0 \)
\( \therefore x \geq 0 \Rightarrow f(x) \leq f(0) \)
\( \Rightarrow \log(1 + x) - x \leq 0 \Rightarrow \log(1 + x) \leq x \)
Thus we get, \( \log(1 + x) \leq x, \forall x \geq 0 \)

4. Let \( P(a\cos\theta, b\sin\theta) \) be any point on the ellipse
\( \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \) with foci \( F_1(ae, 0) \) and \( F_2(-ae, 0) \)
Then area of \( \Delta PF_1F_2 \) is given by
\[ A = \frac{1}{2} \begin{vmatrix} a\cos\theta & b\sin\theta & 1 \\ ae & 0 & 1 \\ -ae & 0 & 1 \end{vmatrix} = \frac{1}{2} \left| -b\sin\theta(ae + ae) \right| = abe |\sin \theta| \]
\( \therefore |\sin \theta| \leq 1 \)
\( \therefore A_{\text{max}} = abe \)

5. The given curve is \( C : y^3 - 3xy + 2 = 0 \)
Differentiating it with respect to \( x \), we get
\( 3y^2 \frac{dy}{dx} - 3x \frac{dy}{dx} - 3y = 0 \Rightarrow \frac{dy}{dx} = \frac{y}{x + y^2} \)
\( \therefore \) Slope of tangent to \( C \) at point \( (x_1, y_1) \) is
\[ \frac{dy}{dx} = \frac{y_1}{x_1 + y_1^2} \]
For horizontal tangent, \( \frac{dy}{dx} = 0 \Rightarrow y_1 = 0 \)
For \( y_1 = 0 \) in \( C \), we get no value of \( x_1 \).
\( \therefore \) There is no point on \( C \) at which tangent is horizontal
\( \therefore H = 0 \)
For vertical tangent \( \frac{dy}{dx} = \frac{1}{0} \Rightarrow x_1 + y_1^2 = 0 \Rightarrow x_1 = y_1^2 \)
From \( C \), \( y_1^3 - 3y_1^3 + 2 = 0 \)
\( \Rightarrow y_1^3 = 1 \Rightarrow y_1 = 1 \Rightarrow x_1 = 1 \)
\( \therefore \) There is only one point \( (1, 1) \) at which vertical tangent can be drawn
\( \therefore V = \{(1, 1)\} \)

B. True / False

1. If \( (x - r) \) is a factor of \( f(x) \) repeated \( m \) times then \( f'(x) \) is a polynomial with \( (x - r) \) as factor repeated \( (m - 1) \) times.
\( \therefore \) Statement is false.

2. Given that \( 0 < a < x \).
Let \( f(x) = \log_a x + \log_a a = \log_a x + 1 \log_a x \geq 2 \)
But equality holds for \( \log_a x = 1 \)
\( \Rightarrow x = a \) which is not possible.
\( \therefore f(x) > 2 \)
\( \therefore f_{\text{min}} \) cannot be 2.
\( \therefore \) Statement is false.

C. MCQs with ONE Correct Answer

1. (a) Consider the function \( f(x) = ax^3 + bx^2 + cx \) on \([0, 1]\) then being a polynomial. It is continuous on \([0, 1]\), differentiable on \((0, 1)\) and
\( f(0) = f(1) = 0 \) \( \text{[as given } a + b + c = 0 \text{]} \)
\( \therefore \) By Rolle's theorem \( \exists x \in (0, 1) \text{ such that} \)
\( f'(x) = 0 \Rightarrow 3ax^2 + 2bx + c = 0 \)
Thus equation \( 3ax^2 + 2bx + c = 0 \) has at least one root in \([0, 1]\).

2. (a) Area of \( \Delta ABC \), \( A = \frac{1}{2} \times d \cos \alpha \times d \sin \alpha = \frac{d^2}{4} \sin 2\alpha \)
which is max. when \( \sin 2\alpha = \frac{1}{2} \)

i.e. \( \alpha = 45^\circ \)

\( \because \) \( \Delta ABC \) is an isosceles triangle.

3. (c) 
\[
\frac{dx}{d\theta} = a(-\sin \theta + \sin \theta \cos \theta) = a\theta \cos \theta \quad \ldots (1)
\]
\[
\frac{dy}{d\theta} = a(\cos \theta - \cos \theta + \sin \theta) = a\theta \sin \theta \quad \ldots (2)
\]
Dividing (2) by (1), we get
\[
\frac{dy}{dx} = \tan \theta \quad \text{(slope of tangent)}
\]

\( \therefore \) Slope of normal = \(- \cot \theta \)

\( \because \) Equation of normal is
\[
y - a(\sin \theta - \cos \theta) = \frac{-\cos \theta}{\sin \theta}(x - a(\cos \theta + \theta \sin \theta))
\]
\[
y = a \sin \theta + a \cos \theta
\]
\[
x \cos \theta + y \sin \theta = a
\]
As \( \theta \) varies inclination is not constant.

\( \therefore \) \( \alpha \) is not correct.

Clearly does not pass through \((0, 0)\).

It's distance from origin = \[\frac{a}{\sqrt{\cos^2 \theta + \sin^2 \theta}}\] = \(a\)

which is constant

4. (b) 
\( y = a \ln x + bx + x \)

has its extreme values at \( x = -1 \) and 2

\( \therefore \frac{dy}{dx} = 0 \) at \( x = -1 \) and 2

\[a + 2bx + 1 = 0 \text{ or } 2bx + x + a = 0\]

\( x \)

has \(-1\) and 2 as its roots.

\[2b - 1 + a = 0 \quad \ldots (1)\]
\[8b + 2a = 0 \quad \ldots (2)\]

Solving (1) and (2) we get \( a = 2, b = -1/2 \).

5. (d) For \( y^2 = 4ax \), \( y \)-axis is tangent at \((0, 0)\), while for \( x^2 = 4ay \), \( x \)-axis is tangent at \((0, 0)\). Thus the two curves cut each other at right angles.

6. (d) 
\[f'(x) = -(x + 2)e^{-x} + e^{-x} = -(x + 1)e^{-x} = 0 \Rightarrow x = -1\]

For \( x \in (-\infty, -1) \), \( f'(x) > 0 \) and for \( x \in (-1, \infty) \), \( f'(x) < 0 \)

\( \therefore \) \( f(x) \) is increasing on \((-\infty, -1)\) and decreasing on \((-1, \infty)\).

7. (b) We have
\[
f(x) = \frac{\ln(\pi + x)}{\ln(e + x)}
\]

\[f'(x) = \frac{\left(\frac{1}{\pi + x}\right)\ln(e + x) - \left(\frac{1}{e + x}\right)\ln(\pi + x)}{[\ln(e + x)]^2}
\]

\( \therefore \)

8. (b) Let \( y = x^{25}(1 - x)^{75} \)

\[\frac{dy}{dx} = 25x^{24}(1 - x)^{75} - 75x^{25}(1 - x)^{74}
\]

\[= 25x^{24}(1 - x)^{74}(1 - x - 3x) = 25x^{24}(1 - x)^{74}(1 - 4x)
\]

For maximum value of \( y \), \( \frac{dy}{dx} = 0 \)

\( \Rightarrow x = 0, 1, 1/4, x = 1/4 \in (0, 1) \)

Also at \( x = 0, y = 0, x = 1, y = 0 \), and at \( x = 1/4, y > 0 \)

\( \therefore \) Max. value of \( y \) occurs at \( x = 1/4 \)

9. (a) Slope of tangent at \((x, f(x))\) is \(2x + 1\)

\[f'(x) = 2x + 1 \Rightarrow f(x) = x^2 + x + c\]

Also the curve passes through \((1, 2)\)

\( \Rightarrow f(1) = 2\)

\[2 + 1 + c = 0 \Rightarrow c = 0 \quad \therefore f(x) = x^2 + x
\]

\( \therefore \) Required area = \[\int_0^1 (x^2 + x) \, dx\]

\[= \left[\frac{x^3}{3} + \frac{x^2}{2}\right]_0^1 = \frac{1}{3} + \frac{1}{2} = \frac{5}{6}
\]

10. (c) We have \( f(x) = x^3 \), \( 0 < x \leq 1 \)

\[\Rightarrow f'(x) = \frac{\sin x - x \cos x}{\sin^2 x}
\]

where \( \sin^2 x \) is always +ve, when \( 0 < x \leq 1 \). But to check \( N_r \), we again let

\( h(x) = \sin x - x \cos x \)

\( \Rightarrow h'(x) = x \sin x > 0 \) for \( 0 < x \leq 1 \) \( \Rightarrow h(x) \) is increasing

\( \Rightarrow h(0) = h(x), \text{ when } 0 < x \leq 1 \)

\( \Rightarrow 0 < \sin x - x \cos x, \text{ when } 0 < x \leq 1 \)

\( \Rightarrow \sin x - x \cos x > 0, \text{ when } 0 < x \leq 1 \)

\( \Rightarrow f'(x) > 0, x \in (0, 1] \)

\( \Rightarrow f(x) \) is increasing on \((0, 1] \)

Again \( g(x) = x \tan x \)

\[\Rightarrow g'(x) = \frac{\tan x - x \sec^2 x}{\tan^2 x}, \text{ when } 0 < x \leq 1
\]

Here \( \tan^2 x > 0 \) But to check \( N_r \), we consider

\( p(x) = \tan x - x \sec^2 x \)

\[p'(x) = \sec^2 x - x - 2 \sec x \sec x \tan x
\]

\[\Rightarrow p'(x) = -2x \sec^2 x \tan x < 0 \text{ for } 0 < x \leq 1
\]

\( \Rightarrow p(x) \) is decreasing, when \( 0 < x \leq 1 \)

\( \Rightarrow p(0) > p(x) \Rightarrow 0 > \tan x - x \sec^2 x
\]

\( \therefore \) \( g'(x) < 0 \)

Hence \( g(x) \) is decreasing when \( 0 < x \leq 1 \).

11. (b) We are given \( f(x) = \sin^4 x + \cos^4 x \)

\[\Rightarrow f'(x) = 4 \sin^3 x \cos x - 4 \cos^3 x \sin x
\]
10. (d) \[ \pi < 4x < 2\pi \Rightarrow \frac{\pi}{4} < x < \frac{\pi}{2} \]
Since, \( f(x) \) increasing on \( (\pi/4, \pi/2) \)

\[ \frac{\pi}{4} < \frac{3\pi}{8} < \frac{\pi}{2} < 2\pi \]
It will be increasing on \( (\pi/4, 3\pi/8) \).

12. (d) From graph it is clear that both \( \sin x \) and \( \cos x \) in the interval \( (\pi/2, \pi) \) are decreasing function.

\[ f(x) = \sin x \implies f'(x) = \cos x < 0 \]
\[ f(x) = \cos x \implies f'(x) = -\sin x < 0 \]
\[ \therefore \] \( S \) is correct.

13. (e) \[ f(x) = \int e^x (x-1)(x-2) \, dx \]
For decreasing function, \( f'(x) < 0 \)

\[ e^x (x-1)(x-2) < 0 \implies (x-1)(x-2) < 0 \]
\[ 1 < x < 2, \quad e^x > 0 \forall x \in \mathbb{R} \]

14. (d) Slope of tangent \( y = f(x) \) is \[ \frac{dy}{dx} = f'(x)(3,4) \]
Therefore, slope of normal \[ -\frac{1}{f'(x)(3,4)} = -\frac{1}{f'(3)} \]

\[ -\frac{1}{f'(3)} = \tan \left( \frac{3\pi}{4} \right) \] (given)

or \[ -\frac{1}{f'(3)} = \tan \left( \frac{\pi}{2} + \frac{\pi}{4} \right) = -1 \]
\[ f'(3) = 1 \]

15. (d) It is clear from figure that at \( x = 0, f(x) \) is not differentiable.

\[ f(x) \text{ has neither maximum nor minimum at } x = 0. \]

16. (b) \[ \text{Let } f(x) = e^x - 1 - x \] then \[ f'(x) = e^x - 1 > 0 \] for \( x \in (0, 1) \)
\[ \therefore \] \( f(x) \) is an increasing function.

\[ f(x) > f(0), \forall x \in (0, 1) \]
\[ \therefore e^x - 1 - x > 0 \iff e^x > 1 + x \]
\[ (a) \text{ does not hold.} \]

17. (a) \[ f(x) = xe^{1-x} \]
\[ f'(x) = x e^{1-x} + (1 - 2x)e^{1-x} \]
\[ = -e^{1-x} (2x^2 - x - 1) = -e^{1-x} (2x + 1)(x - 1) \]
\[ \therefore f(x) \text{ is increasing on } [-1/2, 1] \]

18. (c) Tangent to \( y = x^3 + bx - b \) at \( (1, 1) \),
\[ y - 1 = (2 + b)(x - 1) \implies (2 + b)(1 - 1) = 0 \]
\[ x \text{-intercept } = \frac{b + 1}{b + 2} \text{ and } y \text{-intercept } = -(b + 1) \]

Given \( \Delta = 2 \Rightarrow \frac{1}{b + 1} = (b + 1) \]
\[ b^2 + 2b + 1 = 4(b + 2) \]
\[ b^2 - 2b + 9 = 0 \]
\[ (b + 3)^2 = 0 \Rightarrow b = -3 \]

19. (d) \[ f(x) = (b + 3)x^2 + 2bx + 1 \]
It is a quadratic expression with coeff. \( x^2 = 1 + b^2 > 0 \).

\[ f(x) \text{ represents an upward parabola whose min value is } \frac{-D}{4a} \] \( D \) being the discriminant.

\[ m(b) = \frac{-4b^2 - 4(1 + b^2)}{4(1 + b^2)} \implies m(b) = \frac{1}{1 + b^2} \]
For range of \( m(b) \):
\[ \frac{1}{1 + b^2} > 0 \text{ also } b^2 > 0 \Rightarrow 1 + b^2 > 1 \]
\[ \therefore \frac{1}{1 + b^2} > 1 \text{. Thus } m(b) = (0, 1] \]

20. (a) \[ 3 \sin x - 4 \sin^2 x = \sin 3x \text{ which increases for } \]
\[ 3x \in \left( -\frac{\pi}{6}, \frac{\pi}{6} \right) \Rightarrow x \in \left( -\frac{\pi}{2}, \frac{\pi}{2} \right) \text{ whose length is } \frac{\pi}{3}. \]

21. (d) The given curve is \[ y^2 + 3x^2 = 12y \]
\[ 3y^2 \frac{dy}{dx} + 6x = 12 \frac{dy}{dx} \]
\[ \frac{dy}{dx} = \frac{2x}{4 - y^2} \]
For vertical tangents \( \frac{dy}{dx} = \frac{1}{0} \Rightarrow 4 - y^2 = 0 \Rightarrow y = \pm 2 \]
For \( y = 2, x^2 = -\frac{24 - 9}{3} = \frac{16}{3} \Rightarrow x = \pm \frac{4}{\sqrt{3}} \]
For \( y = -2, x^2 = \frac{24 + 8}{3} = -ve \) (not possible)
\[ \therefore \text{ Req. points are } (\pm 4/\sqrt{3}, 2). \]

22. (a) There is only one function in option (a) whose critical point \( \frac{1}{2} \in (0, 1) \) for the rest of the parts critical point
Applications of Derivatives

0 \not\in (0, 1). It can be easily seen that functions in options (b), (c) and (d) are continuous on [0, 1] and differentiable in (0, 1).

Now for \( f(x) = \begin{cases} \frac{1}{2} - x, & x < 1/2 \\ \frac{1}{2} \sin x, & x \geq 1/2 \end{cases} \)

Here \( f'(1/2) = -1 \) and \( f'(1/2^+) = -2(1 - \frac{1}{2}) = 0 \)

\[ f' \left( \frac{1}{2} \right) \neq f'(1/2^+) \]

\[ \therefore \] \( f \) is not differentiable at \( 1/2 \in (0, 1) \)

\[ \therefore \] LMV is not applicable for this function in [0, 1]

23. (e) Equation of tangent to the ellipse \( \frac{x^2}{27} + y^2 = 1 \) at \( (3\sqrt{3} \cos \theta, \sin \theta), \theta \in (0, \pi/2) \) is \( \frac{\sqrt{3}x \cos \theta}{9} + y \sin \theta = 1 \)

\[ \because \] Intercept on x-axis = \( \frac{9}{\sqrt{3} \cos \theta} \)

\[ \therefore \] Intercept on y-axis = \( \frac{1}{\sin \theta} \)

\[ \therefore \] Sum of intercepts = \( S = 3\sqrt{3} \sec \theta + \csc \theta \)

For min. value of \( S \), \( \frac{dS}{d\theta} = 0 \)

\[ \Rightarrow \] \( 3\sqrt{3} \sec \theta \tan \theta - \csc \theta \cot \theta = 0 \)

\[ \Rightarrow \] \( \frac{3\sqrt{3} \sin \theta}{\cos \theta} = 0 \Rightarrow 3\sqrt{3} \sin^3 \theta - \cos^3 \theta = 0 \)

\[ \Rightarrow \] \( \tan^3 \theta = \left( \frac{1}{\sqrt{3}} \right)^3 \)

\[ \Rightarrow \tan \theta = \frac{1}{\sqrt{3}} = \tan \pi/6 \Rightarrow 0 = \pi/6 \)

24. (a) \( f(x) = x^3 + bx^2 + cx + d \)

\( f'(x) = 3x^2 + 2bx + c \)

Discriminant = \( 4b^2 - 12c = 4(b^2 - 3c) < 0 \)

\[ \therefore \] \( f'(x) > 0 \quad \forall \ x \in \mathbb{R} \)

\[ \Rightarrow \] \( f(x) \) is strictly increasing \( \forall \ x \in \mathbb{R} \)

25. (d) For Rolle’s theorem in \([a, b]\)

\[ f(a) = f(b) \in [0, 1] \Rightarrow f(0) = f(1) = 0 \]

\[ \because \] The function has to be continuous in \([0, 1]\)

\[ f(0) = \lim_{x \to 0^+} f(x) = 0 \Rightarrow \lim_{x \to 0^+} x^\alpha \log x = 0 \]

\[ \lim_{x \to 0^+} \frac{\log x}{x^\alpha} = 0 \]

Applying L’ Hospital’s Rule

\[ \lim_{x \to 0^+} \frac{1}{x^\alpha} = 0 \Rightarrow \lim_{x \to 0^+} \frac{x^\alpha}{x} = 0 \Rightarrow \alpha > 0 \]

26. (b) Let the polynomial be \( P(x) = ax^2 + bx + c \)

Given \( P(0) = 0 \) and \( P(1) = 1 \) \( \Rightarrow \) \( c = 0 \) and \( a + b = 1 \)

\[ \therefore \] \( a = 1 - b \)

\[ \therefore \] \( P(x) = (1 - b)x^2 + bx \)

\[ P'(x) = 2(1 - b)x + b \]

Given \( P'(x) > 0, \forall x \in [0, 1] \)

\[ \Rightarrow (1 - b)x + b > 0 \]

\[ \Rightarrow \] When \( x = 0, b > 0 \) and when \( x = 1, b < 2 \)

\[ 0 < b < 2 \]

\[ \therefore \] \( S = \{(1 - a)x^2 + ax, a \in (0, 2)\} \)

27. (a) The equation of tangent to the curve \( y = e^x \) at \( (c, e^c) \) is \( y - e^c = e^c(x - c) \) \( \ldots (1) \)

and equation of line joining \( (c - 1, e^{c-1}) \) and \( (c + 1, e^{c+1}) \) is \( y - e^{c-1} = \frac{e^{c+1} - e^{c-1}}{2} [x - (c - 1)] \)

\[ \Rightarrow \] \( y - e^{c-1} = \frac{e^c(e - e^{-1})}{2} [x - c + 1] \) \( \ldots (2) \)

Subtracting equation (1) from (2), we get

\[ e^c - e^{-c-1} = e^c(x - c) \left[ \frac{e^{c-1} - 2}{2} + e^c \left( e^{-1} \right) \right] \]

\[ \Rightarrow \] \( x - c = \frac{1}{2} \left[ e^{-e^{-1}} - 2 \right] = \frac{2 - e^{-1}}{2 - e^{-1}} \cdot \frac{e^{-1} - 2}{2} \cdot \frac{e^{-1} - 1}{-e^{-1} - 2} = \frac{-ve}{ve} = -ve \)

\[ \Rightarrow x - c < 0 \Rightarrow x < c \)

28. (b) The given curves are \( C_1: y^2 = 4x \quad \ldots (1) \) and \( C_2: x^2 + y^2 - 6x + 1 = 0 \ldots (2) \)

Solving (1) and (2) we get \( x^2 + 4x - 6x + 1 = 0 \Rightarrow x = 1 \) and \( \Rightarrow y = 2 \) or \(-2 \)

\[ \therefore \] Points of intersection of the two curves are \((1, 2)\) and \((1, -2)\).

For \( C_1: \frac{dy}{dx} = \frac{2}{y} \)

\[ \Rightarrow \left( \frac{dy}{dx} \right)_{(1, 2)} = 1 = m_1 \quad \text{and} \quad \left( \frac{dy}{dx} \right)_{(1, -2)} = -1 = m_1' \]

For \( C_2: \frac{dy}{dx} = \frac{-3 - x}{y} \quad \Rightarrow \left( \frac{dy}{dx} \right)_{(1, -2)} = 1 = m_2 \)

And \( \left( \frac{dy}{dx} \right)_{(1, 2)} = -1 = m_2' \)

\[ \therefore m_1 = m_2 \quad \text{and} \quad m_1' = m_2' \]

\[ \therefore \] \( C_1 \) and \( C_2 \) touch each other at two points.
The given function is
\[ f(x) = \begin{cases} (2 + x)^3, & -3 < x \leq -1 \\ x^{2/3}, & -1 < x - 2 \end{cases} \]

The graph of \( y = f(x) \) is as shown in the figure. From the graph, clearly, there is one local maximum (at \( x = -1 \)) and one local minima (at \( x = 0 \)).

\[ \therefore \text{total number of local maxima or minima} = 2. \]

**30. (e)** Given that \( g(u) = 2 \tan^{-1}(e^u) - \frac{\pi}{2} \)

\[ g(-u) = 2 \tan^{-1}(e^{-u}) - \frac{\pi}{2} = 2 \tan^{-1} \left( \frac{1}{e^u} \right) - \frac{\pi}{2} \]

\[ = 2 \cot^{-1}(e^u) - \frac{\pi}{2} = 2 \left[ \frac{\pi}{2} - \tan^{-1}(e^u) \right] - \frac{\pi}{2} \]

\[ = \pi - 2 \tan^{-1}(e^u) - \frac{\pi}{2} = \frac{\pi}{2} - 2 \tan^{-1}(e^u) \]

\[ = -g(u) \quad \therefore \text{\( g \) is an odd function.} \]

Also, \( g'(u) = \frac{2e^u}{1 + e^{2u}} > 0, \quad \forall u \in (-\infty, \infty) \)

\[ \therefore \text{\( g \) is strictly increasing on \((-\infty, \infty)\).} \]

**31. (e)** Let \( f(x) = 4ax^2 + \frac{1}{x} \)

For \( x > 0, \quad f_{\min} = 1 \)

\[ f'(x) = 8ax - \frac{1}{x^2} = 0 \Rightarrow x = \frac{1}{2a^{1/3}} \]

\[ f_{\min} = 1 \Rightarrow 4a \left( \frac{1}{2a^{1/3}} \right)^2 + 2a^{1/3} = 1 \]

\[ \Rightarrow 3a^3 = 1 \quad \text{or} \quad a = \frac{1}{27} \]

**D. MCQs with ONE or MORE THAN ONE Correct**

**1. (e)** We have \( P'(x) = 2a_1x + 4a_2x^3 + \ldots + 2na_nx^{2n-1} \)

\[ P'(x) = 0 \Rightarrow x = 0 \]

\[ P'(x) = 2a_1 + 12a_2x^2 + \ldots + 2n(2n - 1)a_nx^{2n-2} \]

\[ P''(x) \mid_{x=0} = +ve \quad \text{as} \quad a_1 > 0 \]

\[ \therefore \text{\( P \) has only one minimum at} \ x = 0. \]

**2. (b, c)** Let the line \( ax + by + c = 0 \) be normal to the curve \( xy = 1 \) at the point \( (x', y') \), then

\[ x'y' = 1 \quad \text{[} \quad \text{[pt} (x', y') \text{] lies on the curve]} \]

Also differentiating the curve \( xy = 1 \) with respect to \( x \)

we get \( y + x \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{y}{x} \)

\[ \Rightarrow \frac{dy}{dx} \left( x', y' \right) = \frac{-y'}{x'} \quad \therefore \text{Slope of normal} = \frac{x'}{y'} \]

Also equation of normal suggests, slope of normal

\[ \frac{-a}{b} \]

**4. (a)** Since \( g \) is decreasing in \([0, \infty)\)

\[ 
\therefore \text{For} \ x \geq y, \quad g(x) \leq g(y) \quad \text{...... (1)}
\]

Also \( g(x), g(y) \in [0, \infty) \) and \( f \) is increasing from \([0, \infty)\) to \([0, \infty)\).

\[ \therefore \text{For} \ g(x), g(y) \in [0, \infty) \text{ such that} \ g(x) \leq g(y) \]

\[ \Rightarrow f(g(x)) \leq f(g(y)), \text{ where} \ x \geq y \Rightarrow h(x) \leq h(y) \]

\[ \Rightarrow h \text{ is decreasing function from} \ [0, \infty) \text{ to} \ [0, \infty) \]

\[ \therefore h(x) \leq h(0), \quad \forall \ x \geq 0 \]

But \( h(0) = 0 \quad \text{(given)} \)

\[ \therefore h(x) \leq 0 \quad \forall \ x \geq 0 \quad \text{...... (2)} \]

Also \( h(x) \geq 0 \quad \forall \ x \geq 0 \quad \text{...... (3)} \)

\[ \text{[as} \ h(x) \in [0, \infty) \]

From (2) and (3), we get \( h(x) = 0, \quad \forall \ x \geq 0 \)

Hence, \( h(x) - h(1) = 0 - 0 = 0 \quad \forall \ x \geq 0 \)

**5. (a, b, c)** We are given that

\[ f(x) = \begin{cases} 3x^2 + 2x - 1, & -1 \leq x \leq 2 \\ 37 - x, & 2 < x \leq 3 \end{cases} \]

Then on \([-1, 2], \ f'(x) = 6x + 12 \)

For \ -1 \leq x \leq 2, -6 \leq 6x \leq 12 \]

\[ \Rightarrow 6 \leq 6x + 12 \leq 24 \]

\[ \Rightarrow f'(x) > 0, \quad \forall \ x \in [-1,2] \]

\[ \therefore \text{f is increasing on} \ [-1, 2] \]

Also \( f(x) \) being polynomial for \( x \in [-1,2] \cup (2,3] \)

\( f(x) \) is cont. on \([-1, 3]\) except possibly at \( x = 2, \)
Applications of Derivatives

LHL = \lim_{h \to 0} f(2-h) = \lim_{h \to 0} 3(2-h)^2 + 12(2-h) - 1 = 35

RHL = \lim_{h \to 0} f(2+h) = \lim_{h \to 0} 37 - (2+h) = 35

and \( f(2) = 3.2^2 + 12.2 - 1 = 35 \)

LHL = RHL = f(2)

\( \Rightarrow \) \( f(x) \) is continuous at \( x = 2 \)

Thus, \( f(x) \) is continuous on \([-1, 3]\)

Again at \( x = 2 \)

\[ RD = \lim_{h \to 0} \frac{f(2+h) - f(2)}{h} = \lim_{h \to 0} \frac{37 - (2+h) - 35}{h} = 1 \]

\[ LD = \lim_{h \to 0} \frac{f(2) - f(2-h)}{h} \]

\[ = \lim_{h \to 0} \frac{35 - 3(2-h)^2 - 12(2-h) + 1}{h} \]

\[ = \lim_{h \to 0} \frac{-3h^2 + 24h}{h} = 24 \]

As \( LD \neq RD \)

\( \therefore \) \( f''(2) \) does not exist. Hence \( f(x) \) can not have max. value at \( x = 2 \).

6. \( (a, c) \) We have

\[ h'(x) = f'(x)[1 - 2f(x) + 3f(x)] \]

\[ = 3f'(x)[(f(x))^2 - \frac{2}{3}f(x) + \frac{1}{3}] \]

\[ = 3f'(x)(f(x) - 1/3)^2 + 2/9 \]

Note that \( h'(x) < 0 \) whenever \( f'(x) < 0 \) and \( h'(x) > 0 \) whenever \( f'(x) > 0 \), thus \( h(x)\) increases (decreases) whenever \( f(x) \) increases (decreases).

7. \( (d) \) \( f(x) = \frac{x^2 - 1}{x^2 + 1} = \frac{(x^2 + 1)^2 - 2}{x^2 + 1} = 1 - \frac{2}{x^2 + 1} \)

For \( f(x) \) to be min \( \frac{2}{x^2 + 1} \) should be max, which is so if \( x^2 + 1 \) is min. And \( x^2 + 1 \) is min at \( x = 0 \).

\( \therefore \) \( f_{\min} = \frac{0 - 1}{0 + 1} = -1 \)

8. \( (b) \) The maximum value of \( f(x) = \cos x + \cos(\sqrt{2}x) \) is 2

which occurs at \( x = 0 \). Also, there is no value of \( x \) for which this maximum value will be attained again.

9. \( (b, d) \) \( \frac{dy}{dx} = f'(x) \Rightarrow x(e^x - 1)(x-1)(x-2)(x-3) = 0 \)

Critical points are 0, 1, 2, 3. Consider change of sign of \( \frac{dy}{dx} \) at \( x = 3 \).

\[ x < 3, \frac{dy}{dx} = -ve \text{ and } x > 3, \frac{dy}{dx} = +ve \]

Change is from -ve to +ve, hence minimum at \( x = 3 \).

Again minimum and maximum occur alternately.

\( \therefore \) 2nd minimum is at \( x = 1 \)

10. \( (b, c) \) Let \( f(x) = ax^3 + bx^2 + cx + d \)

Then, \( f(2) = 18 \Rightarrow 8a + 4b + 2c + d = 18 \) \( \ldots (1) \)

\( f(1) = -1 \Rightarrow a + b + c + d = -1 \)

\( f(x) \) has local max. at \( x = -1 \)

\( \Rightarrow 3a - 2b + c = 0 \) \( \ldots (3) \)

\( f'(x) \) has local min. at \( x = 0 \Rightarrow b = 0 \) \( \ldots (4) \)

Solving (1), (2), (3), and (4), we get

\[ f(x) = \frac{1}{4}(19x^3 - 57x + 34) \Rightarrow f(0) = \frac{17}{2} \]

Also \( f'(x) = \frac{57}{4}(x^2 - 1) > 0, \forall x > 1 \)

Also \( f''(x) = 0 \Rightarrow x = 1, -1 \)

\( f''(-1) < 0, f''(1) > 0 \Rightarrow x = -1 \) is a point of local max.

and \( x = 1 \) is a point of local min. Distance between \((-1, 2) \) and \((1, f(1)) \), i.e. \((-1, -1) \) is \( \sqrt{13} \neq 2\sqrt{5} \)

11. \( (a, b) \) \( g(x) = \int_0^x f(t) \, dt \)

\( \Rightarrow g'(x) = f(x) = \begin{cases} e^x, & 0 \leq x \leq 1 \\ -e^x, & 2 < x \leq 3 \end{cases} \)

\( \therefore g'(x) = 0 \Rightarrow e^x = 2 \text{ or } x - e = 0 \)

\( \Rightarrow x - 1 = \log 2 \text{ or } x = e \Rightarrow x = 1 + \ln 2 \text{ or } e \)

\[ g''(x) = \begin{cases} e^x, & 0 \leq x \leq 1 \\ -e^x, & 1 < x \leq 2 \\ 1, & 2 < x \leq 3 \end{cases} \]

\( \therefore \) \( g''(1 + \ln 2) = -2 \) and \( g''(e) = 1 \Rightarrow g(x) \) has local max. at \( x = 1 + \ln 2 \) and local min. at \( x = e \).

Graph of \( g(x) \)

Also graph of \( g'(x) \) suggests, \( g(x) \) has local max. at \( x = 1 \) and local min. at \( x = 2 \)

12. \( (b, c, d) \) We have, \( f(x) = x \cos \frac{1}{x}, x \geq 1 \)

\( \therefore f'(x) = \cos \frac{1}{x} + \frac{1}{x} \sin \frac{1}{x} \)

\( \lim_{x \to \infty} f'(x) = \cos 0 + (0) \times (\text{some finite value}) \)

\( \Rightarrow \lim_{x \to \infty} f'(x) = 1 \)

Also \( f''(x) = \frac{1}{x^2} \sin \frac{1}{x} - \frac{1}{x^3} \sin \frac{1}{x} - \frac{1}{x^3} \cos \frac{1}{x} \)

\( \Rightarrow f''(x) = -\frac{1}{x^3} \cos \frac{1}{x} < 0, \forall x \in [1, \infty) \)
13. (a, b, c, d)

We have $f(x) = \int_0^x e^{(t-2)(t-3)}dt$

$\Rightarrow f'(x) = e^{(-2)(x-2)(x-3)}f'(x) = 0 \Rightarrow x = 2, 3$

$f''(x) = e^{x-2} \cdot 2(x^2 - 5x + 6) + e^{2(x-5)}$

$f''(2) = -ve$ and $f''(3) = +ve$

$\therefore x = 2$ is a point of local maxima and $x = 3$ is a point of local minima.

Also $x = 2, 3, f'(x) < 0$.

$\Rightarrow f$ is decreasing on $(2, 3)$.

Also we observe $f''(0) < 0$ and $f''(1) > 0$.

$\therefore$ There exists a $C \in (0, 1)$ such that $f''(C) = 0$.

All the options are correct.

14. (a, c) Let $L = 8x, B = 15x$ and $y$ be the length of square cut off from each corner. Then volume of box $V = 120x^2y - 40xy^2 + 4y^3$

$\frac{dV}{dy} = 120x^2 - 92xy + 12y^2$

Now $\frac{dV}{dy} = 0$ at $y = 5$ for maximum value of $V$.

$\Rightarrow [30x^2 - 23xy + 3y^2]_{y=5} = 0$

$\Rightarrow 6x^2 - 23x + 15 = 0 \Rightarrow x = 3, \frac{5}{6}$

For $x = 3$, sides are 45 and 24.

15. (a, c, d) $f(x) = \int_0^x e^{-\frac{1}{(t+1)^2}}dt$

$\Rightarrow f'(x) = e^{-\frac{1}{(x+1)^2}} + \frac{x}{(x+1)^2} e^{-\frac{1}{(x+1)^2}}$

$\forall x \in [1, \infty), f'(x) > 0$

(a) is correct.

For $x \in (0, 1), f'(x) > 0$

(b) is not correct

$\Rightarrow f(x) + f\left(\frac{1}{x}\right) = \int_0^x e^{-\frac{1}{(t+1)^2}}dt + \int_0^1 e^{-\frac{1}{(t+1)^2}}dt = 0$

(c) is correct.

Replacing $x$ by $2^x$ in $f(x) + f\left(\frac{1}{x}\right) = 0$

We get $f(2^{2^x}) + f\left(2^{-x}\right) = 0$ or $f(2^x) = -f(2^{-x})$

$\therefore$ $f(2^x)$ is an odd function.

(d) is correct.

16. (b, c) Let $h(x) = f(x) - 3g(x)$

$h(-1) = h(0) = h(2) = 3$

$\therefore$ By Rolle’s theorem, $h'(x) = 0$ has atleast one solution in $(-1, 0)$ and at least one solution in $(0, 2)$. But $h''(x)$ never vanishes in $(-1, 0)$ and $(0, 2)$ therefore $h''(x) = 0$ should have exactly one solution in each interval.

17. (a, d) $\lim_{x \to \infty} \frac{f(x)g(x)}{x^2} = \lim_{x \to \infty} \frac{0}{0} = 1$

$\Rightarrow \lim_{x \to 2} \frac{f'(x)g(x) + f(x)g'(x)}{x^2} = 1$

$\Rightarrow \lim_{x \to 2} \frac{f'(2)g(2) + f(2)g'(2)}{x^2} = 1$

$\Rightarrow f(x) - f'(x) = 0$ for atleast one $x \in R$.

$\therefore$ Range of $f(x)$ is $(0, \infty)$.

$\Rightarrow f(x) > 0, \forall x \in R$

$\Rightarrow f(2) > 0 \Rightarrow f'(2) > 0$

$\Rightarrow f$ has a local minimum at $x = 2$

E. Subjective Problems

1. $f(x) = \frac{(a+x)(b+x)}{(c+x)} = \frac{(a+c+x+c)(b-x+c+x+c)}{x+c} = \frac{(a-c)(b-c)}{x+c} + (x+c) + a + b - 2c$

$\Rightarrow f'(x) = \frac{(a-c)(b-c)}{(x+c)^2} + 1$

$\therefore f'(x) = 0 \Rightarrow x = -c + \sqrt{(a-c)(b-c)}$ [ve sign is taken $\because x > -c$]

$\Rightarrow x = -c + \sqrt{(a-c)(b-c)}$

Also $f''(x) = \frac{2(a-c)(b-c)}{(x+c)^3} > 0$ for $a, b > c$ and $x > -c$

$\therefore f(x)$ is least at $x = -c + \sqrt{(a-c)(b-c)}$

$\therefore f_{min} = \frac{(a-c)(b-c)}{(a-c)(b-c)} + \sqrt{(a-c)(b-c)}$ + $(a-c) + (b-c) + 2\sqrt{(a-c)(b-c)}$ + $(a-c) + (b-c)$

$= \sqrt{(a-c)(b-c)}$

2. Given that $x$ and $y$ are two real variables such that $x > 0$ and $xy = 1$.

To find the minimum value of $x + y$.

Let $S = x + y$

$\Rightarrow S = x + \frac{1}{x}$ (using $xy = 1$)

$\Rightarrow \frac{dS}{dx} = 1 - \frac{1}{x^2}$

For minimum value of $S, \frac{dS}{dx} = 0$
Applications of Derivatives

\[ 1 - \frac{1}{x^2} = 0 \Rightarrow x = \pm 1 \]
But \( x > 0 \), \( \therefore x = 1 \)

Now \( \frac{d^2 S}{dx^2} = \frac{2}{x^3} \)
\[ \Rightarrow \left. \frac{d^2 S}{dx^2} \right|_{x=1} = 2 = +ve \]

\[ \therefore S \text{ is minimum when } x = 1 \quad \therefore S_{\text{min}} = 1 + \frac{1}{2} = 2 \]

3. We are given that
\[ x \in [0,1], |f''(x)|<1 \text{ and } f(0) = f(1) \]
To prove that \( |f'(x)|<1, \forall x \in [0,1] \)
Here \( f(x) \) is continuous on \([0,1]\), differentiable on \((0,1)\)
and \( f(0) = f(1) \)
\[ \therefore \text{ By Rolle's thm.,} \]
\[ \exists c \in (0,1) \text{ such that } f'(c) = 0 \quad \ldots (1) \]

Now there may be three cases for \( x \in [0,1] \)
(i) \( x = c \) (ii) \( x > c \) (iii) \( x < c \)

**Case I:** For \( x = c \).
If \( x = c \) then \( f'(x) = 0 < 1 \) [from (1)]
Hence the result \( |f'(x)|<1 \) is obtained in this case.

**Case II:** For \( x > c \)
Consider the interval \([c,x]\).
As \( f'(x) \) is continuous on \([c,x]\) and differentiable on \((c,x)\)
\[ \therefore \text{ By LMV } f''(\alpha) = \frac{f'(x)-f'(c)}{x-c} \text{ where } \alpha \in (c,x) \]
\[ \Rightarrow f'(x) = (x-c)f''(\alpha) \quad [\because f'(c) = 0] \]
Now, \( x,c \in [0,1] \) and \( x > c \)
\[ \therefore x - c < 1 \quad \ldots \ldots (i) \]
also \( |f''(x)|<1, \forall x \) (given)
\[ \therefore |f''(\alpha)|<1 \quad \ldots \ldots \quad (ii) \]
Combining (i) and (ii), \( (x-c)|f''(\alpha)|<1 \)
\[ \therefore |f'(x)|<1. \text{ Hence the result in this case.} \]

**Case III:** For \( x < c \)
Consider the interval \([x,c]\).
As \( f'(x) \) is continuous on \([x,c]\) and differentiable on \((x,c)\)
\[ \therefore \text{ By LMV for } \beta \in (x,c) \]
\[ f''(\beta) = \frac{f'(c)-f'(x)}{c-x} \Rightarrow f'(x) = (c-x)f''(\beta) \]
[Using \( f'(c) = 0 \)]
\[ \therefore |f'(x)| = |(c-x)f''(\beta)| \]
as \( x,c \in [0,1] \) and \( x < c \)
\[ \therefore 0 < c-x < 1 \text{ also } |f''(\beta)|<1 \text{ as } |f''(x)|<1, \forall x \]
\[ \therefore |(c-x)f''(\beta)|<1 \]
\[ \therefore |f'(x)|<1 \text{ hence the result in this case.} \]
Combining all the three cases we get
\[ |f'(x)|<1, \forall x \in [0,1] \]

4. \( f(x) = x^{1/x}, \quad x > 0 \)
Let \( y = x^{1/x} \) \Rightarrow \log y = \frac{1}{x} \log x \)
Differentiating w.r.t. \( x \) we get
\[ \frac{1}{y} \frac{dy}{dx} = \frac{1-x \log x}{x^2} \Rightarrow \frac{dy}{dx} = \frac{y(1-\log x)}{x^2} \]
For max/min value put \( \frac{dy}{dx} = 0 \)
\[ \Rightarrow \frac{y(1-\log x)}{x^2} = 0 \Rightarrow \log x = 1 \Rightarrow x = e \]
Also,
\[ \frac{d^2 y}{dx^2} = \frac{\left( \frac{dy}{dx} \left( 1-\log x \right) - \frac{1}{x} y \right) x^2 - 2xy(1-\log x)}{x^4} \]
\[ \Rightarrow \left. \frac{d^2 y}{dx^2} \right|_{x=e} = \frac{(-xy)}{x^4} \left|_{x=e} \right. \]
Using \( \frac{dy}{dx} = 0, 1-\log x = 0 \text{ at } x = e \]
\[ = \frac{e^{1/e}}{e} = -ve \]
\[ \therefore y \text{ is max at } x = e \]
\[ \therefore e^{1/e} \text{ is the max. value of } f(x). \]
\[ \therefore 1/x < e^{1/e}, \forall x \]
\[ \therefore \text{ Put } x = \pi, \text{ we get, } \pi^{1/\pi} < e^{1/e} \]
\[ \Rightarrow \text{ Raising to the power } \pi e \text{ on both sides we get } \]
\[ \pi^e < e^\pi \text{ or } e^\pi > \pi^e \]

5. Given that \( f(x) \) and \( g(x) \) are differentiable for \( x \in [0,1] \) such that \( f(0) = 2, f(1) = 6, g(0) = 0, g(1) = 2 \)
To show that \( \exists c \in (0,1) \) such that \( f'(c) = 2g'(c) \)
Let us consider \( h(x) = f(x) - 2g(x) \)
Then \( h(x) \) is continuous on \([0,1]\) and differentiable on \((0,1)\)
Also \( h(0) = f(0) - 2g(0) = 2 - 2 \times 0 = 2 \)
\[ h(1) = f(1) - 2g(1) = 6 - 2 \times 2 = 2 \]
\[ \therefore h(0) = h(1) \]
\[ \therefore \text{ All the conditions of Rolle's theorem are satisfied for } h(x) 
  \text{ on } [0,1] \]
\[ \exists c \in (0,1) \text{ such that } h'(c) = 0 \]
\[ \Rightarrow f'(c) - 2g'(c) = 0 \Rightarrow f'(c) = 2g'(c) \]

6. \((0,c), y = x^2, 0 \leq c \leq 5 \).
Any point on parabola is \((x,x^2)\).
Distance between \((x,x^2)\) and \((0,1)\) is
\[ D = \sqrt{x^2 + (x^2 - c)^2} \]
To minimum \( D \) we consider
\[ D^2 = x^4 - (2c-1)x^2 + c^2 = \left( x^2 - \frac{2c-1}{2} \right)^2 + c - \frac{1}{4} \]
which is minimum when \( x^2 - \frac{2c-1}{2} = 0 \Rightarrow x^2 = \frac{2c-1}{2} \)
\[ \Rightarrow D_{\text{min}} = \sqrt{c - \frac{1}{4}} \]
7. Given \( ax^2 + \frac{b}{x} \geq c \) \( \forall x > 0, a > 0, b > 0 \)

To show that \( 27ab^2 \geq 4c^3 \).
Let us consider the function \( f(x) = ax^2 + b/x \)
then \( f'(x) = 2ax - \frac{b}{x^2} = 0 \)
\[ \Rightarrow x^3 = b/(2a) \Rightarrow x = (b/(2a))^{1/3} \]
\[ \therefore f''(x) = 2a + \frac{2b}{x^3} \]
\[ \Rightarrow f''\left(\frac{b}{2a}\right)^{1/3}\right) = 2a + \frac{2b}{x^3} = 2a + \frac{2b}{b/(2a)} = 6a > 0 \]
\[ \therefore f \text{ is minimum at } x = \left(\frac{b}{2a}\right)^{1/3} \]
As (1) is true \( \forall x \)
\[ \therefore \text{ so is for } x = \left(\frac{b}{2a}\right)^{1/3} \]
\[ \Rightarrow a\left(\frac{b}{2a}\right)^{2/3} + \frac{b}{(b/(2a))^{1/3}} \geq c \]
\[ \Rightarrow \left(\frac{b}{2a}\right)^{2/3} + \frac{b}{b/(2a)} \geq c \]
\[ \Rightarrow \left(\frac{b}{2a}\right)^{2/3} + \frac{b}{b/(2a)} \geq c \]
\[ \Rightarrow 27b^3 \geq 8 \cdot b \cdot c^3 \Rightarrow 27ab^2 \geq 4c^3 \] Hence proved.

8. To show
\[ 1 + x \ln (x + \sqrt{x^2 + 1}) \geq \sqrt{1 + x^2} \text{ for } x \geq 0 \]
Consider \( f(x) = 1 + x \ln (x + \sqrt{x^2 + 1}) - \sqrt{1 + x^2} \)
Here, \( f'(x) = \ln(x + \sqrt{x^2 + 1}) + \frac{x}{x + \sqrt{x^2 + 1}} \)
\[ = \ln(x + \sqrt{x^2 + 1}) \]
As \( x + \sqrt{x^2 + 1} \geq 1 \text{ for } x \geq 1 \)
\[ \therefore \ln(x + \sqrt{x^2 + 1}) \geq 0 \]
\[ \therefore f'(x) \geq 0, \forall x \geq 0 \]
Hence \( f(x) \) is increasing function.
Now for \( x \geq 0 \) \( \Rightarrow f(x) \geq f(0) \)
\[ \Rightarrow 1 + x \ln(x + \sqrt{x^2 + 1}) - \sqrt{1 + x^2} \geq 0 \]
\[ \Rightarrow 1 + x \ln(x + \sqrt{x^2 + 1}) \geq \sqrt{1 + x^2} \]

9. Equation of the curve is given by
\[ y = \frac{x}{1 + x^2} \] ...(1)

**Topic-wise Solved Papers - MATHEMATICS**

Differentiating with respect to \( x \), we get
\[ \frac{dy}{dx} = \frac{1 + x^2 - x(2x)}{(1 + x^2)^2} = \frac{1 - x^2}{(1 + x^2)^2} \]
Again let \( f(x) = \frac{1 - x^2}{(1 + x^2)^2} \)
\[ \frac{df}{dx} = \frac{(1 + x^2)^2(2x) - 2(1 - x^2)(2x)(1 + x^2)}{(1 + x^2)^4} \]
\[ = \frac{(1 + x^2)(2x) - 2(1 - x^2)(2x)(1 + x^2)^3}{(1 + x^2)^3} \]
\[ = \frac{2x(2x^2 - 6)}{(1 + x^2)^3} \]
For the greatest value of slope, we have
\[ f'(x) = \frac{2x(2x^2 - 6)}{(1 + x^2)^3} = 0 \Rightarrow x = 0, \pm \sqrt{3} \]
Again we find,
\[ f''(x) = \frac{12x^2(3 - x^2)(1 + x^2)^4 - 6(1 - x^2)}{(1 + x^2)^3} \]
\[ \therefore f''(0) = -6 \text{ and } f''(\pm \sqrt{3}) = \frac{3}{16} \]
Thus, second order derivative at \( x = 0 \) is negative and second order derivative at \( x = \pm \sqrt{3} \) is positive.
Therefore, the tangent to the curve has maximum slope at \( (0,0) \).

10. Equation of given curve \( y = \cos(x + y) \), \(-2\pi \leq x \leq 2\pi\)
Differentiating with respect to \( x \),
\[ \frac{dy}{dx} = -\sin(x + y) \left[ 1 + \frac{dy}{dx} \right] \]
\[ \Rightarrow [1 + \sin(x + y)] \frac{dy}{dx} = -\sin(x + y) \]
\[ \Rightarrow \frac{dy}{dx} = \frac{-\sin(x + y)}{1 + \sin(x + y)} \] ...(1)
Since the tangent to given curve is parallel to \( x + 2y = 0 \)
\[ \therefore \frac{-\sin(x + y)}{1 + \sin(x + y)} = -\frac{1}{2} \] [For parallel line \( m_1 = m_2 \)]
\[ \Rightarrow 2\sin(x + y) = 1 + \sin(x + y) \]
\[ \Rightarrow \sin(x + y) = 1 \]
Thus, \( \cos(x + y) = 0 \)

Using equation of curve and above result, we get, \( y = 0 \)
\[ \Rightarrow \sin x = 1 \Rightarrow x = n\pi + (-1)^n\frac{\pi}{2}, \ n \in Z \Rightarrow x = \pi/2, -3\pi/2 \]
which belong to the interval \([-2\pi, 2\pi]\)
Thus the points on curve at which tangents are parallel to given line are \((\pi/2, 0)\) and \((-3\pi/2, 0)\)
The equation of tangent at \((\pi/2, 0)\) is
\[ y - 0 = -\frac{1}{2}(x - \pi/2) \]
\[ \Rightarrow 2y = -x + \pi/2 \Rightarrow 2x + 4y - \pi = 0 \]
The equation of tangent at \((-3\pi/2, 0)\) is
\[ y - 0 = -\frac{1}{2}(x + 3\pi/2) \]
\[ \Rightarrow 2y = -x - 3\pi/2 \Rightarrow 2x + 4y + 3\pi = 0 \]
Thus the required equations of tangents are
\( 2x + 4y - \pi = 0 \) and \( 2x + 4y + 3\pi = 0 \).

11. The given function is,
\[ f(x) = \sin^3x + \lambda \sin^2x \] for \(-\pi/2 < x < \pi/2\)
Applications of Derivatives

\[ f'(x) = 3 \sin^2 x \cos x + 2\lambda \sin x \cos x \]
\[ = \frac{1}{2} \sin 2x (3 \sin x + 2\lambda) \]

So, from \( f'(x) = 0 \), we get \( x = 0 \)
or \[ 3 \sin x + 2\lambda = 0 \]

Also, \( f''(x) = \cos 2x (3 \sin x + 2\lambda) + \frac{3}{2} \sin 2x \cos x \)

Therefore, for \( \lambda = \frac{-3}{2} \sin x \), we have
\[ f''(x) = 3 \sin x \cos^2 x - 2\lambda \cos^2 x \]

Now, if \( 0 < x < \frac{\pi}{2} \), then \( -3/2 < \lambda < 0 \) and therefore \( f''(x) > 0 \).
\[ \Rightarrow f(x) \text{ has one minimum for this value of } \lambda. \]

Also for \( x = 0 \), we have \( f''(0) = 2\lambda < 0 \), That is \( f(x) \) has a maximum at \( x = 0 \)
Again if \( -\pi/2 < x < 0 \), then \( 0 < \lambda < 3/2 \) and therefore \( f''(x) < 0 \).

So that \( f(x) \) has a maximum.

Also for \( x = 0 \), \( f''(a) = 2\lambda > 0 \) so that \( f(x) \) has a minimum.

Thus, for exactly one maximum and minimum value of \( f(x) \), \( \lambda \) must lie in the interval
\[ -3/2 < \lambda < 0 \text{ or } 0 < \lambda < 3/2 \]
i.e., \( \lambda \in (-3/2, 0) \cup (0, 3/2) \).

12. The equation of a given curve can be expressed as

\[ \frac{x^2}{a^2} + \frac{y^2}{4} = 1 \quad \text{where } 4 < a^2 < 8 \]

Clearly it is the equation of an ellipse

Let us consider a point \( P(a \cos \theta, b \sin \theta) \) on the ellipse.
Let the distance of \( P(a \cos \theta, b \sin \theta) \) from \((0, -2)\) is \( L \).

Then, \( L^2 = (a \cos \theta - 0)^2 + (2 \sin \theta - 2)^2 \)

\[ \Rightarrow \text{Differentiating with respect to } \theta, \text{ we have} \]

\[ \frac{d(L^2)}{d\theta} = \cos \theta [-2a^2 \sin \theta + 8 \sin \theta + 8] \]

For max. or min. value of \( L \) we should have

\[ \frac{d(L^2)}{d\theta} = 0 \]

\[ \Rightarrow \cos \theta [-2a^2 \sin \theta + 8 \sin \theta + 8] = 0 \]

\[ \Rightarrow \text{Either } \cos \theta = 0 \]
or \[ (8 - 2a^2 \sin \theta + 8 = 0) \Rightarrow \theta = \frac{\pi}{2} \text{ or } \sin \theta = \frac{4}{a^2 - 4} \]

Since \( a^2 < 8 \Rightarrow a^2 - 4 < 4 \)
\[ \Rightarrow \frac{4}{a^2 - 4} > 1 \Rightarrow \sin \theta > 1 \text{ which is not possible} \]

Also \( \frac{d^2(L^2)}{d\theta^2} = \cos \theta [-2a^2 \cos \theta + 8 \cos \theta] \)
\[ + (- \sin \theta) [-2a^2 \sin \theta + 8 \sin \theta + 8] \]

At \( \theta = \frac{\pi}{2} \), \( \frac{d^2(L^2)}{d\theta^2} = 0 - 16a^2 = 2(a^2 - 8) < 0 \)
as \( a^2 < 8 \)
\[ \Rightarrow L \text{ is max. at } \theta = \pi/2 \text{ and the farthest point is } (0, 2). \]

13. We have,

\[ f(x) = \int_t^\pi [2(t^2 - 1)(t^2 - 2) + (t^2 - 2)(t^2 - 1)] \, dt \]

Then using the theorem,

\[ \frac{d}{dx} \left[ \int \phi(x) \, g(t) \, dt \right] = \phi(x)g'(x) - \phi(x) \phi'(x) \]

We get,

\[ f'(x) = 2(x - 1)(x - 2)^2 + 3(x - 2)^2(x - 2)^2 \]
\[ = (x - 1)(x - 2)^2(2x - 4 + 3x - 3) \]
\[ = (x - 1)(x - 2)^2(5x - 7) \]

For extreme values \( f'(x) = 0 \Rightarrow x = 1, 2, 7/5 \)
Now, \( f''(x) = (x - 2)^2(5x - 7) + 2(x - 1)(x - 2)(5x - 7) \)
\[ + 5(x - 1)(x - 2)^2 \]

At \( x = 1 \), \( f''(x) = (1 - 2) = -2 < 0 \)
\[ \Rightarrow f \text{ is max. at } x = 1 \]
At \( x = 2 \), \( f''(x) = 0 \)
\[ \Rightarrow f \text{ is neither maximum nor minimum at } x = 2 \]
At \( x = 7/5 \), \( f''(x) = 5 \left( \frac{7}{5} - 1 \right) \left( \frac{7}{5} - 2 \right) = 5 \times \frac{2}{5} \times \frac{9}{25} = \frac{18}{25} > 0 \)
\[ \Rightarrow f(x) \text{ is minimum at } x = 7/5. \]

14. We have \( y = (x - 1)^2 \), \( 0 \leq x \leq 2 \)

\[ \frac{dy}{dx} = (x - 1)^2 + 2x(x - 1) = (x - 1)(3x - 1) \]

For max. or min. \( \frac{dy}{dx} = 0 \)
\[ \Rightarrow (x - 1)(3x - 1) = 0 \Rightarrow x = 1, 1/3 \]
\[ \frac{d^2y}{dx^2} = 6x - 4 \]

At \( x = 1 \), \( \frac{d^2y}{dx^2} = 2(+ve) \Rightarrow y \text{ is min. at } x = 1 \)

At \( x = 1/3 \), \( \frac{d^2y}{dx^2} = -2(-ve) \Rightarrow y \text{ is max. at } x = 1/3 \)
\[ \Rightarrow \text{Max. value of } y \text{ is } 1 \left( \frac{1}{3} - 1 \right)^2 = \frac{4}{27} \]

Min value of \( y \) is \( 1(1 - 1)^2 = 0 \)

Now the curve cuts the axis \( x \) at \((0, 0)\) and \((1, 0)\). When \( x \) increases from \( 1 \) to \( 2 \), \( y \) also increases and is +ve.
When \( y = 2 \), \( x(1 - x)^2 = 2 \)
\[ \Rightarrow x = 2 \]
Using max./min. values of \( y \) and points of intersection with \( x \)-axis, we get the curve as in figure and shaded area is the required area.
\[ \text{Area of square } OBCD = 2 \int_0^2 y \, dx \]
\[ = 2 \times 2 - \int_0^2 x(x-1) \, dx \]
\[ = 4 - \left( \left( \frac{x(x-1)^3}{3} \right) \bigg|_0^2 - \frac{1}{3} \int_0^2 (x-1)^3 \, dx \right) \]
\[ = 4 - \left( \frac{2}{3} \cdot \frac{1}{12} + \frac{1}{12} \right) = 4 - \frac{2}{3} = 10 \text{ sq.units.} \]

15. Let \( f(x) = 2 \sin x + \tan x - 3x \) on \( 0 \leq x < \pi/2 \)

\[ f'(x) = 2 \cos x + \sec^2 x - 3 \]

and \( f''(x) = -2 \sin x + 2 \sec^2 x \tan x \]

for \( 0 \leq x < \pi/2 \)

\[ f''(x) \geq 0 \]

\[ \Rightarrow f''(x) \text{ is an increasing function on } 0 \leq x < \pi/2. \]

For \( x \geq 0, \Rightarrow f'(x) \geq f'(0) \]

\[ f'(x) \geq 0 \text{ for } 0 \leq x < \pi/2 \]

\[ f(x) \text{ is an increasing function on } 0 \leq x < \pi/2 \]

For \( x \geq 0, f(x) \geq f(0) \]

\[ 2\sin x + \tan x - 3x \geq 0, \quad 0 \leq x < \pi/2 \]

\[ 2\sin x + \tan x \geq 3x, \quad 0 \leq x < \pi/2 \]

Hence proved.

16. As \( QR \parallel XY \) diameter through \( P \) is \( \perp QR \).

Now area of \( \triangle PQR \) is given by \[ A = \frac{1}{2} QR \cdot AP \]

But \( QR = 2, QA = 2\tan 2\theta \)

\[ \therefore A = \frac{1}{2} \cdot 2\sin 2\theta \cdot (r + \rho \cos 2\theta) \]

\[ = r^2 \cdot 2 \sin 2\theta \cos \theta \cdot 2 \cos^2 \theta = 4r^2 \sin \theta \cos^3 \theta \]

For max. value of area,

\[ \frac{dA}{d\theta} = 0 \]

\[ \Rightarrow 4r^2 \left[ \cos^4 \theta - 3 \sin^2 \theta \cos^2 \theta \right] = 0 \]

\[ \Rightarrow \cos^2 \theta(\cos^2 \theta - 3 \sin^2 \theta) = 0 \Rightarrow \tan \theta = \frac{1}{\sqrt{3}} \Rightarrow \theta = 30^\circ \]

Also \[ \frac{d^2A}{d\theta^2} = 4r^2 [-4 \cos^3 \theta \sin \theta - 6 \sin \theta \cos^3 \theta + 6 \sin^3 \theta \cos \theta] \]

\[ \left. \frac{d^2A}{d\theta^2} \right|_{\theta=30^\circ} = 4r^2 \left[ -10 \sin \theta \cos^3 \theta + 6 \sin^3 \theta \cos \theta \right] + 6 \sin^3 \theta \cos \theta \]

17. Let \( AB = \frac{x}{m} \)

\( BC = \frac{y}{m} \)

Then its perimeter including the base \( DC \) of arch

\[ = \left( 2x + 2y + \frac{\pi x}{2} \right) \cdot m \]

\[ \therefore P = \left( 2 + \frac{\pi}{2} \right) x + 2y \quad \text{...(1)} \]

Now, area of rectangle \( ABCD = xy \)

and area of arch \( DCED = \frac{\pi x^2}{2} \)

Let \( \lambda \) be the light transmitted by coloured glass per sq. m.

Then \( 3\lambda \) will be the light transmitted by clear glass per sq. m.

Hence the area of light transmitted \[ = 3\lambda (xy) + \lambda \left[ \frac{\pi x^2}{2} \right] \]

\[ \Rightarrow A = \frac{3\lambda x + \frac{\pi x^2}{2}}{8} \]

Substituting the value of \( y \) from (1) in (2), we get

\[ A = \lambda \left[ 3x + \frac{\pi x^2}{2} \right] \]

\[ = \lambda \left[ 3P \frac{x}{2} - 3(4 + \pi) \cdot \frac{x^2}{2} + \frac{\pi x^2}{2} \right] \]

\[ \therefore \frac{dA}{dx} = \lambda \left[ 3P \frac{x}{2} - 3(4 + \pi) \cdot \frac{x^2}{2} + \frac{\pi x^2}{4} \right] \]

For \( A \) to be maximum, \[ \frac{dA}{dx} = 0 \]

\[ \Rightarrow \frac{3P}{2} - \frac{3(4 + \pi)}{2} \cdot \frac{x}{4} = 0 \Rightarrow x = \frac{6P}{5\pi + 24} \]

Also \[ \frac{d^2A}{dx^2} = \lambda \left[ -\frac{3(4 + \pi)}{4} + \frac{\pi}{4} \right] < 0 \]

\[ \therefore A \text{ is max when } x = \frac{6P}{5\pi + 24} \]

[Using value of \( P \) from (1)]
Applications of Derivatives

\[ (5\pi + 24 - 12 - 3\pi) x = 12y \Rightarrow (2\pi + 12) x = 12y \]
\[ \Rightarrow \frac{y}{x} = \frac{\pi + 6}{6} \]
\[ \therefore \text{ The required ratio of breadth to length of the rectangle} = \frac{\pi + 6}{6} \]

18. Let \( f(x) = ax^3 + bx^2 + cx + d \)
ATQ, \( f(x) \) vanishes at \( x = -2 \)
\[ \Rightarrow -8a + 4b - 2c + d = 0 \]  ... (1)
Agina ATQ, \( f(x) \) has relative max/min at \( x = -1 \) and \( x = \frac{1}{3} \)
\[ \Rightarrow f'(-1) = 0 = f'(1/3) \]
\[ \Rightarrow 3a - 2b + c = 0 \]  ... (2)
and \( a + 2b + 3c = 0 \)  ... (3)
Also, \[ \int_{-1}^{1} f(x) = \frac{14}{3} \]
\[ \Rightarrow \left( \frac{ax^4}{4} + \frac{bx^3}{3} + \frac{cx^2}{2} + dx \right)_{-1}^{1} = \frac{14}{3} \]
\[ \Rightarrow \left[ \frac{a}{4} + \frac{b}{3} + \frac{c}{2} + d \right] - \left[ \frac{a}{4} - \frac{b}{3} + \frac{c}{2} - d \right] = \frac{14}{3} \Rightarrow \frac{b}{3} + d = \frac{7}{3} \]
\[ \Rightarrow b + 3d = 7 \]  ... (4)
From (1), (2), (3), (4) on solving, we get
\[ a = 1, b = 1, c = -1, d = 2 \]
\[ \therefore \text{ The required cubic is} \ x^3 + x^2 - x + 2. \]

19. The given curve is \( y = x^2 \)  ... (1)
Consider any point \( A(t, t^2) \) on (1) at which normal chord drawn is shortest.
Then eq. of normal to (1) at \( A(t, t^2) \) is
\[ y - t^2 = -\frac{1}{2t}(x - t) \quad [\text{where} \quad \frac{dy}{dx} = 2x \quad \text{from (1)}] \]
\[ y - t^2 = -\frac{1}{2t^2}(x - t) \]
\[ \Rightarrow x + 2ty = t + 2t^3 \]  ... (2)
This normal meets the curve again at point \( B \) which can be obtained by solving (1) and (2) as follows:
Putting \( y = x^2 \) in (2), we get
\[ 2tx^2 + x - (t + 2t^3) = 0 \]
\[ D = 1 + 8t(t + 2t^3) = 1 + 8t^2 + 16t^4 = (1 + 4t^2)^2 \]
\[ \therefore x = \frac{-1 + 1 + 4t^2}{4t} \]
\[ \Rightarrow y = t^2, t^2 + \frac{1}{4t^2} + 1 \]
Thus, \( B\left(-\frac{1}{2t}, \frac{1}{4t^2} + 1\right) \)
\[ \therefore \text{Length of normal chord} \]
\[ AB = \sqrt{\left(2t + \frac{1}{2t}\right)^2 + \left(\frac{1}{4t^2} + 1\right)^2} \]
Consider \( Z = AB^2 = \left(2t + \frac{1}{2t}\right)^2 + \left(\frac{1}{4t^2} + 1\right)^2 \)
\[ \Rightarrow Z = \frac{1}{16t^4} + \frac{3}{4t^2} + 3 + 4t^2 \]

For shortest chord, we have to minimize \( Z \), and for that
\[ \frac{dZ}{dt} = 0 \]
\[ \Rightarrow \frac{1}{4t^5} - 8t = 0 \Rightarrow -1 - 6t^2 + 32t^6 = 0 \]
\[ \Rightarrow 32 (t^6 - 6t^2 - 1) = (2t^2 - 1)(16t^4 + 8t^2 + 1) = 0 \]
\[ \Rightarrow t^2 = \frac{1}{2} \quad \text{(leaving} - \text{ve values of} \ t^2) \]
\[ \Rightarrow t = \frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}} \]
\[ \frac{d^2Z}{dt^2} = \begin{cases} 
\frac{5}{4t^6} + \frac{9}{2t^4} + 8 
\end{cases} \]
\[ \text{also} \quad \left| \frac{d^2Z}{dt^2} \right|_{t=\frac{1}{\sqrt{2}}} = +ve \]
\[ \therefore Z \text{ is minimum at} \ t = \frac{1}{\sqrt{2}} \text{ or} -\frac{1}{\sqrt{2}} \]

For \( t = \frac{1}{\sqrt{2}} \) normal chord is (from (2)) \( x + \sqrt{2}y = \sqrt{2} \)

For \( t = -\frac{1}{\sqrt{2}} \) normal chord is \( x - \sqrt{2}y = -\sqrt{2} \)

20. The given curve is \( y = (1 + x)^y + \sin^{-1}(\sin^2 x) \)
Here at \( x = 0, y = (1 + 0)^y + \sin^{-1}(0) \Rightarrow y = 1 \)
\[ \therefore \text{Point at which normal has been drawn is} \ (0, 1) \]
For slope of normal we need to find \( \frac{dy}{dx} \), and for that we consider the curve as \( y = u + v \Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx} \)
where \( u = (1 + x)^y \)  ... (i)
and \( v = \sin^{-1}(\sin^2 x) \)  ... (ii)
Taking log on both sides of equation (i) we get
\[ \log u = y \log (1 + x) \]
\[ \Rightarrow \frac{1}{u} \frac{du}{dx} = \frac{y}{1 + x} + \log(1 + x) \cdot \frac{dy}{dx} \]
\[ \Rightarrow \frac{du}{dx} = (1 + x)^y \left[ \frac{y}{1 + x} + \log(1 + x) \frac{dy}{dx} \right] \]
Also \( v = \sin^{-1}(\sin^2 x) \)
\[ \Rightarrow \frac{dv}{dx} = \frac{1}{\sqrt{1 - \sin^4 x}} \cdot 2\sin x \cos x \]
\[ \Rightarrow \frac{dv}{dx} = \frac{2\sin x}{\sqrt{1 - \sin^2 x}} \]
Thus, we get,
\[ \frac{dy}{dx} = (1 + x)^y \left[ \frac{y}{1 + x} + \log(1 + x) \frac{dy}{dx} \right] + \frac{2\sin x}{\sqrt{1 + \sin^2 x}} \]
\[ \Rightarrow [1 - (1 + x)^y \log(1 + x)] \frac{dy}{dx} = y(1 + x)^y - \frac{2\sin x}{\sqrt{1 + \sin^2 x}} \]
\[ \Rightarrow \frac{dy}{dx} = \frac{y(1 + x)^y - \frac{2\sin x}{\sqrt{1 + \sin^2 x}}}{1 - (1 + x)^y \log(1 + x)} \]
\[ \frac{dy}{dx}_{(0,1)} = 1, \quad \therefore \text{Slope of normal} = -1 \]

\[ \therefore \quad \text{Equation of normal to given curve at} \ (0,1) \ \Rightarrow \ x + y = 1. \]

21. We have, \( f(x) = \begin{cases} 
-x^3 + \frac{b^3 - b^2 + b - 1}{b^3 + 3b + 2}, & 0 \leq x < 1 \\
2x - 3, & 1 \leq x \leq 3
\end{cases} \)

We can see from definition of the function, that \( f(1) = 2(1) - 3 = -1 \)
Also \( f(x) \) is increasing on \([1, 3], f'(x) \) being \( 2 > 0 \).

\( \therefore f(1) = -1 \) is the smallest value of \( f(x) \)
Again \( f'(x) = -3x^2 \) for \( x \in [0, 1] \) such that \( f'(x) < 0 \)
\( \therefore \) \( f(x) \) is decreasing on \([0, 1] \)

\( \therefore \) For fixed value of \( b \), its smallest occur when \( x \to 1 \)
\[ \lim_{h \to 0} f(1-h) = \lim_{h \to 0} -1 + \frac{b^3 - b^2 + b - 1}{b^3 + 3b + 2} \]
\[ = -1 + \frac{b^3 - b^2 + b - 1}{b^3 + 3b + 2} \]
As given that the smallest value of \( f(x) \) occur at \( x = 1 \)
\( \therefore \) Any other smallest value \( \geq f(1) \)
\[ \Rightarrow -1 + \frac{b^3 - b^2 + b - 1}{b^3 + 3b + 2} \geq -1 \]
\[ \Rightarrow \frac{b^3 - b^2 + b - 1}{b^3 + 3b + 2} \geq 0 \]
\[ \Rightarrow \frac{(b^2 + 1)(b-1)}{(b+2)(b+1)} \geq 0 \]
\[ \Rightarrow (b-1)(b+1)(b+2) \geq 0 \]
\[ -2 \quad -1 \quad 1 \]
\( \Rightarrow b \in (-2, -1) \cup (1, \infty). \)

22. Given that \( y = ax^3 + bx^2 + cx + 5 \) touches the \( x \)-axis at \( P(-2, 0) \)
\[ \Rightarrow \left( \frac{dy}{dx} \right)_{x=-2} = 0 \text{ and } P(-2, 0) \text{ lies on curve} \]
\[ \Rightarrow 3ax^2 + 2bx + c|_{x=-2} = 0 \]
\[ \Rightarrow 12a - 4b + c = 0 \]
\[ \Rightarrow -8a + 4b - 2c + 5 = 0 \quad \text{[2]} \]
Also the curve cuts the \( y \)-axis at \( Q \)
\( \therefore \) For \( x = 0, y = 5 \) \( \therefore Q(0, 5) \)
At \( Q \) gradient of the curve is 3
\[ \Rightarrow \left. \frac{dy}{dx} \right|_{x=0} = 3 \quad \Rightarrow 3x^2 + 2bx + c|_{x=0} = 3 \]
\[ \Rightarrow a = -\frac{1}{2}, \ b = -\frac{3}{4} \text{ and } c = 3. \]
Solving (1), (2), and (3), we get
\( a = -\frac{1}{2}, \ b = -\frac{3}{4} \text{ and } c = 3. \)

23. The given circle is \( x^2 + y^2 = r^2 \)
which intersect \( x \)-axis at \( P(-1, 0) \) and \( Q(1, 0) \).
Let radius of circle with centre at \( Q(1, 0) \) be \( r \), where \( r \) is variable.
Then equation of this circle is
\[ (x-1)^2 + y^2 = r^2 \]
\[ \Rightarrow (x-1)^2 = r^2 - y^2 \quad \text{[1]} \]
Subtracting (1) from (2) we get
\[ (x-1)^2 - x^2 = (r^2 - 1) \]
\[ \Rightarrow -2x = r^2 - 1 \quad \Rightarrow x = 1 - \frac{r^2}{2} \]
Substituting this value of \( x \) in (2), we get
\[ \frac{r^4}{4} + y^2 = r^2 \quad \Rightarrow y = \pm r \sqrt{\frac{r^2}{4} - 1} \]
\[ \because k \left( \frac{r^2}{2}, \dot{r} \sqrt{\frac{r^2}{4} - 1} \right) \text{ point being above x-axis.} \]
\[ \therefore \] Area of \( \triangle QRS = \frac{1}{2} \text{SQ} \times \text{ordinate of point } R \)
\[ \Rightarrow A = \frac{1}{2} \times r \times r \sqrt{\frac{r^2}{4} - 1} \]
A will be max. if \( A^2 \) is max.
\[ A^2 = \frac{r^4}{4} \left( 1 - \frac{r^2}{2} \right) \sqrt{\frac{r^2}{4} - 1} \]
\[ = \frac{r^4}{4} \left( 1 - \frac{r^2}{2} \right) \frac{r^2}{4} \frac{r^2}{4} \]
\[ = \frac{r^4}{4} - \frac{r^6}{16} \]
Differentiating \( A^2 \) w.r.t. \( r \), we get
\[ \frac{dA^2}{dr} = r^3 - \frac{3r^5}{8} \]
For \( A^2 \) to be max. \( \frac{dA^2}{dr} = 0 \)
\[ \Rightarrow r^3 \left( 1 - \frac{3}{8} r^2 \right) = 0 \Rightarrow r = \frac{2\sqrt{2}}{\sqrt{3}} \]
\[ \frac{d^2(A^2)}{dr^2} = 3r^2 - \frac{15}{8} r^4 \]
\[ \Rightarrow \frac{d^2(A^2)}{dr^2} \left|_{r=\frac{2\sqrt{2}}{\sqrt{3}}} \right. = 3 \times \frac{8}{9} \times 15 \times \frac{64}{9} = -ve \]
\[ \therefore A^2 \text{ and hence } A \text{ is max. when, } r = \frac{2\sqrt{2}}{\sqrt{3}} \]
Max. area = \[ \sqrt{\frac{1}{16} \left( \frac{2\sqrt{2}}{\sqrt{3}} \right)^4 - \frac{1}{16} \left( \frac{2\sqrt{2}}{\sqrt{3}} \right)^6} \]
\[ = \sqrt{\frac{1}{16} \times \frac{64}{9} \times \frac{1}{16} \times \frac{512}{27}} \]
\[ = \sqrt{\frac{16}{9} \times \frac{32}{27}} \]
\[ = \frac{4\sqrt{3}}{9} \text{ sq. units.} \]

24. Let the given line be \( \frac{x}{a} + \frac{y}{b} = 1 \), so that it makes an intercept of \( a \) units on \( x \)-axis and \( b \) units on \( y \)-axis. As it passes through the fixed point \( (h, k) \), therefore we must have
\[ \frac{k}{b} = 1 - \frac{h}{a} \quad \Rightarrow \quad b = \frac{ak}{a-h} \quad \ldots (1) \]

**Now Area of \( \triangle OPQ = A = \frac{1}{2}ab \)**

\[ \because \quad A = \frac{1}{2}a \left( \frac{ak}{a-h} \right) \quad \text{[using (1)]} \]

or \[ A = \frac{k}{2} \left[ \frac{a^2}{a-h} \right] \]

For min. value of \( A \), \( \frac{dA}{da} = 0 \)

\[ \frac{k}{2} \left[ \frac{4a(a-h)-a^2}{(a-h)^2} \right] = 0 \quad \Rightarrow \quad \frac{k}{2} \left[ \frac{a^2 - 2ah}{(a-h)^2} \right] = 0 \quad \Rightarrow \quad a = 2h \]

Also, \[ \frac{d^2A}{da^2} = \frac{(2a-2h)(a-h)^2 - 2(a-h)(-1)(a^2-2ah)}{(a-h)^4} \]

\[ \because \quad \frac{d^2A}{da^2} \bigg|_{a=2h} = \frac{(2h^3+2h)(0)}{h^4} = \frac{2}{h} > 0, [\because h > 0] \]

\[ \because \quad A \text{ is min. when } a = 2h \]

\[ \because \quad A_{\min} = \frac{k}{2} \left[ \frac{4h^2}{h} \right] = 2kh \]

**25.** The normal to the curve at \( P \) is

\[ a(y-1) + (x-1) = 0 \]

First we consider the case when \( a \neq 0 \)

Slope of normal at \( P(1,1) \) is \( -\frac{1}{a} \)

\[ \Rightarrow \quad \text{Slope of the tangent at } (1,1) \text{ is } a \]

\[ \Rightarrow \quad \left( \frac{dy}{dx} \right)_{(1,1)} = a \quad \ldots (1) \]

But we are given that

\[ \frac{dy}{dx} \propto y \quad \Rightarrow \quad \frac{dy}{dx} = ky \quad \Rightarrow \quad \frac{dy}{y} = kdx \]

\[ \Rightarrow \quad \log |y| = kx + C \quad \Rightarrow \quad |y| = e^{kx+c} = e^c e^{kx} \]

\[ \Rightarrow \quad y = \pm e^c e^{kx} \quad \Rightarrow \quad y = Ae^{kx} \]

Where \( A \) is constant. As the curve passes through \( (1,1) \)

\[ \Rightarrow \quad 1 = Ae^k \quad \Rightarrow \quad A = e^k \]

\[ \because \quad y = e^{k(x-1)} \quad \Rightarrow \quad \frac{dy}{dx} = ke^{k(x-1)} \]

\[ \Rightarrow \quad \left( \frac{dy}{dx} \right)_{(1,1)} = k \]

From (1) and (2), \( \left( \frac{dy}{dx} \right)_{(1,1)} = a = k \)

\[ \therefore \quad y = e^{a(x-1)} \text{ which is the required curve.} \]

Now the area bounded by the curve, \( y \)-axis and normal to curve at \( (1,1) \) is as shown the shaded region in the fig.

\[ ... \]

\[ A = \int_0^1 y_{\text{normal}} dx - \int_0^1 y_{\text{curved}} dx \]

\[ = \int_0^1 \left( \frac{1}{a} (x-1) + 1 \right) dx - \int_0^1 e^{a(x-1)} dx \]

\[ = \left[ \frac{1}{2a} (x-1)^2 + x \right]_0^1 - \left[ \frac{1}{a} e^{a(x-1)} \right]_0^1 \]

\[ = 1 + \frac{1}{2a} - \frac{1}{2a} = 1 + \frac{1}{a} e^a - \frac{1}{2a} \]

Now we consider the case when \( a = 0 \). Then normal at \( (1,1) \) becomes \( x = 0 \) which is parallel to \( y \)-axis, therefore tangent at \( (1,1) \) should be parallel to \( x \)-axis. Thus

\[ \left( \frac{dy}{dx} \right)_{(1,1)} = 0 \quad \ldots (3) \]

Since \( \frac{dy}{dx} \propto y \) gives \( y = e^x(x-1) \)

\[ \text{as in } a \neq 0 \text{ case} \]

\[ \Rightarrow \quad \frac{dy}{dx} = ke^{k(x-1)} \]

\[ \Rightarrow \quad \left( \frac{dy}{dx} \right)_{(1,1)} = k \quad \ldots (4) \]

From (3) and (4), we get \( k = 0 \) and required curve becomes \( y = 1 \)

\[ \therefore \quad \text{In this case the required area = shaded area in fig. = 1 sq. unit.} \]

**26.** \( f(x) = \frac{\ln x - bx + x^2}{8}, x > 0, b \geq 0 \)

\[ f'(x) = \frac{1}{8} - b + 2x \quad \ldots (1) \]

\[ f''(x) = 0 \Rightarrow 16x^2 - 8bx + 1 = 0 \text{ (for max. or min.)} \]

\[ \therefore \quad x = \frac{1}{4} \sqrt{b^2 - 1} \quad \ldots (2) \]
Above will give real values of $x$ if $b^2 - 1 \geq 0$ i.e., $b \geq 1$ or $b \leq -1$. But $b$ is given to be +ve. Hence we choose $b \geq 1$

If $b = 1$ then $x = \frac{1}{4}$; If $b > 1$ then $x = \frac{1}{4} \left[ b \pm \sqrt{b^2 - 1} \right]$

$f''(x) = -\frac{1}{8x^2} + 2 = \frac{16x^2 - 1}{8x^2} = +\text{ve}$

Its sign will depend on $\text{N}'$, $16x^2 - 1$ as $8x^2$ is +ve. We shall consider its sign for $x = \frac{1}{4}$ and $x = \frac{1}{4} \left[ b \pm \sqrt{b^2 - 1} \right]$

$f''(x) = 0$ at $x = 1/4$

\[ \therefore \text{Neither max. nor min. as } f''(x) = 0 \]

$N'$ of $f''(x) = 16x^2 - 1 = [b + \sqrt{b^2 - 1}]^2 - 1$

$= +\text{ve}$ for $b > 1$ :: Minima

or $N'$ of $f''(x) = (b - \sqrt{b^2 - 1})^2 - 1$

$= -\text{ve}$ for $b > 1$ :: Maxima

27. Given that, $f(x) = \begin{cases} xe^{ax}, & x \leq 0 \\ x + ax^2 - x^3, & x > 0 \end{cases}$

Differentiating both sides, we have

$f'(x) = \begin{cases} ae^{ax} + e^{ax}, & x \leq 0 \\ 1 + 3ax - 3x^2, & x > 0 \end{cases}$

Again differentiating both sides, we have

$f''(x) = \begin{cases} 2ae^{ax} + a^2x e^{ax}, & x \leq 0 \\ 2a - 6x, & x > 0 \end{cases}$

For critical points, we put $f''(x) = 0$

\[ x = -\frac{1}{a} \text{ if } x \leq 0 \]

\[ x = -\frac{1}{a} \text{ if } x > 0 \]

\[ -\infty \quad -\frac{1}{a} \quad 0 \quad \frac{1}{a} \quad \infty \]

It is clear from number line that

$f''(x)$ is +ve on \( \left( -\frac{1}{a}, \frac{1}{a} \right) \)

\[ f'(x) \text{ increases on } \left( -\frac{1}{a}, \frac{1}{a} \right) \]

28. Let $b - a = t$, where $a + b = 4$

\[ a = \frac{4-t}{2} \quad b = \frac{t+4}{2} \]

as given $a < 2$ and $b > 2 \Rightarrow t > 0$

Now $\int_{0}^{t} g(x) dx + \int_{0}^{b} g(x) dx$

\[ = \int_{0}^{t} g(x) dx + \int_{0}^{b} g(x) dx = \phi(t) \text{ [say]} \]

\[ \Rightarrow \phi(t) = g \left( \frac{4-t}{2} \right) \left( \frac{1}{2} \right) + g \left( \frac{4+t}{2} \right) \left( \frac{1}{2} \right) \]

NOTE THIS STEP

\[ \frac{d}{dx} \left( \int_{0}^{t} f(t) dt \right) = f(t) \frac{d}{dx} \left( t \right) - \int_{0}^{t} f(t) dt \]

\[ = 2 \left[ g \left( \frac{4+t}{2} \right) - g \left( \frac{4-t}{2} \right) \right] \]

Topic-wise Solved Papers - MATHEMATICS

Since $g(x)$ is an increasing function (given)

\[ \Rightarrow \int_{x_{1}}^{x_{2}} g(x) dx \Rightarrow g(x_{1}) > g(x_{2}) \]

Here we have $\left( \frac{4+t}{2} \right) > \left( \frac{4-t}{2} \right)$

\[ \Rightarrow g \left( \frac{4+t}{2} \right) > g \left( \frac{4-t}{2} \right) \]

\[ \Rightarrow \frac{\phi'(t)}{2} = \frac{1}{2} \left[ g \left( \frac{4+t}{2} \right) - g \left( \frac{4-t}{2} \right) \right] > 0 \Rightarrow \phi'(t) > 0 \]

Hence $\phi(t)$ increase as $t$ increases.

\[ \Rightarrow \int_{0}^{a} g(x) dx + \int_{0}^{b} g(x) dx \text{ increases as } (b-a) \text{ increases.} \]

29. Applying $R_{3} + R_{3} - R_{1} - 2R_{2}$ we get

\[ f'(x) = \begin{cases} 2a & 0 \quad 0 \\ b & b+1 \quad 1 \end{cases} \]

\[ \Rightarrow f'(x) = 2ax + b \]

Integrating, we get $f(x) = ax^2 + bx + C$

where $C$ is an arbitrary constant. Since $f$ has a maximum at $x = 5/2$,

\[ f'(5/2) = 0 \Rightarrow 5a + b = 0 \quad \ldots (1) \]

Also $f(0) = 2 \Rightarrow C = 2$

and $f(1) = 1 \Rightarrow a + b + c = 1$

\[ \Rightarrow a + b = -1 \quad \ldots (2) \]

Solving (1) and (2) for $a, b$ we get,

\[ a = 1/4, b = -5/4 \]

Thus, $f(x) = \frac{1}{4}x^2 - \frac{5}{4}x + 2$.

30. Equation of the tangent at point $(x, y)$ on the curve is

\[ y - y = \frac{dy}{dx} (X - x) \]

This meets axes in

$A \left( x - y \frac{dx}{dy}, 0 \right)$ and $B \left( 0, y - x \frac{dx}{dy} \right)$

Mid-point of $AB$ is $\left( \frac{1}{2} \left( x - y \frac{dx}{dy} \right), \frac{1}{2} \left( y - x \frac{dx}{dy} \right) \right)$

We are given

\[ \frac{1}{2} \left( x - y \frac{dx}{dy} \right) = x \quad \text{and} \quad \frac{1}{2} \left( y - x \frac{dx}{dy} \right) = y \]

\[ \Rightarrow x \frac{dy}{dx} = -y \Rightarrow \frac{dy}{y} = \frac{dx}{x} \]

Integrating both sides,

\[ \int \frac{dy}{y} = -\int \frac{dx}{x} \Rightarrow \log y = -\log x + c \]

Put $x = 1, y = 1$,

\[ \Rightarrow \log 1 = -\log 1 + c \Rightarrow c = 0 \]

\[ \Rightarrow \log y + \log x = 0 \Rightarrow \log xy = 0 \Rightarrow xy = e^0 = 1 \]

Which is a rectangular hyperbola.
Applications of Derivatives

31. Given that, \( p(x) = a_0 + a_1 x + a_2 x^2 + \ldots + a_n x^n \quad \ldots (1) \)

and \( |p(x)| \leq |e^{x^2} - 1|, \forall x \geq 0 \quad \ldots (2) \)

To prove that,

\[ |a_1 + 2a_2 + \ldots + na_n| \leq 1 \]

It can be clearly seen that in order to prove the result it is sufficient to prove that \( |p'(1)| \leq 1 \)

We know that,

\[ |p'(1)| = \lim_{h \to 0} \frac{|p(1+h) - p(1)|}{|h|} \leq \lim_{h \to 0} \frac{|p(1+h)| + |p(1)|}{|h|} \]

[Using \(|x+y| \leq |x| + |y|\)]

But \( |p(1)| \leq e^0 - 1 \)

[Using equation (2) for \( x = 1 \)]

\[ \Rightarrow \frac{|p(1)|}{|1|} \leq 0 \]

But being absolute value, \( |p(1)| \geq 0 \).

Thus we must have \( |p(1)| = 0 \)

Also \( |p(1+h)| \leq e^h - 1 \) \hspace{1cm} (Using eqn (2) for \( x = 1 + h \))

Thus \( |p'(1)| \leq \lim_{h \to 0} \frac{|e^h - 1|}{|h|} = 1 \)

or \( |p'(1)| \leq 1 \Rightarrow |a_1 + 2a_2 + \ldots + na_n| \leq 1 \)

32. Given that \( -1 \leq p \leq 1 \).

Consider \( f(x) = 4x^3 - 3x - p = 0 \)

Now, \( f(1/2) = \frac{1}{2} - \frac{3}{2} + p = -1 - p \)

\[ \Rightarrow f(1) = 4 - 3 - p = 1 - p \geq 0 \quad \text{as} \quad (p \leq 1) \]

\[ \Rightarrow f(x) \text{ has at least one real root between } [1/2, 1]. \]

Also \( f'(x) = 12x^2 - 3 > 0 \text{ on } [1/2, 1] \)

\[ \Rightarrow f \text{ is increasing on } [1/2, 1] \]

\[ \Rightarrow f \text{ has only one real root between } [1/2, 1] \]

To find the root, we observe \( f(x) \) contains \( 4x^3 - 3x \) which is multipie angle formula of \( \cos 3\theta \) if we put \( x = \cos \theta \).

\[ \Rightarrow \text{ Let the req. root be } \cos \theta \text{ then, } \]

\[ 4\cos^3 \theta - 3 \cos \theta - p = 0 \]

\[ \Rightarrow \cos 3\theta = p \Rightarrow 3\cos \theta = \cos^{-1} p \Rightarrow \theta = \frac{1}{3}\cos^{-1}(p) \]

\[ \Rightarrow \text{ Root is } \cos \left(\frac{1}{3}\cos^{-1}(p)\right). \]

33. The given curve is \( x^2 + y^2 = \frac{1}{3} \) (an ellipse)

Any parametric point on it is \( P(\sqrt{6} \cos \theta, \sqrt{3} \sin \theta) \).

Its distance from line \( x + y = 7 \) is given by

\[ D = \frac{\sqrt{6} \cos \theta + \sqrt{3} \sin \theta - 7}{\sqrt{2}} \]

For min. value of \( D \), \( \frac{dD}{d\theta} = 0 \)

\[ \Rightarrow -\sqrt{6} \sin \theta + \sqrt{3} \cos \theta = 0 \Rightarrow \tan \theta = 1/\sqrt{2} \]

\[ \Rightarrow \cos \theta = \frac{\sqrt{2}}{\sqrt{3}} \text{ and } \sin \theta = \frac{1}{\sqrt{3}} \]

\[ \Rightarrow \text{ Required point } P \text{ is } (2, 1) \]

34. Given that \( 2(1 - \cos x) < x^2, x \neq 0 \)

To prove \( \sin (\tan x) \geq x, x \in [0, \pi/4] \).

Let us consider \( f(x) = \sin (\tan x) - x \)

\[ \Rightarrow f'(x) = \cos (\tan x) \sec^2 x - 1 \]

\[ = \frac{\cos (\tan x) - \cos^2 x}{\cos^2 x} \]

As given \( 2(1 - \cos x) < x^2, x \neq 0 \)

\[ \Rightarrow \cos x > 1 - \frac{x^2}{2} \]

Similary, \( \cos (\tan x) > 1 - \frac{\tan^2 x}{2} \)

\[ \Rightarrow f'(x) > 0 \]

\[ \Rightarrow f(x) \text{ is an increasing function.} \]

\[ \Rightarrow f(x) \geq f(0) \]

\[ \Rightarrow \sin (\tan x) - x \geq \sin (\tan 0) - 0 \]

\[ \Rightarrow \sin (\tan x) - x \geq 0 \]

\[ \Rightarrow \sin (\tan x) \geq x \quad \text{Hence proved.} \]

35. Given that \( f \) is a differentiable function on \([0, 4]\).

\[ \Rightarrow \text{ It will be continuous on } [0, 4] \]

\[ \Rightarrow \text{ By Lagrange's mean value theorem, we get } \]

\[ \frac{f(4) - f(0)}{4 - 0} = f'(a), \text{ for } a \in (0, 4) \quad \ldots (1) \]

Again since \( f \) is continuous on \([0, 4]\) by intermediate mean value theorem, we get

\[ \frac{f(4) + f(0)}{2} = f(b) \text{ for } b \in (0, 4) \quad \ldots (2) \]

[If \( f(x) \) is continuous on \([\alpha, \beta]\) then \( \exists \mu \in (\alpha, \beta) \)

such that \( f(\mu) = \frac{f(\alpha) + f(\beta)}{2} \)]

Multiplying (1) and (2) we get

\[ \frac{[f(4)]^2 - [f(0)]^2}{8} = f'(a)f(b), a, b \in (0, 4) \]

or \[ [f(4)]^2 - [f(0)]^2 = 8f'(a)f(b) \]

Hence Proved.

(ii) To prove

\[ \int_0^4 f(t) \, dt = 2(\alpha f(\alpha^2) + \beta f(\beta^2)) \quad \forall \alpha, \beta < 2 \]

Let \( I = \int_0^4 f(t) \, dt \)

Let \( t = u^2 \) also \( t \to 0 \Rightarrow u \to 0 \)

\[ \Rightarrow dt = 2u \, du \text{ as } t \to 4 \Rightarrow u \to 2 \]
\[ \int_0^4 f(t) dt = \int_0^2 f(u^2) 2u \, du \quad \ldots \text{(1)} \]

Consider, \( F(x) = \int_0^x f(u^2) 2u \, du \)

Then clearly \( F(x) \) is differentiable and hence continuous on \([0, 2]\)

By LMV theorem, we get some, \( \mu \in (0, 2) \)

such that \( F'(\mu) = \frac{F(2) - F(0)}{2 - 0} \)

\[ \Rightarrow f(\mu^2) 2\mu = \int_0^2 f(u^2) 2u \, du \quad \ldots \text{(2)} \]

Again by intermediate mean value theorem,

\[ \exists \alpha, \beta \text{ such that } 0 < \alpha < \mu < \beta < 2 \]

\[ \Rightarrow F'(\mu) = \frac{F'(\alpha) + F'(\beta)}{2}, \text{ as } f \text{ is continuous on } [0, 2] \]

\[ \Rightarrow F \text{ is continuous on } [0, 2] \]

\[ \Rightarrow f(\mu^2) 2\mu = \frac{f(\alpha^2) 2\alpha + f(\beta^2) 2\beta}{2} \]

\[ \Rightarrow f(\mu^2) 2\mu = \alpha f(\alpha^2) + \beta f(\beta^2) \quad \ldots \text{(3)} \]

From (2) and (3), we get

\[ \int_0^2 f(u^2) 2u \, du = 2[\alpha f(\alpha^2) + \beta f(\beta^2)] \]

where \( 0 < \alpha, \beta < 2 \)

\[ \int_0^4 f(t) dt = 2[\alpha f(\alpha^2) + \beta f(\beta^2)] \]

where \( 0 < \alpha, \beta < 2 \) \quad (Using eq(1))

Hence proved.

36. We are given that,

\[ \frac{dP(x)}{dx} > P(x), \forall \, x \geq 1 \text{ and } P(1) = 0 \]

\[ \Rightarrow \frac{dP(x)}{dx} - P(x) > 0 \]

Multiplying by \( e^{-x} \), we get,

\[ e^{-x} \frac{dP(x)}{dx} - e^{-x} P(x) > 0 \]

\[ \Rightarrow \frac{d}{dx} \left[ e^{-x} P(x) \right] > 0 \]

\[ \Rightarrow e^{-x} P(x) \text{ is an increasing function.} \]

\[ \therefore \quad \forall \, x > 1, e^{-x} P(x) > e^{-1} P(1) = 0 \quad [\text{Using } P(1) = 0] \]

\[ \Rightarrow e^{-x} P(x) > 0, \forall \, x > 1 \]

\[ \Rightarrow P(x) > 0, \forall \, x > 1 \quad \vdash e^{-x} > 0 \]

37. We are given,

\[ P(x) = 51x^{102} - 2323x^{101} - 45x + 1035 \]

To show that at least one root of \( P(x) \) lies in \((45^{1/100}, 46)\),

using Rolle's theorem, we consider antiderivative of \( P(x) \)

i.e. \( F(x) = \frac{x^{102}}{2} - \frac{2323x^{101}}{101} - \frac{45x^2}{2} + 1035x \)

Then being a polynomial function \( F(x) \) is continuous and differentiable.

Now, \( F(45^{1/100}) = \frac{102}{2} - \frac{2323(45)^{100}}{101} - \frac{45(45)^{100}}{2} + 1035(45)^{100} \)

\[ = \frac{45^2}{2} (45)^{100} - 23 \times 45^1 (45)^{100} \]

\[ = 23 (46)^{101} - 23 \times 45 \times 46 + 1035 \times 46 = 0 \]

\[ \Rightarrow F(46) = \frac{2}{2} - \frac{2323(46)^{101}}{101} - \frac{45(46)^2}{2} + 1035(46) \]

\[ = 23 (46)^{101} - 23 \times 45 \times 46 + 1035 \times 46 = 0 \]

\[ \therefore \quad F(45^{1/100}) = F(46) = 0 \]

\[ \therefore \quad \text{Rolle's theorem is applicable.} \]

Hence, there must exist at least one root of \( F'(x) = 0 \)

\[ \text{i.e. } P(x) = 0 \text{ in the interval } \left( \frac{1}{45^{100}}, 46 \right) \]

38. Let us consider,

\[ f(x) = \sin x + 2x - \frac{3x(x+1)}{\pi} \]

\[ \Rightarrow f'(x) = \cos x + 2 - \frac{3}{\pi} (2x+1) \]

\[ \Rightarrow f''(x) = -\sin x - \frac{6}{\pi} \]

\[ \Rightarrow f'(x) < 0, \forall \, x \in [0, \pi/2] \]

\[ \Rightarrow f'(x) \text{ is a decreasing function.} \quad \ldots \text{(1)} \]

Also \( f'(0) = 3 - \frac{3}{\pi} > 0 \quad \ldots \text{(2)} \)

and \( f'(\pi/2) = 2 - \frac{3}{\pi} (\pi+1) = -1 - \frac{3}{\pi} < 0 \quad \ldots \text{(3)} \)

Equations (1), (2) and (3) shows that.

\[ \Rightarrow \text{There exists a certain value of } x \in [0, \pi/2] \text{ for which } f'(x) = 0 \text{ and this point must be a point of maximum for } f(x) \text{ since the sign of } f'(x) \text{ changes from +ve to -ve.} \]

Also we can see that \( f(0) = 0 \) and

\[ f\left( \frac{\pi}{2} \right) = \pi + 1 - \frac{3}{\pi} \left( \frac{\pi+1}{2} \right) = \frac{\pi}{2} - \frac{1}{2} > 0 \]

Let \( x = p \) be the point at which the max. of \( f(x) \) occurs. There will be only one max. point in \([0, \pi/2]\). Since \( f'(x) = 0 \) is only once in the interval.

Consider, \( x \in [0, p] \)

\[ \Rightarrow f'(x) > 0 \Rightarrow f(x) \text{ is an increasing function.} \quad \ldots \text{(4)} \]

Also for \( x \in [p, \pi/2] \)

\[ \Rightarrow f'(x) < 0 \Rightarrow f(x) \text{ is decreasing function.} \quad \ldots \text{(5)} \]

\[ \Rightarrow f(x) \geq 0 \quad \ldots \text{(4)} \]

\[ \Rightarrow f(x) < 0 \Rightarrow f(x) \text{ is increasing function.} \quad \ldots \text{(5)} \]
Applications of Derivatives

39. Given that, \( |f(x_1) - f(x_2)| < (x_1 - x_2)^2 \), \( x_1, x_2 \in R \)

Let \( x_1 = x + h \) and \( x_2 = x \) then we get

\[
|f(x + h) - f(x)| < h^2 \Rightarrow |f(x + h) - f(x)| < |h|^2
\]

\[
\Rightarrow \left| \frac{f(x + h) - f(x)}{h} \right| < |h|
\]

Taking limit as \( h \to 0 \) on both sides, we get

\[
\lim_{h \to 0} \left| \frac{f(x + h) - f(x)}{h} \right| < \delta \quad \text{(a small +ve number)}
\]

\[
\Rightarrow \left| f'(x) \right| < \delta \quad \Rightarrow f'(x) = 0
\]

\[
\Rightarrow f(x) \text{ is a constant function. Let } f(x) = k \text{ i.e., } y = k
\]

As \( f(x) \) passes through \((1, 2)\) \( \Rightarrow y = 2 \)

\( \therefore \) Equation of tangent at \((1, 2)\) is,

\( y - 2 = 0 (x - 1) \) i.e. \( y = 2 \)

40. Let \( p(x) = ax^3 + bx^2 + cx + d \)

\( p(-1) = 10 \)

\( \Rightarrow -a + b - c + d = 10 \) \( \quad \text{.....(i)} \)

\( p(1) = -6 \)

\( \Rightarrow a + b + c + d = -6 \) \( \quad \text{.....(ii)} \)

\( p(x) \) has max. at \( x = -1 \)

\( \therefore \) \( p'(-1) = 0 \)

\( \Rightarrow 3a - 2b + c = 0 \) \( \quad \text{.....(iii)} \)

\( p'(x) \) has min. at \( x = 1 \)

\( \therefore \) \( p''(1) = 0 \)

\( \Rightarrow 6a + 2b = 0 \) \( \quad \text{.....(iv)} \)

Solving (i), (ii), (iii) and (iv), we get

From (iv), \( b = -3a \)

From (iii), \( 3a + 6a + c = 0 \) \( \Rightarrow c = -9a \)

From (ii), \( a - 3a - 9a + d = -6 \) \( \Rightarrow d = 11a - 6 \)

From (i), \( a - 3a + 9a + 11a - 6 = 10 \)

\( \Rightarrow 16a = 16 \) \( \Rightarrow a = 1 \) \( \Rightarrow b = -3, c = -9, d = 5 \)

\( \therefore \) \( p(x) = x^3 - 3x^2 - 9x + 5 \) \( \Rightarrow p'(x) = 3x^2 - 6x - 9 = 0 \)

\( \Rightarrow 3(x + 1)(x - 3) = 0 \)

\( x = -1 \) is a point of max. (given)

and \( x = 3 \) is a point of min.

\[ \therefore \text{points of local max. is } (-1, 10) \text{ and local min. is } (3, -22). \]

And distance between them is

\[ = \sqrt{[3 - (-1)^2] + (-22 - 10)^2} = \sqrt{16 + 1024} = \sqrt{1040} = 4\sqrt{65} \]

41. \( g(x) = (f''(x))^2 + f''(x)f(x) = \frac{d}{dx}(f(x)f'(x)) \)

Let \( h(x) = f(x)f'(x) \)

Then, \( f(x) = 0 \) has four roots namely \( a, \alpha, \beta, \epsilon \) where \( b < \alpha < c < \beta < d \).

And \( f'(x) = 0 \) at three points \( k_1, k_2, k_3 \) where \( a < k_1 < \alpha < k_2 < \beta < k_3 < \epsilon \)

\[ \therefore \text{Between any two roots of a polynomial function} \]

\( f(x) = 0 \) there lies at least one root of \( f'(x) = 0 \)

\[ \therefore \text{There are at least 7 roots of } f(x) = 0 \]

\[ \Rightarrow \text{There are at least 6 roots of } \frac{d}{dx}(f(x)f'(x)) = 0 \]

i.e. \( \text{of } g(x) = 0 \)

F. Match the Following

1. (A) \( f(x) = x + \sin x \text{ on } (-\pi/2, \pi/2) \)

\( f'(x) = 1 + \cos x \)

As \( 0 \leq \cos x \leq 1 \) for \( x \in (-\pi/2, \pi/2) \)

\( \therefore f'(x) > 0 \text{ on } (-\pi/2, \pi/2) \)

(A) \( \rightarrow p \)

(B) \( f(x) = \sec x \textRightarrow f'(x) = \sec x \tan x \)

Clearly \( f'(x) < 0 \text{ in } (-\pi/2, 0) \) and \( f'(x) > 0 \text{ in } (0, \pi/2) \)

\( \therefore \) On \( (-\pi/2, \pi/2) \) \( f(x) \) is neither increasing nor decreasing.

(B) \( \rightarrow r \)

G. Comprehension Based Questions

1. (c) For \( k = 0 \), line \( y = x \) meets \( y = 0 \), i.e., \( x \)-axis only at one point.

For \( k < 0 \), \( y = ke^x \text{ meets } y = x \text{ only once as shown in the graph.} \)

2. (a) Let \( f(x) = ke^x - x \)

Now for \( f(x) = 0 \) to have only one root means the line \( y = x \) must be tangential to the curve \( y = ke^x \).

Let it be so at \((x_1, y_1)\) then

\[ \frac{dy}{dx}_\text{curve1} = \frac{dy}{dx}_\text{curve2} \quad \Rightarrow 1 = ke^{y_1} \]

\[ \Rightarrow e^{y_1} = \frac{1}{k} \text{ also } y_1 = ke^{y_1} \text{ and } y_1 = x_1 \]

\( \Rightarrow x_1 = 1 \quad \Rightarrow 1 = ke \quad \Rightarrow k = 1/e \)

3. (a) \( \therefore \text{For } y = x \text{ to be tangent to the curve} \)

\( y = ke^x, k = 1/e \)

\( \therefore \text{For } y = ke^x \text{ to meet } y = x \text{ at two points we should have } k < \frac{1}{e} \Rightarrow k \in (0, \frac{1}{e}) \text{ as } k > 0. \)
4. (c) For the statement \( P \)
\[
\begin{align*}
f(x)+2x &= 2(1+x^2) \\
(1-x)^2 \sin 2x + x^2 + 2x &= 2(1+x^2) \\
(1-x)^2 \sin 2x &= x^2 - 2x + 1 + 1 \\
(1-x)^2 \sin x &= (1-x)^2 + 1 \\
(1-x)^2 \cos 2x &= -1 \\
\end{align*}
\]
Which is not possible for any real value of \( x \).
\( \therefore P \) is not true.
Also let \( H(x) = 2f(x) + 1 - 2x (1+x) \)
\( H(0) = 2(0) + 1 - 0 = 1 \)
and \( H(1) = 2(1) + 1 - 4 = -3 \)
\( \Rightarrow H(x) \) has a solution in \( (0, 1) \)
\( \therefore Q \) is true.

5. (b) We have \( g(x) = \int \frac{2(t-1)}{t+1} \ln t \, dt, \ x \in (1, \infty) \)
\[
\Rightarrow g'(x) = \left[ \frac{2(x-1)}{x+1} - \ln x \right] f(x)
\]
\( \Rightarrow \) Here \( f(x) > 0, \ \forall \ x \in (1, \infty) \)
Also let \( h(x) = \frac{2(x-1)}{x+1} - \ln x \)
\[
\frac{h(x)}{h(1)} = \frac{1}{x+1} - \ln x \leq 0, \ x \in (1, \infty)
\]
\( \therefore \) \( h(x) \) is decreasing function.
\( \therefore \) For \( x > 1 \)
\( h(x) < h(1) \Rightarrow h(x) < 0 \ \forall \ x > 1 \)
\( \therefore g'(x) < 0 \ \forall \ x \in (1, \infty) \)
\( \therefore g(x) \) is decreasing on \( (1, \infty) \).

6. (d) We have \( f''(x) - 2f'(x) + f(x) \geq e^x \)
\[
\Rightarrow [f''(x) - f'(x)] - [f'(x) - f(x)] \geq e^x
\]
\[
\Rightarrow \left[ e^{-x} f''(x) - e^{-x} f'(x) \right] - \left[ e^{-x} f'(x) - e^{-x} f(x) \right] \geq 1
\]
\[
\Rightarrow \frac{d}{dx} \left[ e^{-x} f'(x) \right] - \frac{d}{dx} \left[ e^{-x} f(x) \right] \geq 1
\]
\[
\Rightarrow \frac{d}{dx} \left[ e^{-x} f'(x) \right] - \frac{d}{dx} \left[ e^{-x} f(x) \right] \geq 1
\]
\( \Rightarrow g(x) = e^{-x} f(x) \)
Then we have \( g''(x) \geq 1 > 0 \)
So \( g \) is concave upward.
Also \( g(0) = g(1) = 0 \)
\( g(x) < 0, \ \forall \ x \in (0, 1) \)
\( \Rightarrow e^{-x} f(x) < 0 \Rightarrow f(x) < 0, \ \forall \ x \in (0, 1) \)

7. (c) \( g(x) = \frac{e^{-x} f(x)}{4} \)
\( \Rightarrow g'(x) = e^{-x} f'(x) - e^{-x} f(x) = e^{-x} (f'(x) - f(x)) \)
As \( x = \frac{1}{4} \) is point of local minima in \( [0, 1] \)
\( \therefore \) \( g'(x) < 0 \) for \( x \in \left( 0, \frac{1}{4} \right) \)
and \( g'(x) > 0 \) for \( x \in \left( \frac{1}{4}, 1 \right) \)
\( \therefore \) \( \ln \left( \frac{1}{4}, 1 \right), g''(x) < 0 \)
\( \Rightarrow e^{-x} (f'(x) - f(x)) < 0 \Rightarrow f'(x) < f(x) \)

---

### I. Integer Value Correct Type

1. (7) The given function is \( f(x) = 2x^3 - 15x^2 + 36x - 48 \)
and \( A = \{ x | x^2 + 20 \leq 9x \} \)
\( \Rightarrow \)
\( A = \{ x | x^2 - 9x + 20 \leq 0 \} \)
\( \Rightarrow \)
\( A = \{ x | (x - 4)(x - 5) \leq 0 \} \)
\( \Rightarrow A = [4, 5] \)
Also \( f''(x) = 6x^2 - 30x + 36 = 6(x^2 - 5x + 6) \)
\( = 6(x - 2)(x - 3) \)
Clearly \( \forall x \in A, f''(x) > 0 \)
\( \therefore f \) is strictly increasing function on \( A \).
\( \therefore \) Maximum value of \( f \) on \( A \)
\( = f(5) = 2 \times 5^3 - 15 \times 5^2 + 36 \times 5 - 48 \)
\( = 250 - 375 + 180 - 48 = 430 - 423 = 7 \)

2. (0) Let \( p(x) = ax^3 + bx^3 + cx^2 + dx + e \)
Now \( \lim_{x \to 0} \left[ 1 + \frac{p(x)}{x^2} \right] = 2 \)
\( \Rightarrow \lim_{x \to 0} \frac{p(x)}{x^2} = 1 \) \( \ldots (1) \)
\( \Rightarrow p(0) = e = 0 \)
Applying L' Hospital’s rule to \( e^{p'(x)} \), we get
\( \lim_{x \to 0} \frac{p'(x)}{2x} = 1 \Rightarrow p'(0) = 0 \)
\( \Rightarrow d = 0 \)
Again applying L' Hospital’s rule, we get
\( \lim_{x \to 0} \frac{p''(x)}{2} = 1 \Rightarrow p''(0) = 2 \)
\( \Rightarrow 2c = 2 \) or \( c = 1 \)
\( \therefore p(x) = ax^3 + bx^2 + x^2 \)
\( \Rightarrow p'(x) = 3ax^2 + 2bx \)
As \( p(x) \) has extremum at \( x = 1 \) and \( 2 \)
\( \therefore p'(1) = 0 \) and \( p'(2) = 0 \)
\( \Rightarrow 4a + 3b + 2 = 0 \) \( \ldots (i) \)
\( \Rightarrow 2a + 4b + 4 = 0 \) or \( 8a + 3b + 1 = 0 \) \( \ldots (ii) \)
Solving eq’s (i) and (ii) we get \( a = \frac{1}{4} \) and \( b = -1 \)
\( \therefore p(x) = \frac{1}{4}x^4 - x^3 + x^2 \)
So, that \( p(2) = \frac{16}{4} - 8 + 4 = 0 \)

3. (9) The equation of tangent to the curve
\( y = f(x) \) at the point \( P (x, y) \) is
\( \frac{Y - y}{X - x} = \frac{dy}{dx} \) or \( (X - x) \frac{dy}{dx} - (Y - y) = 0 \)
\( \Rightarrow \frac{dy}{dx} - Y = x \frac{dy}{dx} - y \)
Its y-intercept = \( x - \frac{dy}{dx} = x^3 \Rightarrow \frac{dy}{dx} - \frac{x}{y} = -x^2 \)
Applications of Derivatives

I.F. = \( e^{-\int \frac{1}{x} \, dx} = \frac{1}{x} \)

\[ y \cdot \frac{1}{x} = \int x^2 - \frac{1}{x} \, dx = -\frac{x^2}{2} + C, \quad y = -\frac{x^3}{2} + Cx \]

As \( f(1) = 1 \) \( \Rightarrow \) At \( x = 1, \ y = 1 \)

\[ \therefore 1 = -\frac{1}{2} + C \Rightarrow C = 3/2 \quad \therefore \quad y = -\frac{x^3}{2} + \frac{3x}{2} \]

At \( x = -3, \ y = \frac{27}{2} - \frac{9}{2} = 9 \)

\[ \therefore \quad f(-3) = 9. \]

4. (1) We have,

\[ f'(x) = 2010 (x - 2009)(x - 2010)^2 (x - 2111)^3 (x - 2012)^4 \]

As \( f(x) = \ln g(x) \Rightarrow g(x) = e^{f(x)} \Rightarrow g'(x) = e^{f(x)} f'(x) \)

For max/min, \( g'(x) = 0 \Rightarrow f'(x) = 0 \)

Out of two points one should be a point of maxima and other that of minima.

\[ \therefore \quad \text{There is only one point of local maxima.} \]

5. (5) We have

\[ f(x) = |x| + |x^2 - 1| \]

\[ = \begin{cases} 
-2x + x^2 - 1, & x < -1 \\
-2x + x^2 + 1, & -1 \leq x \leq 0 \\
x^2 - 1, & 0 < x < 1 \\
x^2 + x - 1, & x \geq 1 
\end{cases} \]

We have \( f''(x) = \begin{cases} 
2x - 1, & x < -1 \\
-2x - 1, & -1 \leq x \leq 0 \\
-2x + 1, & 0 < x < 1 \\
2x + 1, & x > 1 
\end{cases} \)

Critical pts are \( \frac{1}{2}, -\frac{1}{2}, -1, 0, 1 \) and 1

We observe at five points \( f''(x) \) changes its sign.

\[ \therefore \quad \text{There are 5 points of local maximum or local minimum.} \]

6. (9)

\[ p(x) \] has a local maximum at \( x = 1 \) and a local minimum at \( x = 3 \) and \( p(x) \) is a real polynomial of least degree.

\[ \Rightarrow p'(x) = k(x - 1)(x - 3) = k(x^2 - 4x + 3) \]

\[ \Rightarrow p(x) = \frac{k}{3}(x^3 - 2x^2 + 3x) + C \]

Given \( p(1) = 6 \) and \( p(3) = 2 \)

\[ \Rightarrow \frac{4}{3}k + C = 6 \quad \text{and} \quad 0 + C = 2 \Rightarrow k = 3 \]

\[ \therefore \quad p'(x) = 3(x - 1)(x - 3) \Rightarrow p'(0) = 9 \]

Vertical line \( x = h \), meets the ellipse \( \frac{x^2}{4} + \frac{y^2}{3} = 1 \) at

\[ P \left(h, \frac{\sqrt{3}}{2} \sqrt{4 - h^2} \right) \quad \text{and} \quad Q \left(h, -\frac{\sqrt{3}}{2} \sqrt{4 - h^2} \right) \]

By symmetry, tangents at \( P \) and \( Q \) will meet each other at \( x \)-axis.

\[ \frac{dy}{dx} = \frac{\frac{\sqrt{3}}{2} \cdot h}{\sqrt{4 - h^2}} \]

Tangent at \( P \) is

\[ \frac{xh}{4} + \frac{y\sqrt{3}}{6} \sqrt{4 - h^2} = 1 \]

which meets \( x \)-axis at \( R \left(\frac{4}{h}, 0 \right) \)

Area of \( \Delta PQR = \frac{1}{2} \cdot x \cdot \sqrt{3} \cdot \sqrt{4 - h^2} \times \left(\frac{4}{h} - h \right) \)

\[ = \frac{\sqrt{3}}{2} \left( \sqrt{4 - h^2} \cdot h^2 + 2 \right) < 0 \]

\[ \therefore \quad \Delta(h) \text{ is a decreasing function.} \]

\[ \therefore \quad \frac{1}{2} \leq h \leq 1 \Rightarrow \Delta_{\max} = \Delta \left(\frac{1}{2} \right) \quad \text{and} \quad \Delta_{\min} = \Delta(1) \]

\[ \Delta_1 = \frac{\sqrt{3}}{2} \left( \frac{4 - 1}{4} \right)^{3/2} = \frac{45}{8} \sqrt{5} \]

\[ \Delta_2 = \frac{\sqrt{3}}{2} \left( \frac{3}{2} \right)^{3/2} = \frac{9}{2} \]

\[ \therefore \quad \Delta_1 - 8 \Delta_2 = 45 - 36 = 9 \]

8. (8)

\[ (y - x^2)^2 = x(1 + x^2)^2 \]

\[ 2(y - x^2) = \left( \frac{dy}{dx} - 2x \right) (1 + x^2)^2 + 2x(1 + x^2) \cdot 2x \]

At point \( (1, 3) \)

\[ 2(3 - 1) \left( \frac{dy}{dx} - 5 \right) = (1 + 1)^2 + 2(1 + 1) \cdot 2 \Rightarrow \frac{dy}{dx} = 8 \]

9. (4)

Let \( r \) be the internal radius and \( R \) be the external radius. Let \( h \) be the internal height of the cylinder.

\[ \therefore \quad \pi^2 h = V = \frac{V}{\pi r^2} \]

Also Vol. of material \( M = \pi((r^2 + r^2) - r^2)h + \pi(r^2 + r^2)^2 \cdot 2 \)

or \( M = 4\pi(r + 1), -\frac{r}{\pi r} + 2\pi(r + 2)^2 \)

\[ \Rightarrow \quad M = 4V \left[ \frac{1 + \frac{1}{r}}{r^2} \right] + 2\pi(r + 2)^2 \]

\[ \frac{dM}{dr} = 4V \left[ \frac{-\frac{2}{r^3}}{r^2} \right] + 4\pi(r + 2) \]

For min. value of \( M, \frac{dM}{dr} = 0 \)

\[ \Rightarrow -4V \left( r + 2 \right) + 4\pi(r + 2) = 0 \]

\[ \Rightarrow \frac{4V}{r^2} = 4\pi \text{ or } r^2 = \frac{V}{\pi} = 1000 \]

\[ \therefore \quad V = 1000\pi \]

\[ \therefore \quad \frac{V}{250\pi} = 4 \]
1. (b) Distance of origin from \((x, y) = \sqrt{x^2 + y^2}\)
\[
= \sqrt{a^2 + b^2 - 2ab \cos \left( t - \frac{at}{b} \right)};
\]
\[
\leq \sqrt{a^2 + b^2 + 2ab \left[ \cos \left( t - \frac{at}{b} \right) \right]_{\text{min}} = -1}
\]
\[
= a + b
\]

∴ Maximum distance from origin = \(a + b\)

2. (a) Let \(f(x) = \frac{ax^3}{3} + \frac{bx^2}{2} + cx \Rightarrow f(0) = 0\) and \(f(1)
\[
= \frac{a}{3} + \frac{b}{2} + c = 2a + 3b + 6c
\]
Also \(f(x)\) is continuous and differentiable in \([0, 1]\) and
\([0, 1].\) So by Rolle’s theorem, \(f’(x) = 0.\)
i.e \(ax^2 + bx + c = 0\) has at least one root in \([0, 1].\)

3. (d) \(f(x) = 2x^2 - 9ax^2 + 12a^2x + 1\)
\(f’(x) = 6x^2 - 18ax + 12a^2; f”(x) = 12x - 18a\)
For max. or min.
\[6x^2 - 18ax + 12a^2 = 0 \Rightarrow x^2 - 3ax + 2a^2 = 0\]
\[\Rightarrow x = a \text{ or } x = 2a. \text{ At } x = a \text{ max. and at } x = 2a \text{ min}
\]
\[\therefore p = a \text{ and } q = 2a\]
As per question \(p^2 = q\)
\[\therefore a^2 = 2a \Rightarrow a = 2 \text{ or } a = 0\]
but \(a > 0, \text{ therefore, } a = 2.
\]

4. (a) \(y^2 = 18x \Rightarrow 2y \frac{dy}{dx} = 18 \Rightarrow \frac{dy}{dx} = \frac{9}{y}\)
Given \(\frac{dy}{dx} = 2 \Rightarrow \frac{9}{y} = 2 \Rightarrow y = \frac{9}{2}\)
Putting in \(y^2 = 18x \Rightarrow x = \frac{9}{8}\)
∴ Required point is \(\left(\frac{9}{8}, \frac{9}{2}\right)\)

5. (b) \(f”’(x) = 6(x - 1). \) Integrating, we get
\(f’(x) = 3x^2 - 6x + c\)
Slope at \((2, 1) = f’(2) = c = 3\)
\[\therefore f’(x) = 3x^2 - 6x + 3 = 3(x - 1)^2\]
Inegrating again, we get
\(f(x) = (x - 1)^3 + D\)
The curve passes through \((2, 1)\)
\[\Rightarrow 1 = (2 - 1)^3 + D \Rightarrow D = 0\]
∴ \(f(x) = (x - 1)^3\)

6. (d) \(\frac{dx}{d\theta} = a \sin \theta \text{ and } \frac{dy}{d\theta} = a \cos \theta\)

∴ \(\frac{dy}{dx} = -\cot \theta\)
∴ The slope of the normal at \(\theta = \tan \theta\)
∴ The equation of the normal at \(\theta\) is
\[y - a \sin \theta = \tan \theta(x - a - a \cos \theta)\]
\[\Rightarrow y \cos \theta - a \sin \theta \cos \theta = x \sin \theta - a \sin \theta - a \sin \theta \cos \theta\]
\[\Rightarrow x \sin \theta - y \cos \theta = a \sin \theta\]
\[\Rightarrow y = (x - a) \tan \theta\]
which always passes through \((a, 0)\)

7. (d) Let us define a function
\[f(x) = \frac{ax^3}{3} + \frac{bx^2}{2} + cx\]
Being polynomial, it is continuous and differentiable, also,
\[f(0) = 0 \text{ and } f(1) = \frac{a}{3} + \frac{b}{2} + c\]
\[\Rightarrow f(1) = \frac{2a + 3b + 6c}{6} = 0 \text{ (given)}\]
∴ \(f(0) = f(1)\)
∴ \(f(x)\) satisfies all conditions of Rolle’s theorem therefore \(f’(x) = 0\) has a root in \((0, 1)\)
i.e. \(ax^2 + bx + c = 0\) has at least one root in \((0, 1)\)

8. (a) Area of rectangle \(ABCD = 2a \cos \theta\)
\[2b \sin \theta = 2ab \sin 2\theta\]
\((-a \cos \theta, b \sin \theta) \quad (a \cos \theta, b \sin \theta)\]
\((-a \cos \theta, -b \sin \theta) \quad (a \cos \theta, -b \sin \theta)\]
\[\Rightarrow \text{Area of greatest rectangle is equal to } 2ab\]
When \(\sin 2\theta = 1\)

9. (d) \(x = a(\cos \theta + \sin \theta)\)
\[\Rightarrow \frac{dx}{d\theta} = a(-\sin \theta + \sin \theta + \theta \cos \theta)\]
\[\Rightarrow \frac{dx}{d\theta} = a \theta \cos \theta\]
Applications of Derivatives

\[ y = a ( \sin \theta - \theta \cos \theta ) \]

\[ \frac{dy}{d\theta} = a [ \cos \theta - \cos \theta + \theta \sin \theta ] \]

\[ \Rightarrow \frac{dy}{d\theta} = a \theta \sin \theta \]

\[ \Rightarrow (2) \]

From equations (1) and (2), we get

\[ \frac{dy}{dx} = \tan \theta \Rightarrow \text{Slope of normal} = - \cot \theta \]

Equation of normal at '0' is \( y - a ( \sin \theta - \theta \cos \theta ) \)

\[ = - \cot \theta (x - a ( \cos \theta + \theta \sin \theta )) \]

\[ \Rightarrow y \sin \theta - a \sin^2 \theta + a \theta \cos \theta \sin \theta \]

\[ = - x \cos \theta + a \cos^2 \theta + a \theta \cos \theta \sin \theta \]

\[ \Rightarrow x \cos \theta + y \sin \theta = a \]

Clearly, this is an equation of a straight line which is at a constant distance 'a' from the origin.

10. (b) Given that

\[ \frac{dv}{dt} = 50 \text{ cm/min} \Rightarrow \frac{d}{dt} \left( \frac{4 \pi r^2}{3} \right) = 50 \]

\[ \Rightarrow 4 \pi r^2 \frac{dr}{dt} = 50 \]

\[ \Rightarrow \frac{dr}{dt} = \frac{50}{4 \pi (15)^2} = \frac{1}{18 \pi} \text{ cm/min} \quad \text{(here } r = 10 + 5) \]

11. (b) Let \( f(x) = a_n x^n + a_{n-1} x^{n-1} + \ldots + a_1 x = 0 \)

The other given equation,

\[ n a_n x^{n-1} + (n-1) a_{n-1} x^{n-2} + \ldots + a_1 = f'(x) \]

Given \( a_1 \neq 0 \Rightarrow f(0) = 0 \)

Again \( f(x) \) has root \( \alpha \), \( f(\alpha) = 0 \)

\[ \therefore f(0) = f(\alpha) \]

\[ \therefore \text{By Rolle's theorem } f(x) = 0 \text{ has root between } (0, \alpha) \]

Hence \( f'(x) \) has a positive root smaller than \( \alpha \).

12. (a) \( f(x) = \frac{x}{2} + \frac{2}{x} \Rightarrow f'(x) = \frac{1}{2} - \frac{2}{x^2} = 0 \)

\[ \Rightarrow x^2 = 4 \quad \text{or} \quad x = 2, -2 \]

\[ f''(x) = \frac{4}{x^3} \]

\[ f''(x) \bigg|_{x=2} = +ve \Rightarrow f(x) \text{ has local min at } x = 2. \]

13. (c) Area = \( \frac{1}{2} x^2 \sin \theta \)

Maximum value of \( \sin \theta \) is 1 at \( \theta = \frac{\pi}{2} \)

\[ A_{\text{max}} = \frac{1}{2} x^2 \]

14. (c) Using Lagrange's Mean Value Theorem

Let \( f(x) \) be a function defined on \([a, b]\)

then, \( f'(c) = \frac{f(b) - f(a)}{b - a} \)

\[ \Rightarrow \frac{1}{c} = \frac{f(3) - f(1)}{2} = \frac{\log_e 3}{2} \]

\[ \Rightarrow c = \frac{2}{\log_e 3} \quad \text{or} \quad c = 2 \log_e e \]

15. (d) Given \( f(x) = \tan^{-1}(\sin x + \cos x) \)

\[ f'(x) = \frac{1}{1 + (\sin x + \cos x)^2} \cdot (\cos x - \sin x) \]

\[ \sqrt{2} \left( \frac{1}{\sqrt{2}} \cos x - \frac{1}{\sqrt{2}} \sin x \right) \]

\[ = \frac{\cos \frac{\pi}{4} \cos x - \sin \frac{\pi}{4} \sin x}{1 + (\sin x + \cos x)^2} \]

\[ = \frac{\cos \left( x + \frac{\pi}{4} \right)}{1 + (\sin x + \cos x)^2} \]

\[ \therefore f'(x) = \frac{\sqrt{2} \cos \left( x + \frac{\pi}{4} \right)}{1 + (\sin x + \cos x)^2} \]

If \( f''(x) > 0 \) then \( f(x) \) is increasing function.

Hence \( f(x) \) is increasing, if \( \frac{\pi}{2} < x + \frac{\pi}{4} < \frac{\pi}{2} \)

\[ \Rightarrow \frac{3\pi}{4} < x < \frac{\pi}{4} \]

Hence, \( f(x) \) is increasing when \( n \in \left( \frac{\pi}{4}, \frac{\pi}{4} \right) \)

16. (c) Given that \( p^2 + q^2 = 1 \)

\[ \therefore p = \cos \theta \text{ and } q = \sin \theta \]

Then \( p + q = \cos \theta + \sin \theta \)

We know that

\[ -\sqrt{a^2 + b^2} \leq a \cos \theta + b \sin \theta \leq \sqrt{a^2 + b^2} \]

\[ \therefore -\sqrt{2} \leq \cos \theta + \sin \theta \leq \sqrt{2} \]

Hence, max. value of \( p + q \) is \( \sqrt{2} \)

17. (a) Let \( y = x^3 - px + q \Rightarrow \frac{dy}{dx} = 3x^2 - p \)

For \( \frac{dy}{dx} = 0 \Rightarrow 3x^2 - p = 0 \Rightarrow x = \pm \sqrt{\frac{p}{3}} \)

\[ \frac{d^2 y}{dx^2} = 6x \]
\[ \frac{d^2 y}{dx^2} \bigg|_{x=\pm \sqrt{\frac{p}{3}}} = +ve \quad \text{and} \quad \frac{d^2 y}{dx^2} \bigg|_{x=\mp \sqrt{\frac{p}{3}}} = -ve \]

\[ \therefore \text{y has minima at } x = \sqrt{\frac{p}{3}} \text{ and maxima at } x = -\sqrt{\frac{p}{3}} \]

18. (b) Let \( f(x) = x^7 + 14x^5 + 66x^4 + 30x - 560 \)
\[ \Rightarrow f'(x) = 7x^6 + 70x^4 + 48x^3 + 30 > 0, \forall x \in R \]
\[ \Rightarrow f \text{ is an increasing function on } R \]
Also \( \lim_{x \to \infty} f(x) = \infty \) and \( \lim_{x \to -\infty} f(x) = -\infty \)
\[ \Rightarrow \text{The curve } y = f(x) \text{ crosses x-axis only once.} \]
\[ \therefore f(x) = 0 \text{ has exactly one real root.} \]

19. (b) Given that \( f(x) = x|x| \) and \( g(x) = \sin x \)
So that \( g(f(x)) = g(x|x|) = \sin x|x| \)
\[ = \begin{cases} \sin(-x^2), & x < 0 \\ \sin(x^2), & x \geq 0 \end{cases} \]
\[ = \begin{cases} -x^2 \cos x^2, & x < 0 \\ 2x \cos x^2, & x \geq 0 \end{cases} \]
\[ \therefore (gof)'(x) = \begin{cases} -2x \cos x^2, & x < 0 \\ 2x \cos x^2, & x \geq 0 \end{cases} \]
Here we observe
\[ L \left( (gof)'(x) = 0 \right) = R \left( (gof)'(x) \right) \]
\[ \Rightarrow \text{go f is differentiable at } x = 0 \]
and \( (gof)'(x) \) is continuous at \( x = 0 \)

Now \( (gof)''(x) = \begin{cases} -2 \cos x^2 + 4x^2 \sin x^2, x < 0 \\ 2 \cos x^2 - 4x^2 \sin x^2, x \geq 0 \end{cases} \]
Here \( L \left( (gof)''(x) = 0 \right) = -2 \) and \( R \left( (gof)''(x) \right) = 0 \)
\[ \therefore \text{go f(x) is not twice differentiable at } x = 0. \]
\[ \therefore \text{ Statement - 1 is true but statement - 2 is false.} \]

20. (a) \( \text{We have } P(x) = x^4 + ax^3 + bx^2 + cx + d \)
\[ \Rightarrow P'(x) = 4x^3 + 3ax^2 + 2bx + c \]
But \( P'(0) = 0 \) \( \Rightarrow \ c = 0 \)
\[ \Rightarrow P(x) = x^4 + ax^3 + bx^2 + d \]
As given that \( P(-1) < P(a) \)
\[ \Rightarrow 1 - a + b + d < 1 + a + b + d \Rightarrow a > 0 \]
Now \( P'(x) = 4x^3 + 3ax^2 + 2bx = x(4x^2 + 3ax + 2b) \)
As \( P'(x) = 0 \), there is only one solution \( x = 0 \), therefore \( 4x^2 + 3ax + 2b = 0 \) should not have any real roots i.e. \( D < 0 \)
\[ \Rightarrow 9a^2 - 32b < 0 \Rightarrow b > \frac{9a^2}{32} > 0 \]
Hence, \( a, b > 0 \) \( \Rightarrow P'(x) = 4x^3 + 3ax^2 + 2bx > 0 \)
\( \forall x > 0 \)
\[ \therefore P(x) \text{ is an increasing function on } (0,1) \]
\[ \therefore P(0) < P(a) \]
Similarly we can prove \( P(x) \) is increasing on \((-1,0)\)
\[ \therefore P(-1) > P(0) \]
So we can conclude that
\[ \text{Max } P(x) = P(1) \text{ and Min } P(x) = P(0) \]
\[ \Rightarrow P(-1) \text{ is not minimum but } P(1) \text{ is the maximum of } P \]

21. (c) Since tangent is parallel to x-axis,
\[ \therefore \frac{dy}{dx} = 0 \Rightarrow 1 - \frac{8}{x^3} = 0 \Rightarrow x = 2 \Rightarrow y = 3 \]
Equation of tangent is \( y - 3 = 0(x - 2) \Rightarrow y = 3 \)

22. (c) \[ f(x) = \begin{cases} k - 2x, & \text{if } x \leq -1 \\ 2x + 3, & \text{if } x > -1 \end{cases} \]

This is true where \( k = -1 \)

23. (d) \[ f(x) = \frac{1}{e^x + 2e^{-x}} = \frac{e^x}{e^{2x} + 2} \]
\[ f'(x) = \frac{(e^{2x} + 2)e^x - 2e^{2x}e^x}{(e^{2x} + 2)^2} \]
\[ f'(x) = 0 \Rightarrow e^{2x} + 2 = 2e^{2x} \]
\[ e^{2x} = 2 \Rightarrow e^x = \sqrt{2} \]
\[ \text{maximum } f(x) = \frac{\sqrt{2}}{4} = \frac{1}{2\sqrt{2}} \]
\[ 0 < f(x) \leq \frac{1}{2\sqrt{2}} \forall x \in R \]
Since \( 0 < \frac{1}{3} < \frac{1}{2\sqrt{2}} \Rightarrow \text{ for some } c \in R \)
\[ f(c) = \frac{1}{3} \]

24. (a) Shortest distance between two curve occurred along the common normal
Slope of normal to \( y^2 = x \) at point \( P(t, t) \) is \(-2t\) and slope of line \( y - x = 1 \) is 1.
As they are perpendicular to each other
\[ (-2t) = -1 \Rightarrow t = \frac{1}{2} \]
\[ \therefore P \left( \frac{1}{4}, \frac{1}{2} \right) \]
and shortest distance \( \left| \frac{1}{2} - \frac{1}{4} - \frac{1}{4} \right| = \frac{1}{2} \).
Applications of Derivatives

So shortest distance between them is $\frac{3\sqrt{2}}{8}$

25. (c) $f'(x) = \sqrt{x} \sin x$, $f'(x) = 0$
\[\Rightarrow x = 0 \text{ or } \sin x = 0\]
\[\Rightarrow x = 2\pi, \pi \in \left(0, \frac{5\pi}{2}\right)\]
\[f''(x) = \sqrt{x} \cos x + \frac{1}{2\sqrt{x}} \sin x\]
\[= \frac{1}{2\sqrt{x}} (2x \cos x + \sin x)\]
At $x = \pi$, $f''(x) < 0$
Hence, local maxima at $x = \pi$
At $x = 2\pi$, $f''(x) > 0$
Hence local minima at $x = 2\pi$

26. (c) Volume of spherical balloon = $V = \frac{4}{3} \pi r^3$
\[\Rightarrow 4500\pi = \frac{4}{3} \pi r^3 \quad (\because \text{Given, volume} = 4500\pi m^3)\]
Differentiating both the sides, w.r.t 't' we get,
\[\frac{dV}{dt} = 4\pi r^2 \left(\frac{dr}{dt}\right)\]
Now, it is given that $\frac{dV}{dt} = 72\pi$
\[\therefore \text{After 49 min, Volume } = (4500 - 49 \times 72)\pi = (4500 - 3528)\pi = 972\pi m^3\]
\[\Rightarrow V = 972\pi m^3 \quad (\therefore 972\pi = \frac{4}{3} \pi r^3)\]
\[\Rightarrow r^3 = 3 \times 243 = 3 \times 3^5 = 3^6 = (3^2)^3 \Rightarrow r = 9\]
Also, we have $\frac{dV}{dt} = 72\pi$
\[\therefore 72\pi = 4\pi \times 9 \times 9 \left(\frac{dr}{dt}\right) \Rightarrow \frac{dr}{dt} = \left(\frac{2}{9}\right)\]

27. (b) Given, $f(x) = \ln|x| + bx^2 + ax$
\[\therefore f'(x) = \frac{1}{x} + 2bx + a\]
At $x = -1$, $f'(-1) = -1 - 2b + a = 0$
\[\Rightarrow a - 2b = 1 \quad \ldots(i)\]
At $x = 2$, $f'(2) = \frac{1}{2} + 4b + a = 0$
\[\Rightarrow a + 4b = -\frac{1}{2} \quad \ldots(ii)\]
On solving (i) and (ii) we get $a = \frac{1}{2}$, $b = -\frac{1}{4}$

Thus, $f''(x) = \frac{1}{x^2} - \frac{1}{x} + \frac{2}{2} = \frac{2-x^2+x}{2x}$
\[= \frac{2}{x} - \frac{x^2 + x}{2x} = \frac{-(x^2 - x - 2)}{2x} = \frac{-(x+1)(x-2)}{2x}\]

So maxima at $x = -1, 2$
Hence both the statements are true and statement 2 is a correct explanation for 1.

28. (c) Equation of a line passing through $(x_1, y_1)$ having slope $m$ is given by $y - y_1 = m(x - x_1)$
Since the line $PQ$ is passing through $(1, 2)$ therefore its equation is $y - 2 = m(x - 1)$
where $m$ is the slope of the line $PQ$.
Now, point $P(x, 0)$ will also satisfy the equation of $PQ$
\[\therefore y - 2 = m(x - 1) \Rightarrow 0 - 2 = m(x - 1)\]
\[\Rightarrow -2 = m(x - 1) \Rightarrow x - 1 = \frac{-2}{m} \Rightarrow x = \frac{-2}{m} + 1\]

Also, $OP = \sqrt{(1 - 0)^2 + (0 - 0)^2} = x = \frac{2}{m} + 1$
Similarly, point $Q(0, y)$ will satisfy equation of $PQ$
\[\therefore y - 2 = m(x - 1) \Rightarrow y - 2 = m(-1) \Rightarrow y = 2 - m \text{ and } OQ = y = 2 - m\]
\[\text{Area of } \Delta = \frac{1}{2} \text{ base } \times \text{height} = \frac{1}{2} (2 - m) (2 - m)\]
\[\therefore \text{Area of } \Delta = \frac{1}{2} \left[2 - m - \frac{4}{m} + 2\right] = \frac{1}{2} \left[4 - \left(m + \frac{4}{m}\right)\right]\]
\[= \frac{2}{2} (2 - m - \frac{4}{m} + 2) = \frac{1}{2} \left[4 - \left(m + \frac{4}{m}\right)\right]\]

Let $\text{Area} = f(m) = 2 - \frac{m}{2} - \frac{2}{m}$
Now, $f'(m) = -\frac{1}{2} + \frac{2}{m^2}$
Put $f'(m) = 0$
\[\Rightarrow m^2 = 4 \Rightarrow m = \pm 2\]
Now, $f''(m) = -\frac{4}{m^3}$
\[f''(m) = -\frac{4}{m^3} < 0\]
29. (a) Since, \( y = \int_{0}^{x} t \, dt, \ x \in R \)

therefore \( \frac{dy}{dx} = |x| \)

But from \( y = 2x, \ \frac{dy}{dx} = 2 \)

\( \Rightarrow |x| = 2 \Rightarrow x = \pm 2 \)

Points \( y = \int_{0}^{x} t \, dt = \pm 2 \)

\( \therefore \) equation of tangent is 
\( y - 2 = 2(x - 2) \) or \( y + 2 = 2(x + 2) \)
\( \Rightarrow x \)-intercept = \( \pm 1 \).

30. (b) Since, \( f \) and \( g \) both are continuous functions on \([0, 1]\) and differentiable on \((0, 1)\) then \( \exists c \in (0, 1) \) such that

\[ f'(c) = \frac{f(1) - f(0)}{1} = \frac{6 - 2}{1} = 4 \]

and \( g'(c) = \frac{g(1) - g(0)}{1} = \frac{2 - 0}{1} = 2 \)

Thus, we get \( f'(c) = 2g'(c) \)

31. (a) \( \lim_{x \to 0} \left[ \frac{1 + f(x)}{x^2} \right] = 3 \Rightarrow \lim_{x \to 0} \frac{f(x)}{x^2} = 2 \)

So, \( f(x) \) contains terms in \( x^2, x^3 \) and \( x^4 \).

Let \( f(x) = a_1x^2 + a_2x^3 + a_3x^4 \)

Since \( \lim_{x \to 0} \frac{f(x)}{x^2} = 2 \Rightarrow a_1 = 2 \)

Hence, \( f(x) = 2x^2 + a_2x^3 + a_3x^4 \)

\( f'(x) = 4x + 3a_2x^2 + 4a_3x^3 \)

As given : \( f'(1) = 0 \) and \( f'(2) = 0 \)

Hence, \( 4 + 3a_2 + 4a_3 = 0 \)
\( \text{and} \ 8 + 12a_2 + 32a_3 = 0 \)

By \( 4x \) (eqn) - eqn (2), we get
\( 16 + 12a_2 + 16a_3 - (8 + 12a_2 + 32a_3) = 0 \)
\( \Rightarrow 8 - 16a_3 = 0 \Rightarrow a_3 = 1/2 \)

and by eqn. (1), \( 4 + 3a_2 + 4/2 = 0 \Rightarrow a_2 = -2 \)

\( \Rightarrow f(x) = 2x^2 - 2x^3 + \frac{1}{2} x^4 \)

\( f(2) = 2 \times 4 - 2 \times 8 + \frac{1}{2} \times 16 = 0 \)

32. (d) \( f(x) = \tan^{-1} \left( \frac{1 + \sin x}{\sqrt{1 - \sin x}} \right) \)

\( \Rightarrow \tan^{-1} \left( \frac{\sin \frac{x}{2} + \cos \frac{x}{2}}{\sqrt{\sin \frac{x}{2} - \cos \frac{x}{2}}} \right) \)

\( = \tan^{-1} \left( \frac{1 + \tan \frac{x}{2}}{1 - \tan \frac{x}{2}} \right) \)

\( = \tan^{-1} \left( \tan \left( \frac{\pi}{4} + \frac{x}{2} \right) \right) \)

\( \Rightarrow y = \frac{\pi + x}{4} \)

\( \Rightarrow \frac{dy}{dx} = \frac{1}{2} \)

Slope of normal = \( \frac{-1}{\left( \frac{dy}{dx} \right)} = -2 \)

At \( \left( \frac{\pi}{6}, \frac{\pi}{4} + \frac{\pi}{12} \right) \)

\( y - \left( \frac{\pi}{4} + \frac{\pi}{12} \right) = -2 \left( x - \frac{\pi}{6} \right) \)

\( y - 4\pi = -2x + 2\pi \)
\( \Rightarrow y - \frac{\pi}{3} = -2x + \frac{\pi}{3} \)

\( y = -2x + \frac{2\pi}{3} \)

This equation is satisfied only by the point \( \left( 0, \frac{2\pi}{3} \right) \)

33. (a) \( 4x + 2\pi r = 2 \Rightarrow 2x + \pi r = 1 \)

\( S = x^2 + \pi r^2 \)

\( S = \left( \frac{1 - \pi r}{2} \right)^2 + \pi r^2 \)

\( \frac{dS}{dr} = 2 \left( \frac{1 - \pi r}{2} \right) \left( -\frac{\pi}{2} \right) + 2\pi r \)

\( \Rightarrow -\frac{\pi}{2} + \frac{\pi^2 r}{2} + 2\pi r = 0 \Rightarrow r = \frac{1}{\pi + 4} \)

\( \Rightarrow x = \frac{2}{\pi + 4} \Rightarrow x = 2r \)
Indefinite Integrals

JEE Advanced / IIT-JEE

A. Fill in the Blanks

1. \( \int \frac{4e^x + 6e^{-x}}{9e^x - 4e^{-x}} \, dx = Ax + B \ln(9e^{2x} - 4) + C \)

\[ \Rightarrow \frac{d}{dx} [Ax + B \ln(9e^{2x} - 4) + C] = \frac{4e^x + 6e^{-x}}{9e^x - 4e^{-x}} \]

\[ \Rightarrow A + \frac{18Be^x}{9e^x - 4e^{-x}} = \frac{4e^x + 6e^{-x}}{9e^x - 4e^{-x}} \]

\[ \Rightarrow (9A + 18B)e^x - 4Ae^{-x} = 4e^x + 6e^{-x} \]

\[ \Rightarrow 9A + 18B = 4; -4A = 6 \Rightarrow A = \frac{-3}{2}; \]

\[ B = \left(4 + \frac{27}{2}\right) = \frac{35}{18}; C \text{ can have any real value.} \]

B. MCQs with ONE Correct Answer

1. (c) Given \( I = \int \frac{e^x}{e^{4x} + e^{2x} + 1} \, dx \),

\[ J = \int \frac{e^{-x}}{e^{-4x} + e^{-2x} + 1} \, dx = \int \frac{e^{3x}}{e^{4x} + e^{2x} + 1} \, dx \]

\[ \therefore J = \int \frac{e^x(e^{2x} - 1)}{e^{4x} + e^{2x} + 1} \, dx \]

Let \( e^x = t \) \( \Rightarrow e^x dx = dt \)

\[ \therefore J = \int \frac{2 - 1}{t^4 + t^2 + 1} \, dt = \int \frac{1 - \frac{1}{t^2}}{t^2 + 1 + \frac{1}{t^2}} \, dt \]

Let \( t^2 = u \) \( \Rightarrow \left(1 - \frac{1}{t^2}\right) dt = du \)

\[ \therefore J = \int \frac{du}{u^2 - 1} = \frac{1}{2} \log \left| \frac{u - 1}{u + 1} \right| + C \]

\[ \frac{t^2 + 1}{t^2 + 1} + C = \frac{1}{2} \log \left| \frac{e^{2x} - e^{-x} + 1}{e^{2x} + e^{-x} + 1} \right| + C \]

2. (c) Given that \( \int_{\sin x}^{1} t^2 f(t) \, dt = 1 - \sin x \)

\[ \Rightarrow \frac{d}{dx} \int_{\sin x}^{1} t^2 f(t) \, dt = \frac{d}{dx} (1 - \sin x) \]

\[ \Rightarrow -\sin^2 x f(\sin x) \cdot \cos x = -\cos x \]

\[ \Rightarrow f(\sin x) = \frac{1}{\sin^2 x} \Rightarrow f(1/\sqrt{3}) = \frac{1}{(1/\sqrt{3})^2} = 3 \]

3. (d) \( \int \frac{x^2 - 1}{x^3 \sqrt{2x^4 - 2x^2 + 1}} \, dx = \int \frac{x^2 - 1}{x^3 \sqrt{2 - 2x^2 + 1}} \, dx \)

\[ \Rightarrow \sec x = \frac{1}{2} \left( t + \frac{1}{t} \right) \]

Also \( \sec x (\sec x + \tan x) \, dx = dt \)
Indefinite Integrals

\[ \Rightarrow \sec x \, dx = \frac{dt}{t} \]

\[ \therefore I = \frac{1}{2} \int \left( \frac{1}{t} \right) dt = \frac{1}{2} \int \left( t^{-9/2} + t^{-13/2} \right) dt \]

\[ = \frac{1}{2} \left[ \frac{t^{-9/2+1}}{-\frac{9}{2}+1} + \frac{t^{-13/2+1}}{-\frac{13}{2}+1} \right] + K \]

\[ = \frac{1}{7} t^{-7/2} - \frac{1}{11} t^{-11/2} + K \]

\[ = \frac{-1}{7 t^{7/2}} - \frac{1}{11 t^{11/2}} + K = \frac{1}{11} \left( \frac{1}{11} + \frac{t^2}{7} \right) + K \]

\[ = \frac{-1}{(\sec x + \tan x)^{11/2}} \left( \frac{1}{11} + \frac{1}{7} (\sec x + \tan x)^2 \right) + K \]

E. Subjective Problems

1. \[ I = \int \frac{\sin x}{\sin x - \cos x} \, dx = \frac{1}{2} \int \frac{2 \sin x}{\sin x - \cos x} \, dx \]

\[ = \frac{1}{2} \int \frac{\sin x + \cos x + \sin x - \cos x}{\sin x - \cos x} \, dx \]

\[ = \frac{1}{2} \int \frac{\cos x + \sin x}{\sin x - \cos x} \, dx + \frac{1}{2} \int \frac{\sin x - \cos x}{\sin x - \cos x} \, dx \]

\[ = \frac{1}{2} \log |\sin x - \cos x| + \frac{x}{2} + C \]

2. Let \( I = \int \frac{x^2 \, dx}{(a + bx)^2} \)

Let \( a + bx = t \) \( \Rightarrow x = \frac{t-a}{b} \) \( \Rightarrow dx = \frac{dt}{b} \)

\[ \therefore I = \frac{1}{b^3} \int \frac{(t-a)^2}{t^2} \, dt = \frac{1}{b^3} \int \frac{t^2 - 2at + a^2}{t^2} \, dt \]

\[ = \frac{1}{b^3} \left[ \frac{1}{2} b^2 \left( \frac{2a}{b} \right) \log |t| - \frac{a^2}{t} \right] + C \]

\[ = \frac{1}{b^3} \left[ a + bx - 2a \log |a + bx| - \frac{a^2}{a + bx} \right] + C \]

3. To evaluate \( \int (e^{\log x} + \sin x) \cos x \, dx \)

\[ = \int (x + \sin x) \cos x \, dx \]

[Using \( e^{\log x} = x \)]

\[ = \int x \cos x + \frac{1}{2} \int \sin 2x \, dx \]

\[ = x \sin x - \frac{1}{2} \int \sin x \, dx + \frac{1}{2} \left( \frac{-\cos 2x}{2} \right) + C \]

\[ = x \sin x + \cos x - \frac{1}{4} \cos 2x + C \]

4. \[ I = \int \frac{(x-1)e^x}{(x+1)^3} \, dx = \int \frac{(x+1-2)e^x}{(x+1)^3} \, dx \]

\[ = \int \left[ \frac{1}{(x+1)^2} - \frac{2}{(x+1)^3} \right] e^x \, dx = \frac{e^x}{(x+1)^2} + C \]

(Using \( e^x (f(x) + f'(x) \, dx = e^x f(x) \))

5. Let \( I = \int \frac{dx}{x^3 (x^4 + 1)^{3/4}} \)

Put \( 1 + \frac{1}{x^4} = t \) \( \Rightarrow \frac{4}{x^5} \, dx = dt \) \( \Rightarrow \frac{dx}{x^5} = -\frac{dt}{4} \)

\[ \therefore I = \int \frac{-dt}{4 t^{3/4}} = \frac{1}{4} \left[ \frac{t^{-3/4+1}}{-\frac{3}{4} + 1} \right] + C \]

\[ = -t^{1/4} + C = -\left( 1 + \frac{1}{x^4} \right)^{1/4} + C \]

6. \[ I = \int \frac{1 - \sqrt{x}}{1 + \sqrt{x}} \, dx \]

Put \( x = \cos^2 \theta \) \( \Rightarrow dx = -2 \cos \theta \sin \theta \, d\theta \)

\[ \therefore I = \int \frac{1 - \cos \theta}{1 + \cos \theta} \cdot 2 \sin \theta \cos \theta \, d\theta \]

\[ = -\int \frac{\sin \theta / 2}{\cos \theta / 2} \cdot 2 \sin(\theta / 2) \cos(\theta / 2) \cos \theta \, d\theta \]

\[ = -2 \int (1 - \cos \theta) \cos \theta \, d\theta \]

\[ = -2 \int (\cos \theta - \cos^2 \theta) \, d\theta \]

\[ = -2 \int \left( \cos \theta - \frac{1 + \cos 2\theta}{2} \right) \, d\theta \]

\[ = -2 \left[ \sin \theta - \frac{1}{2} \left( \theta + \sin 2\theta \right) \right] + C \]

\[ = -2 \sqrt{1-x} + \left[ \cos^{-1} \sqrt{x} + \sqrt{x} \sqrt{1-x} \right] + C \]

[Using \( \sin \theta = \sqrt{1-x} \)]

\[ = -2 \sqrt{1-x} + \cos^{-1} \sqrt{x} + \sqrt{x} \sqrt{1-x} + C \]
7. \[ I = \int \frac{\sqrt{\cos 2x}}{\sin x} dx = \int \frac{\sqrt{\cos^2 x - \sin^2 x}}{\sin x} dx = \int \frac{\cot x - 1}{\sin x} dx\]

Let \( \cot x = \sec \theta \) \( \Rightarrow \) \( -\csc^2 x \) \( dx = \sec \theta \) \( \tan \theta \) \( d\theta \)

We get, \( I = \int \sec \theta \tan \theta \frac{1}{1 + \sec^2 \theta} d\theta \)

\[ = -\int \sec \theta \tan^2 \theta \frac{d\theta}{1 + \sec^2 \theta} = -\int \frac{\sin^2 \theta}{\cos \theta + \cos^2 \theta} d\theta \]

\[ = -\int \frac{1 - \cos^2 \theta}{\cos \theta(1 + \cos^2 \theta)} \frac{d\theta}{\cos \theta(1 + \cos^2 \theta)} = -\int \left( \frac{1 + \cos^2 \theta}{\cos \theta} - 2 \cos \theta \right) d\theta \]

\[ = -\int \sec \theta d\theta + 2 \int \frac{\cos \theta}{1 + \cos^2 \theta} d\theta \]

\[ = -\log |\sec \theta + \tan \theta| + 2 \int \frac{1}{2} \log \left( \frac{\sqrt{2} + \sin \theta}{\sqrt{2} - \sin \theta} \right) + C \]

\[ = -\log |\cot x + \sqrt{\cot^2 x - 1}| + \frac{1}{\sqrt{2}} \log \left( \frac{\sqrt{2} + \sqrt{1 - \tan^2 x}}{\sqrt{2} - \sqrt{1 - \tan^2 x}} \right) + C \]

8. \[ I = \int \sqrt{\tan x + \sqrt{\cot x}} \frac{dx}{\sqrt{\sin x}} = \int \cos x \frac{dx}{\sin x} \]

\[ = \sqrt{\sin x} + \sqrt{\cos x} \]

Put \( \sin x - \cos x = t \) \( \Rightarrow \) \( \cos x \) \( \sin x \) \( dx = dt \) also \( (\sin x - \cos x)^2 = t^2 \) \( \Rightarrow 1 - \sin 2x = t^2 \)

\[ \Rightarrow \sin 2x = 1 - t^2 \]

\[ \therefore I = \sqrt{2} \int \frac{dt}{\sqrt{1 - t^2}} \]

\[ = \sqrt{2} \sin^{-1} t + C = \sqrt{2} \sin^{-1} (\sin x - \cos x) + C \]

9. Let \( I = \int \left( \frac{1}{\sqrt{x} + \sqrt{x}} + \frac{\ln \left( \frac{1}{\sqrt{x}} + \sqrt{x} \right)}{\sqrt{x} + \sqrt{x}} \right) dx \)

\[ = \int \frac{1}{\sqrt{x} + \sqrt{x}} dx + \int \frac{\ln \left( \frac{1}{\sqrt{x}} + \sqrt{x} \right)}{\sqrt{x} + \sqrt{x}} dx \]

\[ I = I_1 + I_2 \]

where \( I_1 = \int \frac{1}{\sqrt{x} + \sqrt{x}} dx \)

Let \( x = y^{12} \) so that \( dx = 12 y^{11} dy \)

\[ \therefore I_1 = \int 12 y^{11} \frac{dy}{y^3 + y^3} = 12 \int \frac{y^{11}}{y^{1+\frac{1}{y+1}}} dy \]

\[ = 12 \left( y^7 - y^6 + y^5 - y^4 + y^3 - y^2 + y - 1 + \frac{1}{y+1} \right) dy \]

\[ = 12 \left[ \frac{y^8}{8} - \frac{y^7}{7} + \frac{y^6}{6} - \frac{y^5}{5} + \frac{y^4}{4} - \frac{y^3}{3} + \frac{y^2}{2} - y + \log |y+1| \right] + C_1 \]

\[ = \frac{3}{2} x^{2/3} - \frac{12}{7} x^{7/12} + 2x^{1/2} - \frac{12}{5} x^{5/12} + 3x^{1/3} \]

\[ -4x^{1/4} + 6x^{1/6} - 12x^{1/12} + 12 \log |x^{1/12} + 1| + C_1 \]

\[ ... (2) \]

\[ I_2 = \int \frac{\ln(1 + (x)^{1/6})}{(x)^{1/3} + (x)^{1/2}} dx \]

Let \( x = z^6 \) so that \( dx = 6z^5 dz \)

\[ = \int \frac{6z^5 \ln(z + 1)}{z^2 + z^3} dz = \int \frac{6z^3 \ln(z + 1)}{z + 1} dz \]

Put \( z + 1 = t \) \( \Rightarrow dz = dt \)

\[ \therefore I_2 = 6 \int \frac{(t^3 - 3t + 3) \ln t dt}{t} \]

\[ = 6 \int (t^3 - 3t + 3) \ln t dt - \int \frac{1}{t} (\ln t)^2 dt \]

\[ = 6 \left( \frac{t^3}{3} - \frac{3t^2}{2} + 3t \right) \ln t - \int \left( \frac{t^3}{3} - \frac{3t^2}{2} + 3t \right) \frac{1}{t} dt \]

\[ = 6 \left[ \frac{t^3}{3} - \frac{3t^2}{2} + 3t \right] \ln t - \int \left( \frac{t^3}{3} - \frac{3t^2}{2} + 3t \right) \frac{1}{t} dt \]

\[ = 6 \left[ \frac{t^3}{3} - \frac{3t^2}{2} + 3t \right] \ln t - \frac{(\ln t)^2}{2} + C_2 \]

Thus we get the value of \( I \) on substituting the values of \( I_1 \) and \( I_2 \) from (2) and (3) in equation (1).
10. Let \( I = \int \cos 20 \ln \left( \frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) d\theta \)

Now we observe that

\[
\frac{d}{d\theta} \left( \ln \left( \frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) \right) = \frac{\cos \theta - \sin \theta - (-\cos \theta - \sin \theta)}{\cos \theta + \sin \theta} d\theta
\]

\[
= \frac{2 \sin \theta - 2 \cos \theta}{\cos^2 \theta - \sin^2 \theta}
\]

\[
= \frac{2 \sin \theta + 2 \cos \theta}{\cos^2 \theta - \sin^2 \theta}
\]

\[
\therefore \quad I = \frac{1}{2} \int \frac{1}{x + 1} dx + \frac{1}{2} \int \frac{x + 1}{x^2 + 1} dx + 2 \int \frac{dx}{(x^2 + 1)^2}
\]

\[
= \frac{1}{2} \log |x + 1| + \frac{1}{4} \log(x^2 + 1) + \frac{1}{2} \tan^{-1} x + 2I_1 + C
\]

where \( I_1 = \int \frac{dx}{(x^2 + 1)^2} \), putting \( x = \tan \theta \),

\[
I_1 = \int \sec^2 \theta \sec^4 \theta d\theta = \int (\cos^2 \theta) d\theta = \frac{1}{2} \int (1 + \cos 2\theta) d\theta
\]

\[
= \frac{1}{2} (\theta + \sin 2\theta) = \frac{1}{2} \tan^{-1} x + \frac{1}{4} \frac{2x}{1 + x^2}
\]

\[
\therefore \quad I = \frac{1}{2} \log |x + 1| + \frac{1}{4} \log(x^2 + 1) + \frac{3}{2} \tan^{-1} x + \frac{x}{1 + x^2} + C
\]

where \( C \) is constant of integration.

13. \( I = \int \sin^{-1} \left( \frac{2x + 2}{\sqrt{4x^2 + 8x + 13}} \right) dx \)

\[
= \int \sin^{-1} \left( \frac{x + 1}{\sqrt{x^2 + 2x + 13}} \right) dx
\]

Put \( x + 1 = 3/2 \tan \theta \), \( dx = \frac{3}{2} \sec^2 \theta d\theta \)

\[
\therefore \quad I = \frac{3}{2} \int \frac{3/2 \tan \theta}{\sqrt{\tan^2 \theta + 9/4}} \sec^2 \theta d\theta
\]

\[
= \frac{3}{2} \int \frac{\tan \theta \cos \theta}{\cos \theta} \sec^2 \theta d\theta
\]

\[
= \frac{3}{2} \int \tan^2 \theta d\theta
\]

\[
= \frac{3}{2} \tan \theta - \log |\sec \theta| + C
\]

\[
I = \frac{3}{2} \left[ \frac{2}{3} (x + 1) \tan^{-1} \left( \frac{2}{3} (x + 1) \right) \right] - \log \left( \frac{1 + 4}{9} (x + 1)^2 \right) + C
\]
\[
(x+1) \tan^{-1} \left( \frac{2x+2}{3} \right) - \frac{3}{4} \log(9 + 4x^2 + 8x + 4) + \frac{3}{4} \log 9 + C
\]

\[
= (x+1) \tan^{-1} \left( \frac{2x+2}{3} \right) - \frac{3}{4} \log(4x^2 + 8x + 13) + C
\]

14. \[ I = \int \left( x^3 + x^2 + x^m \right) (2x^2 + 3x + 6)^{1/m} \, dx \]

\[
= \int \left( x^3 + x^2 + x^m \right) \left[ \frac{2x^3 + 3x^2 + 6x^m}{x^m} \right]^{1/m} \, dx
\]

\[
= \int \left( \frac{x^3 + x^2 + x^m}{x} \right) (2x^3 + 3x^2 + 6x^m)^{1/m} \, dx
\]

Put \( 2x^3 + 3x^2 + 6x^m = y \)

\[ \therefore \quad I = \frac{1}{6m} \int y^{1/m} \, dy = \frac{1}{6m} \left( \frac{y^{1/m+1}}{1/m+1} \right) + C \]

**H. Assertion & Reason Type Questions**

1. (d) \[ F(x) = \int \sin^2 x \, dx = \frac{1}{2} \int (1 - \cos 2x) \, dx \]

\[ = \frac{1}{4} (2x - \sin 2x) + C \]

Now, \( F(x + \pi) = \frac{1}{4} (2x + 2\pi - \sin (2x + 2\pi)) + C \)

\[ = \frac{1}{4} [2x + 2\pi - \sin 2x] + C \neq F(x) \]

\[ \therefore \quad \text{Statement 1 is false.} \]

Also \( \sin^2 (x + \pi) = \sin^2 x, \forall x \in \mathbb{R} \)

\[ \therefore \quad \text{Statement 2 is true.} \]
1. (b) \[ \int \frac{\sin x}{\sin (x - \alpha)} \, dx = \int \frac{\sin (x - \alpha + \alpha)}{\sin (x - \alpha)} \, dx \]
\[ = \int \frac{\sin (x - \alpha) \cos \alpha + \cos (x - \alpha) \sin \alpha}{\sin (x - \alpha)} \, dx \]
\[ = \int (\cos \alpha + \sin \alpha \cot (x - \alpha)) \, dx \]
\[ = (\cos \alpha)x + (\sin \alpha) \log |\sin (x - \alpha)| + C \]
\[ \therefore A = \cos \alpha, B = \sin \alpha \]

\[ \Rightarrow I = \frac{1}{2} \int \csc (x + \frac{\pi}{6}) \, dx \]
But we know that \[ \int \csc x \, dx = \log |\tan (x/2)| + C \]
\[ \therefore I = \frac{1}{2} \log \tan \left( \frac{x}{2} + \frac{\pi}{12} \right) + C \]

5. (c) Let \[ I = \sqrt{2} \int \frac{\sin x \, dx}{\sin \left( x - \frac{\pi}{4} \right)} \quad \text{put} \quad x - \frac{\pi}{4} = t \]
\[ \Rightarrow dx = dt \Rightarrow I = \sqrt{2} \int \frac{\sin \left( t + \frac{\pi}{4} \right)}{\sin t} \, dt \]
\[ = \sqrt{2} \int \frac{\sin t + \cos t}{\sin t} \, dt \]
\[ \Rightarrow I = \int (1 + \cot t) \, dt = t + \log |\sin t| + c_1 \]
\[ = x - \frac{\pi}{4} + \log \left| \sin \left( x - \frac{\pi}{4} \right) \right| + c_1 \]
\[ = x + \log \left| \sin \left( x - \frac{\pi}{4} \right) \right| + c \left( \text{where} \ c = c_1 - \frac{\pi}{4} \right) \]

6. (d) \[ \int \frac{5 \tan x}{\tan x - 2} \, dx = \int \frac{5 \sin x}{\cos x} \, dx \]
\[ = \int \frac{5 \sin x \cos x}{\cos x - 2 \cos x} \, dx \]
\[ = \int \frac{5 \sin x}{\cos x} \, dx - \int \frac{5 \sin x}{\sin x - 2 \cos x} \, dx \]
\[ = \int \frac{5 \sin x}{\sin x - 2 \cos x} \, dx \]
\[ = \int \frac{4 \sin x + \sin x + 2 \cos x - 2 \cos x}{\sin x - 2 \cos x} \, dx \]
\[ = \int \left( \frac{4 \sin x + \sin x + 2 \cos x - 2 \cos x}{\sin x - 2 \cos x} \right) \, dx \]
\[ = \int \frac{5 \sin x}{\sin x - 2 \cos x} \, dx + \int \left( \frac{\cos x + 2 \sin x}{\sin x - 2 \cos x} \right) \, dx \]
\[ = \int \frac{5 \sin x}{\sin x - 2 \cos x} \, dx + 2 \int \left( \frac{\cos x + 2 \sin x}{\sin x - 2 \cos x} \right) \, dx \]
\[ = \int \frac{5 \sin x}{\sin x - 2 \cos x} \, dx + 2 \int \left( \frac{\cos x + 2 \sin x}{\sin x - 2 \cos x} \right) \, dx \]
\[ = I_1 + I_2 \quad \text{where} \ I_1 = \int \frac{dx}{\sin x} \text{ and } I_2 = 2 \int \frac{\cos x + 2 \sin x}{\sin x - 2 \cos x} \, dx \]

\[ = I_1 + I_2 \]
put \( \sin x - 2 \cos x = t \)
\[ \Rightarrow (\cos x + 2 \sin x) \, dx = dt \]

\( \therefore I_2 = 2 \int \frac{dt}{t} = 2 \ln t + C = 2 \ln (|\sin x - 2 \cos x|) + C \)

Hence, \( I_1 + I_2 = \int dx + 2 \ln (|\sin x - 2 \cos x|) + C \)
\[ = x + 2 \ln (|\sin x - 2 \cos x|) + k \Rightarrow a = 2 \]

7. (c) Let \( \int f(x) \, dx = \psi(x) \)

Let \( I = \int x^5 f(x^3) \, dx \)
put \( x^3 = t \) \( \Rightarrow 3x^2 \, dx = dt \)
\[ I = \frac{1}{3} \left[ 3 \cdot x^3 \cdot x^3 \cdot f(x^3) \right] \cdot dx \]

\[ = \frac{1}{3} \left[ f(t) \, dt \right] = \frac{1}{3} \left[ t \int f(t) \, dt - \int f(t) \, dt \right] \]
\[ = \frac{1}{3} \left[ x^3 \psi(x^3) - 3 \int x^2 \psi(x^3) \, dx \right] + C \]
\[ = \frac{1}{3} x^3 \psi(x^3) - \int x^2 \psi(x^3) \, dx + C \]

8. (d) Let \( I = \int \left( 1 + x - \frac{1}{x} \right) e^{x^1/2} \, dx \)

\[ = \int e^{x^{1/2}} \, dx + \int \left( x - \frac{1}{x} \right) e^{x^{1/2}} \, dx \]
\[ = xe^{x^{1/2}} - \int \left( x - \frac{1}{x} \right) e^{x^{1/2}} \, dx + \int \left( x - \frac{1}{x} \right) e^{x^{1/2}} \, dx \]
\[ = xe^{x^{1/2}} - \int \left( x - \frac{1}{x} \right) e^{x^{1/2}} \, dx + \int \left( x - \frac{1}{x} \right) e^{x^{1/2}} \, dx \]
\[ = xe^{x^{1/2}} + C \]

9. (b) \( I = \int \frac{dx}{x^2 (x^4 + 1)^{3/4}} = \int \frac{dx}{x^3 (1 + x^{-4})^{3/4}} \)

10. (d) \( \int \frac{2x^{12} + 5x^9}{(x^5 + x^3 + 1)^3} \, dx \)

Dividing by \( x^{15} \) in numerator and denominator
\[ \int \frac{2 + \frac{5}{x^6}}{(x^{5/2} + \frac{1}{x^{10}})^3} \, dx \]
Substitute \( 1 + \frac{1}{x^2} + \frac{1}{x^5} = t \)
\[ \Rightarrow \left( \frac{-2}{x^3} - \frac{5}{x^6} \right) dx = dt \]
\[ \Rightarrow \left( \frac{2}{x^3} + \frac{5}{x^6} \right) dx = -dt \]
This gives, \[ \int \frac{2 + \frac{5}{x^6}}{(1 + \frac{1}{x^2} + \frac{1}{x^5})^3} \, dx = \int \frac{-dt}{t^3} + \frac{1}{2t^2} + C \]
\[ = -\int \frac{1}{2} \left( \frac{1}{x^2} + \frac{1}{x^5} \right)^2 + C \]

A. Fill in the Blanks

1. Given that,
\[ f(x) = \begin{vmatrix} \sec x & \cos x & \sec^2 x + \cot x \cosec x \\ \cos^2 x & \cos^2 x & \cosec^2 x \\ 1 & \cos^2 x & \cos^2 x \end{vmatrix} \]

Operating \( R_1 - \sec x \cdot R_3 \),
\[ \begin{vmatrix} 0 & 0 & \sec^2 x + \cot x \cosec x - \cos x \\ \cos^2 x & \cos^2 x & \cosec^2 x \\ 1 & \cos^2 x & \cos^2 x \end{vmatrix} = \begin{vmatrix} \cos^2 x & \cos^2 x & \cosec^2 x \\ 1 & \cos^2 x & \cos^2 x \end{vmatrix} \]
Expanding along \( R_1 \), we get
\[ = (\sec^2 x + \cot x \cosec x - \cos x)(\cos^4 x - \cos^2 x) \]
\[ = \left( \frac{1 + \cos x}{\cos^2 x - \sin^2 x} \right) \cos^2 x (\cos^2 x - 1) \]
\[ = -\sin^2 x - \cos^2 x \]
\[ \therefore \int_0^{\pi/2} f(x)dx = -\int_0^{\pi/2} (\sin^2 x + \cos^5 x)dx \]

Using
\[ \int_0^{\pi/2} \sin^n x \, dx = \int_0^{\pi/2} \cos^n x \, dx = \frac{(n-1)(n-3)\ldots 2 \text{ or } 1}{(n)(n-2)\ldots 2} \]

Multiply the above by \( \pi/2 \) when \( n \) is even. We get
\[ \int_0^{\pi/2} \sin^2 x \, dx = \int_0^{\pi/2} \cos^2 x \, dx = \frac{\pi}{4} \]
\[ \int_0^{\pi/2} \cos^4 x \, dx = \int_0^{\pi/2} \cos^2 x \, dx = \frac{8}{15} \]
\[ \int_0^{\pi/2} \sin^2 x \, dx = \int_0^{\pi/2} \cos^2 x \, dx = \frac{15}{32} \]

2. \( \int_0^{1.5} [x^2] \, dx \),
We have \( 0 < x < 1.5 \Rightarrow 0 < x^2 < 2.25 \)
\[ \because [x^2] = 0, 0 < x^2 < 1 = 1, 1 \leq x^2 < 2 = 2, 2 \leq x^2 < (1.5)^2 \]
or \( [x^2] = 0, 0 < x < 1, 1 \leq x < \sqrt{2} = 2, \sqrt{2} \leq x < 1.5 \)
\[ \therefore I = \int_0^{1.5} [x^2] \, dx = \int_0^1 0 \, dx + \int_1^\sqrt{2} 1 \, dx + \int_\sqrt{2}^{1.5} 2 \, dx \]
\[ = 0 + [x]^\sqrt{2}_1 + \int_\sqrt{2}^{1.5} 2 \, dx \]
\[ = \sqrt{2} - 1 + 3 - 2\sqrt{2} = 2 - \sqrt{2} \]

3. Let \( I = \int_{-2}^{2} |1 - x^2| \, dx = 2 \left( \int_0^{1} (1 - x^2) \, dx + \int_1^{2} (x^2 - 1) \, dx \right) \]
\[ \therefore \int_{-a}^{a} f(x)dx = 2 \int_0^{a} f(x)dx \text{ if } f \text{ is an even function} \]
\[ = 2 \int_0^{1} (1 - x^2) \, dx + \int_1^{2} (x^2 - 1) \, dx \]
\[ = \left[-x^3 + x^2\right]_0^1 + \left[\frac{x^3}{3} - x\right]_1^2 = \frac{4}{3} + 8 = \frac{12}{3} = 4 \]

4. We have, \[ I = \int_{\pi/4}^{3\pi/4} \frac{\phi}{1 + \sin \phi} \, d\phi \]
\[ \Rightarrow I = \int_{\pi/4}^{3\pi/4} \frac{\pi - \phi}{1 + \sin(\pi - \phi)} \, d\phi \]
[Using \( \int_a^b f(x)dx = \int_a^b f(a + b - x)dx \)]
\[ \Rightarrow I = \int_{\pi/4}^{3\pi/4} \frac{\pi - \phi}{1 + \sin \phi} \, d\phi \]
Adding (1) and (2), we get
\[ 2I = \int_{\pi/4}^{3\pi/4} \frac{\pi}{1 + \sin \phi} \, d\phi \]
\[ = \pi \int_{\pi/4}^{3\pi/4} \frac{1 - \sin \phi}{1 - \sin^2 \phi} \, d\phi = \pi \int_{\pi/4}^{3\pi/4} \frac{1 - \sin \phi}{\cos^2 \phi} \, d\phi \]
\[ = \pi \int_{\pi/4}^{3\pi/4} (\sec^2 \phi - \sec \phi \tan \phi) \, d\phi \]
\[ = \pi \tan \phi - \sec \phi \tan \phi \]
\[ = \pi \tan \frac{3\pi}{4} \]
\[ = \pi \frac{3\pi}{4} \frac{\pi}{4} \frac{\pi}{4} \]
\[ = 2\pi(\sqrt{2} - 1) \Rightarrow I = \pi(\sqrt{2} - 1) \]

5. Let \( I = \int_2^3 \frac{\sqrt{x}}{2\sqrt{5-x} + \sqrt{x}} \, dx \)
\[ \Rightarrow I = \int_2^3 \frac{\sqrt{x}}{\sqrt{5-x} + \sqrt{x}} \, dx \]
[Using \( \int_a^b f(x)dx = \int_a^b f(a + x)dx \)]
Adding (1) and (2), we get
\[ 2I = \int_2^3 \frac{\sqrt{x}}{\sqrt{5-x} + \sqrt{x}} \, dx \]
\[ \Rightarrow I = \frac{1}{2} \int_2^3 dx = \frac{1}{2}(3 - 2) = \frac{1}{2} \]

6. \( af(x) + bf \left( \frac{1}{x} \right) = \frac{1}{x} - 5 \) \( \ldots (1) \)

Integrating both sides within the limits 1 to 2, we get
\[ a \int_1^2 f(x)dx + b \int_1^2 f \left( \frac{1}{x} \right) \, dx = \left[ \log x - 5x \right]_1^2 = \log 2 - 5 \ldots (2) \]
Replacing \( x \) by \( \frac{1}{x} \) in (1), we get \( af \left( \frac{1}{x} \right) + bf(x) = x - 5 \)
Integrating both sides within the limits 1 to 2, we get
\[ a \int_1^2 f \left( \frac{1}{x} \right) dx + b \int_1^2 f(x)dx = \left[ \frac{x^2}{2} - 5x \right]_1^2 = \frac{7}{2} \ldots (3) \]
Definite Integrals and Applications of Integrals

Eliminate \( \int_1^2 f\left( \frac{1}{x} \right) \) between (2) and (3) by multiplying (2) by \( a \) and (3) by \( b \) and subtracting:

\[
(a^2 - b^2) \int_1^2 f(x)dx = a(\log 2 - 5) + b \frac{7}{2}
\]

\[
\int_1^2 f(x)dx = \frac{1}{a^2 - b^2} \left[ a(\log 2 - 5) + \frac{7b}{2} \right]
\]

\[\therefore \int_1^2 f(x)dx = \left[ \frac{a}{(a^2 - b^2)}(\log 2 - 5) + \frac{7b}{2a^2 - 2b^2} \right]
\]

7. Let \( I = \int_0^{2\pi} \frac{x \sin^2 x}{\sin^2 x + \cos^2 x} dx \)

\[
= \int_0^{2\pi} \frac{2\pi \sin^2 x}{\sin^2 x + \cos^2 x} dx \quad \Rightarrow \quad I = 2\pi \int_0^{\pi/2} \frac{\sin^2 x}{\sin^2 x + \cos^2 x} dx
\]

Adding (1) and (2), we get:

\[
2I = \pi \int_0^{\pi/2} \frac{2\pi}{\sin^2 x + \cos^2 x} dx = \pi \int_0^{\pi/2} \frac{\sin^2 x}{\sin^2 x + \cos^2 x} dx
\]

\[
I = \pi^2 \int_0^{\pi/2} \frac{1}{\sin^2 x + \cos^2 x} dx \quad \Rightarrow \quad I = \pi^2 \int_0^{\pi/2} \frac{1}{\sin^2 x + \cos^2 x} dx
\]

\[
\therefore \quad I = \pi^2 \int_0^{\pi/2} \frac{1}{\sin^2 x + \cos^2 x} dx \quad \Rightarrow \quad I = \pi^2
\]

8. Let \( I = \int_1^{e^{\pi}} \frac{\pi \sin(\pi \ln x)}{x} dx \)

Let \( \pi \ln x = t \)

\[
\therefore \frac{\pi}{x} dt = dt \quad \text{as} \quad x \rightarrow 1, t \rightarrow 0, x \rightarrow e^\pi, t \rightarrow 37\pi
\]

\[
\therefore \quad I = \int_0^{37\pi} \sin t dt = [-\cos t]_0^{37\pi} = -\cos 37\pi + 1 = -(-1) + 1 = 2
\]

\[\therefore \quad I = 2 \int_0^{37\pi} \sin t dt = 2 [\cos t]_0^{37\pi} = 2 \cos 37\pi = 2 (-1) = -2
\]

9. \(
\int_1^4 \frac{2e^{\sin^2 x}}{x} dx = F(1) - F(k) = [F(x)]^k_1
\]

Put \( x^2 = t \)

\[\therefore \quad 2dx = dt \quad \text{At} \quad x = 1, t = 1 \quad \text{and at} \quad x = 4, t = 16
\]

\[
\therefore \quad I = \int_1^{16} \frac{e^t}{t} dt = F(t)|_1^{16} = k
\]

\[\therefore \quad k = 16
\]

B. True/False

1. Let \( I = \int_0^{2a} \frac{f(x)}{f(x) + f(2a-x)} dx \quad \ldots (1) \)

\[\Rightarrow \quad I = \int_0^{2a} \frac{f(2a-x)}{f(2a-x) + f(2a-(2a-x))} dx \]

[Using \( \int_0^{a} f(x) dx = \int_0^{a} f(a-x) dx \)]

\[\therefore \quad I = \int_0^{2a} \frac{f(2a-x)}{f(2a-x) + f(x)} \quad \ldots (2)
\]

Adding (1) and (2), we get:

\[
2I = \int_0^{2a} f(x) dx + f(2a-x) dx = \int_0^{2a} 1 dx
\]

\[\therefore \quad I = a
\]

\[\therefore \quad \text{The given statement is true.}
\]

C. MCQs with ONE Correct Answer

1. (d) \( \int_0^{1} (1+e^{-x^2}) dx = \int_0^{1} \left( 1 + \frac{x^2}{1!} + \frac{x^4}{2!} + \frac{x^6}{3!} + \ldots \right) dx \)

\[= \left[ 2x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \ldots \right]_0^1 \]

\[= \left[ 2 - \frac{1}{3!} + \frac{1}{5!} - \frac{1}{7!} + \ldots \right] 
\]

2. (b) Given \( \int_0^{1} (1 + \cos^2 x)(ax^2 + bx + c) dx \)

\[= \int_0^{1} (1 + \cos^2 x)(ax^2 + bx + c) dx \]

\[= \int_0^{1} (1 + \cos^2 x)(ax^2 + bx + c) dx \]

\[\Rightarrow \quad \int_0^{2} (1 + \cos^2 x)(ax^2 + bx + c) dx = 0
\]

Now we know that if \( \int_0^{\beta} f(x) dx = 0 \) then it means that

\( f(x) \) is \(+\) ve on some part of \((\alpha, \beta)\) and \(-\) ve on other part of \((\alpha, \beta)\).

But here \( 1 + \cos^2 x \) is always \(+\) ve,

\( \therefore \quad ax^2 + bx + c \) is \(+\) ve on some part of \([1, 2]\) and \(-\) ve on other part \([1, 2]\)

\[\therefore \quad ax^2 + bx + c = 0 \] has at least one root in \([1, 2]\),

\[\therefore \quad ax^2 + bx + c = 0 \] has at least one root in \([0, 2]\).
3. (c) \[ \int_{1}^{b} f(x) \, dx = (b - 1) \sin(3b + 4) \]

Differentiating both sides w.r.t. \( b \), we get 
\[ f(b) = 3(b - 1) \cos(3b + 4) + \sin(3b + 4) \]
\[ \Rightarrow f(x) = 3(x - 1) \cos(3x + 4) + \sin(3x + 4) \]

4. (a) 
\[ I = \int_{0}^{\pi/2} \frac{\sqrt{\cot x}}{\cot x + \sqrt{\tan x}} \, dx \]  
\[ = \int_{0}^{\pi/2} \frac{\cot(\pi/2 - x)}{\cot(\pi/2 - x)} + \sqrt{\tan(\pi/2 - x)} \, dx \]
\[ I = \int_{0}^{\pi/2} \frac{\sqrt{\tan x}}{\sqrt{\tan x} + \sqrt{\cot x}} \, dx \]  
Adding (1) and (2) we get
\[ 2I = \int_{0}^{\pi/2} \frac{\sqrt{\cot x} + \sqrt{\tan x}}{\cot x + \sqrt{\tan x}} \, dx = \int_{0}^{\pi/2} \frac{1}{dx} \]
\[ = \frac{\pi}{2} \quad : \quad I = \frac{\pi}{4} \]

5. (c) 
\[ I = \int_{0}^{\pi} e^{\cos^{2}x} \cos^{3}(2n+1)x \, dx, n \in \mathbb{Z} \quad \ldots (1) \]
\[ = \int_{0}^{\pi} e^{\cos^{2}(\pi-x)} \cos^{3}[(2n+1)(\pi-x)] \, dx \]
Using \[ \int_{0}^{a} f(x) \, dx = \int_{0}^{a} f(a-x) \, dx \]
\[ \therefore I = \int_{0}^{\pi} e^{\cos^{2}x} \cos^{3}[(2n+1)\pi - (2n+1)x] \, dx \]
\[ I = \int_{0}^{\pi} e^{\cos^{2}x} \cos^{3}(2n+1)x \, dx \]  
Adding (1) and (2) we get
\[ 2I = 0 \quad \Rightarrow I = 0 \]

6. (d) We have,
\[ I = \int_{-\pi/2}^{\pi/2} (f(x) + f(-x)) \{ g(x) - g(-x) \} \, dx \]
Let \( F(x) = (f(x) + f(-x))(g(x) - g(-x)) \)
then \( F(-x) = (f(-x) + f(x))(g(-x) - g(x)) \)
\[ = -[f(x) + f(-x)][g(x) - g(-x)] \]
\[ = -F(x) \]
\[ \therefore \] \( F(x) \) is an odd function, \( \therefore \) we get \( I = 0 \)

7. (d) Let \( I = \int_{0}^{\pi/2} \frac{\cos^{3}x}{\cos^{3}x + \sin^{3}x} \, dx \ldots (1) \)
\[ I = \int_{0}^{\pi/2} \frac{\cos^{3} \left( \frac{\pi}{2} - x \right)}{0 \sin^{3} \left( \frac{\pi}{2} - x \right) + \cos^{3} \left( \frac{\pi}{2} - x \right)} \, dx \]
\[ = \int_{0}^{\pi/2} \frac{\sin^{3}x}{\sin^{3}x + \cos^{3}x} \, dx \]  
Adding (1) and (2) we get
\[ 2I = \int_{0}^{\pi/2} \frac{\cos^{3}x + \sin^{3}x}{\sin^{3}x + \cos^{3}x} \, dx = \int_{0}^{\pi/2} \frac{\pi}{2} \quad \therefore I = \frac{\pi}{4} \]

8. (d) \( f(x) = \sin(\pi x/2) + B \)
\[ \Rightarrow f'(x) = \frac{\pi}{2} \cos \left( \frac{\pi x}{2} \right) \quad \Rightarrow f\left( \frac{1}{2} \right) = \frac{\pi}{2} \cos \frac{\pi}{4} = \frac{\sqrt{2}}{2} \]
\[ A = 4/\pi \quad \text{and} \quad \int_{0}^{1} f(x) \, dx = \frac{2A}{\pi} \]
\[ \Rightarrow \int_{0}^{1} \left[ A \sin \left( \frac{\pi x}{2} \right) + B \right] \, dx = \frac{2A}{\pi} \]
\[ \Rightarrow \left[ -\frac{2A}{\pi} \cos \left( \frac{\pi x}{2} \right) + Bx \right]_{0}^{1} = \frac{2A}{\pi} \]
\[ \Rightarrow B + \frac{2A}{\pi} = \frac{2A}{\pi} \quad \Rightarrow B = 0 \]

9. (a) Let \( I = \int_{0}^{2} \sqrt{2} \sin x \, dx \)
\[ \pi \leq x \leq 7\pi/6 \quad \Rightarrow -1 \leq \sin x < 0 \quad \Rightarrow [2 \sin x] = -1 \]
\[ 7\pi/6 \leq x < 11\pi/6 \quad \Rightarrow -2 \leq 2 \sin x < -1 \]
\[ [2 \sin x] = -1 \]
\[ \therefore I = \int_{0}^{1} -dx + \int_{1}^{2} -dx + \int_{2}^{3} -dx \]
\[ = \left( -\frac{\pi}{6} + \frac{11\pi}{6} \right) + 2 \left( -\frac{\pi}{6} + \frac{7\pi}{6} \right) + \left( -2\pi + \frac{11\pi}{6} \right) \]
\[ = -\pi + \frac{10\pi}{6} - \frac{5\pi}{3} \]

10. (a) Given that \( g(x) = \int_{0}^{x} \cos^{4} t \, dt \)
\[ \Rightarrow g(x + \pi) = \int_{0}^{x+\pi} \cos^{4} t \, dt \]
\[ = \int_{0}^{\pi} \cos^{4} t \, dt + \int_{0}^{x+\pi} \cos^{4} t \, dt \]
\[ \Rightarrow g(x + \pi) = g(\pi) + I, \text{ where } I = \int_{0}^{x+\pi} \cos^{4} t \, dt \]

Put \( t = x + y, \, dt = dy \)
also as \( t \to \pi, \, y \to 0 \)
as \( t \to x + \pi, \, y \to x \)
\[ \therefore I = \int_{0}^{\pi} \cos^{4} (x + y) \, dy \]
\[ = \int_{0}^{\pi} \cos^{4} y \, dy \]
\[ = \int_{0}^{\pi} \cos^{4} t \, dt = g(x) \]
\[ \therefore g(x + \pi) = g(\pi) + g(x) \]

11. (a) We have \( I = \int_{0}^{\pi/4} \frac{dx}{\sin^2 x + \cos^2 x} \ldots (1) \)
Definite Integrals and Applications of Integrals

\[ \int_{\pi/4}^{3\pi/4} \frac{dx}{1 + \cos(\pi - x)} \]

Using the prop. \[ \int_a^b f(x)dx = \int_a^b (f(a + b - x))dx \]

\[ = \int_{\pi/4}^{3\pi/4} \frac{dx}{1 - \cos x} \quad \ldots \quad (2) \]

Adding (1) and (2), we get

\[ 2I = \int_{\pi/4}^{3\pi/4} \left( \frac{1}{1 + \cos x} + \frac{1}{1 - \cos x} \right)dx \]

\[ = \int_{\pi/4}^{3\pi/4} 2\csc^2 x \, dx = 2(-\cot x)_{\pi/4}^{3\pi/4} \]

\[ = -2[\cot 3\pi/4 - \cot \pi/4] = -2(-1 - 1) = 4 \]

\[ \Rightarrow I = 2 \]

12. (c) In the range \( \frac{\pi}{2} \) to \( \frac{3\pi}{2} \), we have to find the value of

\[ [2\sin x] = \begin{cases} 
 2 & \text{if } x = \pi/2 \\
 1 & \text{if } \pi/2 < x \leq 5\pi/6 \\
 0 & \text{if } 5\pi/6 < x \leq \pi \\
 -1 & \text{if } \pi < x \leq 7\pi/6 \\
 -2 & \text{if } 7\pi/6 < x \leq 3\pi/2 
\end{cases} \]

Thus

\[ I = \int_{\pi/2}^{5\pi/6} 1 \, dx + \int_{5\pi/6}^{\pi} 0 \, dx + \int_{\pi}^{7\pi/6} (-1) \, dx + \int_{7\pi/6}^{3\pi/2} (-2) \, dx \]

or \( I = \left[ \frac{5\pi}{6} - \frac{\pi}{2} \right] + 0 - \left[ \frac{7\pi}{6} - \pi \right] - \frac{3\pi}{2} + \frac{7\pi}{6} \]

\[ = \frac{2\pi}{6} - \frac{4\pi}{6} - \frac{3\pi}{6} = -\frac{\pi}{2} \]

13. (b) \( g(x) = \int_0^x f(t) \, dt \)

\[ \Rightarrow g(2) = \int_0^2 f(t) \, dt = \int_0^1 f(t) \, dt + \int_1^2 f(t) \, dt \]

Now, \( \frac{1}{2} \leq f(t) \leq 1 \) for \( t \in [0,1] \)

We get \( \frac{1}{2} \leq \int_0^1 f(t) \, dt \leq \int_0^1 dt \)

(applying line integral on inequality)

\[ \Rightarrow \frac{1}{2} \leq \int_0^1 f(t) \, dt \leq 1 \]

\[ \Rightarrow \frac{1}{2} \leq \int_0^1 f(t) \, dt \leq 1 \]

Again, \( 0 \leq f(t) \leq \frac{1}{2} \) for \( t \in [1,2] \)

We get \( \int_0^2 dt \leq \int_0^1 f(t) \, dt \leq \int_0^1 \frac{1}{2} \, dt \)

(applying line integral on inequality)

\[ \Rightarrow 0 \leq \int_0^1 f(t) \, dt \leq \frac{1}{2} \]

From (1) and (2), we get

\[ \frac{1}{2} \leq \int_0^1 f(t) \, dt + \int_1^2 f(t) \, dt \leq \frac{3}{2} \quad \text{or} \quad \frac{1}{2} \leq g(2) \leq \frac{3}{2} \]

\[ \Rightarrow 0 \leq g(2) \leq 2 \quad \text{is the most appropriate solution.} \]

14. (c) If \( f(x) = \begin{cases} 
 e^{\cos x} \sin x & \text{for } |x| \leq 2 \\
 2 & \text{otherwise} 
\end{cases} \)

\[ = \begin{cases} 
 e^{\cos x} \sin x & \text{for } -2 \leq x \leq 2 \\
 2 & \text{otherwise} 
\end{cases} \]

\[ \int_{-2}^{3} f(x) \, dx = \int_{-2}^{2} f(x) \, dx + \int_{2}^{3} f(x) \, dx \]

\[ = \int_{-2}^{2} e^{\cos x} \sin x \, dx + \int_{2}^{3} 2 \, dx = 0 + 2[x]_{2}^{3} \]

\[ = 2 \quad [\because e^{\cos x} \sin x \text{ is an odd function.}] \]

\[ \Rightarrow \int_{-2}^{3} f(x) \, dx = 2 \]

15. (b) Let \( I = \int_{e^{-1}}^{e} \frac{\log_e x}{x} \, dx \)

We know that for \( \frac{1}{e} < x < 1 \), \( \log_e x < 0 \) and hence \( \log_e x < 0 \)

and for \( 1 < x < e^2 \), \( \log x > 0 \) and hence \( \frac{\log_e x}{x} > 0 \)

\[ I = \int_{1/e}^{1} \left[ -\frac{\log_e x}{x} \right] \, dx + \int_{1}^{e^2} \frac{\log_e x}{x} \, dx \]

\[ = -\frac{1}{2} \left[ (\log_e x)^2 \right]_{1/e}^{1} + \frac{1}{2} \left[ (\log_e x)^2 \right]_{1}^{e^2} \]

\[ = \frac{1}{2} + \frac{5}{2} = \frac{3}{2}. \]
16. (c) \[ I = \int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + a^x} \, dx \] 

Putting \( x = -y \) then \( dx = -dy \)

\[ I = \int_{-\pi}^{\pi} \frac{\cos^2 y}{1 + a^{-y}} \, dy = \int_{-\pi}^{\pi} \frac{a^y \cos^2 y}{1 + a^y} \, dy \]

\[ I = \int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + a^x} \, dx \left[ \int_{a}^{b} f(y) \, dy = \int_{a}^{b} f(x) \, dx \right] \] \hspace{1cm} (2)

Adding (1) and (2),

\[ 2I = \int_{-\pi}^{\pi} \frac{(1 + a^x) \cos^2 x}{1 + a^x} \, dx = \int_{-\pi}^{\pi} \cos^2 x \, dx \]

\[ 2I = 2 \int_{0}^{\pi/2} \cos^2 x \, dx \] \hspace{1cm} (even function)

\[ I = \int_{0}^{\pi/2} \cos^2 x \, dx \] \hspace{1cm} (3)

\[ \frac{2a}{0} \int_{a}^{a} f(x) \, dx = 2 \int_{0}^{a} f(x) \, dx \text{ if } f(2a-x) = f(x) \]

\[ \int_{0}^{\pi/2} \sin^2 x \, dx \] \hspace{1cm} (4)

Adding (3) and (4),

\[ \int_{0}^{\pi/2} \cos^2 x + \sin^2 x \, dx = \frac{\pi}{2} = \pi \]

\[ \therefore I = \frac{\pi}{2} \]

17. (b) The given lines are \( y = x - 1; y = -x - 1; y = x + 1 \) and \( y = -x + 1 \)

which are two pairs of parallel lines and distance between the lines of each pair is \( \sqrt{2} \). Also non parallel lines are perpendicular. Thus lines represent a square of side \( \sqrt{2} \). Hence, area = \( (\sqrt{2})^2 = 2 \) sq. units.

18. (a) Here \( f(x) = x \int_{1}^{\sqrt{2-x^2}} dt \implies f'(x) = \sqrt{2-x^2} \)

Now the given equation \( x^2 - f'(x) = 0 \) becomes \( x^2 - \sqrt{2-x^2} = 0 \implies x^2 = \sqrt{2-x^2} \implies x = \pm 1 \)

19. (c) Given that \( T > 0 \) is a fixed real number. \( f \) is continuous \( \forall x \in R \) such that \( f(x + T) = f(x) \)

\( f \) is a periodic function of period \( T \)

Also given \( I = \int_{0}^{T} f(x) \, dx \)

Then let \( I_1 = \int_{3}^{3+3T} f(2x) \, dx \)

20. (a) Let \( I = \int_{-1/2}^{1/2} \left[ x + \ln \left( \frac{1+x}{1-x} \right) \right] \, dx \)

\[ \int_{-1/2}^{1/2} \left[ x \right] \, dx + \int_{-1/2}^{1/2} \ln \left( \frac{1+x}{1-x} \right) \, dx \]

\[ = \int_{0}^{1/2} (-x) \, dx + \int_{0}^{1/2} \ln \left( \frac{1+x}{1-x} \right) \, dx \]

\[ \left[ \therefore \ln \left( \frac{1+x}{1-x} \right) \text{ is an odd function} \right] \]

\[ = \left[ -\ln \left( \frac{1+x}{1-x} \right) \right]_{0}^{1/2} = 0 - \frac{1}{2} = -1/2 \]

21. (a) We have \( I_{m,n} = \int_{0}^{1} t^m (1+t)^n \, dt \)

Intergrating by parts considering \( (1+t)^n \) as first function, we get

\[ I_{m,n} = \left[ \frac{t^{m+1}}{m+1} (1+t)^n \right]_{0}^{1} - \frac{n}{m+1} \int_{0}^{1} t^{m+1} (1+t)^{n-1} \, dt \]

\[ I_{m,n} = \frac{2^n}{m+1} - \frac{n}{m+1} I_{m+1,n-1} \]
22. (d) We have \( f(x) = \int_{x^2}^{x^2+1} e^{-t^2} dt \)

Then \( f'(x) = e^{-(x^2+1)^2} \cdot 2x - e^{-x^4} \cdot 2x \)

[Using Leibnitz theorem, \( \frac{d}{dx} \int f(t) \, dt \)]

\[ f'(x) = 2x[e^{-(x^2+1)^2} - e^{-x^4}] \]

\[ (x^2 + 1)^2 > x^4 \]

\[ e^{-(x^2+1)^2} > e^{-x^4} \Rightarrow e^{-(x^2+1)^2} < e^{-x^4} \]

\[ -e^{-(x^2+1)^2} - e^{-x^4} < 0 \]

\[ f(x) \text{ increases when } x < 0 \]

23. (d) The curves given are

\[ y = \sqrt{x} \quad \ldots (1) \]

\[ 2y + 3 = x \quad \ldots (2) \]

and x-axis \[ y = 0 \quad \ldots (3) \]

Eqn. (1), \[ y^2 = x \] represents right handed parabola but with +ve values of \( y \) i.e., part of curve lying above x-axis.

Solving (1) and (2) we get,

\[ 2y + 3 = y^2 \]

\[ y^2 - 2y - 3 = 0, \quad (y - 3)(y + 1) = 0 \]

\[ y = 3 \quad \text{(as } y \neq -\text{ve)} \Rightarrow x = 9 \]

Also (2) meets x-axis at (3, 0)

\[ y = \sqrt{x} \]

(9, 3)

\[ 2y + 3 = x \]

(3, 0)

Shaded area is the required area given by

\[ A = \int_0^9 \left[ \frac{x^3}{2} - \frac{x}{2} - 3x \right] dx = \left[ \frac{x^{3/2}}{3} - \frac{x^2}{2} - 3x \right]_0^9 \]

\[ = \frac{2 \times 27}{3} - \frac{1}{2} \left[ 81 - 27 - 9 + 9 \right] \]

\[ = \frac{54}{3} - \frac{1}{2} [18] = 18 - 9 = 9 \text{ sq. units} \]

24. (a) \[ \int_0^{t^2} xf(x) \, dx = \frac{2}{5} f^5 \quad \text{(Here, } t > 0) \]

Differentiating both sides w.r.t. \( t \)

[Using Leibnitz theorem]

\[ t^2 f(t^2) \times 2t - 0 = \frac{2}{5} \times 5t^4 \Rightarrow f(t^2) = t \]

Put \( t = \frac{2}{5} \Rightarrow f\left( \frac{4}{25} \right) = \frac{2}{5} \]

25. (b) \[ I = \int_0^1 \frac{1-x}{\sqrt{1+x}} \, dx \]

\[ = \int_0^1 \frac{1-x}{\sqrt{1-x^2}} \, dx \]

\[ = \frac{\pi}{2} + \frac{1}{2} \left[ 2\sqrt{1-x^2} \right]_0^1 = \frac{\pi}{2} + (0-1) = \frac{\pi}{2} - 1 \]

26. (a) \[ y = ax^2 \quad \text{and } x = ay^2 \]

Points of intersection are \( O(0,0) \) and \( A \left( \frac{1}{a} \right) \)

\[ \therefore \text{ Area } = \int_0^{1/a} \left( \frac{x}{a} - ax^2 \right) dx = \frac{2}{3a^2} - \frac{1}{3a^2} \]

\[ = \frac{1}{3a^2} = 1 \Rightarrow a = \pm \frac{1}{\sqrt{3}} \]

27. (c) \[ I = \int_{-2}^0 [x^3 + 3x^2 + 3x + (x+1)\cos(x+1)] \, dx \]

\[ = \left[ \frac{x^4}{4} + x^3 + \frac{3x^2}{2} + 3x + (x+1)\sin(x+1) + \cos(x+1) \right]_2^0 \]

\[ = (\sin 1 + \cos 1) - (4 - 8 + 6 + \sin 1 + \cos 1) = 4 \]

28. (d) The given curves are

\[ y = (x+1)^2 \quad \ldots (1) \]

upward parabola with vertex at \(-1, 0\) meeting y-axis at \((0, 1)\)

\[ y = (x-1)^2 \quad \ldots (2) \]

upward parabola with vertex at \((1, 0)\) meeting y-axis at \((0, 1)\)

\[ y = 1/4 \quad \ldots (3) \]

a line parallel to x-axis meeting (1) at \( \left( \frac{1}{2} \right) \), (1) at \( \left( \frac{3}{2}, \frac{1}{4} \right) \)

The graph is as shown
The required area is the shaded portion given by ar \(BPCOQB) = 2 \text{ Ar}(PQCP)\) (by symmetry)

\[
2 \left[ \frac{1}{2} \int_0^{1/2} \left( (x-1)^2 - \frac{1}{4} \right) dx \right] = 2 \left[ \frac{1}{3} \frac{x-1}{3} - \frac{x}{4} \right]_{0}^{1/2}
\]

\[
= 2 \left[ \frac{(-\frac{1}{24} - \frac{1}{8}) - (-\frac{1}{3})} {4} \right] = 2 \left[ -\frac{1-3+8}{24} \right] = \frac{1}{3} \text{ sq. units.}
\]

29. (b) The given curves are

\[y = \sqrt{\frac{1 + \sin x}{\cos x}} = \sqrt{\frac{1 + \tan \frac{x}{2}}{1 - \tan \frac{x}{2}}} \quad \ldots (1)\]

and \[y = \sqrt{\frac{1 - \sin x}{\cos x}} = \sqrt{\frac{1 - \tan \frac{x}{2}}{1 + \tan \frac{x}{2}}} \quad \ldots (2)\]

\[\therefore \text{ The area bounded by the above curves, by the lines} \]

\[x = 0 \text{ and } x = \frac{\pi}{4} \text{ is given by}\]

\[A = \int_0^{\pi/4} \left( \sqrt{\frac{1 + \tan \frac{x}{2}}{1 - \tan \frac{x}{2}}} - \sqrt{\frac{1 - \tan \frac{x}{2}}{1 + \tan \frac{x}{2}}} \right) dx\]

\[= \int_0^{\pi/4} \frac{2 \tan \frac{x}{2}}{1 - \tan^2 \frac{x}{2}} dx\]

\[= \frac{\pi}{8} \int_0^{\pi/4} \frac{dt}{1 - \tan^2 \frac{t}{2}} = \frac{\pi}{8} \tan^{-1} \frac{t}{\sqrt{2}} \bigg|_0^{\pi/4} = \frac{\pi}{8} \tan^{-1} \frac{\pi}{4}\]

30. (c) Given that \(f(x)\) is a non-negative function defined on \([0, 1]\) and \(\int_0^x \sqrt{1 - (f'(t))^2} dt = \int_0^x f(t) dt, \ 0 \leq x \leq 1\)

Differentiating both sides with respect to \(x\), we get

\[\sqrt{1 - [f'(x)]^2} = f(x)\]

\[\Rightarrow 1 - [f'(x)]^2 = (f(x))^2 \Rightarrow [f'(x)]^2 = 1 - (f(x))^2\]

\[\Rightarrow \frac{d}{dx} f(x) = \pm \sqrt{1 - (f(x))^2} = \pm \frac{d f(x)}{\sqrt{1 - (f(x))^2}} = dx\]

Integrating both sides with respect to \(x\), we get

\[\pm \int \frac{d f(x)}{\sqrt{1 - (f(x))^2}} = \int dx \Rightarrow \pm \sin^{-1} f(x) = x + C\]

\[\therefore \text{ Given that } f(0) = 0 \Rightarrow C = 0\]

Hence, \(f(x) = \pm \sin x\)

But as \(f(x)\) is a non-negative function on \([0, 1]\)

\[\therefore f(x) = \sin x\]

Now \(\sin x < x, \forall x > 0\)

\[\therefore f\left(\frac{1}{2}\right) < \frac{1}{2} \quad \text{and} \quad f\left(\frac{1}{3}\right) < \frac{1}{3}\]

31. (b) \[\lim_{x \to 0} \frac{\sin x}{x} = \lim_{t \to 0} \frac{\sin t}{t} = 1 \quad \ldots (0 \text{ form})\]

Applying L’Hospital’s rule, we get

\[x \ln(1 + x)\]

\[= \lim_{x \to 0} \frac{x \ln(1 + x)}{3x^2} = \lim_{x \to 0} \frac{\ln(1 + x)}{x} \cdot \frac{1}{3(x^2 + 4)\text{ form}}\]

\[= \frac{1}{12}\]

32. (b) \(e^{-x} f(x) = 2 + \int_0^x \sqrt{1 + t^2} dt \ \forall x \in (-1, 1)\)

At \(x = 0, f(0) = 2\)

Now on differentiating, we get

\[-e^{-x} f(x) + e^{-x} f'(x) = 0 \Rightarrow f(x) + f'(x) = 0\]

\[\Rightarrow f(0) + f'(0) = 1 \Rightarrow f'(0) = 3\]

Now \(f^{-1}(f(x)) = x\)

\[\Rightarrow (f^{-1})'(f(x)) f'(x) = 1\]

\[\Rightarrow (f^{-1})'(0) f'(0) = 1 \Rightarrow (f^{-1})'(0) = \frac{1}{3}\]

33. (a) \[I = \frac{1}{2} \int_{\ln 2}^{\ln 3} \frac{2 \sin x^2}{\sin x^2 + \sin(\pi n - x^2)} dx\]

Let \(x^2 = t \Rightarrow 2x dx = dt\)

Also, when \(x = \sqrt{\ln 2}, t = \ln 2\)

when \(x = \sqrt{\ln 3}, t = \ln 3\)

\[\therefore I = \frac{1}{2} \int_{\ln 2}^{\ln 3} \frac{\sin x^2}{\sin x^2 + \sin(\pi n - x^2)} dt \quad \ldots (1)\]

Using \[\int_a^b f(x) dx = \int_a^b f(a + b - x) dx\]

We get, \[I = \frac{1}{2} \int_{\ln 2}^{\ln 3} \frac{\sin(\pi n - x^2)}{\sin x^2 + \sin(\pi n - x^2)} dt \quad \ldots (2)\]

Adding values of \(I\) in equation (1) and (2)

\[2I = \frac{1}{2} \int_{\ln 2}^{\ln 3} 1 dt = \frac{1}{2} (\ln 3 - \ln 2) = \frac{1}{2} \frac{\ln 3}{2} \Rightarrow I = \frac{1}{4} (\ln 3)^2\]
34. (b) \[ R_1 = \int_0^b (x-1)^2 \, dx = \left[ \frac{(x-1)^3}{3} \right]_0^b = \frac{(b-1)^3}{3} + 1 \]

\[ R_2 = \int_b^1 (x-1)^2 \, dx = \left[ \frac{(x-1)^3}{3} \right]_0^1 = \frac{(b-1)^3}{3} \]

As \( R_1 - R_2 = \frac{1}{4} \Rightarrow \frac{2(b-1)^3}{3} + \frac{1}{3} = \frac{1}{4} \)

or \( (b-1)^3 = -\frac{1}{8} \) or \( b-1 = -\frac{1}{2} \) or \( b = \frac{1}{2} \)

35. (c) We have

\[ R_1 = \int_{-1}^{2} x f(x) \, dx = \int_{-1}^{2} (1-x) f(1-x) \, dx \]

[Using \( \int_a^b f(x) \, dx = \int_a^b f(a+b-x) \, dx \)]

\( \Rightarrow R_1 = \int_{-1}^{2} (1-x) f(x) \, dx \) [As \( f(x) = f(1-x) \) on \([-1, 2]\)]

\( \therefore R_1 + R_4 = \int_{-1}^{2} x f(x) \, dx + \int_{-1}^{2} (1-x) f(x) \, dx \)

\( \Rightarrow 2R_1 = \int_{-1}^{2} f(x) \, dx = R_2 \)

36. (b) \[ \int_{-\pi/2}^{\pi/2} \left[ x^2 + \ln \left( \frac{\pi + x}{\pi - x} \right) \right] \cos x \, dx = \int_{-\pi/2}^{\pi/2} x^2 \cos x \, dx + \int_{-\pi/2}^{\pi/2} \ln \left( \frac{\pi + x}{\pi - x} \right) \cos x \, dx \]

\[ = 2 \int_{0}^{\pi/2} x^2 \cos x \, dx + 0 \quad [\text{as } x^2 \cos x \text{ is an even function and } \ln \left( \frac{\pi + x}{\pi - x} \right) \cos x \text{ is an odd function}] \]

\[ = 2 \left[ x^2 \sin x + 2x \cos x - 2 \sin x \right]_{\pi/2}^{\pi/2} \]

\[ = 2 \left( \frac{\pi^2}{4} - 2 \right) = \frac{\pi^2}{2} - 4 \]

37. (b) The rough graph of \( y = \sin x + \cos x \) and \( y = |\cos x - \sin x| \) suggest the required area is

\[ \int_0^{\pi/2} [\sin x + \cos x] - |\cos x - \sin x| \, dx \]

\[ = \int_0^{\pi/4} 2 \sin x \, dx + \int_{\pi/4}^{\pi/2} 2 \cos x \, dx \]

\[ = 2 \left[ (-\cos x)_{\pi/4}^{\pi/2} + (\sin x)_{\pi/4}^{\pi/2} \right] = 2 \sqrt{2} (\sqrt{2} - 1) \]

38. (d) We have \( f(x) - 2f(x) < 0 \)

\( \Rightarrow e^{-2x} f(x) - 2e^{-2x} f(x) < 0 \)

\( \Rightarrow \frac{d}{dx}(e^{-2x} f(x)) < 0 \)

\( \Rightarrow e^{-2x} f(x) \) is strictly decreasing function on \( \left[ \frac{1}{2}, 1 \right] \)

\( \therefore e^{-2x} f(x) < e^{-2} f\left( \frac{1}{2} \right) \) or \( f(x) < e^{2x-1} \)

Also given that \( f(x) \) is positive function so \( f(x) > 0 \)

\( \therefore 0 < f(x) < e^{2x-1} \)

\( \Rightarrow 0 < \int_{1/2}^{1} f(x) \, dx < \int_{1/2}^{1} e^{2x-1} \, dx \)

\( \Rightarrow 0 < \int_{1/2}^{1} f(x) \, dx < \left[ \frac{e^{2x-1}}{2} \right]_{1/2}^{1} \)

\( \Rightarrow \int_{1/2}^{1} f(x) \, dx \in \left( 0, \frac{e-1}{2} \right) \)

39. (a) Let \( I = \int_{\pi/4}^{\pi/2} (2\csc x)^{17} \, dx \)

\[ = \int_{\pi/4}^{\pi/2} \left( \frac{\cos x + \cot x + \csc x - \cot x}{\csc x} \right)^{16} 2\csc x \, dx \]

\[ = \int_{\pi/4}^{\pi/2} \left( \csc x + \cot x + \frac{1}{\csc x + \cot x} \right)^{16} \csc x \, dx \]

Let \( \csc x + \cot x = e^u \)

\( \Rightarrow (- \csc x \cot x - \csc^2 x) \, dx = e^u \, du \)

\( \Rightarrow - \csc x \, dx = du \)

Also at \( x = \frac{\pi}{4}, u = \ln(\sqrt{2} + 1) \)
at \( x = \frac{\pi}{2}, u = \ln 1 = 0 \)

\[
\therefore \quad I = -2 \int_{\ln(\sqrt{2}+1)}^{0} \left( e^u + e^{-u} \right)^6 du
\]

\[
= 2 \int_0^{\ln(\sqrt{2}+1)} \left( e^u + e^{-u} \right)^6 du
\]

40. (a) \[ I = \int_{-\pi/2}^{\pi/2} \frac{x^2 \cos x}{1 + e^x} \; dx \quad \text{...(i)} \]

Applying \( \int_a^b f(x) \; dx = \int_a^b f(a + b - x) \; dx \), we get

\[ I = \int_{-\pi/2}^{\pi/2} \frac{e^x x^2 \cos x}{1 + e^x} \; dx \quad \text{...(ii)} \]

Adding (i) and (ii)

\[ 2I = \int_{-\pi/2}^{\pi/2} x^2 \cos x \; dx = 2 \int_0^{\pi/2} x^2 \cos x \; dx \]

\[ I = \left[ x^2 \sin x + 2x \cos x - 2 \sin x \right]_0^{\pi/2} \]

\[ = \frac{\pi^2}{4} - 2 \]

41. (c) \[ y \geq \sqrt{|x+3|} \Rightarrow y^2 = |x+3| \]

\[ \Rightarrow y^2 = \begin{cases} -(x+3) & \text{if } x < -3 \\ (x+3) & \text{if } x \geq -3 \end{cases} \quad \text{...(i)} \]

Also \( y \leq \frac{x+9}{5} \) and \( x \leq 6 \) \quad \text{...(ii)}

Solving (i) and (ii), we get intersection points as \((1, 2), (6, 3), (-4, 1), (-39, -6)\)

The graph of given region is as follows-

\[ \text{The two curves meet at} \quad mx = x - x^2 \quad \text{or} \quad x^2 = x(1-m), \quad \therefore \quad x = 0, 1-m \]

\[ \int_{p}^{l} (y_1 - y_2) \; dx = \int_{p}^{l} (x - x^2 - mx) \; dx \]

Clearly \( m < 1 \) or \( m > 1 \), but \( m \neq 1 \)

Now,

\[
\left( 1 - m \right) \frac{x^2}{2} \left[ 1 - \frac{x^3}{3} \right]_0^{1-m} = \frac{9}{2}, \text{if } m < 1
\]

or \( (1-m)^3 = 27 \), \( \therefore \quad m = -2 \)

But if \( m > 1 \) then \( 1 - m \) is negative, then

\[
\left( 1 - m \right) \frac{x^2}{2} \left[ 1 - \frac{x^3}{3} \right]_0^{-1} = \frac{9}{2}
\]

\[ \therefore \quad (1-m)^3 = -27, \text{or} \quad 1 - m = -3, \quad \therefore \quad m = 4. \]

4. (a, b, c, d)

\[ \therefore f(x) \text{ is a non constant twice differentiable function such that} \quad f(x) = f(1-x) \Rightarrow f'(x) = -f'(1-x) \quad \text{...(1)} \]
Definite Integrals and Applications of Integrals

For \( x = \frac{1}{2} \), we get \( f'(\frac{1}{2}) = -f'(1 - \frac{1}{2}) \)

\( \Rightarrow f'(\frac{1}{2}) + f'(\frac{1}{2}) = 0 \Rightarrow f'(\frac{1}{2}) = 0 \)

(b) is correct

For \( x = \frac{1}{4} \), we get \( f'(\frac{1}{4}) = -f'(\frac{3}{4}) \)

but given that \( f'(\frac{1}{4}) = 0 \)  \( \Rightarrow f'(\frac{1}{4}) = f'(\frac{3}{4}) = 0 \)

doefx satisfies all conditions of Rolle's theorem for

\( x \in \left[ \frac{1}{4}, \frac{1}{4} + \frac{1}{2} \right] \) and \( \frac{1}{4} + \frac{1}{2} \) . So there exists at least one point

\( C_1 \in \left( \frac{1}{4}, \frac{1}{2} \right) \) and at least one point \( C_2 \in \left( \frac{1}{4} + \frac{1}{2}, \frac{1}{2} \right) \). Such that

\( f''(C_1) = 0 \) and \( f''(C_2) = 0 \)

\( \therefore f''(x) \) vanishes at least twice on \([0, 1]\)  \( \Rightarrow \) (a) is correct.

Also using \( f(x) = f(1 - x) \)

\( \Rightarrow f\left( x + \frac{1}{2} \right) = f\left( 1 - x - \frac{1}{2} \right) = f\left( -x + \frac{1}{2} \right) \)

\( \Rightarrow f\left( x + \frac{1}{2} \right) \) is an even function.

\( \Rightarrow \sin x \cdot f\left( x + \frac{1}{2} \right) \) is an odd function.

\( \Rightarrow \int_{-1/2}^{1/2} f\left( x + \frac{1}{2} \right) \sin x \, dx = 0 \),  \( \therefore \) (c) is correct.

5. (b, c, d)

The area bounded by the curve \( y = e^x \) and lines \( x = 0 \) and \( y = e \) is as shown in the graph.

Required area = \( \int_{0}^{1} (e - e^x) \, dx = [ex]_{0}^{1} - \int_{0}^{1} e^x \, dx \)

\( = e - \int_{0}^{1} e^x \, dx \cdot 1 \)

Also required area

\( = \int_{0}^{e} x \, dy \)  \( \text{(where } e^x = y \Rightarrow x = \ln y \text{)} \)

\( = \int_{1}^{e} \ln y \, dy \)

\( = \int_{1}^{e} \ln(e + 1 - y) \, dy \)  \( \left[ \text{Using the property} \right] \)

\( \int_{a}^{b} f(x) \, dx = \int_{a}^{b} f(a + b - x) \, dx \)

6. (a, b, c)

We have

\( I_n = \int_{-\pi}^{\pi} \frac{\sin nx}{(1 + \pi^x) \sin x} \, dx \)

\( \Rightarrow I_n = \int_{-\pi}^{\pi} \frac{\sin nx}{(1 + \pi^{-x}) \sin(-x)} \, dx \)

\( \Rightarrow I_n = \int_{-\pi}^{\pi} \frac{-\sin nx}{(1 + \pi^{-x}) \sin x} \, dx \)

[Using \( \int_{a}^{b} f(x) \, dx = \int_{a}^{b} f(a + b - x) \, dx \)]

\( \Rightarrow I_n = \int_{-\pi}^{\pi} \frac{\pi \sin nx}{(1 + \pi^{-x}) \sin x} \, dx \)  \( \ldots (2) \)

Adding equations (1) and (2), we get

\( 2I_n = \int_{-\pi}^{\pi} \frac{\sin nx}{\sin x} \, dx = 2 \int_{0}^{\pi} \frac{\sin nx}{\sin x} \, dx \)

[as integrand is an even function]

\( \Rightarrow I_n = \int_{0}^{\pi} \frac{\sin nx}{\sin x} \, dx \)

Now \( I_{n+2} - I_n = \int_{0}^{\pi} \frac{\sin(n + 2)x - \sin nx}{\sin x} \, dx \)

\( = \int_{0}^{\pi} \frac{2\cos(n + 1)x \sin x}{\sin x} \, dx = 2\int_{0}^{\pi} \cos(n + 1)x \, dx \)

\( = 2 \left[ \frac{\sin(n + 1)x}{n + 1} \right]_{0}^{\pi} = 0 \)

\( \therefore I_{n+2} = I_n \)

Also \( I_1 = \int_{0}^{\pi} dx = \pi \) and \( I_0 = 0 \)

Hence \( \sum_{m=1}^{10} I_{2m+1} = I_3 + I_5 + I_7 + \ldots + I_{21} \)

\( = 10 \left( \text{using } I_{n+2} = I_n \right) = 10 \pi \)

and \( \sum_{m=1}^{10} I_{2m} = I_2 + I_4 + I_6 + \ldots + I_{20} \)

\( = 20 \times I_0 \left( \text{using } I_{n+2} = I_n \right) \)

\( = 20 \times 0 = 0 \)

7. (a)

\( \int_{0}^{1} x^4(1-x)^4 \, dx = \int_{0}^{1} \left( x^6 - 4x^5 + 5x^4 - 4x^3 + 4 - \frac{4}{1 + x^2} \right) \, dx \)

\( = \left[ \frac{x^7}{7} - 2\frac{x^6}{3} + \frac{5x^5}{5} - 4\frac{x^4}{4} + 4x - 4 \tan^{-1}x \right]_{0}^{1} \)

\( = \frac{1}{7} \left( -\frac{2}{3} + 4 + 4 - \frac{4}{4} \right) \pi = \frac{22}{7} - \pi \)
8. \((b, c)\) We have

\[
f(x) = \ln x + \int_0^x \frac{1}{\sqrt{1+\sin t}} \, dt
\]

\[
\Rightarrow f'(x) = \frac{1}{x} + \frac{1}{\sqrt{1+\sin x}} \text{ which exists } \forall x \in (0, \infty)
\]

and \(f'(x)\) has finite value \(\forall x \in (0, \infty)\), so \(f'(x)\) is continuous

Also \(f''(x) = -\frac{1}{x^2} + \frac{\cos x}{2\sqrt{1+\sin x}}\)

Which does not exist at the points where

\[
\sin x = -1 \text{ like } x = \frac{3\pi}{2}, \frac{7\pi}{2}, ...
\]

\[
\therefore f'(x) \text{ is not differentiable.}
\]

\(\therefore (a)\) is false but \((b)\) is true

Now \(\sqrt{1+\sin t} \geq 0 \Rightarrow \int_0^x \frac{1}{\sqrt{1+\sin t}} \, dt \geq 0 \forall x \in (0, \infty)\)

And \(\ln x > 0 \forall x \in (1, \infty) \Rightarrow f(x) > 0 \forall x \in (1, \infty)\)

For \(x \geq e^3\)

\[
f(x) = \ln x + \int_0^x \frac{1}{\sqrt{1+\sin t}} \, dt \geq 3
\]

\[
f'(x) = \frac{1}{x} + \frac{1}{\sqrt{1+\sin x}} \leq \frac{1}{x} + \sqrt{2}, \forall x > 0
\]

Now for \(x \geq e^3\)

\[
\Rightarrow 0 < f'(x) \leq \frac{1}{x} + \sqrt{2} < \frac{1}{e^3} + \sqrt{2} < 3 \forall x \in (e^3, \infty)
\]

\[
\Rightarrow |f'(x)| < |f(x)|
\]

\(\therefore (c)\) is true.

Also \(\lim_{x \to \infty} f(x) = \infty\)

\(\therefore |f(x)| + |f'(x)|\) is not bounded.

\(\therefore (d)\) is wrong.

9. \((a, b, d)\) First of all let us draw a rough sketch of \(y = e^{-x}\).

At \(x = 0, y = 1\) and at \(x = 1, y = 1/e\)

Also \(\frac{dy}{dx} = -2te^{-x^2} < 0 \forall x \in (0, 1)\)

\(\therefore y = e^{-x^2}\) is decreasing on \((0, 1)\)

Hence its graph is as shown in figure given below

\[
\begin{align*}
&A(0, 1) \quad P \quad Q \\
&M \quad T \quad B\left(1, \frac{1}{e}\right) \\
&O \quad S \quad R \\
&X
\end{align*}
\]

\[
\text{Now, } S = \text{area enclosed by curve } ABRO
\]

and area of rectangle ORBM = \(\frac{1}{e}\)

Clearly \(S > \frac{1}{e}\) \(\therefore A\) is true.

Also \(x^2 < x \forall x \in [0, 1]\)

\[
\Rightarrow -x^2 > -x \Rightarrow e^{-x^2} \geq e^{-x} \forall x \in [0, 1]
\]

\[
\Rightarrow \int_0^1 e^{-x^2} \, dx \geq \int_0^1 e^{-x} \, dx = 1 - \frac{1}{e}
\]

\(\Rightarrow S > 1 - \frac{1}{e}\) \(\therefore (b)\) is true.

Now \(S < \text{area of rectangle APSO + area of rectangle CSRN}\)

\[
\Rightarrow S < \frac{1}{\sqrt{2}} \times 1 + \left(1 - \frac{1}{\sqrt{2}}\right) \frac{1}{\sqrt{e}}
\]

\(\therefore S < \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{e}} \left(1 - \frac{1}{\sqrt{2}}\right) \quad \therefore (d)\) is true

Also as \(\frac{1}{4} \left(1 + \frac{1}{\sqrt{e}}\right) < 1 - \frac{1}{e}\) \(\therefore (c)\) is incorrect.

10. \((a, c)\) Let \(F(t) = e^t \sin^6 at + \cos^6 at\)

Then \(F(k\pi + t) = e^{k\pi + t} \sin^6 (k\pi + t)a + \cos^6 (k\pi + t)a\)

\(\Rightarrow F(k\pi + t) = e^{k\pi} e^t \sin^6 at + \cos^6 at\) for even values of \(a\).

\(\therefore F(k\pi + t) = e^{k\pi} F(t) \quad \cdots (i)\)

Now \(\int_0^{4\pi} F(t) \, dt = \int_0^{2\pi} F(t) \, dt + \int_2^{2\pi} F(t) \, dt + \int_0^{3\pi} F(t) \, dt + \int_{3\pi}^{4\pi} F(t) \, dt\)

Also \(\int_0^{2\pi} F(t) \, dt = \int_0^{\pi} F(\pi + x) \, dx\) (putting \(t = \pi + x\))

\(\Rightarrow \int_0^{\pi} e^t F(x) \, dx \text{ using eqn}(i) = e^t \int_0^{\pi} F(t) \, dt\)

Similarly \(\int_0^{3\pi} F(t) \, dt = \int_0^{2\pi} F(t) \, dt + \int_2^{3\pi} F(t) \, dt + \int_0^{3\pi} F(t) \, dt\)

\(\Rightarrow \int_0^{4\pi} F(t) \, dt = e^{3\pi} \int_0^{\pi} F(t) \, dt\)

\(\therefore \int_0^{4\pi} F(t) \, dt = (1 + e^\pi + e^{2\pi} + e^{3\pi}) \int_0^{\pi} F(t) \, dt\)

\(\Rightarrow \frac{\int_0^{4\pi} F(t) \, dt}{\int_0^{\pi} F(t) \, dt} = \frac{e^{4\pi} - 1}{e^{\pi} - 1}, \text{ where } 'a' \text{ can take any even value.}\)

11. \((a, b)\) \(f(x) = 7 \tan^8 x + 7\tan^6 x - 3\tan^4 x - 3\tan^2 x\)

\(= (7\tan^4 x - 3) (\tan^4 x + \tan^2 x)\)

\(= (7\tan^6 x - 3\tan^2 x) \sec^2 x\)

\(\Rightarrow \int_0^{\pi/4} f(x) \, dx = \left[ \tan^7 x - \tan^3 x \right]_0^{\pi/4} = 1 - 1 = 0\)
Definite Integrals and Applications of Integrals

\[ \int_{0}^{\pi/4} x f(x) \, dx = \left[ x \left( \tan^7 x - \tan^3 x \right) \right]_{0}^{\pi/4} - \int_{0}^{\pi/4} \left( \tan^7 x - \tan^3 x \right) \, dx \]

\[ = \int_{0}^{\pi/4} \tan^3 x (1 - \tan^2 x) \sec^2 x \, dx = \left[ \frac{\tan^4 x}{4} - \frac{\tan^6 x}{6} \right]_{0}^{\pi/4} \]

\[ = \frac{1}{12} \]

12. (d) \( f(x) = \frac{192x^3}{2 + \sin^4 \pi x} \)

\[ \Rightarrow \frac{192x^3}{3} \leq f'(x) \leq \frac{192x^3}{2} \Rightarrow 64x^3 \leq f'(x) \leq 96x^3 \]

\[ \Rightarrow \int_{1/2}^{x} 64x^3 \, dx \leq \int_{1/2}^{x} f'(x) \, dx \leq \int_{1/2}^{x} 96x^3 \, dx \]

\[ \Rightarrow \frac{64x^4}{4} - \frac{64x^4}{16} \leq \int_{1/2}^{x} f'(x) \, dx \leq \frac{96x^4}{4} - \frac{96}{4 \times 16} \]

\[ \Rightarrow 16x^4 - 1 \leq \int_{1/2}^{x} f'(x) \, dx \leq 24x^4 - \frac{3}{2} \]

\[ \Rightarrow 16x^4 - 1 \leq f(x) \leq 24x^4 - \frac{3}{2} \]

\[ \Rightarrow \int_{1/2}^{1} (16x^4 - 1) \, dx \leq \int_{1/2}^{1} f(x) \, dx \leq \int_{1/2}^{1} (24x^4 - \frac{3}{2}) \, dx \]

\[ \Rightarrow \left( \frac{16x^5}{5} - x \right)_{1/2}^{1} \leq \int_{1/2}^{1} f(x) \, dx \leq \left[ \frac{24x^5}{5} - \frac{3}{2}x \right]_{1/2}^{1} \]

\[ \Rightarrow 2.6 \leq \int_{1/2}^{1} f(x) \, dx \leq 3.9 \]

\[ \therefore \text{Only (d) is the correct option.} \]

13. (b, c)

\[ f(x) = \lim_{n \to \infty} \left[ \frac{n^n (x + n)}{n!(x^2 + n^2)} \left( \frac{x + n}{2} \right) \left( \frac{x + n}{3} \right) \cdots \left( \frac{x + n}{n} \right) \right]^{\gamma x/n} \]

\[ = \lim_{n \to \infty} \left[ \frac{n^{2n} \gamma^n (x + n)}{n! \left( \frac{x^2 + n^2}{2} \right) \left( \frac{x + n}{2} \right) \left( \frac{x + n}{3} \right) \cdots \left( \frac{x + n}{n} \right)} \right]^{\gamma x/n} \]

\[ = \lim_{n \to \infty} \left[ \frac{\left( \frac{x + 1}{n} \right) \left( \frac{x + 1}{n} \right) \cdots \left( \frac{x + 1}{n} \right)}{\left( \frac{x^2 + 1}{n^2} \right) \left( \frac{x^2 + 1}{n^2} \right) \cdots \left( \frac{x^2 + 1}{n^2} \right)} \right]^{\gamma x/n} \]

\[ \Rightarrow \ln f(x) = \lim_{n \to \infty} \frac{x}{n} \sum_{r=1}^{n} \ln \left( \frac{x + 1}{n} \right) - \sum_{r=1}^{n} \ln \left( \frac{rx^2 + 1}{n^2} \right) \]

E. Subjective Problems

1. To find the area bounded by

\[ x^2 = 4y \]

which is an upward parabola with vertex at (0, 0).

and \( x - 4y = -2 \) or \( \frac{x}{-2} + \frac{y}{1/2} = 1a \)

which is a straight line with its intercepts as -2 and 1/2 on axes. For Pt's of intersection of (1) and (2) putting value of 4y from (2) in (1) we get

\[ x^2 = x + 2 \Rightarrow x^2 - x - 2 = 0 \Rightarrow (x - 2)(x + 1) = 0 \]

\[ \Rightarrow x = 2, -1 \Rightarrow y = 1, 1/4 \]

\[ \therefore A(-1, 1/4)B(2, 1). \]
Shaded region in the fig is the req area.

\[ \text{Required area} = \int_{-1}^{1} (y_{\text{line}} - y_{\text{parabola}}) \, dx \]

\[ = \int_{-1}^{1} \left( \frac{x + 2 - x^2}{4} \right) \, dx = \left[ \frac{x^2}{2} + 2x - \frac{x^3}{3} \right]_{-1}^{1} \]

\[ = \frac{1}{4} \left[ 1 + 2(2) - 1 \right] = 9/8 \text{ sq. units} \]

2. We know that in integration as a limit sum

\[ \int_{0}^{1} f(x) \, dx = \lim_{n \to \infty} \sum_{r=1}^{n} f(r/n) \]

Similarly the given series can be written as

\[ \lim_{n \to \infty} \left( \frac{1}{n+1} + \frac{1}{n+2} + \ldots + \frac{1}{2n} \right) = \lim_{n \to \infty} \sum_{r=1}^{n} \frac{1}{n+r} \]

\[ = \lim_{n \to \infty} \frac{1}{n} \sum_{r=1}^{n} \frac{1}{1 + \frac{r}{n}} \]

\[ = \int_{0}^{1} \frac{1}{1+x} \, dx = \left[ \log |1+x| \right]_{0}^{1} = \log 2 - \log 1 = \log 2 \]

3. Let \( I = \int_{0}^{\pi} x f(\sin x) \, dx \)

\[ \Rightarrow I = \int_{0}^{\pi} (\pi - x) f(\sin x) \, dx \]

Adding (1) and (2), we get, \( 2I = \int_{0}^{\pi} \pi f(\sin x) \, dx \)

\[ I = \frac{\pi}{2} \int_{0}^{\pi} f(\sin x) \, dx \]

Hence Proved.

4. \( \int_{-1}^{1} |x \sin \pi x| \, dx \)

For \(-1 \leq x < 0 \Rightarrow -\pi < p \cdot x < 0 \Rightarrow \sin \pi x < 0 \)

\[ \Rightarrow x \sin \pi x > 0 \]

For \(1 < x < 3/2 \Rightarrow \pi < \pi x < 3\pi/2 \Rightarrow \sin \pi x < 0 \)

\[ \Rightarrow x \sin \pi x < 0 \]

\[ \therefore \int_{-1}^{1} |x \sin \pi x| \, dx = \int_{-1}^{1} x \sin \pi x \, dx + \int_{-1}^{1/2} (-x \sin \pi x) \, dx \]

\[ = \frac{1}{2} \int_{-1}^{1} x \sin \pi x \, dx \]

\[ = 2 \left[ \frac{-x \cos \pi x}{\pi^2} + \frac{\sin \pi x}{\pi^2} \right]_{0}^{1/2} \]

\[ = 2 \left[ \frac{-1}{2} \frac{1}{\pi^2} + \frac{0}{\pi^2} \right] - \left[ \frac{-1}{2} \frac{1}{\pi^2} + \frac{\pi}{\pi^2} \right] \]

\[ = 2 \left[ \frac{-1}{2} \frac{1}{\pi^2} \right] \]

5. Let \( P(t) \) and \( Q(-t) \) be two points on the hyperbola.

\[ \text{Area} \ (PRQOP) = \int_{-t}^{t} y \, dx = \int_{-t}^{t} \left( 2 \frac{e^{t} + e^{-t}}{2} \right) \, dt \]

\[ = \int_{-t}^{t} \left( \frac{e^{t} - e^{-t}}{2} \right) \, dt = \int_{-t}^{t} \left( \frac{e^{2t} + e^{-2t} - 2}{4} \right) \, dt \]

\[ = \frac{1}{2} \left( e^{2t} - e^{-2t} \right) \bigg|_{-t}^{t} \]

\[ = \frac{1}{2} \left( 2e^{2t} - 2e^{-2t} - 4t \right) \]

\[ = e^{2t} - e^{-2t} - t \]

6. \( I = \int_{0}^{\pi/4} \sin x + \cos x \, dx \)

Let \( \sin x - \cos x = t \Rightarrow \cos x = 0, t \to -1 \) as \( x \to \pi/4, t \to 0 \)

\[ \Rightarrow (\cos x + \sin x) \, dx = dt \]

Also, \( t^2 = 1 - \sin 2x \Rightarrow \sin 2x = 1 - t^2 \)

\[ I = \int_{0}^{\pi/4} \frac{dt}{16(1-t^2)} = \int_{-1}^{1} \frac{dt}{25 - 16t^2} \]

\[ = \frac{1}{16} \left[ \frac{5}{4} \right]^{1/2} - t^2 \]

\[ = \frac{1}{16} \left[ \frac{5}{4} \right]^{1/2} - t^2 \]

\[ = \frac{1}{16} \left[ \frac{5}{4} \right]^{1/2} - t^2 \]

\[ = \frac{1}{16} \left[ \frac{5}{4} \right]^{1/2} - t^2 \]

\[ = \frac{1}{16} \left[ \frac{5}{4} \right]^{1/2} - t^2 \]

\[ = \frac{1}{16} \left[ \frac{5}{4} \right]^{1/2} - t^2 \]

\[ = \frac{1}{16} \left[ \frac{5}{4} \right]^{1/2} - t^2 \]
Definite Integrals and Applications of Integrals

\[ = \frac{1}{40} \left[ \log 1 - \log \frac{1}{9} \right] = \frac{\log 9}{40} = \frac{2 \log 3}{40} = \frac{1}{20} \log 3 \]

7. \( y = 1 + \frac{8}{x^2} \)

Req. area = \( \int_{2}^{4} y \, dx = \int_{2}^{4} \left( 1 + \frac{8}{x^2} \right) \, dx = \left[ x - \frac{8}{x} \right]_{2}^{4} = 4 \)

If \( x = 4a \) bisects the area then we have

\[ \int_{2}^{a} \left( 1 + \frac{8}{x^2} \right) \, dx = \left[ x - \frac{8}{x} \right]_{2}^{a} = \frac{a - 8}{a} - 4 = \frac{4}{2} \]

\( \Rightarrow a - \frac{8}{a} = 0 \Rightarrow a^2 = 0 \Rightarrow a = \pm 2\sqrt{2} \)

Since \( 2 < a < 4 \)

\( \therefore a = 2\sqrt{2} \)

8. Let \( I = \int_{0}^{\pi/2} \frac{x \sin^{-1} x}{\sqrt{1-x^2}} \, dx \)

Put \( x = \sin \theta \) \( \Rightarrow \, dx = \cos \theta \, d\theta \)

Also when \( x = 0, \theta = 0 \)

and when \( x = 1/2, \theta = \pi/6 \)

Thus, \( I = \int_{0}^{\pi/6} \frac{\sin \theta \sin^{-1} (\sin \theta)}{\sqrt{1 - \sin^2 \theta}} \cos \theta \, d\theta \)

\( \Rightarrow \, I = \int_{0}^{\pi/6} \theta \cos \theta \, d\theta \)

Integrating the above by parts, we get

\( I = \left[ \theta (\sqrt{\cos \theta}) \right]_{0}^{\pi/6} + \int_{0}^{\pi/6} 1 \cos \theta \, d\theta \)

\( = \left[ \theta \sqrt{\cos \theta} \right]_{0}^{\pi/6} = \frac{\pi}{6} \cdot \frac{\sqrt{3}}{2} + 2 = \frac{6 - \pi \sqrt{3}}{12} \)

9. To find the area bold by x - axis and curves

\( y = \tan x, -\pi/3 \leq x \leq \pi/3 \)

and \( y = \cot x, \pi/6 \leq x \leq 3\pi/2 \)

The curves intersect at \( P \), where \( \tan x = \cot x \), which is satisfied at \( x = \pi/4 \) within the given domain of \( x \).

The required area is shaded area

\[ A = \int_{\pi/6}^{\pi/4} \tan x \, dx + \int_{\pi/4}^{\pi/3} \cot x \, dx \]

\[ = \left[ \log \sec x \right]_{\pi/6}^{\pi/4} + \left[ \log \sin x \right]_{\pi/4}^{\pi/3} \]

\[ = \left( \log \sqrt{2} - \log \frac{2}{\sqrt{3}} \right) + \left( \log 2 - \log \frac{1}{\sqrt{2}} \right) \]

\[ = 2 \left( \log \sqrt{2} - \log 2 \right) = 2 \log \sqrt{2} = \log 3/2 \text{ sq. units} \]

10. Let \( I = \int f(x) \, dx = F(x) + c \)

Then \( F'(x) = f(x) \) \hspace{1cm} \cdots (1)

Now \( I = \int_{a}^{a+t} f(x) \, dx = F(a + t) - F(a) \)

\[ \therefore \frac{dI}{da} = F'(a + t) - F(a) = f(a + t) - f(a) \]

[Using eq. (1)]

\[ = f(a) - f(a) \] [Using given condition]

\[ = 0 \]

This shows that \( I \) is independent of \( a \).

11. Let \( I = \int_{0}^{\pi/2} \frac{x \sin x \cos x}{\cos^4 x + \sin^4 x} \, dx \) \hspace{1cm} \cdots (1)

\[ I = \int_{0}^{\pi/2} \frac{(\pi/2 - x) \sin(\pi/2 - x) \cos(\pi/2 - x)}{\cos^4(\pi/2 - x) + \sin^4(\pi/2 - x)} \, dx \]

[Using eq. (1)]

\[ = \int_{0}^{\pi/2} \frac{a}{\sin^4 x + \cos^4 x} \, dx \]

\[ \Rightarrow \, I = \frac{\pi}{2} \int_{0}^{\pi/2} \frac{\sin x \cos x}{\sin^4 x + \cos^4 x} \, dx \]

Adding (1) and (2), we get

\[ 2I = \frac{\pi}{2} \int_{0}^{\pi/2} \frac{\sin x \cos x}{\sin^4 x + \cos^4 x} \, dx \]

\[ \Rightarrow \, I = \frac{\pi}{4} \int_{0}^{\pi/2} \frac{\sec^2 x \tan x}{\tan^4 x + 1} \, dx \]

(Dividing Nr and Dr by \( \cos^4 x \))

\[ = \frac{\pi}{2} \int_{0}^{\pi/2} \frac{2 \tan x \sec^2 x \, dx}{1 + (\tan^2 x)^2} \]

Put \( \tan^2 x = t \) \( \Rightarrow \, 2 \tan x \sec^2 x \, dx = dt \)

Also as \( x \to 0, t \to 0; \text{ as } x \to \pi/2, t \to \infty \)

\[ \therefore \, I = \frac{\pi}{8} \int_{0}^{\pi/2} \frac{dt}{1 + t^2} = \frac{\pi}{8} \left[ \tan^{-1} t \right]_{0}^{\pi/2} = \frac{\pi}{8} \left[ \pi/2 - 0 \right] = \pi^2 / 16 \]
12. The given curves are

\[ y = \sqrt{5-x^2} \quad \ldots \text{(1)} \]
\[ y = x - 1 \quad \ldots \text{(2)} \]

We can clearly see that (on squaring both sides of (1)) eq. (1) represents a circle. But as \( y \) is +ve sq. root, \( \therefore \) (1) represents upper half of circle with centre \((0,0)\) and radius \(\sqrt{5}\).

Eq. (2) represents the curve

\[ y = \begin{cases} -x + 1 & \text{if } x < 1 \\ x - 1 & \text{if } x \geq 1 \end{cases} \]

Graph of these curves are as shown in figure with point of intersection of \( y = \sqrt{5-x^2} \) and \( y = -x + 1 \) as \( A(-1,2) \) and of \( y = \sqrt{5-x^2} \) and \( y = x - 1 \) as \( C(2,1) \).

The required area = Shaded area

\[
\frac{2}{0} \left( y_{(1)} - y_{(2)} \right) dx = \frac{2}{-1} \left( \sqrt{5-x^2} \right) dx - \frac{2}{-1} \left( x - 1 \right) dx
\]

\[
= \left[ \frac{\sqrt{5-x^2}}{2} + \frac{5}{2} \sin^{-1} \left( \frac{x}{\sqrt{5}} \right) \right]^2 - \left[ \frac{\sin^{-1} \left( -\frac{1}{2} \right)}{2} \right]^2 - \left( x - 1 \right) dx
\]

\[
= \left[ \frac{\sqrt{5-x^2}}{2} + \frac{5}{2} \sin^{-1} \left( \frac{x}{\sqrt{5}} \right) \right]^2 - \left( \frac{\sin^{-1} \left( -\frac{1}{2} \right)}{2} \right)^2 - \left( x - 1 \right) dx
\]

\[
= 1 + \frac{5}{2} \sin^{-1} \left( \frac{1}{\sqrt{5}} \right) + 1 + \frac{5}{2} \sin^{-1} \left( \frac{1}{\sqrt{5}} \right)
\]

\[
= 2 + \frac{5}{2} \sin^{-1} \left( \frac{1}{\sqrt{5}} \right)
\]

\[
= \frac{5\pi - 2}{4} \text{ square units.}
\]

13. Let \( I = \int_{0}^{\pi} \frac{x dx}{1 + \cos \alpha \sin x} \quad \ldots \text{(1)} \)

\( I = \int_{0}^{\pi} \frac{(\pi - x) dx}{1 + \cos \alpha (\sin(\pi - x))} \)

\[ \text{Using } \int_{0}^{a} f(x) dx = \int_{0}^{a} f(a-x) dx \]

\[ \therefore \quad I = \int_{0}^{\pi} \frac{(\pi - x) dx}{1 + \cos \alpha \sin x} \quad \ldots \text{(2)} \]

Adding (1) and (2), we get

\[ 2I = \int_{0}^{\pi} \frac{x + \pi - x}{1 + \cos \alpha \sin x} dx = \int_{0}^{\pi} \frac{\pi}{1 + \cos \alpha \sin x} dx \]

\[ \therefore \quad I = \frac{\pi}{2} \int_{0}^{\pi/2} \frac{1}{1 + \cos \alpha \sin x} dx \]

\[ = \pi \int_{0}^{\pi/2} \frac{1}{1 + \frac{2\tan x/2}{1 + \tan^2 x/2}} dx \]

Put \( \frac{x}{2} = t, \quad \frac{1}{2} \sec^2 x/2 dx = dt \Rightarrow \sec^2 x/2 dx = 2dt \)

Also when \( x \to 0, t \to 0 \) as \( x \to \pi/2, t \to 1 \)

\[ \therefore \quad I = \pi \int_{0}^{1} \frac{2dt}{t^2 + (2\cos \alpha)t + 1} \]

\[ = 2\pi \int_{0}^{1} \frac{dt}{(t + \cos \alpha)^2 + 1 - \cos^2 \alpha} = 2\pi \int_{0}^{1} \frac{dt}{(t + \cos \alpha)^2 + \sin^2 \alpha} \]

\[ = 2\pi \int_{0}^{\sin \alpha} \left[ \tan^{-1} \left( \frac{t + \cos \alpha}{\sin \alpha} \right) \right]_0^1 \]

\[ = 2\pi \int_{0}^{\sin \alpha} \left[ \tan^{-1} \left( \frac{1 + \cos \alpha}{\sin \alpha} \right) - \tan^{-1} \left( \frac{\cos \alpha}{\sin \alpha} \right) \right] \]

\[ = 2\pi \int_{0}^{\sin \alpha} \left[ \tan^{-1} \left( \frac{2 \cos^2 \alpha / 2}{2 \sin \alpha / 2 \cos \alpha / 2} \right) - \tan^{-1} \left( \cot \alpha \right) - \tan^{-1} \left( \cot \alpha / 2 \right) \right] \]

\[ = 2\pi \int_{0}^{\sin \alpha} \left[ \tan^{-1} \left( \tan^{-1}(\pi/2 - \alpha/2) \right) - \tan^{-1}(\tan(\pi/2 - \alpha)) \right] \]

\[ = 2\pi \int_{0}^{\sin \alpha} \left[ \frac{\pi}{2} - \frac{\alpha}{2} - \frac{\pi}{2} + \alpha \right] \]

\[ = \frac{\pi \alpha}{\sin \alpha} \]

14. We have to find the area bounded by the curves

\[ x^2 + y^2 = 25 \quad \ldots \text{(1)} \]
\[ 4y = 4 - x^2 \quad \ldots \text{(2)} \]
\[ x = 0 \quad \ldots \text{(3)} \]

and above x-axis.
Definite Integrals and Applications of Integrals

Now, $4y = |4x - x^2| = \begin{cases} 4 - x^2, & \text{if } x^2 < 4 \\ 2x^2, & \text{if } x^2 \geq 4 \end{cases}$

Thus we have three curves

(I) $C$ : Circle $x^2 + y^2 = 25$

(II) $P_1$ : Parabola $y = 4(y - 1), -2 \leq x \leq 2$

(III) $P_2$ : Parabola $x^2 = 4(y + 1), y \geq 2$ or $x \leq -2$

(I) and (II) intersect at $-4 + 4 + y^2 = 25$

or $(y - 2)^2 = 5^2 \therefore y - 2 = \pm 5$

$y = 7, x = -3$

$y = -3, 7$ are rejected since.

$y = -3$ is below x-axis and $y = 7$ gives imaginary value of $x$. So, (I) and (II) do not intersect but II intersects x-axis at $(2, 0)$ and $(-2, 0)$.

(I) and (III) intersect at

$I = 4 + 4 + y^2 = 25$ or $(y + 2)^2 = 5^2$

$y = 3, x = 4$. Hence the points of intersection of (I) and (III) are $(4, 3)$ and $(-4, 3)$. Thus we have the shape of the curve as given in figure.

Tangent (2) meets x-axis at, $L \left( \frac{\pi}{4}, 0 \right)$

Now the required area = shaded area

$\frac{\pi}{4} = \int_0^\frac{\pi}{4} \frac{x}{2}dx - \frac{1}{2} \text{Area(PLM)}$

$= \int_0^\frac{\pi}{4} \tan x dx - \frac{1}{2} \text{Area(PLM)}$

$= [\log \sec x]_0^{\frac{\pi}{4}} \frac{1}{2} \left( \frac{\pi}{4} \right) - \frac{1}{2} \left( \frac{\pi}{2} \right) = \frac{1}{2} \left[ \log 2 - \frac{1}{2} \right] \text{sq.units.}$

16. Let $I = \int_0^1 \log(\sqrt{1 + x} + \sqrt{1 + x}) dx$

Intergrating by parts, we get

$I = \left[ x \log(\sqrt{1 + x} + \sqrt{1 + x}) \right]_0^1 - \int_0^1 \frac{x}{\sqrt{1 + x} + \sqrt{1 + x}} \left( \frac{1}{2\sqrt{1 + x}} + \frac{1}{2\sqrt{1 + x}} \right) dx$

$= \log 2 - \int_0^1 \frac{x}{\sqrt{1 + x} + \sqrt{1 + x}} \left( \frac{1}{2\sqrt{1 + x}} + \frac{1}{2\sqrt{1 + x}} \right) dx$

$= \log 2 + \frac{1}{2} \int_0^1 \frac{x(\sqrt{1 + x} - \sqrt{1 + x})^2}{(1 + x - 1 + x)^2} dx$

$= \log 2 + \frac{1}{2} \int_0^1 \frac{1 + x + 1 - x - 2\sqrt{1 + x}^2}{2\sqrt{1 + x}^2} dx$

$= \log 2 + \frac{1}{2} \int_0^1 \frac{1}{\sqrt{1 - x^2}} dx - \frac{1}{2} \left[ \log(\sin^2 x) \right]_0^1 = \frac{1}{2} \left[ \log 2 + \pi / 2 - 1 \right]$
17. Let \( I = \int_{0}^{a} f(x)g(x) \, dx = \int_{0}^{a} f(a-x)g(a-x) \, dx \)

[Using the prop. \( \int_{0}^{a} f(x) \, dx = \int_{0}^{a} f(a-x) \, dx \)]

\[ = \int_{0}^{a} f(x)(2-g(x)) \, dx \]

As given that \( f(a-x) = f(x) \) and \( g(a-x) + g(x) = 2 \)

\[ = 2 \int_{0}^{a} f(x) \, dx - \int_{0}^{a} f(x)g(x) \, dx \]

\[ \therefore \quad I = 2 \int_{0}^{a} f(x) \, dx - I \]

\[ \Rightarrow \quad 2I = 2 \int_{0}^{a} f(x) \, dx \quad \Rightarrow \quad I = \int_{0}^{a} f(x) \, dx \]

Hence the result.

18. We have, \( I = \int_{0}^{\pi/2} f(\sin 2x) \cos x \, dx \) \hspace{1cm} (1)

\[ I = \int_{0}^{\pi/2} f(\sin 2x) \sin x \, dx \hspace{1cm} (2) \]

[Using property \( \int_{0}^{a} f(x) \, dx = \int_{0}^{a} f(a-x) \, dx \) ]

Adding (1) and (2), we get

\[ 2I = \int_{0}^{\pi/2} f(\sin 2x) \cos x + \sin x \, dx \]

\[ \Rightarrow \quad 2I = 2 \int_{0}^{\pi/4} f(\sin 2x) \sin x + \cos x \, dx \]

[Using the property, \( \int_{0}^{a} f(x) \, dx = 2 \int_{0}^{\pi/4} f(x) \, dx \) when \( f(2a-x) = f(x) \) ]

\[ \Rightarrow \quad I = \int_{0}^{\pi/4} f(\sin 2x) \sin x + \cos x \, dx \]

\[ = \sqrt{2} \int_{0}^{\pi/4} f(\sin 2x) \sin(\pi/4 + x) \, dx \]

\[ = \sqrt{2} \int_{0}^{\pi/4} f \left[ \sin \left( \frac{\pi}{4} + (\pi/4 - x) \right) \right] \sin(\pi/4 + \pi/4 - x) \, dx \]

[Using the property \( \int_{0}^{a} f(x) \, dx = \int_{0}^{a} f(a-x) \, dx \) ]

\[ \Rightarrow \quad I = \sqrt{2} \int_{0}^{\pi/4} f(\cos 2x) \cos x \, dx \]

Hence proved.

19. To prove: \( \frac{\sin 2kx}{x} = 2[\cos x + \cos 3x + \ldots + \cos(2k-1)x] \)

It is equivalent to prove that \( \sin 2kx = 2\sin x \cos x + 2\sin 3x \sin x + \ldots + 2\cos(2k-1)x \sin x \)

Now, R.H.S.

\[ = (\sin 2x) + (\sin 4x - \sin 2x) + (\sin 6x - \sin 4x) + \ldots \]

\[ + (\sin 2kx - \sin(2k-2)x) \]

\[ = \sin 2kx = \text{L.H.S.} \]

Hence proved.

Now \( \int_{0}^{\pi/2} \sin 2k x \cot x \, dx = \int_{0}^{\pi/2} \frac{\sin 2kx}{\sin x} \cos x \, dx \)

\[ = \int_{0}^{\pi/2} 2(\cos x + \cos 3x + \ldots + \cos(2k-1)x) \cos x \, dx \]

[Using the identity proved above]

\[ = \int_{0}^{\pi/2} (2\cos^2 x + 2\cos 3x \cos x + 2\cos 5x \cos x + \ldots + 2\cos(2k-1)x \cos x) \, dx \]

\[ = \int_{0}^{\pi/2} [(1 + \cos 2x) + (\cos 4x + \cos 2x) + (\cos 6x + \cos 4x) + \ldots + (\cos 2kx + \cos(2k-2)x)] \, dx \]

\[ = \int_{0}^{\pi/2} 1 + 2[\cos 2x + \cos 4x + \cos 6x + \ldots + \cos(2k-2)x + \cos 2kx] \, dx \]

\[ = \left[ x + 2 \left[ \frac{\sin 2x}{2} + \frac{\sin 4x}{4} + \frac{\sin 6x}{6} + \ldots + \frac{\sin(2k-2)x}{2k-2} + \frac{\sin 2kx}{2k} \right] \right]_{0}^{\pi/2} \]

\[ = \frac{\pi}{2} \]

[\( \therefore \sin n \pi = 0, \forall n \in N \)]

Hence proved.

20. The given curves are \[ y = e^{x} \log e \] \hspace{1cm} (1)

and \[ y = \frac{\log e \, x}{e} \] \hspace{1cm} (2)

The two curves intersect where \( e^{x} \log e \frac{x}{e} \)

\[ \Rightarrow \left( e \cdot \frac{1}{e} \right) \log x = 0 \Rightarrow x = 1 \text{ or } x = 1 \]

At \( x = 1/e \) or \( x = 1 \), \( \log x = -\log e = -1, y = -1 \)

So that \( \left( \frac{1}{e}, -1 \right) \) is one point of intersection and at \( x = 1, \log 1 = 0 \) \hspace{1cm} \( y = 0 \)

\( \therefore \) \( (1, 0) \) is the other common point of intersection of the curves. Now in between these two points, \( \frac{1}{e} < x < 1 \)
Definite Integrals and Applications of Integrals

or \( \log \left( \frac{1}{e} \right) < \log x < \log 1 \), or \( -1 < \log x < 0 \)

i.e. \( \log x \) is – ve, throughout

\[ y_1 = e \log x, \quad y_2 = \frac{\log x}{e} \]

Clearly under the condition stated above \( y_1 < y_2 \) both being –ve in the interval \( e \frac{1}{e} < x < 1 \).

The rough sketch of the two curves is as shown in fig. and shaded area is the required area.

\[
egin{align*}
\text{Required area} &= \text{Shaded area} \\
&= \int_{1/e}^{1/e} (y_1 - y_2) \, dx \\
&= \int_{1/e}^{1/e} \left[ e \log x - \frac{\log x}{e} \right] \, dx \\
&= e \int_{1/e}^{1/e} x \log x \, dx - \frac{1}{e} \int_{1/e}^{1/e} \log x \, dx \\
&= e \left[ \frac{x^2}{2} \log x - \frac{x^2}{4} \right]_{1/e}^{1/e} - \frac{1}{e} \left[ \frac{(\log x)^2}{2} \right]_{1/e}^{1/e} \\
&= e \left[ \left( \frac{1}{4} - \frac{1}{2e^2} \right) - \frac{1}{2e} \right] - \frac{1}{e} \left[ \frac{1}{2} - \frac{1}{2} \right] \\
&= e \left[ \frac{1}{4} + \frac{3}{4e^2} + \frac{1}{2e^2} \right] - \frac{e}{4} + \frac{1}{2e} \\
&= \frac{5}{4e} - \frac{e^2}{4e} \\
&= \frac{5 - e^2}{4e} \\
\end{align*}
\]

22. We are given that \( f(x) \) is a continuous function and

\[
\int_{0}^{x} f(t) \, dt \to \infty \text{as} \, x \to \infty
\]

To show that every line \( y = mx \) intersects the curve

\[ y^2 + \int_{0}^{x} f(t) \, dt = 2 \]

If possible, let \( y = mx \) intersects the given curve, then Substituting \( y = mx \) in the equation of the curve we get

\[
m^2 x^2 + \int_{0}^{x} f(t) \, dt = 2 \]

Consider \( F(x) = m^2 x^2 + \int_{0}^{x} f(t) \, dt - 2 \)

Then \( F(x) \) is a continuous function as \( f(x) \) is given to be continuous.

Also \( F(x) \to \infty \text{as} \, x \to \infty \)

But \( F(0) = -2 \)

Thus \( F(0) < 0 \) and \( F(b) > 0 \) for some value of \( b \), and \( F(x) \) is continuous.

Therefore \( F(x) = 0 \) for some value of \( x \in (0, b) \) or eq. (1) is solvable for \( x \).

Hence \( y = mx \) intersects the given curve.

23. Let \( I = \int_{0}^{\pi/2} \frac{x \sin(2x) \sin \left( \frac{\pi}{2} \cos x \right)}{2x - \pi} \, dx \)

Consider, \( 2x - \pi = y \) \( \Rightarrow \, dx = \frac{dy}{2} \), Also, \( x = \frac{\pi}{2} + \frac{y}{2} \)

When \( x \to 0, \, y \to -\pi \) when \( x \to \pi, \, y \to \pi \).

\[ \therefore \quad I = \int_{-\pi}^{\pi} \left( \frac{\pi + y}{2} \right) \sin (\pi + y) \sin \left( \frac{\pi}{2} \cos \left( \frac{\pi}{2} + \frac{y}{2} \right) \right) \, dy \]

\[ = \frac{1}{4} \int_{-\pi}^{\pi} \left( \frac{\pi}{2} + \frac{y}{2} \right) (-\sin y) \sin \left( \frac{\pi}{2} \sin \frac{y}{2} \right) \, dy \]

The graph of curves are as shown in the figure.
\[
\int_{-\infty}^{\infty} \sin y \sin(\pi/2) \frac{\sin(y/2)}{y} \, dy \\
\quad + \frac{1}{4} \int_{-\infty}^{\infty} \sin y \sin\left(\frac{\pi}{2} \sin\frac{y}{2}\right) \, dy \\
= \frac{\pi}{4} \int_{-\infty}^{\infty} \sin y \sin\left(\frac{\pi}{2} \sin\frac{y}{2}\right) \, dy \\
= 0 + \frac{1}{4} \int_{0}^{\infty} \sin y \sin\left(\frac{\pi}{2} \sin\frac{y}{2}\right) \, dy
\]

[Using \( \int_{-a}^{a} f(x) \, dx = 0 \) if \( f \) is odd function]

\[
= 2 \int_{0}^{\infty} f(x) \, dx \text{ if } f \text{ is an even function}
\]

\[
: I = \frac{1}{2} \int_{0}^{\infty} 2 \sin y/2 \cos y/2 \sin(\pi/2) \sin(y/2) \, dy
\]

Let \( \sin y/2 = u \Rightarrow \frac{1}{2} \cos y/2 \, dy = du \\
\Rightarrow \cos y/2 \, dy = 2du
\]

Also as \( y \to 0, u \to 0 \) and as \( y \to \infty, u \to 1 \)

\[
: I = \int_{0}^{1} 2u \sin\left(\frac{\pi u}{2}\right) \, du
\]

\[
= \left[ \frac{\cos\frac{\pi u}{2}}{\frac{\pi}{2}} \right]_{0}^{1} + \int_{0}^{1} \frac{2}{\pi} \cos\left(\frac{\pi u}{2}\right) \, du
\]

\[
= 0 + \frac{8}{\pi^2} \left( \frac{\sin\frac{\pi}{2} - 0}{\frac{\pi}{2}} \right) = \frac{8}{\pi^2}
\]

\[
24. \quad \text{The given curves are } y = x^2 \text{ and } y = \frac{2}{1 + x^2}. \text{ Here } y = x^2 \text{ is upward parabola with vertex at origin.}
\]

Also, \( y = \frac{2}{1 + x^2} \) is a curve symm. with respect to y-axis.

At \( x = 0, y = 2 \),
\[
\frac{dy}{dx} = \frac{-4x}{(1 + x^2)^2} < 0 \quad \text{for } x > 0
\]

\( \therefore \) Curve is decreasing on \((0, \infty)\)

Moreover \( \frac{dy}{dx} = 0 \) at \( x = 0 \)

\( \Rightarrow \) At \((0,2)\) tangent to curve is parallel to x-axis.

As \( x \to \infty, y \to 0 \)

\( \therefore y = 0 \) is asymptote of the given curve.

For the given curves, point of intersection : solving their equations we get \( x = 1, y = 1 \), i.e., \((1,1)\).

Thus the graph of two curves is as follows:

\[
\text{The required area } = 2 \int_{0}^{1} \left( \frac{2}{1 + x^2} - x^2 \right) \, dx
\]

\[
= \left( 4 \tan^{-1} x - \frac{2x^3}{3} \right)_{0}^{1} = 4 \cdot \frac{\pi}{4} - \frac{2}{3} = \pi - \frac{2}{3} \text{ sq. units.}
\]

\[
25. \quad \text{Given that } \int_{0}^{1} e^x (x-1)^n \, dx = 16 - 6e
\]

where \( n \in \mathbb{N} \) and \( n \leq 5 \)

To find the value of \( n \).

Let \( I_n = \int_{0}^{1} e^x (x-1)^n \, dx \\
= [(x-1)^n e^x]_0^1 - \int_{0}^{1} n(x-1)^{n-1} e^x \, dx
\]

\[
= (-1)^n - \int_{0}^{1} n(x-1)^{n-1} e^x \, dx
\]

\[
I_n = (-1)^{n+1} - n I_{n-1}
\]

\[\text{......(1)}\]

Also, \( I_1 = \int_{0}^{1} e^x (x-1) \, dx \\
= [e^x (x-1)]_0^1 - \int_{0}^{1} e^x \, dx = (-1) - (e^1)
\]

\[= -e - 1 = 2 - e
\]

Using eq. (1), \( I_2 = (-1)^3 - 2 I_1 = -1 - 2(2-e) = 2e - 5
\]

Similarly, \( I_3 = (-1)^4 - 3 I_2 = 1 - 3(2e - 5) = 16 - 6e
\]

\( \therefore n = 3 \)

\[
26. \quad I = \int_{2}^{3} \frac{2x^5 + x^4 - 3x^3 + 2x^2 + 1}{(x^2 + 1)(x^4 - 1)} \, dx
\]

\[
= \int_{2}^{3} \frac{2x^5 - 2x^3 + x^4 + 2x^2 + 1}{2(x^2 + 1)^2(x^2 - 1)} \, dx
\]

\[
= \int_{2}^{3} \frac{2x^3(x^2 - 1) + (x^4 + 1)^2}{2(x^2 + 1)^2(x^2 - 1)} \, dx
\]

\[
= \int_{2}^{3} \frac{2x^3}{x^2 + 1} \, dx + \int_{2}^{3} \frac{1}{2(x^2 + 1)^2} \, dx
\]

\[
= \int_{2}^{3} \frac{x^2 - 2x}{x^2 + 1} \, dx + \frac{1}{2} \log \frac{x - 1}{x + 1}
\]

\[
= \int_{5}^{10} t^{-1} \, dt + \frac{1}{2} \log \frac{2 - \log \frac{1}{3}}{t^2}
\]

Put \( x^2 + 1 = t, 2x \, dx = dt \\
when \( x = 2, t = 5, \, x = 3, t = 10 \)

\[
= \int_{5}^{10} \left( \frac{1}{t} - \frac{1}{t^2} \right) \, dt + \frac{1}{2} \log \frac{3}{2} = \left( \log |t| + \frac{1}{2} \right)_{5}^{10} + \frac{1}{2} \log \frac{3}{2}
\]

\[
= \log 10 - \log 5 + \frac{1}{2} - \frac{1}{2} = \frac{3}{2}
\]
27. To prove that \( \int_0^{n+\pi} \sin x \, dx = 2n + 1 - \cos \pi \)

Let \( I = \int_0^{n+\pi} \sin x \, dx \)

\[ I = \int_0^n \sin x \, dx + \int_n^{n+\pi} \sin x \, dx \]

Now we know that \( |\sin x| \) is a periodic function of period \( \pi \), So using the property,

\[ \int_a^{a+nT} f(x) \, dx = n \int_0^T f(x) \, dx \]

where \( n \in \mathbb{I} \) and \( f(x) \) is a periodic function of period \( T \)

We get,

\[ I = \int_0^n \sin x \, dx + n \int_0^\pi \sin x \, dx \]

\[ = (-\cos x)|_0^n + n(-\cos x)|_0^\pi = -\cos \pi + 1 + n(1+1) \]

\[ = 2n + 1 - \cos \pi = \text{R.H.S.} \]

28. The given equations of parabola are

\[ y = 4x - x^2 \text{ or } (x - 2)^2 = -(y - 4) \quad \text{......(1)} \]

and \( y = x^2 - x \text{ or } \left(x - \frac{1}{2}\right)^2 = \left(y - \frac{1}{4}\right) \quad \text{......(2)} \)

Solving the equations of two parabolas we get their points of intersection as \( O(0,0), A \left(\frac{5}{2}, \frac{15}{4}\right) \)

Here the area below \( x \)-axis,

\[ A_1 = \int_0^1 (-y_2) \, dx = \int_0^1 (x - x^2) \, dx \]

\[ = \left[ \frac{x^2}{2} - \frac{x^3}{3} \right]_0^1 = \frac{1}{2} \left( \frac{1}{2} - \frac{1}{3} \right) = \frac{1}{6} \text{ sq. units.} \]

Area above \( x \)-axis,

\[ A_2 = \int_0^{5/2} y_1 \, dx - \int_1^{5/2} y_2 \, dx \]

\[ = \int_0^{5/2} (4x - x^2) \, dx - \int_1^{5/2} (x^2 - x) \, dx \]

\[ = \left[ \frac{8x^2}{2} - \frac{x^3}{3} \right]_0^{5/2} - \left[ \frac{x^3}{3} - \frac{x^2}{2} \right]_1^{5/2} \]

\[ = \frac{25}{2} - \frac{125}{24} \quad \text{R.H.S.} \]

\[ = \frac{25}{2} \left( \frac{300 - 250 + 75 - 4}{24} \right) = \frac{121}{24} \]

\[ \therefore \text{ Ratio of areas above } x \text{-axis and below } x \text{-axis.} \]

\[ A_2 : A_1 = \frac{121}{24} : 6 = \frac{121}{4} = 30.25 : 4 \]

29. Given \( I_m = \int_0^\pi \frac{1 - \cos mx}{1 - \cos x} \, dx \)

To prove: \( I_m = m\pi, m = 0, 1, 2, \ldots \)

For \( m = 0 \),

\[ I_0 = \int_0^\pi \frac{1}{1 - \cos x} \, dx = \int_0^\pi \frac{1}{1 - \cos x} \, dx = 0 \]

\[ \therefore \text{ Result is true for } m = 0 \]

For \( m = 1 \),

\[ I_1 = \int_0^\pi \frac{1 - \cos x}{1 - \cos x} \, dx = \int_0^\pi 1 \, dx \]

\[ (x)|_0^\pi = 0 = \pi \]

\[ \therefore \text{ Result is true for } m = 1 \]

Let the result be true for \( m \leq k \text{ i.e. } I_k = k\pi \quad \text{......(1)} \]

Consider \( I_{k+1} = \int_0^\pi \frac{1 - \cos(k + 1)x}{1 - \cos x} \, dx \)

Now, \( 1 - \cos(k + 1)x \)

\[ = 1 - \cos kx \cos x + \sin kx \sin x \]

\[ = 1 + \cos kx \cos x + \sin kx \sin x - 2 \cos kx \cos x \]

\[ = 1 + \cos (k - 1)x - 2 \cos kx \cos x \]

\[ = 2((1 - \cos kx)(1 - \cos x)) - 2 \cos kx \cos x \]

\[ = 2\left(1 - \cos kx + 2 \cos kx \cos x - 2 \cos kx \cos x \right) \]

\[ = 2\left(1 - \cos kx \right) + 2 \cos kx (1 - \cos x) - (1 - \cos kx) \]

\[ \therefore I_{k+1} = \int_0^\pi \frac{2(1 - \cos kx) + 2 \cos kx (1 - \cos x) - (1 - \cos kx) \, dx}{1 - \cos x} \]

\[ = 2\int_0^\pi \frac{1 - \cos kx}{1 - \cos x} \, dx + \int_0^\pi \cos kx \, dx - \int_0^\pi \frac{1 - \cos kx}{1 - \cos x} \, dx \]

\[ = 2I_k + 2\left( \frac{\sin kx}{x} \right)_0^\pi - I_{k-1} \]

\[ = 2(k\pi) + 2(0) - (k - 1)\pi \]

\[ = 2k\pi - k\pi + \pi = (k + 1)\pi \]

Thus result is true for \( m = k + 1 \) as well. Therefore by the principle of mathematical induction, given statement is true for all \( m = 0, 1, 2, \ldots \).
30. Let \( I = \int_{-1/\sqrt{3}}^{1/\sqrt{3}} \frac{x^4}{1-x^4} \cos^{-1} \left( \frac{2x}{1+x^2} \right) \, dx \)

We know that \( \sin^{-1} \left( \frac{2x}{1+x^2} \right) = 2 \tan^{-1} x \)

Also \( \sin^{-1} y + \cos^{-1} y = \frac{\pi}{2} \)

\[ \therefore \quad \frac{\pi}{2} \, \cos^{-1} \left( \frac{2x}{1+x^2} \right) = 2 \tan^{-1} x \]

\[ \Rightarrow \cos^{-1} \left( \frac{2x}{1+x^2} \right) = \frac{\pi}{2} - 2 \tan^{-1} x \]

\[ \therefore \quad I = \int_{-1/\sqrt{3}}^{1/\sqrt{3}} \frac{x^4}{1-x^4} \left[ \frac{\pi}{2} - 2 \tan^{-1} x \right] \, dx \]

\[ = \frac{\pi}{2} \int_{-1/\sqrt{3}}^{1/\sqrt{3}} \frac{x^4}{1-x^4} \, dx - 2 \int_{-1/\sqrt{3}}^{1/\sqrt{3}} \frac{x^4}{1-x^4} \tan^{-1} x \, dx \]

\[ = 2 \frac{\pi}{2} \int_{0}^{1/\sqrt{3}} \frac{x^4}{1-x^4} \, dx - 2 \times 0 \]

\[ = \left[ \text{Using } \int_{a}^{b} f(x) \, dx = 2 \int_{0}^{b} f(x) \, dx \text{ if } f \text{ is even} \right] \]

\[ = 0 \text{ if } f \text{ is odd} \]

\[ = \pi \int_{0}^{1/\sqrt{3}} \frac{x^4}{1-x^4} \, dx \]

\[ \therefore \quad I = -\pi \int_{0}^{1/\sqrt{3}} \left( \frac{1}{1-x^4} - \frac{1}{1-x^4} \right) \, dx \]

\[ = -\pi \int_{0}^{1/\sqrt{3}} \frac{1}{1-x^4} \, dx = -\pi \int_{0}^{1/\sqrt{3}} \left[ 1-\frac{1}{2} \log \left( \frac{1+x}{1-x} \right) + \tan^{-1} x \right]^{1/\sqrt{3}} \, dx \]

\[ = -\pi \left[ x - \frac{1}{2} \log \left( \frac{1+x}{1-x} \right) + \tan^{-1} x \right]_{0}^{1/\sqrt{3}} \]

\[ = -\pi \left[ \frac{1}{\sqrt{3}} - \frac{1}{2} \log \left( \frac{1+1/\sqrt{3}}{1-1/\sqrt{3}} \right) - \tan^{-1} \left( \frac{1}{\sqrt{3}} \right) - 0 \right] \]

\[ = -\pi \left[ \frac{1}{\sqrt{3}} - \frac{1}{2} \log \left( \frac{\sqrt{3}+1}{\sqrt{3}-1} \right) - \frac{\pi}{12} \right] \]

\[ = \pi \left[ \frac{1}{12} + \frac{1}{4} \log(2 + \sqrt{3}) - \frac{\sqrt{3}}{3} \right] \]

\[ = \frac{12}{4} \left[ \frac{1}{3} + \log(2 + \sqrt{3}) - \frac{\sqrt{3}}{3} \right] \]

31. Let us consider any point \((x, y)\) inside the square such that its distance from origin \(\leq\) its distance from any of the edges say AD

\[ \therefore \quad OP = PM \quad \text{or} \quad \sqrt{(x^2 + y^2)} < 1 - x \]

\[ \text{or} \quad y^2 < -2 \left( x - \frac{1}{2} \right) \quad \text{......(1)} \]

Above represents all points within and on the parabola 1. If we consider the edges BC then \(OP < PN\) will imply

\[ y^2 < 2 \left( x + \frac{1}{2} \right) \quad \text{......(2)} \]

Similarly if we consider the edges AB and CD, we will have

\[ x^2 < -2 \left( y - \frac{1}{2} \right) \quad \text{......(3)} \]

\[ x^2 < 2 \left( y + \frac{1}{2} \right) \quad \text{......(4)} \]

Hence \(S\) consists of the region bounded by four parabolas meeting the axes at \((-1/2, 0)\) and \((0, 1/2)\)

The point \(L\) is intersection of \(P_1\) and \(P_3\) given by (1) and (3).

\[ y^2 - x^2 = -2(y - x) = 2(y - x) \]

\[ \therefore \quad y - x = 0 \quad \therefore \quad y = x \]

\[ x^2 + 2x - 1 = 0 \Rightarrow (x + 1)^2 = 2 \]

\[ \therefore \quad x = \sqrt{2} - 1 \text{ as } x \text{ is positive} \]

\[ \therefore \quad L \text{ is } (\sqrt{2} - 1, \sqrt{2} - 1) \]

\[ \therefore \quad \text{Total area} = 4 \left[ \text{square of side } (\sqrt{2} - 1) + 2 \int_{\sqrt{2} - 1}^{1/2} y \, dx \right] \]

\[ = 4 \left[ (\sqrt{2} - 1)^2 + 2 \int_{\sqrt{2} - 1}^{1/2} \sqrt{(1-2x)} \, dx \right] \]

\[ = 4 \left[ 3 - 2\sqrt{2} - 2 \left( \frac{2}{3} \right) (1-2x)^{3/2} \right]_{\sqrt{2} - 1}^{1/2} \]

\[ = 4 \left[ 3 - 2\sqrt{2} - \frac{2}{3} \left( 0 - (1 - 2\sqrt{2} + 2)^{3/2} \right) \right] \]

\[ = 4 \left[ 3 - 2\sqrt{2} + \frac{2}{3} (3 - 2\sqrt{2})^{3/2} \right] \]

\[ = 4 \left[ 3 - 2\sqrt{2} \left( 1 + \frac{2}{3} (\sqrt{2} - 1) \right) \right] \]

\[ = \frac{4}{3} (3 - 2\sqrt{2})(1 + 2\sqrt{2}) = \frac{4}{3} \left[ (4\sqrt{2} - 5) \right] = \frac{16\sqrt{2} - 20}{3} \]
32. We have \( A_n = \int_0^{\pi/4} (\tan x)^n \, dx \)

Since \( 0 < \tan x < 1 \), when \( 0 < x < \pi/4 \), we have 

\[ 0 < (\tan x)^{n+1} < (\tan x)^n \quad \text{for each} \quad n \in \mathbb{N} \]

\[ \Rightarrow \int_0^{\pi/4} (\tan x)^{n+1} \, dx < \int_0^{\pi/4} (\tan x)^n \, dx \]

\[ \Rightarrow A_{n+1} < A_n \]

Now, for \( n > 2 \)

\[ A_n + A_{n+2} = \int_0^{\pi/4} [(\tan x)^n + (\tan x)^{n+2}] \, dx \]

\[ = \int_0^{\pi/4} (\tan x)^n + (1 + \tan^2 x) \, dx \]

\[ = \int_0^{\pi/4} (\tan x)^n + (\sec^2 x) \, dx \]

\[ = \left[ \frac{1}{n+1} (\tan x)^{n+1} \right]_0^{\pi/4} \]

\[ \Rightarrow I = \frac{\int_0^{\pi/4} f(x) \, f'(x) \, dx}{n+1} \]

\[ = \frac{1}{n+1} (1 - 0) \]

Since \( A_{n+2} < A_{n+1} < A_n \), we get, \( A_n + A_{n+2} < 2A_n \)

\[ \Rightarrow \frac{1}{n+1} < 2A_n \Rightarrow \frac{1}{2n+2} < A_n \]

\[ \text{......(1)} \]

Also for \( n > 2, A_n + A_n < A_n + A_{n-2} = \frac{1}{n-1} \)

\[ \Rightarrow 2A_n < \frac{1}{n-1} \]

\[ \Rightarrow A_n < \frac{1}{2n-2} \]

\[ \text{......(2)} \]

Combining (1) and (2) we get

\[ \frac{1}{2n+2} < A_n < \frac{1}{2n-2} \]

\[ \text{Hence Proved.} \]

33. \( \int_{-\pi}^{\pi} \frac{2x(1 + \sin x)}{1 + \cos^2 x} \, dx = I \) (say)

or \( I = \int_{-\pi}^{\pi} \frac{2x}{1 + \cos^2 x} \, dx + \int_{-\pi}^{\pi} \frac{2x \sin x}{1 + \cos^2 x} \, dx \)

\[ I = 0 + 2 \int_0^\pi \frac{2x \sin x}{1 + \cos^2 x} \, dx \]

\[ \Rightarrow 2x \text{ is an odd function} \]

\[ \text{or} \quad I = 4 \int_0^{\pi/4} \frac{x \sin x}{1 + \cos^2 x} \, dx \]

\[ \text{......(1)} \]

\[ \text{or} \quad I = 4 \int_0^{\pi/2} \frac{(\pi - x) \sin (\pi - x)}{1 + \cos^2 (\pi - x)} \, dx = 4 \int_0^{\pi/2} \frac{\sin x}{1 + \cos^2 x} \, dx \]

\[ \text{or} \quad I = 4 \int_0^\pi \frac{\sin x}{1 + \cos^2 x} \, dx \]

\[ \text{Putting} \quad x = \tan^{-1}(t), \quad -\tan x \, dx = dt \]

When \( x \to 0, t \to 1 \) and when \( x \to \pi, t \to -1 \)

\[ \Rightarrow I = 2\pi \int_{1}^{-1} \frac{-dt}{1 + t^2} = 2\pi \int_{1}^{-1} \frac{dt}{1 + t^2} = 4\pi \int_{1}^{-1} \frac{dt}{1 + t^2} \]

\[ \Rightarrow I = 4\pi \left[ \tan^{-1}(t) \right]_0^1 = 4\pi \left( \tan^{-1}(1) - \tan^{-1}(0) \right) \]

\[ \Rightarrow I = 4\pi \left( \frac{\pi}{4} - 0 \right) \]

\[ = \pi^2 \]

34. We draw the graph of \( y = x^2 \), \( y = (1-x)^2 \) and \( y = 2x(1-x) \) in figure.

Let us find the point of intersection of \( y = x^2 \) and \( y = 2x(1-x) \).

The \( x \) - coordinate of the point of intersection satisfies the equation \( x^2 = 2x(1-x) \), \( \Rightarrow 3x^2 = 2x \Rightarrow 0 \) or \( x = 2/3 \)

\( \therefore \) \( A, x = 2/3 \)

Similarly, we find the \( x \) coordinate of the points of intersection of \( y = (1-x)^2 \) and \( y = 2x(1-x) \) are \( x = 1/3 \) and \( x = 1 \)

\( \therefore \) At \( A, x = 1/3 \) and at \( C, x = 1 \)

From the figure it is clear that

\[ (1-x)^2 \text{ for } 0 \leq x \leq 1/3 \]

\[ 2x(1-x) \text{ for } 1/3 \leq x \leq 2/3 \]

\[ x^2 \text{ for } 2/3 \leq x \leq 1 \]

The required area \( A \) is given by

\[ A = \int_0^1 f(x) \, dx \]

\[ = \int_0^{1/3} (1-x)^2 \, dx + \int_{1/3}^{2/3} 2x(1-x) \, dx + \int_{2/3}^1 x^2 \, dx \]
35. \[ I = \int_{0}^{1} y dx = \int_{0}^{1} \tan^{-1} x dx - \int_{0}^{1} \tan^{-1} (x-1) dx \]

Using \[ \int_{a}^{b} f(x) dx = \int_{0}^{a} f(a-x) dx \]

\[ = \int_{0}^{1} \tan^{-1} x dx - \int_{0}^{1} (-\tan^{-1} x) dx = 2\int_{0}^{1} \tan^{-1} x dx \quad \text{(Proved)} \]

\[ = \left[ \frac{x}{2} \tan^{-1} x - \frac{1}{2} \log(1+x^2) \right]_{0}^{1} \]

\[ = \frac{\pi}{2} - \log 2 \quad \ldots \quad (1) \]

Now, \[ \int_{0}^{1} \tan^{-1}(1-x+x^2) dx \]

\[ = \int_{0}^{1} \cot^{-1} \frac{1}{1-x+x^2} dx = \int_{0}^{1} \left( \frac{\pi}{2} - \tan^{-1} \frac{1}{1-x+x^2} \right) dx \]

\[ = \left[ \frac{\pi}{2} x - \pi \right]_{0}^{1} - \int_{0}^{1} \frac{\pi}{2} \log(1+x^2) dx \quad \text{(log 2 by (1))} \]

36. \( f(x) = x^3 - x^2 \)

Let \( P \) be on \( C_1 \), \( y = x^2 \) be \( (t, t^2) \)

\[ \therefore \text{ordinate of} \ Q \text{ is also} \ t^2 \]

Now \( Q \) lies on \( y = 2x \), and \( y = t^2 \)

\[ \therefore \quad x = t^2/2 \]

\[ \therefore \quad R \left( \frac{t^2}{2}, t^2/2 \right) \]

For point \( R \), \( x = t \) and it is on \( y = f(x) \)

\[ \therefore \quad R \text{ is} \ (t, f(t)) \]

Area \( OPQ = \int_{0}^{t} (x_1 - x_2) dy = \int_{0}^{t} (\sqrt{y} - y/2) dy \]

\[ = \frac{2}{3} t^3 - \frac{1}{4} t^4 \quad \ldots \quad (1) \]

Area \( OPR = \int_{0}^{t} y dx + \int_{0}^{t} y dx \]

\[ = \int_{0}^{t} x^2 dx + \int_{0}^{t} f(x) dx \]

Equating (1) and (2), we get,

\[ \frac{t^3}{3} - \frac{1}{4} \left[ \left[ f(x) dx \right] \right] \]

Differentiating both sides, we get,

\[ t^2 - t^3 = -f(t) \]

\[ \therefore \quad f(t) = t^3 - t^2. \]

37. \[ I = \int_{0}^{\pi} \frac{e^{\cos x}}{e^{\cos x} + e^{-\cos x}} dx \]

\[ \Rightarrow I = \int_{0}^{\pi} \frac{e^{\cos x}}{e^{\cos x} + e^{-\cos x}} dx = I = \int_{0}^{\pi} e^{-\cos x} e^{\cos x} \]

Adding, \[ 2I = \int_{0}^{\pi} dx = \pi \Rightarrow I = \pi/2 \]

38. \[ f(x) = \begin{cases} x^2 + ax + b; & x < -1 \\ 2x; & -1 \leq x \leq 1 \\ x^2 + ax + b; & x > 1 \end{cases} \]

\[ \because \ f(x) \text{ is continuous at} \ x = -1 \text{ and} \ x = 1 \]

\[ (-1)^2 + a(-1) + b = -2 \]

\[ 2 = (1)^2 + a \cdot 1 + b \]

\[ \text{i.e.} \quad a - b = 3 \quad \text{and} \quad a + b = 1 \]

On solving we get \( a = 2, b = -1 \)

\[ \therefore \quad f(x) = \begin{cases} x^2 + 2x - 1; & x < -1 \\ 2x; & -1 \leq x \leq 1 \\ x^2 + 2x - 1; & x > 1 \end{cases} \]

Given curves are \( y = f(x) \), \( y = -2x^2 \) and \( 8x + 1 = 0 \)

\[ \text{Solving} \ x = -2y^2, y = x^2 + 2x - 1 \ (x < -1) \text{ we get} \]

\( x = -2 \)

Also \( y = 2x, x = -2y^2 \) meet at \((0, 0)\)

\[ y = 2x \text{ and} \ x = -1/8 \text{ meet at} \left( -\frac{1}{8}, -\frac{1}{4} \right) \]

The required area is the shaded region in the figure.
Definite Integrals and Applications of Integrals

\[
\int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \sin bx \cos ax \, dx = \frac{a}{b} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \sin x \cos x \, dx = \frac{a}{b} \left[ \frac{\sin^2 x}{2} \right]_{-\frac{\pi}{2}}^{\frac{\pi}{2}} = 0
\]

\[
\int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \sin bx \sin ax \, dx = \frac{a}{b} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \sin x \sin x \, dx = \frac{a}{b} \left[ \frac{\sin^2 x}{2} \right]_{-\frac{\pi}{2}}^{\frac{\pi}{2}} = 0
\]

\[
\int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \cos bx \cos ax \, dx = \frac{a}{b} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \cos x \cos x \, dx = \frac{a}{b} \left[ \frac{\cos^2 x}{2} \right]_{-\frac{\pi}{2}}^{\frac{\pi}{2}} = \pi \frac{a}{b}
\]

\[
\int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \cos bx \sin ax \, dx = \frac{a}{b} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \cos x \sin x \, dx = \frac{a}{b} \left[ \frac{\sin^2 x}{2} \right]_{-\frac{\pi}{2}}^{\frac{\pi}{2}} = 0
\]

39. \( f(x) = \int_{1}^{x} \frac{\ln t}{1 + t} \, dt \) for \( x > 0 \) (given)

Now \( f \left( \frac{1}{x} \right) = \int_{1}^{1/x} \frac{\ln t}{1 + t} \, dt \) : Put \( t = \frac{1}{u} \), so that

\[
dt = -\frac{1}{u^2} \, du
\]

Therefore \( f \left( \frac{1}{x} \right) = \int_{1}^{x} \frac{x \ln u}{1 + u} \, (-1) \, \frac{1}{u^2} \, du = \int_{1}^{x} \frac{\ln u}{1 + u} \, du \)

Now, \( f(x) + f \left( \frac{1}{x} \right) = \int_{1}^{x} \frac{x \ln t}{1 + t} \, dt + \int_{1}^{x} \frac{\ln \left( \frac{1}{t} \right)}{1 + \left( \frac{1}{t} \right)} \, dt = \int_{1}^{x} \frac{x \ln t}{1 + t} \, dt + \int_{1}^{x} \frac{\ln t}{t(1 + t)} \, dt = \int_{1}^{x} \frac{\ln t}{t} \, dt - \frac{1}{2} (\ln x)^2 \)

Put \( x = e \), hence \( f(e) + f \left( \frac{1}{e} \right) = \frac{1}{2} (\ln e)^2 = \frac{1}{2} \)

Hence Proved.

40. Given that \( x = \sin by \), \( e^{-ay} \Rightarrow -e^{-ay} \leq x \leq e^{-ay} \)

The figure is drawn taking \( a \) and \( b \) both +ve. The given curve oscillates between \( x = e^{-ay} \) and \( x = -e^{-ay} \)

Clearly, \( S_j = \int_{\pi b}^{(j+1)\pi b} \sin by \, e^{-ay} \, dy \)

Integrating by parts, \( I = \int \sin by \, e^{-ay} \, dy \)

We get \( I = -\frac{e^{-ay}}{a^2 + b^2} (a \sin by + b \cos by) \)

So, \( S_j = \left[ -\frac{e^{-ay}}{a^2 + b^2} (a \sin j + b \cos j) \right]_{\pi b}^{(j+1)\pi b} = \left[ -\frac{e^{-a(j+1)b} - (-1)^j e^{-a(j)b}}{a^2 + b^2} b(-1)^j \right]_{\pi b}^{(j+1)\pi b} = \left[ -\frac{e^{a(j+1)b} - e^{-a(j)b}}{a^2 + b^2} b(-1)^j \right]_{\pi b}^{(j+1)\pi b} \)

\[
= \frac{b(-1)^j}{a^2 + b^2} \left( e^{a(j+1)b} - e^{-a(j)b} \right) = \frac{a(-1)^j}{a^2 + b^2} \left( e^{ab(j+1)} - e^{-abj} \right)
\]

Now, \( \frac{S_j}{S_{j-1}} = -\frac{e^{a(j)b}}{e^{a(j-1)b}} = e^{a(b)} = \text{constant} \)

\( \Rightarrow S_0, S_1, S_2, \ldots, S_j \text{ form a G.P.} \)

For \( a = -1 \) and \( b = \pi \), \( S_j = \frac{\pi e^{j}}{(1 + \pi^2)^2} (e^{2j} - 1) \)

\( \Rightarrow \sum_{j=0}^{n} S_j = \frac{\pi(1 + e)}{(1 + \pi^2)^2} (e^{2(n+1)} - 1) \)

41. The given curves are \( y = x^2 \)

which is an upward parabola with vertex at \( (0, 0) \)

\( y = [2 - x^2] \)

or \( y = \begin{cases} 2 - x^2 & \text{if } \ -\sqrt{2} \leq x \leq \sqrt{2} \\ x^2 - 2 & \text{if } x < -\sqrt{2} \text{ or } x > \sqrt{2} \end{cases} \)

or \( x^2 = -(y - 2) \), \( -\sqrt{2} < x < \sqrt{2} \)

A downward parabola with vertex at \( (0, 2) \)

\( x^2 = y + 2 \), \( x < -\sqrt{2} \text{ or } x > \sqrt{2} \)

An upward parabola with vertex at \( (0, -2) \)

\( y = 2 \)

A straight line parallel to \( x \)-axis

\( x = 1 \)

A straight line parallel to \( y \)-axis

The graph of these curves is as follows.
42. Given that \( f(x) \) is an even function, then to prove
\[
\int_{0}^{\pi/2} f(\cos 2x) \cos x \, dx = \sqrt{2} \int_{0}^{\pi/4} f(\sin 2x) \cos x \, dx
\]
Let \( I = \int_{0}^{\pi/2} f(\cos 2x) \cos x \, dx \) ...........................(1)
\[
= \int_{0}^{\pi/2} f(\sin x) \cos x \, dx
\]
\[
= \int_{0}^{\pi/4} f(\sin 2x) \cos x \, dx
\]
Using \( \int_{a}^{b} f(x) \, dx = \int_{a}^{b} f(a-x) \, dx \)
\[
= \int_{0}^{\pi/2} f(-\cos 2x) \sin x \, dx
\]
\[
I = \int_{0}^{\pi/2} f(\cos 2x) \sin x \, dx
\]
[As \( f \) is an even function]
Adding two values of \( I \) in (1) and (2) we get
\[
2I = \sqrt{2} \int_{0}^{\pi/4} f(\sin 2x) \left[ \frac{1}{\sqrt{2}} \sin x + \frac{1}{\sqrt{2}} \cos x \right] \, dx
\]
\[
\Rightarrow I = \frac{\sqrt{2}}{2} \int_{0}^{\pi/4} f(\cos 2x) \cos x \, dx
\]
Let \( x - \pi/4 = t \) so that \( dx = dt \)
as \( x \to 0, \ t \to -\pi/4 \)
and as \( x \to \pi/4, \ t \to \pi/2 - \pi/4 = \pi/4 \)
\[
\therefore I = \frac{1}{\sqrt{2}} \int_{-\pi/4}^{\pi/4} f(2t + \pi/4) \cos t \, dt
\]
\[
= \frac{1}{\sqrt{2}} \int_{-\pi/4}^{\pi/4} f(-\sin 2t) \cos t \, dt
\]
\[
= \frac{1}{\sqrt{2}} \int_{-\pi/4}^{\pi/4} f(\sin 2t) \cos t \, dt
\]
\[
= \frac{2}{\sqrt{2}} \int_{0}^{\pi/4} f(2t) \cos t \, dt
\]
\[
= \sqrt{2} \int_{0}^{\pi/4} f(2x) \cos x \, dx
\]
\[
\text{R.H.S. Hence proved.}
\]
43. We have,
\[
y(x) = \int_{x^2/16}^{x^2/16} \cos x \cos \sqrt{\theta} \, d\theta
\]
44. Let \( I = \int_{0}^{\pi/3} \frac{\pi + 4x^3}{2 - \cos \left( \frac{x}{x + \pi} \right)} \, dx \)
\[
= \int_{0}^{\pi/3} \frac{\pi}{2 - \cos \left( \frac{x + \pi}{3} \right)} \, dx + \int_{0}^{\pi/3} \frac{4x^3}{2 - \cos \left( \frac{x + \pi}{3} \right)} \, dx
\]
The second integral becomes zero integrand being an odd function of \( x \).
\[
= 2\pi \int_{0}^{\pi/3} \frac{dx}{2 - \cos \left( \frac{x + \pi}{3} \right)}
\]
\{ using the prop. of even function and also \( x = \pi \) for \( 0 \leq x \leq \pi/3 \}
Let \( x + \pi/3 = y \Rightarrow dx = dy \)
also as \( x \to 0, \ y \to \pi/3 \) as \( x \to \pi/3, \ y \to 2\pi/3 \).
\text{The given integral becomes}
\[
= 2\pi \int_{\pi/3}^{2\pi/3} \frac{dy}{2 - \cos y} = 2\pi \int_{0}^{\pi/3} \frac{dt}{3 - \tan^2 y/2}
\]
\[
= 2\pi \int_{0}^{\pi/3} \sec^2 y/2 \, dy
\]
\[
= 2\pi \int_{0}^{\pi/3} \frac{dy}{3 \tan^2 y/2 + 1}
\]
\[
= 2\pi \int_{0}^{\pi/3} \frac{dy}{\tan^2 y/2 + (1/3)^2}
\]
\[
= 2\pi \int_{0}^{\pi/3} \frac{dy}{\tan^2 y/2 + 1/3^2}
\]
\[
= 4\pi \left[ \tan^{-1} \left( \frac{\sin(\pi/3) \tan y/2}{\sqrt{3}} \right) \right]_{\pi/3}
\]
\[
= 4\pi \left[ \tan^{-1} \left( \frac{\sin(\pi/3) \tan y/2}{\sqrt{3}} \right) \right]_{\pi/3}
\]
\[
= \frac{4\pi}{3} \left[ \tan^{-1} \left( \pi/3 - \tan^{-1} 1 \right) \right]
\]
45. Let
\[
I = \int_{0}^{\pi} e^{\cos x} \left[ 2 \sin \left( \frac{1}{2} \cos x \right) + 3 \cos \left( \frac{1}{2} \cos x \right) \right] \sin x \, dx
\]
Definite Integrals and Applications of Integrals

\[= \int_0^\pi e^{\cos x} \sin^2 x \sin x \, dx + \int_0^\pi e^{\cos x} \cos^2 x \sin x \, dx\]

\[= I_1 + I_2\]

Now using the property that

\[\int_0^{2a} f(x) \, dx = \int_0^a f(x) \, dx \quad \text{if} \quad f(2a-x) = f(x)\]

\[0 \quad \text{if} \quad f(2a-x) = -f(x)\]

We get, \(I_1 = 0\)

and \(I_2 = 2 \int_0^{\pi/2} e^{\cos x} \cos \left(\frac{1}{2} \cos x\right) \sin x \, dx\)

\[= 6 \int_0^{\pi/2} e^{\cos x} \cos \left(\frac{1}{2} \cos x\right) \sin x \, dx\]

Put \(\cos x = t \Rightarrow -\sin x \, dx = dt,\)

\[\therefore \quad I_2 = 6 \int_0^1 e^{t \cos t/2} \, dt\]

Integrating by parts, we get

\[I_2 = 6 \left\{ e^{\cos(1/2)} - 1 + \frac{1}{2} \left( e^{\sin(1/2)} - \frac{1}{2} \int_0^1 e^{t \cos(t/2)} \, dt \right) \right\}\]

\[= 6 \left\{ e^{\cos(1/2)} - 1 + \frac{1}{2} \left( e^{\sin(1/2)} - \frac{1}{2} I_2 \right) \right\}\]

\[= 6 \left\{ e^{\cos(1/2)} - 1 + \frac{1}{2} \left( e^{\sin(1/2)} - \frac{1}{2} I_2 \right) \right\}\]

\[= 6 \left\{ e^{\cos(1/2)} - 1 + \frac{1}{2} \left( e^{\sin(1/2)} - \frac{1}{2} I_2 \right) \right\}\]

\[= 6 \left[ e \cos(1/2) + \frac{1}{2} e \sin(1/2) - 1 \right]\]

\[\Rightarrow \frac{5}{4} I_2 = 6 \left[ e \cos(1/2) + \frac{1}{2} e \sin(1/2) - 1 \right]\]

\[\Rightarrow I_2 = \frac{24}{5} \left[ e \cos(1/2) + \frac{1}{2} e \sin(1/2) - 1 \right]\]

47. Given that \(f(x)\) is a differentiable function such that \(f''(x) = g(x)\), then

\[\int_0^3 g(x) \, dx = \int_0^3 f'(x) \, dx = [f(x)]_0^3 = f(3) - f(0)\]

But \(f(x) < 1 \Rightarrow -f(x) < 1, \forall x \in R\)

\[\Rightarrow f(3) = f(0) = (-1, 1)\]

Similarly

\[\int_{-3}^0 g(x) \, dx = \int_{-3}^0 f'(x) \, dx = [f(x) - f(-3)] (-2, 2)\]

Also given \([f(0)]^2 + [g(0)]^2 = 9\)

\[\Rightarrow [g(0)]^2 = 9 - [f(0)]^2\]

\[\Rightarrow g(0) > 2\sqrt{2}\]

\[\Rightarrow g(0) > 2\sqrt{2}\] or \(g(0) < -2\sqrt{2}\)

First let us consider \(g(0) > 2\sqrt{2}\)

Let us suppose that \(g''(x)\) be positive for all \(x \in (-3, 3)\). Then \(g''(x) > 0 \Rightarrow \) the curve \(y = g(x)\) is open upwards. Now one of the two situations are possible.

(i) \(g(x)\) is increasing

46. The given curves are \(x^2 = y\) ..............(i)

\(x^2 = -y\) ..............(ii)

\(y^2 = 4x - 3\) ..............(iii)

Clearly point of intersection of (i) and (ii) is (0, 0). For point of intersection of (i) and (iii), solving them as follows:

\[x^4 - 4x + 3 = 0 \quad (x - 1)(x^3 + x^2 + x - 3) = 0\]

or \((x - 1)^2(x^2 + 2x + 3) = 0\) \(\Rightarrow x = 1\) and then \(y = 1\)

\(\Rightarrow\) Req. point is \((1, 1)\). Similarly point of intersection of (ii) and (iii) is \((1, -1)\). The graph of three curves is as follows:

\[\therefore \int_0^3 g(x) \, dx > \text{area of rect. } OABC\]

i.e. \(\int_0^3 g(x) \, dx > 6\sqrt{2} > 2\)

a contradiction as \(\int_0^1 g(x) \, dx \in (-2, 2)\)

\(\Rightarrow\) at least at one of the point \(c \in (-3, 3), g''(x) < 0\). But \(g(x) > 0 \text{ on } (-3, 3)\)

Hence \(g(x) g''(x) < 0 \text{ at some } x \in (-3, 3)\).
(ii) \( g(x) \) is decreasing

\[
\int_{-3}^{0} g(x) \, dx > \text{area of rect. } OABC
\]

i.e.

\[
\int_{-3}^{0} g(x) \, dx \geq 3.2 \sqrt{2} = 6 \sqrt{2} > 2
\]

A contradiction as \( \int_{-3}^{0} g(x) \, dx \in (-2, 2) \)

\[
\therefore \text{At least at one of the point } c \in (-3, 3), g''(x) \text{ should be negative. But } g(x) < 0 \text{ on } (-3, 3).
\]

Hence \( g(x) > 0 \) at some \( x \in (-3, 3) \).

Secondly let us consider \( g(0) < -2 \sqrt{2} \).

Let us suppose that \( g''(x) \) be negative on \((-3, 3)\).

Then \( g''(x) < 0 \Rightarrow \) the curve \( y = g(x) \) is open downward.

Again one of the two situations are possible

(i) \( g(x) \) is decreasing then

\[
\int_{0}^{3} g(x) \, dx > \text{Ar or rect. } OABC = 3.2 \sqrt{2} = 6 \sqrt{2} > 2
\]

A contradiction as \( \int_{0}^{3} g(x) \, dx \in (-2, 2) \)

\[
\therefore \text{At least at one of the point } c \in (-3, 3), g''(x) \text{ is positive. But } g(x) < 0 \text{ on } (-3, 3).
\]

Hence \( g(x) > 0 \) at some \( x \in (-3, 3) \).

(ii) \( g(x) \) is increasing then

\[
\int_{-3}^{0} g(x) \, dx > \text{Ar of rect. } OABC = 3.2 \sqrt{2} = 6 \sqrt{2} > 2
\]

A contradiction as \( \int_{-3}^{0} g(x) \, dx \in (-2, 2) \)

\[
\Rightarrow 4a^2 f(-1) + 4bf(1) + f(2) = 3a^2 + 3a
\]

\[
4b^2 f(-1) + 4bf(1) + f(2) = 3b^2 + 3b
\]

\[
4c^2 f(-1) + 4cf(1) + f(2) = 3c^2 + 3c
\]

\[
\Rightarrow 4x^2 f(-1) + 4xf(1) + f(2) = 3x^2 + 3x
\]

or \[4f(-1) - 3x^2 + 4f(1) - 3x + f(2) = 0\]

Then clearly this eqn. is satisfied by \( x = a, b, c \)

A quadratic eqn. satisfied by more than two values of \( x \) means it is an identity and hence

\[
f(-1) - 3 = 0 \Rightarrow f(-1) = \frac{3}{4}
\]

\[
f(1) - 3 = 0 \Rightarrow f(1) = \frac{3}{4}
\]

\[
f(2) = 0 \Rightarrow f(2) = 0
\]

Let \( f(x) = px^2 + qx + r \) \( \left[ f(x) \text{ being a quadratic eqn.} \right] \)

\[
f(-1) = \frac{3}{4} \Rightarrow p - q + r = \frac{3}{4}
\]

\[
f(1) = \frac{3}{4} \Rightarrow p + q + r = \frac{3}{4}
\]

\[
f(2) = 0 \Rightarrow 4p + 2q + r = 0
\]

Solving the above we get \( q = 0, p = -\frac{1}{4}, r = 1 \)

\[
f(x) = -\frac{1}{4} x^2 + 1
\]

Its maximum value occur at \( f'(x) = 0 \)

i.e., \( x = 0 \) then \( f(x) = 1 \). \( \therefore \nabla (0, 1) \)

Let \( A(-2, 0) \) be the point where curve meet \( x \)-axis.

Let \( B \) be the point \( h, \frac{4 - h^2}{4} \)

As \( \angle AVB = 90^\circ \), \( m_{AV} \times m_{BV} = -1 \)

\[
\Rightarrow \left( \frac{0 - 1}{-2 - 1} \right) \times \left( \frac{4 - h^2}{h - 0} \right) = -1
\]

\[
\Rightarrow \frac{1}{2} \times \left( \frac{-h}{4} \right) = -1 \Rightarrow h = 8
\]

\[
\therefore B(8, -15)
\]

Equation of chord \( AB \) is

\[
y + 15 = \frac{0 - (-15)}{-2 - 8} (x - 8) \Rightarrow y + 15 = -\frac{3}{2} (x - 8)
\]

\[
\Rightarrow 2y + 30 = -3x + 24 \Rightarrow 3y + 2y + 6 = 0
\]
Definite Integrals and Applications of Integrals

Required area is the area of shaded region given by

\[
\int_{-2}^{2} \left( \frac{-x^2}{4} + 1 \right) dx + \int_{-2}^{2} \left( \frac{-6 - 3x}{2} \right) dx - \int_{-2}^{2} \left( \frac{-x^2}{4} + 1 \right) dx
\]

\[
= 2 \int_{0}^{2} \left( \frac{-x^2}{4} + 1 \right) dx + \frac{1}{2} \int_{-2}^{2} (6 + 3x) dx + \frac{1}{4} \int_{-2}^{2} (x^2 + 4) dx
\]

\[
= 2 \left[ \left( \frac{-x^3}{12} + x \right) \right]_{0}^{2} + \frac{1}{2} \left[ 6x + \frac{3x^2}{2} \right]_{-2}^{2} + \frac{1}{4} \left[ \frac{x^4}{3} + 4x \right]_{-2}^{2}
\]

\[
= 2 \left[ \frac{-8}{12} + 2 \right] + \frac{1}{2} \left[ (48 + 3x^2) \right]_{-2}^{2} - (-12 + 6)
\]

\[
+ \frac{1}{4} \left( \frac{512}{3} + 32 \right) - \left( \frac{8}{3} + 8 \right)
\]

\[
= 2 \left[ \frac{4}{3} \right] + \frac{1}{2} \left[ 150 + \frac{432}{3} \right] = \frac{125}{3} \text{ sq. units.}
\]

49. Let \( I = \int_{0}^{1} (1 - x^{50})^{100} \) dx and \( I' = \int_{0}^{1} (1 - x^{50})^{100} \) dx

Then, \( I' = \int_{0}^{1} (1 - x^{50})^{100} \) dx

\[
= \left[ x(1 - x^{50})^{100} \right]_{0}^{1} + 100 \int_{0}^{1} x(1 - x^{50})^{99} dx
\]

\[
= +5050 \int_{0}^{1} x(1 - x^{50})^{100} dx
\]

\[
- I' = +5050 \int_{0}^{1} x(1 - x^{50})^{100} dx
\]

\[
\Rightarrow 5050 I - I' = 5050 \int_{0}^{1} (1 - x^{50})^{100} dx
\]

\[
\Rightarrow 5050 I = I' \Rightarrow 5050 I = 5051
\]

F. Match the Following

1. (A) → p, (B) → s, (C) → p, (D) → r

(A) \( \int_{0}^{\pi/2} \sin x \cos x \cot x - \log(\sin x)^{\sin x} \) dx

\[
= \int_{0}^{\pi/2} du \text{ where } (\sin x)^{\cos x} = u = 1
\]

(A) → (p)

(B) \( \int_{-4}^{4} \) and \( y^2 = \frac{-1}{4}x \), we get intersection points as \( (-4, \pm 1) \)

\[ \Rightarrow \text{Required area} \]

\[ = \int_{-4}^{4} ((1 - y^2) + 4y^2) dy = 2 \int_{0}^{4} (1 - y^2) dy = \frac{4}{3}, \]

(C) By inspection, the point of intersection of two curves \( y = x^{3-1} \log x \) and \( y = x^{3-1} - 1 \) is \( (1, 0) \)

For first curve \( \frac{dy}{dx} = x^{3-1} + 3x^{3-1} \log x \)

\[ \Rightarrow \left( \frac{dy}{dx} \right)_{(1, 0)} = 1 = m_1 \]

For second curve \( \frac{dy}{dx} = x^{3} + 3x^{3} \log x \)

\[ \Rightarrow \left( \frac{dy}{dx} \right)_{(1, 0)} = 1 = m_2 \]

\[ \Rightarrow m_1 = m_2 \Rightarrow \text{Two curves touch each other} \]

\[ \Rightarrow \text{Angle between them is 0°} \]

\[ \Rightarrow \cos \theta = 1, \]

(C) → (p)

(D) \( \frac{dy}{dx} = \frac{-6}{x+y} \Rightarrow \frac{dx}{dy} = \frac{1}{x+y} = \frac{y}{6} \)

I.F. = \( e^{-y/6} \)

\[ \Rightarrow \text{Solution is } xe^{-y/6} = -ye^{-y/6} - 6e^{-y/6} + c \]

\[ \Rightarrow x + y + 6 = ce^{y/6} \]

\[ \Rightarrow x + y + 6 = 6e^{y/6} \text{ (using } x + y = 6) \]

\[ \Rightarrow y = 6 \ln 2 \rightarrow (r) \]

2. (A) → s; (B) → s; (C) → p; (D) → r

(A) \( \int_{-1}^{1} \frac{dx}{x^2 + 1} = \tan^{-1}(x) \) \[ \Rightarrow \frac{\pi}{4} \left( \frac{\pi}{4} \right) = \frac{2\pi}{4} = \frac{\pi}{2} \]

(B) \( \int_{0}^{1} \frac{dx}{\sqrt{1-x^2}} = \left[ \sin^{-1}x \right]_{0}^{1} = \sin^{-1}(1) - \sin^{-1}(0) \)

\[ = \frac{\pi}{2} - 0 = \frac{\pi}{2} \]

(C) \( \int_{2}^{3} \frac{dx}{1-x^2} = \left[ \frac{1}{2} \log \left( \frac{1+x}{1-x} \right) \right]_{2}^{3} = \frac{1}{2} \log(2) - \log(3) \]

\[ = \frac{1}{2} \log 2/3 \]
3. (d) \[ P(2) \text{ Let } f(x) = ax^2 + bx + c \]
where \(a, b, c \geq 0\) and \(a, b, c\) are integers.
\[ \therefore f(0) = 0 \Rightarrow c = 0 \]
\[ \therefore f(x) = ax^2 + bx \]
Also \[ \int_0^1 f(x) \, dx = 1 \]
\[ \Rightarrow \int_0^1 \left( \frac{ax^3 + bx^2}{3} \right) \, dx = 1 \]
\[ \Rightarrow \frac{a}{3} + \frac{b}{2} = 1 \Rightarrow 2a + 3b = 6 \]
\[ \therefore a \text{ and } b \text{ are integers} \]
\[ a = 0 \text{ and } b = 2 \]
or \[ a = 3 \text{ and } b = 0 \]
\[ \therefore \text{There are only 2 solutions.} \]
\[ Q(3) \text{ } f(x) = \sin^2 x + \cos^2 x \]
f(x) is max. \( \sqrt{2} \) at \( x^2 = \frac{\pi}{4} \) or \( \frac{9\pi}{4} \)
\[ \Rightarrow x = \pm \frac{\sqrt{2}}{2} \text{ or } \pm \frac{3\sqrt{2}}{2} \in [-\sqrt{13}, \sqrt{13}] \]
\[ \therefore \text{There are four points.} \]
\[ R(1) \text{ } I = \frac{2}{3} \int_{-2}^{+2} \frac{3x^2}{2} \, dx = \frac{2}{3} \int_{-2}^{+2} 3x^2 \, dx \]
\[ = \left[ \frac{x^3}{2} \right]_{-2}^{+2} = 8 - (-8) = 16 \Rightarrow I = 8 \]
\[ S(4) \text{ } \frac{1}{2} \int_0^{\frac{1}{2}} \cos 2x \log \left( \frac{1+x}{1-x} \right) \, dx = 0 \]
\[ \Rightarrow \text{Numerator} = 0, \text{function being odd.} \]
\[ \therefore \text{Hence option (d) is correct sequence.} \]

G. Comprehension Based Questions

1. (a) \[ \int_0^{\pi/2} \frac{\sin x}{\sqrt{x^2 - 1}} \, dx = \frac{\pi}{2} \left( \frac{\pi}{2} - 2 \sin \frac{\pi}{4} \right) \]
\[ = \frac{\pi}{8} (1 + \sqrt{2}) \]

2. (d) \[ \lim_{x \to a} \frac{\int_0^x f(x) \, dx - \left( \frac{x-a}{2} \right) (f(x) + f(a))}{(x-a)h} = 0 \]
\[ \lim_{h \to 0} \frac{\int_0^{a+h} f(x) \, dx - \frac{h}{2} (f(a+h) + f(a))}{h^2} = 0 \]
\[ \Rightarrow \lim_{h \to 0} \frac{f(a+h) - \frac{1}{2} f(a) + \frac{h}{2} f'(a+h)}{h^2} = 0 \]
\[ \Rightarrow \lim_{h \to 0} \frac{f(a+h) - \frac{1}{2} f(a) + \frac{h}{2} f'(a+h)}{h^2} = 0 \]
\[ \Rightarrow \lim_{h \to 0} \frac{1}{6h} = 0 \Rightarrow f''(a+h) = 0 \Rightarrow f''(x) = 0, \forall x \in R \]
\[ \therefore f(x) \text{ must be of max. degree 1.} \]

3. (b) \[ f''(x) < 0, \forall x \in (a, b), \text{ for } c \in (a, b) \]
\[ F(c) = \frac{c-a}{2} (f(a) + f(c)) + \frac{b-c}{2} (f(b) + f(c)) \]
\[ = \frac{b-a}{2} f(c) + \frac{c-a}{2} f(a) + \frac{b-c}{2} f(b) \]
\[ \Rightarrow F'(c) = \frac{b-a}{2} f'(c) + \frac{1}{2} (f(a) - f(b)) \]
\[ = \frac{1}{2} [(b-a) f'(a) - f(b)] \]
\[ F''(c) = \frac{1}{2} (b-a) f''(c) < 0 \]
\[ [: \text{ } f''(x) < 0, \forall x \in (a, b) \text{ and } b > a] \]
\[ \therefore F(c) \text{ is max. at the point } (c, f(c)) \text{ where } F''(c) = 0 \]
\[ \Rightarrow f'(c) = \frac{1}{2} \left( \frac{f(b) - f(a)}{b-a} \right) \]

(For 4-6).
Given the implicit function \( y^3 - 3y + x = 0 \)
For \( x \in (-\infty, -2) \cup (2, \infty) \) it is \( y = f(x) \) real valued differentiable function, and for \( x \in (-2, 2) \) it is \( y = g(x) \) real valued differentiable function.

4. (b) We have \( y^3 - 3y + x = 0 \) \[ \Rightarrow 3y^2 \cdot \frac{dy}{dx} - 3 \cdot \frac{dy}{dx} + 1 = 0 \]
\[ \Rightarrow \frac{dy}{dx} = \frac{1}{3(1-y^2)} \text{ or } f'(x) = \frac{1}{3[1-(f(x))^2]} \]
Also \( 3y^2 \frac{d^2y}{dx^2} + 6y \frac{dy}{dx} - 3 \cdot \frac{d^2y}{dx^2} = 0 \]
\[ \Rightarrow \frac{d^2y}{dx^2} = \frac{2y}{1-y^2} \left( \frac{dy}{dx} \right)^2 \Rightarrow \frac{f''(x)}{f(x)} = \frac{2f(x)}{9[1-(f(x))^2]^3} \]
\[ \therefore f''(-10\sqrt{2}) = \frac{2 \times 2 \sqrt{2}}{9[1 - 8^3]} = \frac{-4\sqrt{2}}{3^2 \times 7^3} \]
5. (a) For \( x < -2 \)
we have, \( 3y - y^3 < -2 \) \( \Rightarrow \) \( y^3 - 3y - 2 > 0 \)
\( \Rightarrow (y + 1)^2(y - 2) > 0 \) \( \Rightarrow y > 2 \) \( \forall \ x < -2 \)
\( \Rightarrow f(x) \) is positive \( \forall \ x < -2 \)
Hence required area \( = \int_a^b f(x) - 1f(x) \) \( dx \)
\( = x f(x)_{a}^{b} - \int_a^b x f'(x) \) \( dx \)
\( = b f(b) - a f(a) - \int_a^b \frac{x}{3(1 - (f(x))^2)} \) \( dx \)
\( = \int_a^b \frac{x}{3(1 - (f(x))^2)} + b f(b) - a f(a) \)

6. (d) For \( y = g(x) \), we have \( y^3 - 3y + x = 0 \)
\( \Rightarrow [g(x)]^3 - 3[g(x)] + x = 0 \) \( ...(1) \)
Putting \( x = -x \), we get
\( \Rightarrow [g(-x)]^3 - 3[g(-x)] - x = 0 \) \( ...(2) \)
Adding equations \((1)\) and \((2)\) we get
\( [g(x)]^3 + [g(-x)]^3 - 3 \{[g(x)] + [g(-x)]\} = 0 \ \frac{n!}{r!(n-r)!} \)
\( \Rightarrow [g(x)] + [g(-x)] = \frac{[g(x)]^3 + [g(-x)]^3 - 3 \{[g(x)] + [g(-x)]\}}{0 - n!} \)
\( \Rightarrow g(x) \) is an odd function
\( \Rightarrow 1 \int_{-1}^{1} g'(x)dx = [g(x)]_{-1}^{1} = g(1) - g(-1) \)
\( = g(1) + g(1) = 2g(1). \)

7. (a) We have \( f(x) = \frac{x^2 - ax + 1}{x^2 + ax + 1} ; 0 < a < 2 \)
\( \Rightarrow f'(x) = \frac{2ax^2 - 1}{(x^2 + ax + 1)^2} \)
\( \Rightarrow (x^2 + ax + 1)^2 f'(x) = 2ax^2 - 1 \)
\( \Rightarrow (x^2 + ax + 1)^2 f''(x) + 2(x^2 + ax + 1) \)
\( (2x + a)f'(x) = 4ax \) \( ...(1) \)
Putting \( x = -1 \) in equation \((1)\), we get
\( (2 - a)^2 f''(-1) = -4a \) \( ...(2) \)
Putting \( x = 1 \) in equation \((1)\), we get
\( (2 + a)^2 f''(1) = 4a \) \( ...(3) \)
Adding equations \((2)\) and \((3)\), we get
\( (2 + a)^2 f''(1) + (2 - a)^2 f''(-1) = 0 \)

5. (a) We have \( f'(x) = \frac{2ax^2 - 1}{(x^2 + ax + 1)^2} \)
\( f'(x) = 0 \Rightarrow x = -1, 1 \) are the critical points.
\( \Rightarrow f(x) \) is decreasing on \((-1, 1)\)
Also using equation \((1)\), \( f''(-1) = \frac{-4a}{(2 - a)^2} < 0 \)
and \( f''(1) = \frac{4a}{(2 + a)^2} > 0 \)
\( \Rightarrow x = -1 \) is a point of local maximum
and \( x = 1 \) is a point of local minimum.

9. (b) \( g(x) = \int_0^e f'(t) dt \Rightarrow g'(x) = f'(e^x) = \frac{f'(e^x)}{1 + e^{2x}} \)
\( = \int_0^e \frac{2(ae^{-x} - 1)e^x}{(e^{2x} + ae^x + 1)^2} \)
\( = \frac{2ae^x}{(e^{2x} + ae^x + 1)^2} \)
\( \Rightarrow g'(x) > 0 \) for \( e^{2x} - 1 > 0 \) \( \Rightarrow x > 0 \)
and \( g'(x) < 0 \) for \( e^{2x} - 1 < 0 \) \( \Rightarrow x < 0 \)
\( \Rightarrow g(x) \) is negative on \((-\infty, 0)\) and positive on \((0, \infty)\)

10. (c) \( f(x) = 4x^3 + 3x^2 + 2x + 1 \)
\( \Rightarrow f(x) \) is a cubic polynomial
\( \Rightarrow f(x) \) has at least one real root.
Also \( f'(x) = 12x^2 + 6x + 2 = 2(6x^2 + 3x + 1) > 0 \ \forall \ x \in \mathbb{R} \)
\( \Rightarrow f(x) \) is strictly increasing function
\( \Rightarrow \) There is only one real root of \( f(x) = 0 \)
Also \( f(-1/2) = 1 - 1 + \frac{3}{4} - \frac{1}{2} > 0 \)
and \( f(-3/4) = 1 - \frac{3}{2} + \frac{27}{16} - \frac{27}{16} < 0 \)
\( \Rightarrow \) Real root lies between \(-\frac{3}{4}\) and \(-\frac{1}{2}\) and hence
\( s \in \left(\frac{3}{4}, -\frac{1}{2}\right) \)

11. (a) \( y = f(x) \), \( x = 0 \), \( y = 0 \) and \( x = t \) bounds the area as shown in the figure
\( A = \int_0^t dx = \int_0^t \left(4x^3 + 3x^2 + 2x + 1\right) dx \)
\( = t^4 + t^3 + t^2 + t = t(t+1)(t^2 + 1) \)
12. (b) \(f'(x) = 2(6x^2 + 3x + 1)\)

\(f''(x) = 6(4x + 1) \Rightarrow \text{Critical point } x = -1/4\)

\(\therefore \text{decreasing in } \left(-t, -\frac{1}{4}\right)\)

\(\therefore \text{increasing in } \left(-\frac{1}{4}, t\right)\)

13. (a) \(g(a) = \lim_{h \to 0^+} \int_{h}^{1-h} t^{-a} (1-t)^{a-1} dt\)

\(\therefore g\left(\frac{1}{2}\right) = \lim_{h \to 0^+} \int_{h}^{1-h} t^{-1/2} (1-t)^{1/2} dt\)

\(= \lim_{h \to 0^+} \left[\frac{1}{\sqrt{1-t}}\right]_{h}^{1-h} = \lim_{h \to 0^+} \left[\frac{1}{\sqrt{1-h}} - \frac{1}{\sqrt{1-1/2}}\right] = \lim_{h \to 0^+} \left[\sin^{-1}\left(\frac{t-1}{2}\right)\right]_{h}^{1-h} = \lim_{h \to 0^+} \left[\sin^{-1}\left(\frac{1}{2} \cdot (2t-1)\right)\right]_{h}^{1-h} = \frac{\pi}{2} - \frac{\pi}{2} = \pi\)

14. (d) \(g(a) = \lim_{h \to 0^+} \int_{h}^{1-h} t^{-a} (1-t)^{a-1} dt\)

\(g(a) = \lim_{h \to 0^+} \int_{h}^{1-h} t^{-a} (1-t)^{a-1} dt\)

\(\left\{\text{Using} \int f(x)dx = \int f(a+b-x)dx\right\}\)

Also \(g(1-a) = \lim_{h \to 0^+} \int_{h}^{1-h} t^{-a} (1-t)^{a-1} dt\)

Thus \(g(a) = g(1-a)\)

\(\therefore g'(a) = -g'(1-a) \Rightarrow g'(a) + g'(1-a) = 0\)

Putting \(a = 1/2\) we get \(g'\left(\frac{1}{2}\right) + g'\left(\frac{1}{2}\right) = 0\)

or \(g'\left(\frac{1}{2}\right) = 0\)

15. (a, b, c) \(f(x) = 3x \Rightarrow f'(x) = 3\)

\(\therefore f'(1) = 3 > 0\)

16. (c, d) \(\int_{1}^{3} x^2 F'(x)dx = -12\)

\(\Rightarrow \left[ x^2 F(x) \right]_{1}^{3} - \int_{1}^{3} 2x F(x)dx = -12\)

\(\Rightarrow 9 F(3) - F(1) - 2 \int_{1}^{3} x F(x)dx = -12\)

\(\Rightarrow \int_{1}^{3} x F(x)dx = -12 \Rightarrow \int_{1}^{3} f(x)dx = -12 \quad \quad \cdots(i)\)

Also \(\int_{1}^{3} x^3 F'(x)dx = 40\)

\(\Rightarrow \left[ x^3 F'(x) \right]_{1}^{3} - 3 \int_{1}^{3} x^2 F'(x)dx = 40\)

\(\Rightarrow \left[ x^2 (f'(x) - F(x)) \right]_{1}^{3} - 3 \times (-12) = 40\)

\(\Rightarrow 9(f'(3) - F(3)) - (f'(1) - F(1)) = 4\)

\(\Rightarrow 9f'(3) - 9x(-4) - f'(1) + 0 = 4\)

\(\Rightarrow 9f'(3) - f'(1) + 32 = 0\)

I. Integer Value Correct Type

1. (0) Given that \(f(x) = \int_{0}^{x} f(t)dt\)

Clearly \(f(0) = 0\). Also \(f'(x) = f(x) \Rightarrow f'(x) = \frac{f'(x)}{f(x)} = 1\)

Integrating both sides with respect to x, we get

\(\int \frac{f'(x)}{f(x)} dx = \int 1 dx\)

\(\Rightarrow \ln f(x) = x + C \Rightarrow f(x) = Ce^x\)

Now \(f(0) = 0 \Rightarrow Ce^0 = 0 \Rightarrow C = 0\)

\(\therefore \) if \(x > 0 \Rightarrow f(x) = 0\)

2. (4) Given function is \(f(x) = \left\{ \begin{array}{ll}
3x - [x] & \text{if } [x] \text{ is odd} \\
1 + [x] - x & \text{if } [x] \text{ is even}
\end{array} \right.\)

The graph of this function is as below

Clearly \(f(x)\) is periodic with period 2
Also \( \cos \pi x \) is periodic with period 2

\[
\therefore f(x) \cos \pi x \text{ is periodic with period 2}
\]

\[
I = \frac{\pi^2}{10} \int_{-10}^{10} f(x) \cos \pi x \, dx
\]

\[
= \frac{\pi^2}{10} \times 10 \int_{-1}^{1} f(x) \cos \pi x \, dx
\]

\[
= \pi^2 \left[ \int_{0}^{1} (1-x) \cos \pi x \, dx + \int_{0}^{-1} (x-1) \cos \pi x \, dx \right]
\]

\[
= \pi^2 \left\{ \left[ (1-x) \frac{\sin \pi x}{\pi} \right]_{0}^{1} + \left[ \frac{\sin \pi x}{\pi} \right]_{1}^{x} \right\} + 
\]

\[
\left\{ (x-1) \frac{\sin \pi x}{\pi} \right\}_{3}^{-1} - \left\{ \frac{\sin \pi x}{\pi} \right\}_{1}^{x} \}
\]

\[
= \pi^2 \left[ \left[ \frac{\pi}{2} \cos \pi x \right]_{0}^{1} - \left[ \frac{\pi}{2} \cos \pi x \right]_{1}^{x} \right]
\]

\[
= \left[ \cos \pi + \cos 0 \right] - \left[ \cos 2\pi + \cos \pi \right] = [2+2] = 4
\]

3. \( \int_{0}^{4} \int_{0}^{1} \frac{d^2}{dx^2} \left( 1-x^2 \right)^5 \, dx \)

\[
= 4x^3 \left[ \frac{d}{dx} (1-x^2) \right]_0^4 - \left\{ \frac{d}{dx} (1-x^2)^5 \right\} \int_{0}^{4} 12x^2 \, dx
\]

\[
= -12x^2 \left( 1-x^2 \right)^5 \bigg|_0^4 + \left( 1-x^2 \right)^5 \cdot 24 \, dx
\]

\[
= -12 \left( \frac{1}{x^2} \right)^6 \bigg|_0^4 - 12 \left( 0 - \frac{1}{6} \right) = 2
\]

4. \( I = \int_{x+1}^{2} \frac{xf(x^2)}{2} \, dx \)

\(-1 < x < 2 \Rightarrow 0 < x^2 < 4\)

Also \( 0 < x^2 < 1 \Rightarrow f(x^2) = |x^2| = 0 \)

\( 1 < x^2 < 2 \Rightarrow f(x^2) = |x^2| = 1 \)

\( 2 < x^2 < 3 \Rightarrow f(x^2) = 0 \) (using definition of \( f \))

\( 3 < x^2 < 4 \Rightarrow f(x^2) = 0 \) (using definition of \( f \))

Also \( 1 < x^2 < 2 \Rightarrow 1 < x < \sqrt{2} \)

\( \Rightarrow 2 < x + 1 < \sqrt{2} + 1 \)

\( \Rightarrow f(x+1) = 0 \)

\[
I = \int_{1+2}^{2} \frac{xf(x^2)}{2} \, dx = \left[ \frac{x^2}{2} \right]_{0}^{4} = \frac{2}{4} + \frac{1}{4} = 1
\]

\( \Rightarrow 4I = 1 \) or \( 4I - 1 = 0 \)

5. \( F(x) = \int_{x}^{x+\pi/6} 2 \cos^2 t \, dt \)

\( F'(\alpha) = 2 \cos^2 \left( \alpha + \frac{\pi}{6} \right) .2 \alpha - 2 \cos^2 \alpha 
\]

\( \Rightarrow \quad f(\alpha) = 4 \cos \left( 2 \alpha + \frac{\pi}{6} \right). \left[ -\sin \left( \alpha + \frac{\pi}{6} \right) \right] .2 \alpha 
\]

\( + 4 \cos^2 \left( \alpha + \frac{\pi}{6} \right) = 4 \times \frac{3}{4} = 3 \)

6. \( \alpha = \int_{0}^{4e} e^{(9x+3\tan^{-1} x)} \left( \frac{12+9x^2}{1+x^2} \right) \, dx \)

\( \Rightarrow \quad \alpha = \int_{0}^{4e} e^{9x+3\tan^{-1} x} \left( \frac{12+9x^2}{1+x^2} \right) \, dx = dt \)

\( \Rightarrow \quad \alpha = \int_{0}^{9} e^{9x+3\tan^{-1} x} \left( \frac{12+9x^2}{1+x^2} \right) \, dx = \frac{9e^{9}}{4} - 1 \)

\( \Rightarrow \quad \log_e \left| 1 + e^{9} \frac{3}{4} - 1 \right| = -\frac{3}{4} = 9 \)

7. \( \lim_{x \to 1} \frac{F(x)}{x-1} G(x) = \frac{1}{14} \Rightarrow \lim_{x \to 1} \frac{\int_{x}^{1} f(t) \, dt}{(x-1)|f(f(x))|} dt \)

\( \Rightarrow \quad \int_{1}^{x} f(t) \, dt = 0 \) and \( \int_{1}^{x} |f(f(t))| \, dt = 0 \)

\( f(t) \) being odd function

\( \therefore \) Using L'Hospital's rule, we get

\( \lim_{x \to 1} \frac{f(x)}{x-1} = \frac{1}{14} \)

\( \therefore \quad \left| f(1) \right| = \frac{1}{14} \Rightarrow \left| f\left( \frac{1}{2} \right) \right| = \frac{1}{14} \)

\( \Rightarrow \quad \left| f\left( \frac{1}{2} \right) \right| = 7 \Rightarrow f\left( \frac{1}{2} \right) = 7 \)

8. \( \text{Let } f(x) = \int_{0}^{x} \frac{t^2}{1+t^4} \, dt - 2x + 1 \)

\( \Rightarrow f'(x) = \frac{x^2}{1+x^4} - 2 < 0 \ \forall x \in [0, 1] \)

\( \because f \) is decreasing on \([0, 1] \)

Also \( f(0) = 1 \)

and \( f(1) = \int_{0}^{1} \frac{t^2}{1+t^4} \, dt - 1 \)

For \( 0 < t < 1 \Rightarrow 0 < \frac{t^2}{1+t^4} < \frac{1}{2} \)

\( \therefore \quad \int_{0}^{1} \frac{t^2}{1+t^4} \, dt < \frac{1}{2} \)

\( \Rightarrow f(1) < 0 \)

\( \therefore \ f(x) \) crosses x-axis exactly once in \([0, 1] \)

\( \therefore \ f(x) = 0 \) has exactly one root in \([0, 1] \)
1. (a) \[ I = \int_{0}^{\pi} |\sin x| \, dx = 10 \int_{0}^{\pi} |\sin x| \, dx = 10 \int_{0}^{\pi} \sin x \, dx \]

\[ \therefore |\sin x| \text{ is periodic with period } \pi \text{ and } \sin x > 0 \text{ if } 0 < x < \pi \]

\[ = 10 \int_{0}^{\pi/2} \sin x \, dx = 20 \left[ -\cos x \right]_{0}^{\pi/2} = 20 \]

2. (b) \[ I_n + I_{n+2} = \int_{0}^{\pi/4} \tan^n x (1 + \tan^2 x) \, dx \]

\[ = \int_{0}^{\pi/4} \tan^n x \sec^2 x \, dx = \left[ \frac{\tan^{n+1} x}{n+1} \right]_{0}^{\pi/4} \]

\[ = \frac{1}{n+1} \left( \frac{\tan^{n+1} x}{n+1} \right) \]

\[ \therefore I_n + I_{n+2} = \frac{1}{n+1} \Rightarrow \lim_{n \to \infty} n \left[ I_n + I_{n+2} \right] \]

\[ = \lim_{n \to \infty} n \cdot \frac{1}{n+1} = \lim_{n \to \infty} \frac{n}{n+1} = 1 \]

3. (d) \[ \int_{0}^{2} \left[ x^2 \right] \, dx = \int_{0}^{1} x^2 \, dx + \int_{1}^{2} x^2 \, dx + \int_{1}^{2} \sqrt{3} x^2 \, dx \]

\[ = \int_{0}^{1} x^2 \, dx + \int_{1}^{2} x^2 \, dx + \int_{1}^{2} \sqrt{3} x^2 \, dx \]

\[ = \frac{2}{3} + \frac{2}{3} + \frac{2\sqrt{3}}{3} = \frac{2}{3} + \frac{2\sqrt{3}}{3} \]

4. (b) \[ = \int_{0}^{\pi} \frac{2x}{1 + \cos^2 x} \, dx \]

\[ = \int_{\pi}^{0} \left[ x \sin x \right]_{0}^{\pi} \, dx \]

\[ = 0 + \frac{\pi \sin x}{0 + \cos^2 x} \left[ \because \int_{0}^{\pi} f(x) \, dx = 0 \right] \]

if \( f(x) \) is odd

\[ = 2 \int_{0}^{\pi} \left[ x \sin x \right]_{0}^{\pi} \, dx \]

\[ = 2 \int_{0}^{\pi} \left( x \sin x \right) \, dx \]

\[ = 2 \int_{0}^{\pi} \left( x \sin x \right) \, dx \]

\[ = 2 \int_{0}^{\pi} \left( x \sin x \right) \, dx \]

\[ \Rightarrow I = 4 \int_{0}^{\pi} \frac{\sin x}{1 + \cos^2 x} \, dx - 4 \int_{0}^{\pi} \frac{x \sin x}{1 + \cos^2 x} \, dx \]

\[ \Rightarrow 2I = 4\pi \int_{0}^{\pi} \frac{\sin x}{1 + \cos^2 x} \, dx \]

\[ \text{put } \cos x = t \Rightarrow -\sin x \, dx = dt \]

\[ \therefore I = -2\pi \int_{1}^{1} \frac{1}{1 + t^2} \, dt = 2\pi \int_{1}^{1} \frac{1}{1 + t^2} \, dt \]

\[ = 2\pi \left[ \tan^{-1} t \right]_{1}^{1} = 2\pi \left[ \tan^{-1} 1 - \tan^{-1} (-1) \right] \]

\[ = 2\pi \left[ \frac{\pi}{4} - \frac{-\pi}{4} \right] = \frac{\pi}{2} \]

5. (d) We have \[ \int_{0}^{2} f(x) \, dx = \frac{3}{4} \]; Now,

\[ \int_{0}^{2} f'(x) \, dx = \int_{0}^{2} f''(x) \, dx - \int_{0}^{2} f(x) \, dx \]

\[ = \left[ f(x) \right]_{0}^{2} - \frac{3}{4} = 2f(2) - \frac{3}{4} \]

\[ = 0 - \frac{3}{4} \Rightarrow f(2) = \frac{3}{4} \]

6. (a) First we draw each curve as separate graph

NOTE: Graph of \( y = |f(x)| \) can be obtained from the graph of the curve \( y = f(x) \) by drawing the mirror image of the portion of the graph below the x-axis, with respect to the x-axis.

Clearly the bounded area is as shown in the following figure.

\[ \text{Required area} = \int_{0}^{1} (-\ell n x) \, dx \]

\[ = -\ell n x \left[ x \right]_{0}^{1} = 4 \text{ sq. units} \]
An image of a page from a document with mathematical expressions and calculations. The page contains problems and solutions related to definite integrals and applications of integrals. The text includes integrals, limits, and series, with figures and equations presented in a natural, readable format.
16. (d) The required area is shown by shaded region

\[
A = \int_1^3 (x - 2) \, dx = 2 \left[ \frac{x^2}{2} - 2x \right]_1^3 = 1
\]

17. (b) \[ I_1 = \int_0^1 2x \, dx, \quad I_2 = \int_0^1 x^2 \, dx, \]
\[ = I_3 = \int_0^1 2x \, dx, \quad I_4 = \int_0^1 x^2 \, dx \quad \forall 0 < x < 1, \quad x^2 > x^3 \]
\[ \Rightarrow \int_0^1 2x > \int_0^1 x^2 \quad \Rightarrow \quad I_1 > I_2 \]

18. (a) The graph of the curve \( y = \log_e(x + e) \) is as shown in the fig.

\[
\begin{align*}
\text{Required area} & = \int_0^e y \, dx = \int_1^{1-e} \log_e(x + e) \, dx \\
\end{align*}
\]
put \( x + e = t \Rightarrow dx = dt \) also \( At x = 1 - e, t = 1 \)

\[
\text{At } x = 0, t = e \quad \therefore \quad A = \int_1^e \log_e t \, dt = [t \log_e t - t]_1^e \]
\[ e - e - 0 + 1 = 1 \]
Hence the required area is 1 square unit.

19. (d) Intersection points of \( x^2 = 4y \) and \( y^2 = 4x \) are \((0, 0)\) and \((4, 4)\). The graph is as shown in the figure.

\[
\begin{align*}
\text{Intersection points} \quad & x^2 = 4y \quad \text{and} \quad y^2 = 4x \quad \text{are} \quad (0, 0) \quad \text{and} \quad (4, 4). \\
\end{align*}
\]

20. (d) Given \( f(x) = \frac{\beta}{\pi/4} \cos \beta + \frac{\pi}{4} \sin \beta + \sqrt{2} \)

Differentiating w.r.t \( \beta \)

\[
f(\beta) = \beta \cos \beta + \sin \beta - \frac{\pi}{4} \sin \beta + \sqrt{2} \]
\[ f\left(\frac{\pi}{2}\right) = \left(1 - \frac{\pi}{4}\right) \sin \frac{\pi}{2} + \sqrt{2} = 1 - \frac{\pi}{4} + \sqrt{2} \]

21. (b) Let \( I = \int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + a^x} \, dx \quad \ldots \text{(1)} \)
\[ = \int_{-\pi}^{\pi} \frac{\cos^2 (-x)}{1 + a^{-x}} \, dx \]
\[ \text{Using } \int_a^b f(x) \, dx = \int_a^b f(a + b - x) \, dx \]
\[ = \int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + a^x} \, dx \quad \ldots \text{(2)} \]
Adding equations (1) and (2) we get

\[
2I = \int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + a^x} \, dx = \int_{-\pi}^{\pi} \cos^2 x \, dx \]
\[ = 2 \int_0^{\pi} \cos^2 x \, dx = 2 \times \frac{1}{2} \sin^2 x \, dx = 2 \frac{\pi}{2} = \frac{\pi}{2} \sin^2 x \, dx \]
\[ \Rightarrow I = 2 \int_0^{\pi/2} \sin^2 x \, dx = 2 \int_0^{\pi/2} (1 - \cos^2 x) \, dx \]
\[ \Rightarrow I = 2 \left( \frac{\pi}{2} - \frac{\pi}{2} \right) = \pi \Rightarrow 1 = \frac{\pi}{2} \]

22. (b) \[ I = \int x \sqrt{9 - x^2} \, dx \quad \ldots \text{(1)} \]
\[ I = \int x \sqrt{9 - x^2} \, dx \quad \ldots \text{(2)} \]
Definite Integrals and Applications of Integrals

\[ \int_a^b f(x) \, dx = \int_a^{a+b-x} f(x) \, dx \]

Adding equation (1) and (2)

\[ 2I = \int_a^b f(x) \, dx = \frac{2}{3} \Rightarrow I = \frac{3}{2} \]

23. \( I = \int \frac{\sin x}{x} \, dx = \int_0^\pi \frac{\sin x}{x} \, dx \)

\[ = \pi \int_0^\pi \frac{\sin x}{x} \, dx \]

\[ = \frac{\pi}{3} \int_0^\pi f(\sin x) \, dx \]

\[ = \frac{\pi}{2} \int_0^{\pi/2} f(\sin x) \, dx \]

\[ = \frac{\pi}{2} \int_0^{\pi/2} f(\cos x) \, dx \]

\[ = \int_0^\pi [(x + \pi)^3 + \cos^2 (x + 3\pi)] \, dx \]

Put \( x + \pi = t \)

\[ I = \int_0^\pi [(t + \pi)^3 + \cos^2 t] \, dt = \frac{\pi}{2} \int_0^\pi \cos^2 t \, dt \]

\[ = \frac{\pi}{2} \int_0^\pi \left(1 + \cos 2t\right) \, dt = \frac{\pi}{2} + 0 \]

25. \( b \) Let \( a = k + h \) where \( k \) is an integer such that \([a] = k\)

and \( 0 \leq h < 1 \)

\[ \int_1^a f'(x) \, dx = \int_1^b f'(x) \, dx + \int_2^3 f'(x) \, dx + \cdots + \int_{k-1}^k f'(x) \, dx + \int_k^{k+h} f'(x) \, dx \]

\[ = f(2) - f(1) + 2f(3) - f(2) + 3f(4) - f(3) + \cdots + h_f(k) - f(k-1) + k_f(k + h) - f(k) \]

\[ = a_f(a) - f(1) + f(2) + f(3) + \cdots + f([a]) \]

26. \( c \) Given \( f(x) = f(x) + f\left(\frac{1}{x}\right) \), where \( f(x) = \int_1^x \frac{\log t}{1 + t} \, dt \)

\[ F(e) = f(e) + f\left(\frac{1}{e}\right) \]

\[ F(e) = \int_1^e \frac{\log t}{1 + t} \, dt + \int_{1/e}^1 \frac{\log t}{1 + t} \, dt \quad \ldots \quad {A} \]

Now for solving, \( I = \int_1^{1/e} \frac{\log t}{1 + t} \, dt \)

\[ \frac{1}{t} = z \Rightarrow \frac{1}{t^2} \, dt = dz \Rightarrow dt = -\frac{dz}{z^2} \]

and limit for \( t = 1 \Rightarrow z = 1 \) and for \( t = 1/e \Rightarrow z = e \)

\[ I = \int_1^e \frac{\log z}{z} \, dz \]

\[ = \int_1^e \frac{\log z}{z(1 + z)} \, dz \]

\[ = \int_1^e \frac{\log z}{z(z + 1)} \, dz \]

\[ \therefore I = \int_1^e \frac{\log t}{1 + t} \, dt \]

[By property \( \int_a^b f(t) \, dt = \int_a^b f(x) \, dx \)]

Equation (A) becomes

\[ F(e) = \int_1^e \frac{\log t}{1 + t} \, dt + \int_1^{1/e} \frac{\log t}{1 + t} \, dt \]

\[ = \int_1^e \frac{e \log t + \log t}{t(1 + t)} \, dt = \int_1^e \frac{e \log t}{t(1 + t)} \, dt \]

\[ \Rightarrow F(e) = \int_1^e \frac{\log t}{t} \, dt \]

Let \( \log t = x \)

\[ \therefore \frac{1}{t} \, dt = dx \]

[for limit \( t = 1, x = 0 \) and \( t = e, x = \log e = 1 \)

\[ \therefore F(e) = \int_0^1 x \, dx \quad F(e) = \left[ \frac{x^2}{2} \right]_0^1 \Rightarrow F(e) = \frac{1}{2} \]

27. \( d \) \( \int_0^\pi \frac{dt}{\sqrt{t^2 - 1}} = \frac{\pi}{2} \)

\[ \Rightarrow \left[ \sec^{-1} t \right]_0^\pi = \frac{\pi}{2} \]

\[ \Rightarrow \sec^{-1} x - \sec^{-1} \sqrt{2} = \frac{\pi}{2} \]

\[ \Rightarrow \sec^{-1} x = \frac{\pi}{4} \Rightarrow x = \sec \frac{\pi}{4} \Rightarrow x = \sqrt{2} \]

28. \( a \) The area enclosed between the curves \( y^2 = x \) and \( y = |x| \)

From the figure, area lies between \( y^2 = x \) and \( y = x \)
29. (b) We know that $\frac{\sin x}{x} < 1$, for $x \in (0, 1)$

$\implies \frac{\sin x}{\sqrt{x}} < \sqrt{x}$ on $x \in (0, 1)$

$\implies \int_0^1 \frac{\sin x}{\sqrt{x}} \, dx < \int_0^1 \sqrt{x} \, dx = \left[ \frac{2x^{3/2}}{3} \right]_0^1 = \frac{2}{3}$

$\implies \int_0^1 \frac{\sin x}{\sqrt{x}} \, dx < \frac{2}{3} \implies \sin x < \frac{2}{3} \sqrt{x}

\text{Also, } \cos x < \frac{1}{\sqrt{x}} \text{ for } x \in (0, 1)$

30. (d) $x + 2y^2 = 0 \implies y^2 = -\frac{x}{2}$

[Left handed parabola with vertex at $(0, 0)$]

$x + 3y^2 = 1 \implies y^2 = -\frac{1}{3} (x - 1)$

[Left handed parabola with vertex at $(1, 0)$]

Solving the two equations we get the points of intersection as $(-2, 1), (-2, -1)$

The required area is ACBDMA, given by

$$\int_0^1 (1 - 3y^2 - 2y^2) \, dy = \left[ -\frac{5y^3}{3} \right]_{-1}^1$$

31. (b) The given parabola is $(y - 2)^2 = x - 1$

Vertex $(1, 2)$ and it meets $x$-axis at $(5, 0)$

Also it gives $y^2 - 4y - x + 5 = 0$

So, that equation of tangent to the parabola at $(2, 3)$ is

$y - 3 - \frac{1}{2} (x + 2) + 5 = 0$ or $x - 2y + 4 = 0$

which meets $x$-axis at $(-4, 0)$.

In the figure shaded area is the required area.

Let us draw PD perpendicular to $y$-axis.

Then required area = $ABD + AB (OCPD) - AAPD$

$$= \frac{1}{2} \times 4 \times 2 + \int_0^3 x \, dy - \frac{1}{2} \times 2 \times 1$$

$$= 3 + \int_0^3 (y - 2)^2 + 1 \, dy = 3 + \left[ \frac{(y - 2)^3}{3} + y \right]_0^3$$

$$= 3 + \left[ \frac{1}{3} + \frac{8}{3} \right] = 3 + 6 = 9 \text{ Sq. units}$

32. (c) Let $I = \int_0^\pi [\cot x] \, dx$ ...(1)

$$J = \int_0^\pi [-\cot x] \, dx = \int_0^\pi [-\cot x] \, dx \quad \text{...(2)}$$

Adding two values of $I$ in eqn $(1)$ & $(2)$, We get

$$2I = \int_0^\pi ([\cot x] + [-\cot x]) \, dx = \int_0^\pi (-1) \, dx$$

$$\therefore \{x\} + [-x] = -1, \text{ if } x \in z \text{ and } [x] + [-x] = 0, \text{ if } x \in z$$

$$\therefore I = -\frac{\pi}{2}$$

33. (d) Area above $x$-axis = Area below $x$-axis
Definite Integrals and Applications of Integrals

\[ \int_0^\frac{\pi}{2} (\cos x - \sin x) \, dx + \int_0^{\frac{\pi}{4}} (\sin x - \cos x) \, dx + \int_0^{\frac{\pi}{2}} \sin x \, dx \]

\[ = 4\sqrt{2} - 2 \]

34. (a) \( p'(x) = p(1-x) \Rightarrow p(x) = -p(1-x) + c \)
    at \( x = 0 \)
    \( p(0) = -p(1) + c \Rightarrow 42 = c \)
    Now, \( p(x) = -p(1-x) + 42 \Rightarrow p(x) + p(1-x) = 42 \)

\[ \Rightarrow I = \int_0^1 p(x) \, dx \quad \ldots (i) \]

\[ \Rightarrow I = \int_0^1 p(1-x) \, dx \quad \ldots (ii) \]

on adding (i) and (ii), \( 2I = \int_0^1 (42) \, dx \Rightarrow I = 21 \)

35. (d) \( I = \int_0^{\frac{\pi}{4}} \frac{8\log(1+x)}{1+x^2} \, dx \)

Put \( x = \tan \theta \), \( \therefore \frac{dx}{d\theta} = \sec^2 \theta \Rightarrow dx = \sec^2 \theta \, d\theta \)

\[ \therefore I = 8 \int_0^{\pi/4} \frac{\log(1+\tan \theta)}{1+\tan^2 \theta} \cdot \sec^2 \theta \, d\theta \]

\[ I = 8 \int_0^{\pi/4} \log(1+\tan \theta) \, d\theta \quad \ldots (i) \]

\[ = 8 \int_0^{\pi/4} \log \left(1 + \tan \left(\frac{\pi}{4} - \theta\right)\right) \, d\theta \]

\[ = 8 \int_0^{\pi/4} \log \left[\frac{1 + \tan \theta}{1 + \tan \theta}\right] \, d\theta = 8 \int_0^{\pi/4} \log \left[\frac{2}{1 + \tan \theta}\right] \, d\theta \]

\[ = 8 \int_0^{\pi/4} \left[\log 2 - \log(1 + \tan \theta)\right] \, d\theta \]

\[ I = 8 \log 2 \int_0^{\pi/4} (x) \, d\theta - 8 \int_0^{\pi/4} \log(1 + \tan \theta) \, d\theta \]

\[ I = 8 \cdot 0.4 \cdot \log 2 - 0 \quad \text{[From equation (i)]} \]

\[ \Rightarrow 2I = 2\pi \log 2, \quad \therefore I = \pi \log 2 \]

36. (b) Area of required region \( AOB \)

\[ = \int_0^1 x \, dx + \int_1^e \frac{x}{x} \, dx = \frac{1}{2} + 1 = \frac{3}{2} \text{ sq. units} \]

37. (c) Given curves \( x^2 = \frac{y}{4} \) and \( x^2 = 9y \) are the parabolas whose equations can be written as \( y = 4x^2 \) and \( y = \frac{1}{9}x^2 \).

Also, given \( y = 2 \).

Now, shaded portion shows the required area which is symmetric.

\[ \therefore \text{Area} = 2\int_0^2 \left( \sqrt{9y} - \frac{y}{4} \right) \, dy \]

Area = \[ 2\int_0^2 \left( 3\sqrt{y} - \frac{y}{2} \right) \, dy \]

\[ = 2 \left[ \frac{2}{3} \cdot 3 \cdot y^2 \cdot \frac{3}{2} - \frac{2}{1} \cdot y^2 \frac{3}{2} \right]_0 \]

\[ = 2 \left[ 2 \cdot \frac{3}{2} \cdot \frac{3}{2} - \frac{1}{2} \cdot \frac{3}{2} \cdot 3 \cdot y^2 \right]_0 \]

\[ = 2 \cdot \frac{5}{3} \cdot \frac{3}{2} \cdot \frac{3}{2} \cdot 3 \cdot y^2 \]

38. (b, c) \( g(x + \pi) = \int_0^{x+\pi} \cos 4t \, dt \)

\[ = \int_0^{\pi} \cos 4t \, dt + \int_\pi^{x+\pi} \cos 4t \, dt = g(\pi) + \int_0^x \cos 4t \, dt \]

Putting \( t = \pi + y \) in second integral, we get

\[ \int_0^x \cos 4t \, dt = \int_0^\pi \cos 4t \, dt \]

\[ = g(\pi) + g(x) - g(\pi) \]

\[ \therefore g(\pi) = 0 \]
39. (d) Let \( L = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan x}} \)
\[ = \int_{\pi/6}^{\pi/3} \sqrt{\tan x} \frac{dx}{\sqrt{\tan x}} = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\tan x} \ dx}{\sqrt{\tan x}} \quad \text{...(i)} \]

Also, Given, \( L \)
\[ = \int_{\pi/6}^{\pi/3} \sqrt{\tan x} \ dx \quad \frac{\sqrt{\tan x}}{\sqrt{\tan x}} \quad \text{...(2)} \]

By adding (1) and (2), we get
\[ 2L = \int_{\pi/6}^{\pi/3} \sqrt{\tan x} \ dx \]
\[ \Rightarrow L = \frac{1}{2} \left[ \pi - \frac{\pi}{6} \right] = \frac{\pi}{12} \quad \text{statement-1 is false} \]

\[ b \int_{a}^{b} f(x)\,dx = \int_{a}^{b} f(a + b - x)\,dx \]

It is fundamental property.

40. (a) Given curves are
\[ y = \sqrt{x} \quad \text{...(1)} \]
and \( 2y - x + 3 = 0 \quad \text{...(2)} \]
On solving both we get \( y = -1, 3 \)

Required area \( = \int_{0}^{3} (2y + 3) - y^2 \ dy \)
\[ = y^2 + 3y - \frac{y^3}{3} \bigg|_{0}^{3} = 9. \]

41. (b) Let \( L = \int_{0}^{\pi/2} \sqrt{1 + 4 \sin^2 \frac{x}{2} - 4 \sin \frac{x}{2}} \ dx \)
\[ = \int_{0}^{\pi/3} \left( 2 \sin \frac{x}{2} \right) \ dx + \int_{\pi/3}^{\pi/2} \left( 2 \sin \frac{x}{2} - 1 \right) \ dx \]
\[ \because \sin \frac{x}{2} = \frac{1}{2} \Rightarrow x = \frac{\pi}{3}, \frac{\pi}{6} \Rightarrow x = \frac{5\pi}{6} \Rightarrow x = \frac{5\pi}{3} \]
\[ = \frac{\pi}{3} + 4 \sqrt{3} - 4 + \left( 0 - \pi + 4 \sqrt{3} + \frac{\pi}{3} \right) = 4\sqrt{3} - 4 - \frac{\pi}{3} \]

42. (c) Given curves are \( x^2 + y^2 = 1 \) and \( y^2 = 1 - x \). Intersecting points are \( x = 0, 1 \)
Area of shaded portion is the required area.
So, \( \text{Required Area} = \text{Area of semi-circle} + \text{Area bounded by parabola} \)
\[ = \frac{\pi}{2} \left[ 0 \right] + \frac{1}{2} \left[ \sqrt{1 - x} \ dx \right]_{0}^{1} \]
\[ = \frac{\pi}{2} + \frac{1}{2} \left[ \sqrt{1 - x} \ dx \right]_{0}^{1} \]
\[ = \frac{\pi}{2} + \frac{1}{2} \left[ \left( 1 - x \right)^{3/2} \right]_{0}^{1} \]
\[ = \frac{\pi}{2} + \frac{4}{3} (-1) = \frac{\pi}{2} + \frac{4}{3} \quad \text{Squ. unit} \]

43. (b) Required area

\[ = \text{Area of } ABCD - \text{ar (ABOCD)} \]
\[ = \int_{-1/2}^{1/2} \int_{-3/2}^{3} \sqrt{1 - y^2} \ dy \ dx \]
\[ = \frac{1}{4} \left[ y^2 + \frac{y^4}{4} \right]_{-1/2}^{1/2} \]
\[ = \frac{1}{4} \left[ \frac{3}{8} + \frac{9}{8} - 15/32 - 9/32 \right] = \frac{9}{32} \]

44. (a) \( I = \int_{0}^{1} \frac{\log x^2}{2 \log x^2 + \log(36 - 12x + x^2)} \ dx \)
\[ I = \frac{4}{2} \log x^2 + \log(6 - x) \]
\[ I = \frac{4}{2} \log x^2 + \log(6 - x) \]
\[ \quad \text{...(i)} \]

\[ I = \frac{4}{2} \log x^2 + \log(6 - x) \]
\[ \quad \text{...(ii)} \]
Adding (1) and (2)
\[ 2I = \frac{4}{2} \log x^2 = \Rightarrow I = \frac{1}{2} \]

45. (d) Points of intersection of the two curves are \( (0, 0), (2, 2) \) and \( (2, -2) \)
Area = Area (OAB) – area under parabola (0 to 2)
\[ = \frac{\pi \times (2)^2}{4} - 2 \int_{0}^{2} \sqrt{2 - x} \ dx = \frac{\pi - 8}{3} \]
Given that \( y(0) = -1 \) \( \Rightarrow \) \(-1 = -1 + C \Rightarrow C = 0 \)
\[ \therefore \quad y = -\frac{1}{1+t} \quad \therefore \quad y(1) = -\frac{1}{1+1} = -\frac{1}{2} \]

4. (a) \( \frac{dy}{dx} \left( \frac{2 + \sin x}{1 + y} \right) = -\cos x, \quad y(0) = 1 \)
\[ \Rightarrow \quad \frac{dy}{dx} \left( \frac{2 + \sin x}{1 + y} \right) = -\cos x \int (1 + y) dx \]
Integrating both sides
\[ \Rightarrow \quad \ln(1 + y) = -\ln(2 + \sin x) + C \]
Put \( x = 0 \) and \( y = 1 \) \( \Rightarrow \) \( \ln(2) = -\ln 2 + C \Rightarrow C = \ln 4 \)
Put \( x = \frac{\pi}{2} \) \( \ln(1 + y) = -\ln 3 + \ln 4 = \ln \frac{4}{3} \Rightarrow y = \frac{1}{3} \)

5. (c) Given that \( y = y(x) \)
and \( x \cos y + y \cos x = \pi \) \( \quad \ldots(1) \)
For \( x = 0 \) in (1) we get \( y = \pi \)
Differentiating (1) with respect to \( x \), we get
\[ -x \sin y' + y' \cos y + y' \cos x - y \sin x = 0 \]
\[ \Rightarrow \quad y' = \frac{y \sin x - \cos y}{\cos x - x \sin y} \quad \ldots(2) \]
\[ y'(0) = 1 \quad (\text{Using } y(0) = \pi) \]

Differentiating (2) with respect to \( x \), we get

\[ (y' \sin x + y \cos x + \sin y, y') (\cos x - x \sin y) \]
\[ y'' = \frac{-(-\sin x - \sin y - x \cos y y') (y \sin x - \cos y)}{(\cos x - x \sin y)^2} \]

\[ \Rightarrow y''(0) = \frac{\pi(1) - 1}{1} = \pi - 1 \]

6. (c) The given D.E. is \((x^2 + y^2)dy = xydx\) s.t. \( y(1) = 1 \) and \( y(x_0) = e \)

The given eqn can be written as

\[ \frac{dy}{dx} = \frac{xy}{x^2 + y^2} \]

Put \( y = vx \), \( \therefore y + x \frac{dv}{dx} = \frac{v}{1 + v^2} \)

\[ \Rightarrow x \frac{dv}{dx} = \frac{-v^3}{1 + v^2} \Rightarrow \int \frac{1 + v^2}{v^3} dv + \int \frac{dx}{x} = 0 \]

\[ \Rightarrow \frac{1}{2v^2} + \log |v| + \log |x| = C \]

\[ \Rightarrow \log y = C + \frac{x^2}{2y^2} \quad (\text{using } v = y/x) \]

Also, \( y(1) = 1 \Rightarrow \log 1 = C + \frac{1}{2} \Rightarrow C = -\frac{1}{2} \)

\[ \because \log y = \frac{x^2 - y^2}{2y^2}, \text{ But given } y(x_0) = e \]

\[ \Rightarrow \log e = \frac{x^2 - y^2}{2e^2} \Rightarrow x_0^2 = 3e^2 \Rightarrow x_0 = \sqrt{3}e \]

7. (a) The given eqn is

\[ ydx + y^2dy = xdy ; x \in R, y > 0, y(l) = 1 \]

\[ \Rightarrow \frac{ydx - xdy}{y^2} + dy = 0 \Rightarrow \frac{d}{dx} \left( \frac{x}{y} \right) + dy = 0 \]

On integration, we get

\[ \frac{x}{y} + y = C \]

\[ y(l) = 1 \Rightarrow 1 + 1 = C \Rightarrow C = 2 \]

\[ \therefore \frac{x}{y} + y = 2 \]

Now to find \( y(-3), \) putting \( x = -3 \) in above eqn, we get

\[ \frac{3}{y} + y = 2 \Rightarrow y^2 - 2y - 3 = 0 \Rightarrow y = 3, -1 \]

But given that \( y > 0, \therefore y = 3 \)

8. (c) \[ \frac{dy}{dx} = \frac{\sqrt{1 - y^2}}{y} \Rightarrow \frac{-2y}{\sqrt{1 - y^2}} dy + 2dx = 0 \]

\[ \Rightarrow 2\sqrt{1 - y^2} + 2x = 2c \Rightarrow \sqrt{1 - y^2} + x = c \]

\[ \Rightarrow (x - c)^2 + y^2 = 1 \]

which is a circle of fixed radius 1 and variable centre \((c, 0)\) lying on \( x\)-axis.

Given D.E. can be written as

\[ \frac{dy}{dx} = \frac{x^4 + 2x}{1 - x^2} \]

\[ \Rightarrow \int \frac{\frac{-x}{1 - x^2}}{\frac{1}{x^2}} dx + \int \frac{1}{x^2} dx = \int \frac{1}{1 - x^2} dx \]

\[ \Rightarrow \int \frac{-x}{1 - x^2} dx = \int \frac{1}{x^2} dx \]

\[ \therefore \text{ Solution is given by} \]

\[ y\sqrt{1 - x^2} = \int \frac{x^4 + 2x}{\sqrt{1 - x^2}} dx \]

\[ y\sqrt{1 - x^2} = \frac{x^5}{5} + x^2 + c \]

\[ f(0) = 0 \Rightarrow At x = 0, y = 0 \]

\[ \therefore c = 0 \]

\[ \because y(\sqrt{1 - x^2} = \frac{x^5}{5} + x^2 \]

\[ \text{or } y = f(x) = \frac{x^5}{5} + x^2 \]

\[ \therefore I = \int_0^1 \frac{x^2}{\sqrt{1 - x^2}} dx \]

\[ \Rightarrow I = \frac{\sqrt{3}}{2} \frac{x^2}{\sqrt{1 - x^2}} dx \]

\[ \Rightarrow I = 2 \int_0^\frac{\pi}{2} \frac{x^2}{\sqrt{1 - x^2}} \left( \because \frac{x^5}{5} \text{ is odd} \right) \]

put \( x = \sin \theta \Rightarrow dx = \cos \theta d\theta \)

\[ \therefore I = \int_0^\frac{\pi}{2} \sin^2 \theta d\theta = \frac{3}{4} \int_0^\frac{\pi}{2} (1 - \cos 2\theta) d\theta \]

\[ = \left( \frac{0 - \sin 2\theta}{2} \right)^\frac{\pi}{2} \left( \frac{\pi}{3} - \frac{\sqrt{3}}{4} \right) \]

D. MCQs with ONE or MORE THAN ONE Correct

1. (c) The given solution of D.E. is

\[ y = (c_1 + c_2) \cos(x + c_3) = c_4 e^{x + c_5} \]

\[ = (c_1 + c_2) \cos(x + c_3) - c_4 e^{c_5} e^x \]

\[ = A \cos(x + c_3) - B e^x \]

[Taking \( c_1 + c_2 = A, c_4 e^{c_5} = B \)]

Thus, there are actually three arbitrary constants and hence this differential equation should be of order 3.
2. \( (a, c) \quad 2y_1y_3 = 2c \quad \Rightarrow \quad c = y_1y_3 \)

Eliminating \( c \), we get,
\[
y^2 = 2y_1(x + \sqrt{y_1}) \text{ or } (y - 2y_1)^2 = 4y_1^3
\]

It involves only 1st order derivative, its order is 1 but
its degree is 3 as \( y_3^2 \) is there.

3. \( (c, d) \quad \) Tangent to the curve \( y = f(x) \) at \( (x, y) \) is

\[
Y - y = \frac{dy}{dx}(X - x)
\]

\[
\therefore \quad \begin{cases}
A \left( \frac{dy}{dx} - y \right) + B \left( 0, -x \frac{dy}{dx} + y \right)
\end{cases}
\]

\[
3 \left( \frac{x \frac{dy}{dx} - y}{\frac{dy}{dx}} \right) + 1 \times 0
\]

\[ \therefore \quad \text{BP: PA = 3:1} \quad \Rightarrow \quad x = \frac{4}{1} \]

\[
\Rightarrow \quad \frac{x}{dy} + 3y = 0 \quad \Rightarrow \quad \int \frac{dy}{y} = \int -3 \frac{dx}{x}
\]

\[
\Rightarrow \quad \log y = -3 \log x + \log c \quad \Rightarrow \quad y = \frac{c}{x^3}
\]

As curve passes through \((1, 1), c = 1\)

\[ \therefore \quad \text{curve is } x^3y = 1, \text{ which also passes through} \]

\[ \left( \frac{2}{1}, 8 \right) \]

4. \( (a, d) \)
The given differential equation is

\[
\frac{dy}{dx} - y \tan x = 2x \sec x,
\]

I.F. = \( e^{\int \tan x \, dx} = \cos x \)

\[ \therefore \quad y \cos x = \int 2x \sec x \, dx = 2y + c \quad y(0) = 0 \quad \Rightarrow \quad c = 0 \]

\[ \therefore \quad y = x^2 \sec x \]

Now at \( x = \frac{\pi}{4}, \quad y = \frac{\pi^2}{16} \times \sqrt{2} = \frac{\pi^2}{8\sqrt{2}} \)

At \( x = \frac{\pi}{3}, \quad y = \frac{\pi^2}{9} \times 2 = \frac{2\pi^2}{9} \)

At \( x = \frac{\pi}{4}, \quad y' = \frac{2\pi}{4} \times \sqrt{2} + \frac{\pi^2}{8\sqrt{2}} \times 1 = \frac{\pi^2}{8\sqrt{2}} + \frac{\pi}{\sqrt{2}} \)

At \( x = \frac{\pi}{3}, \quad y' = \frac{2\pi}{3} \times 2 + \frac{2\pi^2}{9} \times \sqrt{3} = \frac{2\pi^2}{3\sqrt{3}} + \frac{4\pi}{3} \)

5. \( (a) \quad \frac{dy}{dx} = \frac{y}{x} + \sec \frac{y}{x} \)

Putting \( y = vx \) and \( \frac{dy}{dx} = v + x \frac{dv}{dx} \), we get \( x \frac{dv}{dx} = \sec v \)

\[ \therefore \quad \int \cos v \, dv = \int \frac{dx}{x} \]

\[ \Rightarrow \quad \sin v = \log x + c \quad (\because x > 0) \]

\[ \Rightarrow \quad \sin \frac{y}{x} = \log x + c \]

It passes through \( (1, \frac{\pi}{6}) \) \( \Rightarrow \quad C = \frac{1}{2} \)

\[ \therefore \quad \sin \frac{y}{x} = \log x + \frac{1}{2} \]

6. \( (a, c) \quad \frac{dy}{dx} + \frac{e^x}{1 + e^x} y = \frac{1}{1 + e^x} \)

I.F. = \( 1 + e^x \)

\[ \text{Sol}: \quad y(1 + e^x) = x + c \]

\[ y(0) = 2 \quad \Rightarrow \quad c = 4 \]

\[ \therefore \quad y = \frac{x + 4}{e^x + 1} \quad \therefore \quad y(-4) = 0 \]

Also \( \frac{dy}{dx} = \frac{(e^x + 1) - e^x(x + 4)}{(e^x + 1)^2} \)

For critical point \( \frac{dy}{dx} = 0 \)

\[ \Rightarrow \quad e^x(x + 3) = 1 \quad \Rightarrow \quad x + 3 = e^{-x} \]

Its solution will be intersection point of \( y = x + 3 \) and \( y = e^{-x} \)

![Graph showing intersection point](image)

7. \( (b, c) \quad \) Let the equation of circle be

\[ x^2 + y^2 + 2gx + 2gy + c = 0 \]

\[ \Rightarrow \quad 2x + 2yy' + 2g + 2gy' = 0 \]

\[ \Rightarrow \quad x + yy' + g + gy' = 0 \quad \text{(i)} \]

Differentiating again,

\[ 1 + yyy'' + (y')^2 + gy'' = 0 \quad \Rightarrow \quad g = -\frac{1 + (y')^2 + yy''}{y''} \]

Substituting value of \( g \) in eqn. (i)

\[ x + yy' - \frac{1 + (y')^2 + yy''}{y''} \left( \frac{1 + (y')^2 + yy''}{y''} \right) y' = 0 \]

\[ \Rightarrow \quad xy'' + yyy'' - (y')^2 - yy'' - y' - (y')^3 - yy'y'' = 0 \]

\[ \Rightarrow \quad (x - y)yy'' - y'(1 + y' + (y')^2) = 0 \]

or \( (y - x)yy'' + [1 + y' + (y')^2]y' + 1 = 0 \)

\[ Pyy'' + Qy' + 1 = 0 \]

\[ \therefore \quad P = y - x, \quad Q = 1 + y' + (y')^2 \]

Also \( P + Q = 1 - x + y' + (y')^2 \)
8. (a) \( f'(x) = 2 - \frac{f(x)}{x} \)
\[\Rightarrow f'(x) + \frac{1}{x} f(x) = 2 \]
If \( e^{\log x} = x \)
\[\therefore f(x) = \int 2x \, dx = x^2 + C \]
or \( f(x) = x + \frac{C}{x}, C \neq 0 \) as \( f(x) \neq 1 \)

(a) \[\lim_{x \to 0^+} f'(x) = \lim_{x \to 0^+} (1 - Cx^2) = 1 \]

(b) \[\lim_{x \to 0^+} x f'(x) = \lim_{x \to 0^+} \left( \frac{1}{x} + Cx \right) \lim_{x \to 0^+} 1 + Cx^2 = 1 \]

(c) \[\lim_{x \to 0^+} x^2 f'(x) = \lim_{x \to 0^+} x^2 \left( 1 - C \frac{1}{x^2} \right) = \lim_{x \to 0^+} x^2 - C = -C \]

(d) for \( C \neq 0 \), \( f(x) \) is unbounded as \( 0 < x < 2 \)
\[\Rightarrow \frac{C}{2} < \frac{C}{x} < \infty \Rightarrow \frac{C}{2} < x + \frac{C}{x} < \infty \]

9. (a, d) \([x + 2] \int (x + 2) \, dy = y^2 \)
\[\Rightarrow \int \frac{dy}{dx} (x + 2) = \frac{1}{y^2} \]
\[\Rightarrow \frac{1}{x + 2} \frac{dy}{dx} = \frac{1}{y^2} \]
Let \( \frac{1}{x + 2} = u \Rightarrow \frac{1}{(x + 2)^2} \frac{dy}{dx} = du \)
\[\therefore \text{Eqn becomes} \]
\[\frac{du}{y^2} + \frac{1}{y} = \frac{1}{y^2} \]
I.F. = \( e^{\log y} = y \)
\[\therefore \text{Solution is: } u \times y = \int y \times \frac{1}{y^2} \, dy = \log y + C \]
\[\Rightarrow -\frac{1}{x + 2} = \log y + C \]
As it passes through \((1, 3) \Rightarrow C = 1 - \log 3 \)
\[\therefore -\frac{1}{x + 2} = \log y - 1 - \log 3 \]
\[\Rightarrow \log y = \frac{1}{3} - \frac{1}{x + 2} \] \( \cdots (1) \)
Intersection of (1) and \( y = x + 2 \)
\[\log \frac{y}{3} = 0 \Rightarrow y = 3 \Rightarrow x = 1 \]
\[\therefore (1, 3) \text{ is the only intersection point.} \]
Intersection of (1) and \( y = (x + 2)^2 \)

E. Subjective Problems

1. (a) \( (a + bx)e^x = x \)
\[\Rightarrow \frac{y}{e^x} = \frac{x}{a + bx} \] \( \cdots (1) \)
Diff. w.r. to \( x \), we get
\[\frac{y}{e^x} \frac{dy}{dx} - y = \frac{a + bx - bx}{(a + bx)^2} \]
or \[\frac{dy}{dx} = \frac{ax^2}{(a + bx)^2} \] \( \cdots (2) \)
From (1) using \( e^x = \frac{x}{a + bx}, \) we get
\[\frac{dy}{dx} = \frac{ax}{a + bx} \] \( \cdots (3) \)
Differentiating (3) w.r. to \( x \), we get
\[\frac{x}{x^2} \frac{dy}{dx} + \frac{dy}{dx} \frac{dy}{dx} = \frac{(a + bx)a - axb}{(a + bx)^2} \]
or \[\frac{x}{x^2} \frac{dy}{dx} = \frac{a^2}{(a + bx)^2} \]
\[\Rightarrow x^3 \frac{dy}{dx} = \left( \frac{ax}{a + bx} \right)^2 \] \( \cdots (4) \)
Comparing (3) and (4) we get
\[\frac{x}{x^2} \frac{dy}{dx} = \left( \frac{dy}{dx} \right)^2 \]
2. The length of norma \( PQ \) to any curve \( y = f(x) \) is given by
\[\sqrt{1 + \left( \frac{dy}{dx} \right)^2} \]
According to question length of \( PQ = k \)
\[\Rightarrow \left( \frac{dy}{dx} \right)^2 + y^2 = k^2 \]
\[\Rightarrow \frac{dy}{dx} = \pm \sqrt{k^2 - y^2} \]
Differential Equations

which is the required differential equation of given curve. On solving this D.E. we get the eq of curve as follows

\[ \int \frac{y dy}{\sqrt{k^2 - y^2}} = \pm dx \Rightarrow -\frac{1}{2} \cdot 2\sqrt{k^2 - y^2} = \pm x + C \]

\[-\sqrt{k^2 - y^2} = \pm x + C\]

As it passes through \((0, k)\) we get \(C = 0\)

\[\therefore \quad \text{Eq of curve is} \quad -\sqrt{k^2 - y^2} = \pm x \quad \text{or} \quad x^2 + y^2 = k^2\]

3. Equation of the tangent to the curve \(y = f(x)\) at point \((x, y)\) is \(y = f'(x)(X - x)\) ...(I)

The line (I) meets \(X\)-axis at \(P\left(x - \frac{y}{f'(x)}, 0\right)\) and \(Y\)-axis in \(Q(0, y - xf'(x))\)

Area of triangle \(OPQ\) is

\[= \frac{1}{2} \cdot (OP)(OQ) = \frac{1}{2} \left( x - \frac{y}{f'(x)} \right) \left( y - xf'(x) \right) \]

\[= \frac{(y - xf'(x))^2}{2f'(x)}\]

We are given that area of \(\Delta OPQ = 2\)

\[\Rightarrow \frac{(y - xf'(x))^2}{2f'(x)} = 2 \Rightarrow (y - xf'(x))^2 + 4f'(x) = 0\]

\[\Rightarrow \quad (y - px)^2 + 4p = 0 \quad \text{...(2)}\]

where \(p = f'(x) = \frac{dy}{dx}\)

Since \(OQ > 0, y - xf'(x) > 0\). Also note that \(p = f'(x) < 0\)

We can write (2) as \(y - px = 2\sqrt{-p}\)

\[\Rightarrow \quad y = px + 2\sqrt{-p} \quad \text{...(3)}\]

Differentiating (3) with respect to \(x\), we get

\[\frac{dy}{dx} = p + \frac{dp}{dx} + 2 \left( \frac{1}{2} \right) (-p)^{-1/2} (-1) \frac{dp}{dx}\]

\[\Rightarrow \quad \frac{dp}{dx} x - (p)^{-1/2} \frac{dp}{dx} = 0\]

\[\therefore \frac{dp}{dx} \left[ x - (p)^{-1/2} \right] = 0 \Rightarrow \frac{dp}{dx} = 0 \text{ or } x = (p)^{-1/2}\]

If \(\frac{dp}{dx} = 0\), then \(p = c\) where \(c < 0\) \([\because p < 0]\)

Putting this value in (3) we get

\[y = cx + 2\sqrt{-c} \quad \text{...(4)}\]

This curve will pass through \((1, 1)\) if

\[1 = c + 2\sqrt{-c} \Rightarrow -c - 2\sqrt{-c} + 1 = 0\]

\[\Rightarrow (\sqrt{-c} - 1)^2 = 0\]

or \(\sqrt{-c} = 1 \Rightarrow -c = 1 \text{ or } c = -1\)

Putting the value of \(c\) in (4), we get

\[y = -x + 2, \text{ or } x + y = 2\]

Next, putting \(x = (-p)^{-1/2}\) or \(p = x^{-2}\) in (3) we get

\[y = \frac{-x}{x^2} + 2 \left( \frac{1}{x} \right) = \frac{1}{x}\]

\[\Rightarrow \quad xy = 1(x > 0, y > 0)\]

Thus, the two required curves are \(x + y = 2\) and \(xy = 1, (x > 0, y > 0)\).

4. Put \(10x + 6y = v\)

\[\therefore \quad 10 + 6 \frac{dy}{dx} = \frac{dv}{dx} \quad \because \quad \frac{dv}{dx} - 10 = 6 \sin v\]

\[\Rightarrow \quad \frac{dv}{6 \sin v + 10} = dx \quad \text{or} \quad \frac{dv}{12 \sin v \cos v + 10} = dx\]

Divide numerator and denominator by \(\cos^2 \left( \frac{\sqrt{v}}{2} \right)\) and put

\[\tan \left( \frac{\sqrt{v}}{2} \right) = t\]

\[\therefore \quad \frac{2 dt}{12t + 10(1 + t^2)} = dx \quad \text{or} \quad \frac{dt}{5t^2 + 6t + 5} = dx\]

or \(\frac{dt}{\left( t + \frac{3}{2} \right)^2 + \left( \frac{4}{5} \right)^2} = 5 dx\)

or \(\frac{\frac{5}{4} \tan^{-1} \frac{5t + 3}{4}}{4} = 5x + 5c \text{ or } \tan^{-1} \frac{5t + 3}{4} = 4x + c\)

At origin \(x = 0, y = 0\)

\[\therefore \quad v = 0, \quad \therefore \quad t = \tan \left( \frac{\sqrt{v}}{2} \right) = 0\]

Hence, from above

\[\tan^{-1} \frac{3}{4} = c \Rightarrow \tan^{-1} \frac{5t + 3}{4} - \tan^{-1} \frac{1}{4} = 4x\]

or \(\frac{5t + 3}{4} = \tan 4x \text{ or } \frac{20t}{25 + 15t} = \tan 4x\)

or \(4t = (5 + 3t) \tan 4x \text{ or } (4t - 3 \tan 4x) = 5 \tan 4x\)
or \( \frac{v}{4} = \frac{5\tan 4x}{4 - 3\tan 4x} \)

or \( \tan (5x + 3y) = \frac{5\tan 4x}{4 - 3\tan 4x} \)

or \( 5x + 3y = \tan^{-1} \left( \frac{5\tan 4x}{4 - 3\tan 4x} \right) \)

or \( y = \frac{1}{3} \tan^{-1} \left( \frac{5\tan 4x}{4 - 3\tan 4x} \right) - 5x \)

5. (i) \( y = u(x) \) and \( y = v(x) \) are solutions of given differential equations.

(ii) \( u(x_1) > v(x_1) \) for some \( x_1 \)

(iii) \( f(x) > g(x) \), \( \forall x > x_1 \)

\[ \frac{du}{dx} + p(x)u = f(x) \]

\[ \therefore \frac{d}{dx} \left[ u(x)e^{\int p \, dx} \right] = f(x)e^{\int p \, dx} \]

Similarly, \( \frac{d}{dx} \left[ v(x)e^{\int p \, dx} \right] = g(x)e^{\int p \, dx} \)

Subtracting, \( \frac{d}{dx} \left( u(x)-v(x)e^{\int p \, dx} \right) = (f(x)-g(x))e^{\int p \, dx} \)

From above since \( f(x) > g(x) \), \( \forall x > x_1 \) and exponential function is always +ive, then R.H.S. is +ive.

\[ \therefore \frac{d}{dx} \left( u(x)-v(x)e^{\int p \, dx} \right) > 0 \] or \( \frac{dF}{dx} > 0 \)

Hence the function \( F = (u-v)e^{\int p \, dx} \) is an increasing function.

Again \( u(x_1) > v(x_1) \) for some \( x_1 \)

\[ \therefore F = (u-v)e^{\int p \, dx} \] is +ive at \( x = x_1 \)

\[ \Rightarrow F = (u-v)e^{\int p \, dx} \] is +ive \( \forall x > x_1 \)

\( F \) being increasing function

\[ \therefore u(x) > v(x), \forall x > x_1 \]

\[ \therefore \text{Hence there is no point} \ (x, y) \ \text{such that} \ x > x_1 \ \text{which can satisfy the equations.} \]

\( y = u(x) \) and \( y = v(x) \).

6. Equation of normal is, \( \frac{dx}{dy} (X-x) + Y-y = 0 \)

\[ \therefore \frac{\left| \frac{dx}{dy} \right|}{\sqrt{1 + \left( \frac{dx}{dy} \right)^2}} = |y| \]

\[ \Rightarrow x^2 \left( \frac{dx}{dy} \right)^2 + y^2 + 2xy \frac{dx}{dy} = y^2 + y^2 \left( \frac{dx}{dy} \right)^2 \]

\[ \Rightarrow \left( \frac{dx}{dy} \right)^2 = \frac{2xy}{y^2 - x^2} \]

If \( \frac{dx}{dy} = 0 \), then \( x = c \), when \( x = 1, y = 1, c = 1 \).

\[ \therefore x = 1 \] ...(1)

When \( \frac{dx}{dy} = \frac{2xy}{y^2 - x^2} \) (homogeneous)

Putting \( x = vy \) \( \Rightarrow \frac{dx}{dy} = v + y \frac{dv}{dy} \)

\[ \therefore v + y \frac{dv}{dy} = \frac{2v}{1-v^2} \]

\[ \Rightarrow \frac{y}{1-v^2} \frac{dv}{dy} = \frac{2v}{1-v^2} - v = \frac{2v-v+v^3}{1-v^2} = \frac{v+v^3}{1-v^2} \]

\[ \Rightarrow \frac{(1-v^2)dy}{y(1+v^2)} = \frac{dv}{y} \Rightarrow \left( 1 - \frac{2v}{v(1+v^2)} \right) dy = \frac{dv}{y} \]

\[ \Rightarrow \log v - \log(1+v^2) = \log y + \log c \]

or \( \frac{v}{1+v^2} = cy \Rightarrow \frac{xy}{x^2 + y^2} = cy \)

\[ \Rightarrow \frac{x}{x^2 + y^2} = c, \]

Putting \( x = 1, y = 1 \) gives \( c = \frac{1}{2} \).

\[ \because \text{Solution is} \ x^2 + y^2 - 2x = 0 \] ...(2)

Hence the solutions are,

\[ x^2 + y^2 - 2x = 0, \ x = 1, \]

7. Let \( X_0 \) be initial population of the country and \( Y_0 \) be its initial food production. Let the average consumption be a units. Therefore, food required initially \( aX_0 \). It is given

\[ Y_0 = aX_0 \left( \frac{90}{100} \right) = 0.9aX_0 \] ...(i)

Let \( X \) be the population of the country in year \( t \).

Then \( \frac{dX}{dt} = \text{rate of change of population} \)

\[ = \frac{3}{100}X = 0.03X \]

\[ \frac{dX}{X} = 0.03 \, dt; \text{ Integrating, } \int \frac{dX}{X} = \int 0.03 \, dt \]

\[ \Rightarrow \log X = 0.03t + c \Rightarrow X = Ae^{0.03t} \]

At \( t = 0, X = X_0 \), thus \( X_0 = A, X = X_0e^{0.03t} \)

Let \( Y \) be the food production in year \( t \).

Then \( Y = Y_0 \left( \frac{1 + \frac{4}{100}t}{1} \right) = 0.9aX_0(1.04)^t \)

(since \( Y = 0.9aX_0 \) from (i))
9. Let at time \( t, r \) and \( h \) be the radius and height of cone of water.
\( \therefore \) At time \( t \), surface area of liquid in contact with air = \( \pi r^2 \).

\[
A \quad \frac{dV}{dt} \propto \pi r^2
\]

\[
\therefore \text{sign shows that } V \text{ decreases with time.}
\]

\[
\frac{dV}{dt} = -k \pi r^2 \Rightarrow \frac{d}{dt} \int \frac{1}{3} \pi r^2 h = -k \pi r^2
\]

\[
\Rightarrow \frac{1}{\pi} \int \frac{dt}{r^2} = -k \pi
\]

But from figure \( \frac{r}{h} = \frac{R}{H} \) [Using similarity of \( \triangle \)'s]

\[
\Rightarrow h = \frac{rH}{R}
\]

\( \therefore \) We get, \( \frac{1}{3} \int \frac{dt}{r^2} = -kr^2
\]

\[
\Rightarrow \frac{r^2H}{R} \frac{dr}{dt} = -kr^2
\]

\[
\Rightarrow \frac{dr}{dt} = -\frac{kR}{H} \Rightarrow r = -k \frac{R}{H} t + C
\]

But at \( t = 0, r = R \Rightarrow R = 0 + C \Rightarrow C = R
\]

\( \therefore \) \( r = -k \frac{Rt}{H} + R \)

Now let the time at which cone is empty be \( T \) then at \( T, r = 0 \) (no liquid is left)

\( \therefore \) \( 0 = -kRT + R \Rightarrow T = \frac{H}{k} \)

10. According to question

slope of curve \( C \) at \( (x, y) = \frac{(x+1)^2 + (y-3)}{(x+1)} \)

\[
\frac{dy}{dx} = (x+1) + \frac{y-3}{x+1}
\]

\[
\frac{dy}{dx} \left( \frac{1}{x+1} \right) y = x + 1 - \frac{3}{x+1}
\]

\( \text{I.F.} = e^{\int \frac{1}{x+1} dx} = e^{-\log(x+1)} = \frac{1}{x+1} \)
\[ y + \frac{3}{x+1} = \int \left[ 1 - \frac{3}{(x+1)^2} \right] dx \]
\[ \frac{y}{x+1} = x + \frac{3}{x+1} + C \]
\[ y = x(x+1) + 3 + C(x+1) \quad \ldots (1) \]

As the curve passes through (2, 0)
\[ 0 = 2.3 + 3C \]
\[ C = -3 \]
\[ \text{Eqn. (1) becomes} \]
\[ y = x(x+1) + 3 - 3x - 3 \]
\[ y = x^2 - 2x \quad \ldots (2) \]

which is the required eqn of curve.

This can be written as \((x-1)^2 = (y+1)\)

[Upward parabola with vertex at (1, -1), meeting x-axis at (0, 0) and (2, 0)]

\[ \text{Area bounded by curve and x-axis in fourth quadrant is as shaded region in fig. given by} \]
\[ A = \int_0^2 y \, dx = \int_0^2 (x^2 - 2x) \, dx = \left[ \frac{x^3}{3} - x^2 \right]_0^2 \]
\[ = \frac{8}{3} - 4 = \frac{4}{3} 	ext{ sq. units.} \]

11. We know that length of tangent to curve \( y = f(x) \) is given by
\[ y \sqrt{1 + \left( \frac{dy}{dx} \right)^2} \]
As per question
\[ y \sqrt{1 + \left( \frac{dy}{dx} \right)^2} = 1 \]
\[ y^2 \left( 1 + \left( \frac{dy}{dx} \right)^2 \right) = \left( \frac{dy}{dx} \right)^2 \]
\[ \left( \frac{dy}{dx} \right)^2 = \frac{y^2}{1-y^2} \quad \Rightarrow \quad \frac{dy}{dx} = \pm \frac{y}{\sqrt{1-y^2}} \]

\[ \Rightarrow \int \frac{\sqrt{1-y^2}}{y} \, dy = \int \pm \, dx \]
\[ \Rightarrow \text{Put } y = \sin \theta \text{ so that } dy = \cos \theta \, d\theta \]
\[ \Rightarrow \int \frac{\cos \theta}{\sin \theta} \cos \theta \, d\theta = \pm x + c \]
\[ \Rightarrow \int (\csc \theta - \sin \theta) \, d\theta = \pm x + c \]
\[ \Rightarrow \log |\csc \theta - \cot \theta| + \cos \theta = \pm x + c \]
\[ \Rightarrow \log \left| 1 - \frac{\sqrt{1-y^2}}{y} \right| + \sqrt{1-y^2} = \pm x + c \]

**F. Match the Following**

1. \(A-p, q, r, s, t; \quad B-p, t; \quad C-p, q, r, t; \quad D-s\)

(A) \((x-3)^2 y' + y = 0 \)
\[ \Rightarrow \int \left( \frac{1}{y} \right) dy = \int \left( \frac{1}{(x-3)^2} \right) dx \]
or \(\log |y| = \frac{1}{x-3} + \log c, x \neq 3 \)
\[ \Rightarrow \frac{y}{c} = e^{x-3} \text{ or } y = ce^{x-3}, x \neq 3 \]
\[ \Rightarrow \frac{y}{c} = -3 \quad \Rightarrow \quad \text{The solution set is } (-\infty, -\infty) - \{3\} \]

The interval \((-\pi, \pi)\) contained in the domain
\[ \Rightarrow \quad (A) \rightarrow p, q, r, s, t \]

(B) \(\int_1^5 (x-1)(x-2)(x-3)(x-4)(x-5) \, dx \)
Let \((x-3) = t \Rightarrow dx = dt \)
Also when \(x \rightarrow 1, t \rightarrow -2 \)
and when \(x \rightarrow 5, t \rightarrow 2 \)
\[ \Rightarrow \quad \text{Integral becomes} \]
\[ \int_{-2}^2 (t+2)(t+1)(t-1)(t-2) \, dt \]
\[ = \int_{-2}^2 (t^2 - 1)(t^2 - 4) \, dt = 0 \]
as integrand is an odd function.

\(O\) is contained by \((-\pi, \pi)\) and \((-\pi, \pi)\)
\[ \Rightarrow \quad (B) \rightarrow p, t. \]
Differential Equations

(C) Let \( f(x) = \cos^2 x + \sin x \)
\[ f'(x) = -2 \sin x \cos x + \cos x \]
For critical point \( f'(x) = 0 \) \( \Rightarrow \) \( \sin x = \frac{1}{2} \) or \( \cos x = 0 \)
\[ \Rightarrow x = \frac{\pi}{6}, \frac{5\pi}{6}, \text{ or } x = \frac{\pi}{2}, \frac{3\pi}{2} \]
Now \( f''(x) = -2 \cos 2x - \sin x \)
\[ f''(x) \big|_{x=\pi/6} = -\sqrt{3} \quad f''(x) \big|_{x=\pi/2} = -\sqrt{3} \]
\[ f''(x) \big|_{x=\pi/6} = +\sqrt{3} \quad f''(x) \big|_{x=\pi/2} = +\sqrt{3} \]
\[ \therefore \frac{\pi}{6} \text{ and } \frac{5\pi}{6} \text{ are the points of local maxima.} \]
Clearly all the intervals given in column II except \( 0, \frac{\pi}{8} \) contain at least one point of local maxima.
\[ \therefore \quad (C) \rightarrow p, q, r, t \]

(D) Let \( f(x) = \tan^{-1} (\sin x + \cos x) \)
\[ f'(x) = \frac{1}{1 + 2 \sin^2 \left( x + \frac{\pi}{4} \right)} \sqrt{2} \cos \left( x + \frac{\pi}{4} \right) \]
For \( f(x) \) to be an increasing function,
\[ f'(x) > 0 \]
\[ \Rightarrow \cos \left( x + \frac{\pi}{4} \right) > 0 \]
\[ \Rightarrow \frac{\pi}{2} < x + \frac{\pi}{4} < \frac{3\pi}{2} \]
\[ \Rightarrow \frac{3\pi}{4} < x < \frac{\pi}{4} \]
Clearly only \( 0, \frac{\pi}{8} \) \( \subset \left( -\frac{3\pi}{4}, \frac{\pi}{4} \right) \)
\[ \therefore \quad (D) \rightarrow s. \]

Section-B

1. (c) \( \left( 1 + \tan^{-1} y \right)^2 = \left( \frac{4 \tan^{-1} y}{3} \right)^3 \)
\[ 1 + \tan^{-1} y = 16 \left( \frac{\tan^{-1} y}{3} \right)^3 \]
2. (b) \( \frac{d^2 y}{dx^2} = e^{-2x}, \quad \frac{dy}{dx} = e^{-2x} + c; \quad y = e^{-2x} + cx + d \)
3. (c) \( y^2 = 4a(x - h), \quad 2yy_1 = 4a \Rightarrow yy_1 = 2a \)
Differentiating, \( y_x^2 + yy_2 = 0 \)
Degree = 1, order = 2.

H. Assertion & Reason Type Questions

1. (c) The given differential equation is
\[ \int \frac{dy}{y^2 - 1} = \int \frac{dx}{x^2 - 1} \Rightarrow y = \sec^{-1} x + C \]
\[ \Rightarrow y = \sec \left[ \sec^{-1} x + C \right] \quad \therefore \quad y(2) = \frac{2}{\sqrt{3}} \]
\[ \Rightarrow \frac{2}{\sqrt{3}} = \sec \left( \sec^{-1} 2 + C \right) \Rightarrow \frac{2}{\sqrt{3}} = \sec^{-1} 2 - \sec^{-1} 2 = C \]
\[ \Rightarrow C = \frac{\pi}{6} \therefore \quad y = \sec \left( \sec^{-1} x - \frac{\pi}{6} \right) \]
Statement 1 is true.
Also \( \frac{1}{y} = \cos \left( \cos^{-1} \frac{1}{x} - \frac{\pi}{6} \right) \cos \frac{\pi}{6} + \sin \left( \cos^{-1} \frac{1}{x} - \frac{\pi}{6} \right) \sin \frac{\pi}{6} \)
\[ \Rightarrow \frac{1}{y} = \frac{\sqrt{3}}{2} + \frac{1}{2} \left( \frac{1}{x} - \frac{1}{x^2} \right) \therefore \text{Statement 2 is false.} \]

1. (b) The given equation is
\[ \frac{dy}{dx} + g'(x)y = g(x)g'(x) \]
I.F. = \( e^{\int g'(x)dx} = e^{g(x)} \)
\[ \therefore \text{Solution is } y e^{g(x)} = \int e^{g(x)}g(x)g'(x)dx \]
Put \( g(x) = t \) so that \( g'(x) \, dx = dt \)
\[ = e^t dt = e^t (t - 1) + c \]
\[ \therefore y e^{g(x)} = e^{g(x)}[g(x) - 1] + c \]
As \( y(0) = 0 \) and \( g(0) = 0 \)
\[ \therefore \quad C = 1 \]
\[ \therefore y e^{g(x)} = e^{g(x)}[g(x) - 1] + 1 \]
As \( g(2) = 0 \), putting \( x = 2 \) we get \( y(2), e^{g(2)} = e^{g(2)}[g(2) - 1] + 1 \Rightarrow y(2) = 0 \)
5. (c) \[ x^2 + y^2 - 2ay = 0 \] \[ \text{Differentiate,} \]
\[ 2x + 2y \frac{dy}{dx} - 2a \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{x + ay}{y} \]
Put in (1), \[ (x^2 + y^2)\frac{dy}{dx} - 2xy - 2y^2 \frac{dy}{dx} = 0 \Rightarrow (x^2 - y^2)\frac{dy}{dx} = 2xy \]

6. (b) \[ ydx + (x + x^2 y)dy = 0 \]
\[ \Rightarrow \frac{dx}{dy} = \frac{x + x^2 y}{y} \Rightarrow \frac{dx}{dy} = -x + \frac{x}{y} \]
It is Bernoulli’s form. Divide by \( x^2 \)
\[ \frac{dx}{dy} + \left( 1 - \frac{1}{y} \right) \frac{x}{y} = -1 \]
Put \( x^{-1} = t \), \( -x^2 \frac{dx}{dy} = \frac{dt}{dy} \)
We get, \( \frac{dt}{dy} + t(1 + \frac{1}{y}) = -1 \Rightarrow \frac{dt}{dy} = \frac{1}{y} t = 1 \)
It is linear in \( t \).
\[ \int (y^{-1})dy = e^{-\log y} = y^{-1} \]
\[ \therefore \text{Solution is} \ t(y^{-1}) = \int (y^{-1})dy + c \]
\[ \Rightarrow \frac{1}{x} = \log y + c \Rightarrow \log y - \frac{1}{xy} = c \]

7. (c) \[ y^2 = 2c(x + \sqrt{c}) \] \[ \text{ii) } 2yy' = 2c \text{ or } yy' = c \]
\[ \Rightarrow y^2 = 2yy' (x + \sqrt{c^2}) \]
[On putting value of \( c \) from (ii) in (i)]
On simplifying, we get
\[ (y - 2xy)^2 = 4y^3 \]
Hence equation (iii) is of order 1 and degree 3.

8. (c) \[ \frac{xdv}{dx} = y (\log y - \log x + 1) \]
\[ \frac{dy}{dx} = \frac{y}{x} \left[ \log \left( \frac{y}{x} \right) + 1 \right] \]
Put \( y = vx \)
\[ \frac{dy}{dx} = v + \frac{xdv}{dx} \Rightarrow v + \frac{xdv}{dx} = v (\log v + 1) \]
\[ \frac{xdv}{dx} = v \log v \Rightarrow \frac{dv}{v \log v} = \frac{dx}{x} \]

9. (d) \[ Ax^2 + By^2 = 1 \]
\[ A + By \frac{dy}{dx} = 0 \]
\[ A + By \frac{dy}{dx} = 0 \]
From (2) and (3)
\[ x - By \frac{dy}{dx} = 0 \]
Dividing both sides by \( -B \), we get
\[ \Rightarrow xy \frac{dy}{dx} = x \frac{dy}{dx} - y \frac{dy}{dx} = 0 \]
Which is a DE of order 2 and degree 1.

10. (a) General equation of circles passing through origin and having their centres on the x-axis is \( x^2 + y^2 + 2gx = 0 \) \( (i) \)
On differentiating w.r.t. \( x \), we get
\[ 2x + 2y \cdot \frac{dy}{dx} + 2g = 0 \Rightarrow g = - \left( x + y \frac{dy}{dx} \right) \]
\[ \therefore \text{equation (i) be} \]
\[ x^2 + y^2 + 2 \left( - \left( x + y \frac{dy}{dx} \right) \right) x = 0 \]
\[ \Rightarrow x^2 + y^2 - 2x^2 - 2xy \frac{dy}{dx} = 0 \Rightarrow y^2 = x^2 + 2xy \frac{dy}{dx} \]

11. (d) \[ \frac{dy}{dx} = \frac{x + y}{x} = 1 + \frac{y}{x} \]
Putting \( y = vx \) and \( \frac{dy}{dx} = v + x \frac{dv}{dx} \)
we get
\[ v + x \frac{dv}{dx} = 1 + v \Rightarrow \int \frac{dv}{v} = \int \frac{dx}{x} \]
\[ \Rightarrow v = \log x + c \Rightarrow y = x \ln x + cx \]
As \( y(1) = 1 \)
\[ \therefore c = 1 \]
So solution is \( y = x \ln x + x \)

12. (c) We have \( y = c_1 e^{c_2 x} \)
\[ \Rightarrow y' = c_1 c_2 e^{c_2 x} = c_2 y \]
\[ \Rightarrow \frac{y'}{y} = c_2 \Rightarrow \frac{y'^2 - (y')^2}{y^2} = 0 \Rightarrow \text{y'' = (y')^2} \]

13. (d) \[ \cos x \frac{dy}{dx} = y (\sin x - y) \]
\[ \frac{dy}{dx} = y \tan x - y^2 \sec x \]
Differential Equations

\[ \frac{1}{y^2} \frac{dy}{dx} - \tan x = -\sec x \quad \text{(i)} \]

Let \( \frac{1}{y} = t \Rightarrow -\frac{1}{y^2} \frac{dy}{dx} = \frac{dt}{dx} \)

From equation (i)

\[ -\frac{dt}{dx} - t \tan x = -\sec x \Rightarrow \frac{dt}{dx} + (\tan x)t = \sec x \]

I.F. = \( e^{\int \tan x \, dx} = (e)^{\log \sec x} \sec x \)

Solution: \( t(I.F) = \int (I.F) \sec x \, dx \Rightarrow \frac{1}{y} \sec x = \tan x + c \)

14. (d) \[ \frac{dy}{dx} = y + 3 \Rightarrow \int \frac{dy}{y + 3} = \int dx \Rightarrow \ln |y + 3| = x + c \]

Since \( y(0) = 2 \), \( \ln 5 = c \)

\( \Rightarrow \ln |y + 3| = x + \ln 5 \)

When \( x = \ln 2 \), then \( \ln |y + 3| = \ln 2 + \ln 5 \)

\( \Rightarrow \ln |y + 3| = \ln 10 \)

\( \therefore \ y + 3 = \pm 10 \Rightarrow y = 7, -13 \)

15. (a) \[ \frac{dV(t)}{dt} = -k(T-t) \Rightarrow \int dV = -k \int (T-t) \, dt \]

\[ V(t) = \frac{k(T-t)^2}{2} + c \]

\( V(0) = I \Rightarrow I = \frac{KT^2}{2} + C \Rightarrow C = I - \frac{KT^2}{2} \)

\( \therefore \ V(T) = 0 + C = 1 - \frac{KT^2}{2} \)

16. (a) Given differential equation is

\[ \frac{dp(t)}{dt} = 0.5(p(t) - 450) \]

\[ \Rightarrow \frac{dp(t)}{dt} = \frac{1}{2} p(t) - 450 \Rightarrow \frac{dp(t)}{dt} = \frac{p(t) - 900}{2} \]

\[ \Rightarrow 2 \cdot \frac{dp(t)}{dt} = [900 - p(t)] \Rightarrow -2 \frac{dp(t)}{900 - p(t)} = -dt \]

Integrate both sides, we get

\[ -2 \int \frac{dp(t)}{900 - p(t)} = \int dt \]

Let \( 900 - p(t) = u \)

\( \Rightarrow -dp(t) = du \)

\( \therefore \) We have, \( 2 \int \frac{du}{u} = \int dt \Rightarrow 2 \ln u = t + c \)

\[ \Rightarrow 2 \ln [900 - p(t)] = t + c \]

When \( t = 0, p(0) = 850 \)

\( \therefore \ ln 50 = c \)

\[ \Rightarrow 2 \ln \left( \frac{900 - p(t)}{50} \right) = t \Rightarrow 900 - p(t) = 50 \cdot e^{\frac{t}{2}} \]

\[ \Rightarrow p(t) = 900 - 50 \cdot e^{\frac{t}{2}} \]

Let \( p(t_1) = 0 \)

\( 0 = 900 - 50e^{\frac{t_1}{2}} \quad \therefore \ t_1 = 2 \ln 18 \)

17. (c) Given, Rate of change is \[ \frac{dP}{dx} = 100 - 12\sqrt{x} \]

\[ \Rightarrow dP = (100 - 12\sqrt{x}) \, dx \]

By integrating

\[ \int dP = \int (100 - 12\sqrt{x}) \, dx \]

\[ P = 100x - 8x^{3/2} + C \]

Given, when \( x = 0 \) then \( P = 2000 \)

\[ \Rightarrow C = 2000 \]

Now when \( x = 25 \) then

\[ P = 100 \times 25 - 8 \times (25)^{3/2} + 2000 \]

\[ = 4500 - 1000 \]

\[ \Rightarrow P = 3500 \]

18. (c) Given differential equation is

\[ \frac{dp(t)}{dt} = \frac{1}{2} p(t) - 200 \]

By separating the variable, we get

\[ \frac{dp(t)}{\frac{1}{2} p(t) - 200} = dt \]

Integrating on both the sides,

\[ \int \frac{dp(t)}{\frac{1}{2} p(t) - 200} = \int dt \]

Let \( \frac{1}{2} p(t) - 200 = s \Rightarrow \frac{dp(t)}{2} = ds \)

So, \[ \int \frac{dp(t)}{\frac{1}{2} p(t) - 200} = \int dt \]

\[ \Rightarrow \int \frac{2ds}{s} = \int dt \Rightarrow 2 \log s = t + c \]

\[ \Rightarrow 2 \log \left( \frac{p(t)}{2} - 200 \right) = t + c \Rightarrow \frac{p(t)}{2} - 200 = e^{\frac{1}{2} k} \]

Using given condition \( p(t) = 400 - 300 e^{2/2} \)

19. (a) Given, \[ \frac{dy}{dx} + \left( \frac{1}{x \log x} \right) y = 2 \]

I.F. = \( e^{-\int \frac{1}{x \log x} \, dx} = e^{\log (\log x)} = \log x \)

\( y \cdot \log x = \frac{1}{2} \log x \, dx + c \)

\( y \log x = 2 \left[ \log x - x \cdot \log x \right] + c \)

Put \( x = 1, y(0) = -2 + c \Rightarrow c = 2 \)

Put \( x = e \)

\( y \log e = 2e(\log e - 1) + c \Rightarrow y(e) = c = 2 \)

20. (b) \( y(1 + xy)dx = xdy \)

\[ \frac{x dy - y dx}{y^2} = xdy \Rightarrow \int -d \left( \frac{x}{y} \right) = \int xdy \]

\[ \frac{x^2}{2} + C \quad \text{as} \ y(1) = -1 \Rightarrow C = \frac{1}{2} \]

Hence, \( y\left( \frac{-2x}{x^2 + 1} \right) \Rightarrow f \left( \frac{-1}{2} \right) = \frac{4^2}{5} \)
# Vector Algebra and Three Dimensional Geometry

</table>
Section-A

1. Given that \[ \|\mathbf{A}\| = 3 \; ; \; \|\mathbf{B}\| = 4 \; ; \; \|\mathbf{C}\| = 5 \]

\[ \overrightarrow{A} \perp (\overrightarrow{B} + \overrightarrow{C}) \Rightarrow \overrightarrow{A} \cdot (\overrightarrow{B} + \overrightarrow{C}) = 0 \Rightarrow \overrightarrow{A} \cdot \overrightarrow{B} + \overrightarrow{A} \cdot \overrightarrow{C} = 0 \] ..(1)

\[ \overrightarrow{B} \perp (\overrightarrow{C} + \overrightarrow{A}) \Rightarrow \overrightarrow{B} \cdot (\overrightarrow{C} + \overrightarrow{A}) = 0 \Rightarrow \overrightarrow{B} \cdot \overrightarrow{C} + \overrightarrow{B} \cdot \overrightarrow{A} = 0 \] ..(2)

\[ \overrightarrow{C} \perp (\overrightarrow{A} + \overrightarrow{B}) \Rightarrow \overrightarrow{C} \cdot (\overrightarrow{A} + \overrightarrow{B}) = 0 \Rightarrow \overrightarrow{C} \cdot \overrightarrow{A} + \overrightarrow{C} \cdot \overrightarrow{B} = 0 \] ..(3)

Adding (1), (2) and (3) we get

\[ 2(\overrightarrow{A} \cdot \overrightarrow{B} + \overrightarrow{C} \cdot \overrightarrow{A} + \overrightarrow{C} \cdot \overrightarrow{B}) = 0 \] ..(4)

Now, \[ \|\overrightarrow{A} + \overrightarrow{B} + \overrightarrow{C}\|^2 = (\overrightarrow{A} + \overrightarrow{B} + \overrightarrow{C}) \cdot (\overrightarrow{A} + \overrightarrow{B} + \overrightarrow{C}) \]

\[ = \overrightarrow{A} \cdot \overrightarrow{A} + \overrightarrow{B} \cdot \overrightarrow{B} + \overrightarrow{C} \cdot \overrightarrow{C} + 2(\overrightarrow{A} \cdot \overrightarrow{B} + \overrightarrow{B} \cdot \overrightarrow{C} + \overrightarrow{C} \cdot \overrightarrow{A}) \]

\[ = 9 + 16 + 25 + 0 \; \text{ (using equation 4)} \]

\[ = 50 \]

\[ \|\overrightarrow{A} + \overrightarrow{B} + \overrightarrow{C}\| = 5\sqrt{2} \]

2. Required unit vector, \[ \hat{n} = \pm \frac{\overrightarrow{PQ} \times \overrightarrow{PR}}{||\overrightarrow{PQ} \times \overrightarrow{PR}||} \]

\[ \overrightarrow{PQ} = \hat{i} + \hat{j} - 3\hat{k} ; \; \overrightarrow{PR} = -\hat{i} + 3\hat{j} - \hat{k} \]

\[ \therefore \overrightarrow{PQ} \times \overrightarrow{PR} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 1 & -3 \\ -1 & 3 & -1 \end{vmatrix} \]

\[ = (-1+9)\hat{i} + (3+1)\hat{j} + (3+1)\hat{k} = 8\hat{i} + 4\hat{j} + 4\hat{k} \]

\[ ||\overrightarrow{PQ} \times \overrightarrow{PR}|| = \sqrt{64 + 16 + 16} = \sqrt{96} = 4\sqrt{6} \]

\[ \hat{n} = \pm \frac{8\hat{i} + 4\hat{j} + 4\hat{k}}{4\sqrt{6}} = \pm \frac{2\hat{i} + \hat{j} + \hat{k}}{\sqrt{6}} \]

3. Area of \( \triangle ABC = \frac{1}{2} ||\overrightarrow{BA} \times \overrightarrow{BC}|| \)

\[ \overrightarrow{BA} = \hat{i} - 2\hat{j} + 3\hat{k} \; ; \; \overrightarrow{BC} = \hat{i} - 2\hat{j} + 3\hat{k} \]

\[ \therefore \Delta = \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -2 & 3 \\ 1 & -2 & 3 \end{vmatrix} = \frac{1}{2} |6\hat{j} + 4\hat{k}| = |3\hat{j} + 2\hat{k}| = \sqrt{9 + 4} = \sqrt{13} \]

4. Given that \( \hat{a}, \hat{b}, \hat{c}, \hat{d} \) are position vectors of points \( A, B, C \) and \( D \) respectively, such that

\( (\hat{a} - \hat{d}) \cdot (\hat{b} - \hat{c}) = (\hat{b} - \hat{d}) \cdot (\hat{c} - \hat{a}) = 0 \)

\[ \Rightarrow \overrightarrow{DA} \cdot \overrightarrow{CB} = \overrightarrow{DB} \cdot \overrightarrow{AC} = 0 \]

\[ \Rightarrow \overrightarrow{DA} \perp \overrightarrow{CB} \text{ and } \overrightarrow{DB} \perp \overrightarrow{AC} \]

Clearly \( D \) is orthocentre of \( \triangle ABC \)

5. Given that \[ \begin{bmatrix} a & b^2 & 1 + a^3 \\ b & c^2 & 1 + b^3 \\ c & a^2 & 1 + c^3 \end{bmatrix} = 0 \]

\[ \Rightarrow \begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 + abc \\ c & c^2 & 1 + c^2 \end{vmatrix} = 0 \]

Operating \( C_2 \leftrightarrow C_3 \) and then \( C_1 \leftrightarrow C_2 \) in first determinant

\[ \begin{vmatrix} 1 & a^2 & 1 \\ b & b^2 & 1 + abc \\ c & c^2 & 1 + c^2 \end{vmatrix} = 0 \]
\[
\begin{vmatrix}
1 & a & a^2 \\
1 & b & b^2 \\
1 & c & c^2 \\
\end{vmatrix} = 0
\]
\[\Rightarrow (1 + abc) \begin{vmatrix}
1 & a & a^2 \\
1 & b & b^2 \\
1 & c & c^2 \\
\end{vmatrix} = 0\]

\[
\Rightarrow \text{either } 1 + abc = 0 \text{ or } \begin{vmatrix}
1 & a & a^2 \\
1 & b & b^2 \\
1 & c & c^2 \\
\end{vmatrix} = 0
\]

Also given that the vectors \( \vec{A}, \vec{B}, \vec{C} \) are noncoplanar
i.e., \( \begin{vmatrix} \vec{A} \vec{B} \vec{C} \end{vmatrix} \neq 0 \) where \( \vec{A} = \hat{i} + a \hat{j} + a^2 \hat{k} \)

\[\vec{B} = \hat{i} + b \hat{j} + b^2 \hat{k}, \quad \vec{C} = \hat{i} + c \hat{j} + c^2 \hat{k} \Rightarrow \begin{vmatrix}
1 & a & a^2 \\
1 & b & b^2 \\
1 & c & c^2 \\
\end{vmatrix} \neq 0\]

\[\therefore \text{We must have } 1 + abc = 0 \Rightarrow abc = -1\]

6. As given that \( \vec{A}, \vec{B}, \vec{C} \) are three noncoplanar vectors, therefore, \( \begin{vmatrix} \vec{A} \vec{B} \vec{C} \end{vmatrix} \neq 0 \)
Also by the property of scalar triple product we have
\[\vec{A}(\vec{B} \times \vec{C}) = \begin{vmatrix} \vec{A} \vec{B} \vec{C} \end{vmatrix}, \quad \vec{B}(\vec{A} \times \vec{C}) = -\begin{vmatrix} \vec{A} \vec{B} \vec{C} \end{vmatrix}\]

\[\vec{C} \times (\vec{A} \vec{B}) = \begin{vmatrix} \vec{A} \vec{B} \vec{C} \end{vmatrix}, \quad \vec{C} \times (\vec{B} \vec{A}) = -\begin{vmatrix} \vec{A} \vec{B} \vec{C} \end{vmatrix}\]

\[\therefore \begin{vmatrix} \vec{A} \vec{B} \vec{C} \end{vmatrix} \times \begin{vmatrix} \vec{A} \vec{B} \vec{C} \end{vmatrix} = 0\]

7. Given \( \vec{A} = \hat{i} + \hat{j} + \hat{k} \), \( \vec{C} = \hat{j} - \hat{k} \)
Let \( \vec{B} = x\hat{i} + y\hat{j} + z\hat{k} \)

\[ATQ, \quad \vec{A} \times \vec{B} = \vec{C} \Rightarrow \begin{vmatrix}
\hat{i} & \hat{j} & \hat{k} \\
x & y & z \\
1 & 1 & 1 \\
\end{vmatrix} = \hat{j} - \hat{k}\]

\[\Rightarrow (z-y) \hat{j} + (x-z) \hat{j} + (y-x) \hat{k} = \hat{j} - \hat{k}\]

\[\therefore z-y = 0, \quad x-z = 1, \quad y-x = -1\]

Also, \( \vec{A} \vec{B} = 3 \Rightarrow x + y + z = 3 \) \hspace{1cm} \ldots(2)

Using equations (1) and (2) we get

\[1 + z + z + z = 3 \Rightarrow z = 2/3 \Rightarrow y = 2/3, x = 5/3\]

\[\therefore \vec{B} = \frac{5}{3} \hat{i} + \frac{2}{3} \hat{j} + \frac{2}{3} \hat{k}\]

8. Given that the vectors \( \hat{u} = a\hat{i} + j + \hat{k}, \quad \hat{v} = b\hat{j} + \hat{k} \) and \( \hat{w} = \hat{i} + c \hat{k} \) where \( a \neq b \neq c \neq 1 \) are coplanar

\[\therefore \begin{vmatrix} \hat{u} \hat{v} \hat{w} \end{vmatrix} = 0 \Rightarrow \begin{vmatrix}
a & 1 & 1 \\
1 & b & 1 \\
0 & 1 & c \\
\end{vmatrix} = 0\]

Operating \( C_1 - C_2, C_2 - C_3 \)
\[\begin{vmatrix}
a-1 & 0 & 1 \\
1-b & b-1 & 0 \\
0 & 1-c & c \\
\end{vmatrix} = 0\]

Taking \((1-a), (1-b), (1-c)\) common from \( R_1, R_2 \) and \( R_3 \) respectively.

\[\begin{vmatrix}
-1 & 1 & \frac{1}{1-a} \\
0 & 1 & \frac{1}{1-b} \\
0 & 1 & \frac{1}{1-c} \\
\end{vmatrix} = 0\]

\[\Rightarrow (1-a)(1-b)(1-c) \left[ -1 + \frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} \right] \left[ (1-0) \right] = 0\]

\[\Rightarrow (1-a)(1-b)(1-c) \left[ 1 + \frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} \right] = 0\]

\[\Rightarrow (a-1)(b-1)(c-1) \left[ 1 + \frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} \right] = 0\]

But \( a \neq b \neq c \neq 1 \) (given)

\[\therefore \frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} - 1 = 0 \Rightarrow \frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} = 1\]

9. Let \( \vec{c} = a\hat{i} + b\hat{j} \)

As \( \vec{b} \perp \vec{c} \) (given) \quad \therefore \vec{b} \cdot \vec{c} = 0

\[\Rightarrow (4\hat{i} + 3\hat{j}) \cdot (a\hat{i} + b\hat{j}) = 0 \Rightarrow 4a + 3b = 0\]

\[\Rightarrow \alpha = -\frac{3b}{4} \Rightarrow \frac{\alpha}{4} + \frac{b}{3} = \lambda\]

\[\Rightarrow \alpha + 3\lambda, \beta = -4\lambda \quad \ldots(1)\]

Now, let \( \vec{a} = x\hat{i} + y\hat{j} \) be the required vectors.

Then as per question

Projection of \( \vec{a} \) along \( \vec{b} = \frac{\vec{a} \cdot \vec{b}}{|\vec{b}|} = \frac{4x + 3y}{\sqrt{4^2 + 3^2}} = 1\]

\[\Rightarrow 4x + 3y = 5 \quad \ldots(2)\]

Also, projection of \( \vec{a} \) along \( \vec{c} = 2\)

\[\frac{\vec{a} \cdot \vec{c}}{|\vec{c}|} = 2 \Rightarrow \frac{ax + by}{\sqrt{a^2 + b^2}} = 2 \Rightarrow \frac{3\lambda x - 4\lambda y}{\sqrt{(3\lambda)^2 + (-4\lambda)^2}} = 2\]

\[\Rightarrow 3\lambda x - 4\lambda y = 10\lambda\]

\[\Rightarrow 3\lambda x - 4\lambda y = 10\lambda \quad \ldots(3)\]

Solving (2) and (3), we get \( x = 2, y = -1\)

\[\therefore \text{The required vector is } 2\hat{i} - \hat{j}\]
10. Component of \( \vec{a} \) along \( \vec{b} = \overrightarrow{OD} = OA \cos \theta \cdot \vec{b} \)

\[
\begin{pmatrix}
\frac{\vec{a} \cdot \vec{b}}{|\vec{b}|^2}
\end{pmatrix} \cdot \vec{b} = \frac{\vec{a} \cdot \vec{b}}{|\vec{b}|^2} \vec{b}
\]

Component of \( \vec{a} \) perpendicular to \( \vec{b} \)

\[
\vec{DA} = \vec{a} - \overrightarrow{OD} = \vec{a} - \frac{\vec{a} \cdot \vec{b}}{|\vec{b}|^2} \vec{b}
\]

11. See the solution to Q-7

12. Let \( x\hat{i} + y\hat{j} + z\hat{k} \) be a unit vector, coplanar with \( \hat{i} + \hat{j} + 2\hat{k} \) and \( \hat{i} + 2\hat{j} + \hat{k} \) and also perpendicular to \( \hat{i} + \hat{j} + \hat{k} \)

\[
\begin{pmatrix}
x & y & z
\end{pmatrix}
\]

Then, \[
\begin{pmatrix}
1 & 1 & 2 \\
1 & 2 & 1
\end{pmatrix}
\Rightarrow -3x + y + z = 0 \quad \text{...(i)}
\]

and \( x + y + z = 0 \quad \text{...(iii)} \)

Solving the above by cross multiplication method, we get:

\[
\begin{pmatrix}
x & y & z
\end{pmatrix}
\] \[
\begin{pmatrix}
0 & 4 & -3 \\
0 & 1 & -1
\end{pmatrix}
\Rightarrow x = 0, y = \lambda, z = -\lambda
\]

As \( \hat{x}i + \hat{y}j + \hat{z}k \) is a unit vector, therefore

\[
0 + \lambda^2 + \lambda^2 = 1 \Rightarrow \lambda^2 = \frac{1}{2} \Rightarrow \lambda = \pm \frac{1}{\sqrt{2}}
\]

\( \therefore \) The required vector is \( \frac{\hat{j} - \hat{k}}{\sqrt{2}} \) or \( \frac{-\hat{j} + \hat{k}}{\sqrt{2}} \)

13. We have position vectors of points \( P(\hat{i} + \hat{j} + 2\hat{k}), Q(2\hat{i} - \hat{k}) \),

\( R(2\hat{j} + \hat{k}) \)

\( \therefore \overrightarrow{QP} = (\hat{i} + \hat{j} + 2\hat{k}) - (2\hat{i} - \hat{k}) = -\hat{i} - \hat{j} + 3\hat{k} \)

\( \overrightarrow{QR} = 2\hat{j} + \hat{k} - 2\hat{i} + \hat{k} = -2\hat{i} + 2\hat{j} + 2\hat{k} \)

Now any vector perpendicular to the plane formed by pts

\[
\overrightarrow{PQ} \times \overrightarrow{QR} = \begin{vmatrix}
\hat{i} & \hat{j} & \hat{k} \\
-1 & -1 & 3 \\
-2 & 2 & 2
\end{vmatrix} = -8\hat{i} - 4\hat{j} - 4\hat{k}
\]

\( \therefore \) Unit vector normal to plane is \( \pm \frac{(-8\hat{i} - 4\hat{j} - 4\hat{k})}{\sqrt{64 + 16 + 16}} \)

\( = \pm \frac{2\hat{i} + \hat{j} + \hat{k}}{\sqrt{6}} \)

14. Eq° of plane containing vectors \( \hat{i} \) and \( \hat{i} + \hat{j} \) is

\[
[r - \hat{i} \cdot \hat{i} + \hat{j} + \hat{k}] = 0 \Rightarrow
\begin{pmatrix}
x - 1 & y & z
\end{pmatrix}
\begin{pmatrix}
1 & 0 & 0
1 & 1 & 0
\end{pmatrix}
\Rightarrow z = 0 \quad \text{...(1)}
\]

Similarly, eq° of plane containing vectors \( \hat{i} - \hat{j} \) and \( \hat{i} + \hat{k} \) is

\[
[r - (\hat{i} - \hat{j}) \cdot \hat{i} - \hat{j} + \hat{k}] = 0 \Rightarrow
\begin{pmatrix}
x - 1 & y + 1 & z
\end{pmatrix}
\begin{pmatrix}
1 & -1 & 0
1 & 0 & 1
\end{pmatrix}
\Rightarrow (x - 1)(-1) - (y + 1)(1 - 0) + z(0 + 1) = 0
\Rightarrow x - 1 - y - 1 + z = 0
\Rightarrow x + y - z = 0 \quad \text{...(2)}
\]

Let \( \vec{a} = a\hat{i} + a_2\hat{j} + a_3\hat{k} \)

Since \( \vec{a} \) is parallel to (1) and (2)

\( a_2 = 0 \) and \( a_1 + a_2 - a_3 = 0 \Rightarrow a_1 = -a_2, a_3 = 0 \)

\( \therefore \) a vector in direction of \( \vec{a} \) is \( \hat{i} - \hat{j} \)

15. Let us consider \( \vec{b} = \hat{i} \) and \( \vec{c} = \hat{j} \) then \( \vec{b} \times \vec{c} = \hat{k} \)

Let \( \vec{a} = x\hat{i} + y\hat{j} + z\hat{k} \)

Then, \( \vec{a} \times \vec{b} + (\vec{a} \cdot \vec{c})\hat{k} = \vec{b} \times \vec{c} \)

Now, \( \begin{align*}
\vec{a} \times \vec{b} &= (\vec{a} \cdot \vec{c})\hat{k} \\
\frac{\vec{a} \cdot \vec{c}}{|\vec{b} \times \vec{c}|} &= \vec{b} \times \vec{c}
\end{align*} \)

16. \( q \) = area of parallelogram with \( \overrightarrow{OA} \) and \( \overrightarrow{OC} \) as adjacent sides = \( |\overrightarrow{OA} \times \overrightarrow{OC}| = |\vec{a} \times \vec{b}| \)

and \( p \) = area of quadrilateral \( OABC \)

\[
\begin{align*}
p &= \frac{1}{2} |\overrightarrow{OA} \times \overrightarrow{OB}| + \frac{1}{2} |\overrightarrow{OB} \times \overrightarrow{OC}|
= \frac{1}{2} [\vec{a} \times (10\vec{a} + 2\vec{b})] + \frac{1}{2} [\vec{b} \times (10\vec{a} + 2\vec{b})] \cdot \vec{b}
= |\vec{a} \times \vec{b}| + 5|\vec{a} \cdot \vec{b}| = 6|\vec{a} \times \vec{b}|
\therefore p = 6q \Rightarrow k = 6
\end{align*}
\]

B. True/False

1. \( \vec{A}, \vec{B}, \vec{C} \) are three unit vectors such that \( \vec{A} \cdot \vec{B} = \vec{A} \cdot \vec{C} = 0 \) \( \quad \text{...(1)} \)

and angle between \( \vec{B} \) and \( \vec{C} \) is \( \pi/6 \).

Now eq. (1) shows that \( \vec{A} \) is perpendicular to both \( \vec{B} \) and \( \vec{C} \).

\( \therefore \vec{B} \times \vec{C} = \lambda \vec{A} \)

\( \Rightarrow |\vec{B} \times \vec{C}| = |\lambda \vec{A}| \Rightarrow \sin \pi/6 = \pm \lambda \)

Given \( \overrightarrow{OR} \perp \overrightarrow{OS} \Rightarrow \overrightarrow{OR} \cdot \overrightarrow{OS} = 0 \)

\[ \Rightarrow \frac{1}{4} [3p + 2q], (3p - 2q) = 0 \]

\[ \Rightarrow 9 |p|^2 = 4 |q|^2 \Rightarrow 9p^2 = 4q^2 \]

8. (b) Let the given position vectors be of point \( A, B \) and \( C \) respectively, then

\[ |\overrightarrow{AB}| = \sqrt{(\beta - \alpha)^2 + (\gamma - \beta)^2 + (\alpha - \gamma)^2} \]

\[ |\overrightarrow{BC}| = \sqrt{(\gamma - \beta)^2 + (\alpha - \gamma)^2 + (\beta - \alpha)^2} \]

\[ |\overrightarrow{CA}| = \sqrt{(\alpha - \gamma)^2 + (\beta - \alpha)^2 + (\gamma - \beta)^2} \]

\[ \therefore |\overrightarrow{AB}| = |\overrightarrow{BC}| = |\overrightarrow{CA}| \]

\[ \Rightarrow \Delta ABC \text{ is an equilateral } \Delta. \]

9. (a) Let \( \overrightarrow{d} = \hat{x}i + \hat{y}j + \hat{z}k \)

where \( x^2 + y^2 + z^2 = 1 \) \( \ldots (1) \)

\( (\overrightarrow{d} \text{ being unit vector}) \Rightarrow \overrightarrow{a} \cdot \overrightarrow{d} = 0 \)

\[ \Rightarrow x - y = 0 \Rightarrow x = y \quad \ldots (2) \]

\[ \begin{bmatrix} \overrightarrow{b} \cdot \overrightarrow{d} \end{bmatrix} = 0 \Rightarrow \begin{vmatrix} 0 & 1 & -1 \\ -1 & 0 & 1 \\ x & y & z \end{vmatrix} = 0 \]

\[ \Rightarrow x + y + z = 0 \]

\[ \Rightarrow 2x + z = 0 \quad \text{ (using (2))} \]

\[ \Rightarrow z = -2x \quad \ldots (3) \]

From (1), (2) and (3)

\[ x^2 + x^2 + 4x^2 = 1 \Rightarrow x = \pm \frac{1}{\sqrt{6}} \]

\[ \therefore d = \pm \left( \frac{1}{\sqrt{6}} \hat{i} + \frac{1}{\sqrt{6}} \hat{j} - \frac{2}{\sqrt{6}} \hat{k} \right) = \pm \left( \frac{\hat{i} + \hat{j} - 2 \hat{k}}{\sqrt{6}} \right) \]

10. (a) Since \( \overrightarrow{a} \times (\overrightarrow{b} \times \overrightarrow{c}) = \overrightarrow{b} + \overrightarrow{c} \)

\[ \therefore (\overrightarrow{a} \overrightarrow{c}) - (\overrightarrow{a} \overrightarrow{b}) \overrightarrow{c} = \frac{1}{\sqrt{2}} \overrightarrow{b} + \frac{1}{\sqrt{2}} \overrightarrow{c} \Rightarrow \overrightarrow{a} \overrightarrow{c} = \frac{1}{\sqrt{2}} \]

\[ [\because \overrightarrow{b} \text{ and } \overrightarrow{c} \text{ are non-coplanar}] \]

\[ \text{and } \overrightarrow{a} \overrightarrow{b} = \frac{1}{\sqrt{2}} \Rightarrow \cos \theta = \frac{1}{\sqrt{2}} \]

\[ \Rightarrow \cos \frac{3\pi}{4} = \cos \theta \Rightarrow \theta = 3\pi/4 \]

11. (b) \[ \because \overrightarrow{u} + \overrightarrow{v} + \overrightarrow{w} = 0 \]

\[ \Rightarrow |\overrightarrow{u}|^2 + |\overrightarrow{v}|^2 + |\overrightarrow{w}|^2 + 2(\overrightarrow{u} \cdot \overrightarrow{v} + \overrightarrow{v} \cdot \overrightarrow{w} + \overrightarrow{w} \cdot \overrightarrow{u}) = 0 \]

\[ \Rightarrow 9 + 16 + 25 + 2(\overrightarrow{u} \cdot \overrightarrow{v} + \overrightarrow{v} \cdot \overrightarrow{w} + \overrightarrow{w} \cdot \overrightarrow{u}) = 0 \]

\[ \Rightarrow \overrightarrow{u} \cdot \overrightarrow{v} + \overrightarrow{v} \cdot \overrightarrow{w} + \overrightarrow{w} \cdot \overrightarrow{u} = -25 \]

12. (d) \[ (\overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c}) \cdot (\overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c}) \]

\[ = (\overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c}) \cdot (\overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c}) + \overrightarrow{a} \cdot \overrightarrow{a} + \overrightarrow{b} \cdot \overrightarrow{b} + \overrightarrow{c} \cdot \overrightarrow{c} \]

\[ = (\overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c}) \cdot (\overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c}) + \overrightarrow{a} \cdot \overrightarrow{a} + \overrightarrow{b} \cdot \overrightarrow{b} + \overrightarrow{c} \cdot \overrightarrow{c} \]

\[ = (\overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c}) \cdot (\overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c}) + \overrightarrow{a} \cdot \overrightarrow{a} + \overrightarrow{b} \cdot \overrightarrow{b} + \overrightarrow{c} \cdot \overrightarrow{c} \]

13. (b) \[ |(\overrightarrow{a} \overrightarrow{b} \times \overrightarrow{c})| = |\overrightarrow{a} \times \overrightarrow{b}||\overrightarrow{c}| \sin 30^\circ \]

\[ = \frac{1}{2} |\overrightarrow{a} \times \overrightarrow{b}||\overrightarrow{c}| \ldots (1) \]

We have, \( \overrightarrow{a} = 2\hat{i} + \hat{j} - 2\hat{k} \) and \( \overrightarrow{b} = \hat{i} + \hat{j} \)

\[ \Rightarrow \overrightarrow{a} \times \overrightarrow{b} = 2\hat{i} - 2\hat{j} + k \Rightarrow |\overrightarrow{a} \times \overrightarrow{b}| = \sqrt{9} = 3 \]

Also given \( |\overrightarrow{c} - \overrightarrow{a}| = 2\sqrt{2} \)

\[ \Rightarrow |\overrightarrow{c} - \overrightarrow{a}| = 2\sqrt{2} \]

\[ \Rightarrow |\overrightarrow{a} \times \overrightarrow{b}||\overrightarrow{c}| \sin 30^\circ = 3 \}

\[ \Rightarrow |\overrightarrow{a} \times \overrightarrow{b}||\overrightarrow{c}| \sin 30^\circ = 3 \}

\[ \Rightarrow |\overrightarrow{a} \times \overrightarrow{b}||\overrightarrow{c}| = \frac{3}{2} \]

14. (a) As \( \overrightarrow{c} \) is coplanar with \( \overrightarrow{a} \) and \( \overrightarrow{b} \), we take, \( \overrightarrow{c} = \alpha \overrightarrow{a} + \beta \overrightarrow{b} \)

\[ \ldots (1) \]

where \( \alpha, \beta \) are scalars.

As \( \overrightarrow{c} \) is perpendicular to \( \overrightarrow{a}, \alpha \overrightarrow{a} = 0 \)

\[ \therefore \text{From (1) we get, } 0 = \alpha \overrightarrow{a} + \beta \overrightarrow{b} = 0 \]

\[ \Rightarrow \alpha = 0 \]

\[ \Rightarrow \beta = \frac{-2\overrightarrow{a}}{\overrightarrow{b}} \]

Thus, \( \overrightarrow{c} = \frac{1}{2} (-j + k) \)

\[ \Rightarrow \alpha = \frac{1}{2} \quad \therefore \overrightarrow{c} = \frac{1}{2} (-j + k) \]

Thus, we may take \( \overrightarrow{c} = \frac{1}{2} (-j + k) \).

15. (b) Given \( \overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c} = 0 \) (by triangle law)

\[ \therefore \overrightarrow{a} \times (\overrightarrow{a} + \overrightarrow{b} + \overrightarrow{c}) = \overrightarrow{a} \times \overrightarrow{c} = 0 \]

\[ \Rightarrow \overrightarrow{a} \times \overrightarrow{a} + \overrightarrow{a} \times \overrightarrow{b} + \overrightarrow{a} \times \overrightarrow{c} = 0 \]

\[ \Rightarrow \overrightarrow{a} \times \overrightarrow{b} + \overrightarrow{c} \times \overrightarrow{a} = 0 \]

\[ \therefore \overrightarrow{a} \times \overrightarrow{a} = \overrightarrow{c} \times \overrightarrow{a} \]

Similarly, \( \overrightarrow{a} \times \overrightarrow{b} = \overrightarrow{b} \times \overrightarrow{c} \)

Therefore \( \overrightarrow{a} \times \overrightarrow{b} = \overrightarrow{b} \times \overrightarrow{c} \times \overrightarrow{a} \)

16. (a) Given that \( \overrightarrow{a}, \overrightarrow{b}, \overrightarrow{c}, \overrightarrow{d} \) are vectors such that \( \overrightarrow{a} \times \overrightarrow{b} \times (\overrightarrow{c} \times \overrightarrow{d}) = 0 \)

\[ \therefore P_1 \text{ is the plane determined by vectors } \overrightarrow{a} \text{ and } \overrightarrow{b} \]

\[ \therefore \text{Normal vectors } \overrightarrow{n}_1 \text{ to } P_1 \text{ will be given by } \overrightarrow{n}_1 = \overrightarrow{a} \times \overrightarrow{b} \]

Similarly, \( P_2 \) is the plane determined by vectors \( \overrightarrow{c} \) and \( \overrightarrow{d} \)

\[ \therefore \text{Normal vectors } \overrightarrow{n}_2 \text{ to } P_2 \text{ will be given by } \overrightarrow{n}_2 = \overrightarrow{c} \times \overrightarrow{d} \]

Substituting the values of \( \overrightarrow{n}_1 \) and \( \overrightarrow{n}_2 \) in eq(1)
We get, $\mathbf{n}_1 \times \mathbf{n}_2 = 0 \Rightarrow \mathbf{n}_1 \parallel \mathbf{n}_2$
and hence the planes will also be parallel to each other. Thus angle between the planes = 0.

17. (a) $\mathbf{a},\mathbf{b},\mathbf{c}$ are unit coplanar vectors, $2\mathbf{a} - \mathbf{b}, 2\mathbf{b} - \mathbf{c}$ and $2\mathbf{c} - \mathbf{a}$ are also coplanar vectors, being linear combination of $\mathbf{a},\mathbf{b}$ and $\mathbf{c}$.

Thus, $\left|\begin{array}{ccc}
2\mathbf{a} - \mathbf{b} & 2\mathbf{b} - \mathbf{c} & 2\mathbf{c} - \mathbf{a}
\end{array}\right| = 0$

18. (c) $\mathbf{a} = \mathbf{i} - \mathbf{j} + \mathbf{k}$, $\mathbf{b} = x\mathbf{i} + \mathbf{j} + (1-x)\mathbf{k}$
$c = y\mathbf{i} + x\mathbf{j} + (1+x-y)\mathbf{k}$

\[
\begin{vmatrix}
1 & 0 & -1 \\
x & 1 & 1-x \\
y & 1+x & 1+y
\end{vmatrix}
\]
$= 1((1+x)(1+y)-(1+y)(1+x)) - 1((1+y)-y) = 1$

Depends neither on $x$ nor on $y$.

19. (b) $\mathbf{a},\mathbf{b},\mathbf{c}$ are units vectors.

\[
\begin{align*}
\mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{c} = \mathbf{c} \cdot \mathbf{a} &= 1 \\
\mathbf{a} \cdot \mathbf{b} &= |\mathbf{a}| |\mathbf{b}| \cos \theta = 1
\end{align*}
\]

Now, $x = |\mathbf{a} - \mathbf{b}|^2 + |\mathbf{b} - \mathbf{c}|^2 + |\mathbf{c} - \mathbf{a}|^2$

$= \mathbf{a} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} + \mathbf{c} \cdot \mathbf{c} + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a})$

Also

$\Rightarrow |\mathbf{a} + \mathbf{b} + \mathbf{c}| \leq 0 \Rightarrow |\mathbf{a} + \mathbf{b} + \mathbf{c}|^2 \geq 0$

$\Rightarrow |\mathbf{a} + \mathbf{b} + \mathbf{c}| \geq 0$

$\Rightarrow \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a} \geq 0$

$\Rightarrow |\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}| \leq 3$

Also

$\Rightarrow \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a} \leq 3$

$\Rightarrow 6 - 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) \leq 9$  \(\text{(2)}\)

From (1) and (2), $x < 9$. \(\therefore x\) does not exceed 9

20. (b) Given that $\mathbf{a}$ and $\mathbf{b}$ are two unit vectors

\[
\therefore |\mathbf{a}| = 1 \text{ and } |\mathbf{b}| = 1
\]

Also, given that $(\mathbf{a} + 2\mathbf{b}) \perp (5\mathbf{a} - 4\mathbf{b})$

$\Rightarrow (\mathbf{a} + 2\mathbf{b}) \cdot (5\mathbf{a} - 4\mathbf{b}) = 0$

$\Rightarrow 5|\mathbf{a}|^2 - 8|\mathbf{b}|^2 - 4\mathbf{a} \cdot \mathbf{b} + 10\mathbf{b} \cdot \mathbf{a} = 0$

$\Rightarrow 5 - 8 + 6a \cdot b = 0 \Rightarrow 6|\mathbf{a}||\mathbf{b}| \cos \theta = 3$

[where $\theta$ is the angle between $\mathbf{a}$ and $\mathbf{b}$]

$\Rightarrow \cos \theta = \frac{1}{2} \Rightarrow \theta = 60^\circ$

21. (e) Given that $\mathbf{v} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$ and $\mathbf{w} = \mathbf{i} + 3\mathbf{k}$ and $u$ is a unit vector. \(\therefore |u| = 1\)

Now, $[\mathbf{u} \mathbf{v} \mathbf{w}] = u . (v \times w)$

\[
\text{Topic-wise Solved Papers - MATHEMATICS}
\]

$= \mathbf{u} \cdot (3\mathbf{i} - \mathbf{j} - \mathbf{k}) \times (\mathbf{i} + 3\mathbf{k})$

$= \mathbf{u} \cdot (\mathbf{3i} - \mathbf{7j} - \mathbf{k}) = \sqrt{3^2 + 7^2 + 1^2} \cos \theta$

which is max. when $\theta = 1$

\(\therefore\text{ Max. value of } [\mathbf{u} \mathbf{v} \mathbf{w}] = \sqrt{59}\)

22. (a) As the line $\frac{x-4}{1} = \frac{y-2}{1} = \frac{z-k}{2}$ lies in the plane

$2x - 4y + z = 7$, the point $(4, 2, k)$ through which line passes must also lie on the given plane and hence

$2 \times 4 - 4 \times 2 + k = 7 \Rightarrow k = 7$

23. (c) Vol. of parallelopiped formed by $\mathbf{v} = i + a \mathbf{j} + k, \mathbf{w} = j + ak, \mathbf{w} = ai + k$ is

\[
\begin{vmatrix}
1 & a & 1 \\
0 & 1 & a \\
1 & 0 & 1
\end{vmatrix}
\]

$= 1(1 - 0) - a(0 - a^2) + 1(0 - a) = 1 + a^3 - a$

For $V$ to be min $\frac{dV}{da} = 0$

$\Rightarrow 3a^2 - 1 = 0 \Rightarrow a = \pm \frac{1}{\sqrt{3}}$

24. (c) $(\mathbf{a} \times \mathbf{b}) \times \mathbf{a} = (\mathbf{a} \cdot \mathbf{b}) \mathbf{a} - (\mathbf{a} \cdot \mathbf{a}) \mathbf{b} = (\mathbf{a} \cdot \mathbf{a}) \mathbf{a} - (\mathbf{a} \cdot \mathbf{a}) \mathbf{b}$

\(\therefore (j - k) \times (i + j + k) = (\sqrt{3})^2 (\mathbf{b} - (i + j + k) \Rightarrow 3\mathbf{b} = \mathbf{i} \Rightarrow \mathbf{b} = \mathbf{i}\)

25. (b) $\frac{x-1}{2} = \frac{y+1}{3} = \frac{z-1}{4} = \lambda$

The lines intersect

$\Rightarrow x = 2\lambda + 1, y = 3\lambda - 1$ and $z = 4\lambda + 1$

$\Rightarrow x = 3 + \mu, y = k + 2\mu$ and $z = \mu$

Since above lines intersect

$\Rightarrow 2\lambda + 1 = 3 + \mu \Rightarrow \lambda = \frac{9}{2}$

26. (c) Any vector coplanar to $\mathbf{a}$ and $\mathbf{b}$ can be written as

$\mathbf{r} = \mathbf{a} + \lambda \mathbf{b}$

$\mathbf{r} = (1 + 2\lambda)\mathbf{i} + (-1 + \lambda)\mathbf{j} + (1 + \lambda)\mathbf{k}$

Since $\mathbf{r}$ is orthogonal to $\mathbf{i} + 2\mathbf{j} + 6\mathbf{k}$

$\Rightarrow 5(1 + 2\lambda) + 2(-1 + \lambda) + 6(1 + \lambda) = 0$

$\Rightarrow 9 + 18\lambda = 0 \Rightarrow \lambda = -\frac{1}{2}$
Vector Algebra and Three Dimensional Geometry

\[ \therefore \hat{r} \text{ is } 3j - k \]

Since \( \hat{r} \) is a unit vector, \( \therefore \hat{r} = \frac{3j - k}{\sqrt{10}} \)

27. (d) Let the eq\( ^{a} \) of variable plane be \( \frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1 \) which meets the axes at \( A (a, 0, 0), B (0, b, 0) \) and \( C (0, 0, c) \).

\[ \therefore \text{Centroid of } \Delta ABC \text{ is } \left( \frac{a+b+c}{3}, \frac{3}{3}, \frac{3}{3} \right) \]

and it satisfies the relation

\[ \frac{1}{x^2} + \frac{1}{y^2} + \frac{1}{z^2} = k \Rightarrow \frac{9}{a^2} + \frac{9}{b^2} + \frac{9}{c^2} = k \]

\[ \Rightarrow \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} = \frac{k}{9} \]

...(1)

Also given that the distance of plane \( \frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1 \) from \( (0, 0, 0) \) is 1 unit.

\[ \Rightarrow \frac{1}{\sqrt{a^2 + b^2 + c^2}} = 1 \Rightarrow \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} = 1 \]

...(2)

From (1) and (2), we get \( k = 9 \) i.e. \( k = 9 \)

28. (b) We observe that

\[ \vec{a} \cdot \vec{b} = \vec{a} \cdot \left( \frac{\vec{b} \cdot \vec{a}}{|\vec{a}|^2} \right) \cdot \vec{a} = \frac{|\vec{b} \cdot \vec{a}|}{|\vec{a}|} = 0 \]

\[ \vec{a} \cdot \vec{c} = \vec{a} \cdot \left( \frac{\vec{c} \cdot \vec{a}}{|\vec{a}|^2} \cdot \vec{a} \right) = \frac{|\vec{c} \cdot \vec{a}|}{|\vec{a}|} \]

\[ = \vec{a} \cdot \vec{c} - \frac{|\vec{c} \cdot \vec{a}|}{|\vec{a}|} \cdot |\vec{a}| = 0 \quad \therefore \vec{a} \cdot \vec{b} = 0 \]

And \( \vec{b}_1 \cdot \vec{c}_2 = \vec{b}_1 \cdot \left( \frac{\vec{c} \cdot \vec{a}}{|\vec{a}|^2} \cdot \vec{a} \right) \]

\[ = \vec{b}_1 \cdot \left( \frac{\vec{c} \cdot (\vec{b}_1) \cdot \vec{a}}{|\vec{a}|^2} \cdot |\vec{b}_1| \cdot \vec{b}_1 \right) \]

\[ = \vec{b}_1 \cdot \vec{c} - \vec{b}_1 \cdot \vec{c} = 0 \quad \therefore \vec{a} \cdot \vec{b}_1 = \vec{a} \cdot \vec{c}_2 = \vec{b}_1 \cdot \vec{c}_2 = 0 \]

\[ \Rightarrow (\vec{a}, \vec{b}_1, \vec{c}_2) \text{ is a set of orthogonal vectors.} \]

29. (d) The equation of plane through the point \( (1, -2, 1) \) and perpendicular to the planes \( 2x - 2y + z = 0 \) and \( x - y + 2z = 4 \) is given by

\[
\begin{vmatrix}
x-1 & y+2 & z-1 \\
2 & -2 & 1 \\
1 & -1 & 2 \\
\end{vmatrix} = 0 \Rightarrow x + y + 1 = 0
\]

It’s distance from the point \( (1, 2, 2) \) is

\[
\frac{|1 + 2 + 1|}{\sqrt{2}} = 2\sqrt{2}.
\]

30. (a) A vector in the plane of \( \vec{a} \) and \( \vec{b} \) is

\[ \vec{u} = \vec{a} + \lambda \vec{b} = (1 + \lambda)\hat{i} + (2 - \lambda)\hat{j} + (1 + \lambda)\hat{k} \]

Projection of \( \vec{u} \) on \( \vec{c} = \frac{1}{\sqrt{3}} \Rightarrow \frac{\vec{u} \cdot \vec{c}}{|\vec{c}|} = \frac{1}{\sqrt{3}} \)

\[ \Rightarrow \vec{u} \cdot \vec{c} = 1 \Rightarrow |1 + \lambda + 2 - \lambda - 1| = 1 \]

\[ \Rightarrow |2 - \lambda| = 1 \Rightarrow \lambda = 1 \text{ or } 3 \]

\[ \Rightarrow \vec{u} = 2\hat{i} + \hat{j} + 2\hat{k} \text{ or } 4\hat{i} - \hat{j} + 4\hat{k} \]

31. (c) We know that three vectors are coplanar if their scalar triple product is zero.

\[ \begin{vmatrix}
-\lambda^2 & 1 & 1 \\
1 & -\lambda^2 & 1 \\
1 & 1 & -\lambda^2 \\
\end{vmatrix} = 0 \]

\[ R_1 \rightarrow R_1 + R_2 + R_3 \]

\[ \begin{vmatrix}
-2\lambda^2 & 2 - \lambda^2 & 2 - \lambda^2 \\
1 & -\lambda^2 & 1 \\
1 & 1 & -\lambda^2 \\
\end{vmatrix} = 0 \]

\[ \Rightarrow \begin{vmatrix}
1 & 1 & 1 \\
1 & 1 & -\lambda^2 \\
0 & -(1 + \lambda^2) & 0 \\
\end{vmatrix} = 0 \]

\[ (R_2 - R_1, R_3 - R_2) \]

\[ \Rightarrow (2 - \lambda^2)(1 + \lambda^2) = 0 \Rightarrow \lambda = \pm \sqrt{2} \]

\therefore Two real solutions.

32. (b) Since, \( \vec{a} + \vec{b} + \vec{c} = 0 \) and \( \vec{a}, \vec{b}, \vec{c} \) are unit vectors, therefore \( \vec{a}, \vec{b}, \vec{c} \) form an equilateral triangle.

\[ \vec{a} \times (\vec{a} + \vec{b} + \vec{c}) = 0 \]

\[ \vec{a} \times \vec{a} + \vec{a} \times \vec{b} + \vec{a} \times \vec{c} = 0 \Rightarrow \vec{a} \times \vec{b} = \vec{c} \times \vec{a} \]

Similarly, \( \vec{b} \times \vec{c} = \vec{c} \times \vec{a} \)
\[
\Rightarrow \vec{a} \times \vec{b} = \vec{b} \times \vec{c} = \vec{c} \times \vec{a}
\]
Also since \(\vec{a}, \vec{b}, \vec{c}\) are non parallel (these form an equilateral \(\Delta\)).

33. (a) We know that the volume of a parallelopiped with coterminus edges as the vectors \(\vec{a}, \vec{b}, \vec{c}\) is given by

\[
V = \begin{vmatrix}
\vec{a} & \vec{b} & \vec{c} \\
\vec{a} \vec{b} & \vec{b} \vec{b} & \vec{b} \vec{c} \\
\vec{c} \vec{a} & \vec{c} \vec{b} & \vec{c} \vec{c}
\end{vmatrix}
\]
\[
\Rightarrow V^2 = \left| \begin{array}{ccc}
1 & 1/2 & 1/2 \\
1/2 & 1 & 1/2 \\
1/2 & 1/2 & 1
\end{array} \right|^2 = \frac{1}{4} \Rightarrow V = \frac{1}{\sqrt{2}}
\]

34. (a) Given \(\overrightarrow{OP} = a \cos t + b \sin t\)

\[
\Rightarrow |\overrightarrow{OP}| = \cos^2 t + \sin^2 t + 2 \hat{a} \hat{b} \sin t \cos t
\]
\[
\Rightarrow |\overrightarrow{OP}|^2 = 1 + \hat{a} \hat{b} \sin 2t \leq 1 + \hat{a} \hat{b} \quad \text{(Max. at } t = \frac{\pi}{4})
\]
\[
\therefore |\overrightarrow{OP}|_{\text{max}} = \sqrt{1 + \hat{a} \hat{b}}
\]
Also \(\hat{a} = |\overrightarrow{OP}|_{\text{max}}\)

Maximum occurs at \(t = \frac{\pi}{4}\)

\[
\therefore |\overrightarrow{OP}|_{\text{max}} = \frac{\hat{a} + \hat{b}}{\sqrt{2}} \quad \therefore |\hat{OP}|_{\text{max}} = \frac{\hat{a} + \hat{b}}{|\hat{a} + \hat{b}|}
\]
Hence \(\hat{u} = \frac{\hat{a} + \hat{b}}{|\hat{a} + \hat{b}|}\) and \(M = \sqrt{1 + \hat{a} \hat{b}}\)

35. (a) Given that \(P(3, 2, 6)\) is a point in space and \(Q\) is a point on line

\[
\vec{r} = (\hat{i} - \hat{j} + 2\hat{k}) + \mu(-3\hat{i} + \hat{j} + 5\hat{k})
\]

or \(\frac{x-1}{-3} = \frac{y+1}{1} = \frac{z-2}{5} = \mu\)

Let coordinates of \(Q\) be \((-3\mu + 1, -\mu - 1, 5\mu + 2)\)

\(\therefore\) d.r’s of \(\overrightarrow{PQ} = -3\mu - 2, -\mu - 3, 5\mu - 4\)

As \(\overrightarrow{PQ}\) is parallel to the plane \(x - 4y + 3z = 1\)

\(\therefore\) \(1(-3\mu - 2) - 4(-\mu - 3) + 3(5\mu - 4) = 0\)

\(\Rightarrow 8\mu = 2 \text{ or } \mu = \frac{1}{4}\)

36. (c) \(\vec{a}, \vec{b}, \vec{c}\) and \(\vec{d}\) are unit vectors,

Let \(\vec{a} \times \vec{b} = (\sin \alpha) \vec{n}_1\) and \(\vec{c} \times \vec{d} = (\sin \beta) \vec{n}_2\)

then \((\vec{a} \times \vec{b}) \cdot (\vec{c} \times \vec{d}) = 1\)

\(\Rightarrow (\sin \alpha) (\sin \beta) \vec{n}_1 \cdot \vec{n}_2 = 1\)

\(\Rightarrow \sin \alpha \sin \beta \vec{n}_1 \cdot \vec{n}_2 = 1 \Rightarrow \sin \alpha \sin \beta \cos \gamma = 1\)

where \(\gamma\) is the angle between \(\vec{n}_1\) and \(\vec{n}_2\).

37. (c) The line has \(+ve\) and equal direction cosines, these are \(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\) or direction ratios are \(1, 1, 1\). Also the lines passes through \(P(2, -1, 2)\).

\(\therefore\) Equation of line is \(\frac{x-2}{1} = \frac{y+1}{1} = \frac{z-2}{1} = \lambda\) (say)

Let \(Q(\lambda + 2, \lambda - 1, \lambda + 2)\) be a point on this line where it meets the plane \(2x + y + z = 9\)

Then \(Q\) must satisfy the eqn of plane

\(\therefore\) \(2(\lambda + 2) + \lambda - 1 + \lambda + 2 = 9 \Rightarrow \lambda = 1\)

\(\therefore\) \(Q\) has coordinates \((3, 0, 3)\)

Hence the length of line segments \(PQ\)

\(= \sqrt{(2-3)^2 + (-1-0)^2 + (2-3)^2} = \sqrt{3}\)

38. (a) We have \(\overrightarrow{PQ} = 6\hat{i} + \hat{j}, \overrightarrow{QR} = -\hat{i} + 3\hat{j}, \overrightarrow{SR} = 6\hat{i} + \hat{j}\)

\(\overrightarrow{PS} = \hat{i} + \hat{j}\) \(\Rightarrow \overrightarrow{PQ} = \overrightarrow{SR}; \overrightarrow{QR} = \overrightarrow{PS} \text{ and } \overrightarrow{PQ}, \overrightarrow{PS} \neq 0\)

Also \(\overrightarrow{PQ} = |\overrightarrow{QR}|\)

\(\Rightarrow\) \(PQRS\) is a parallelogram but neither a rhombus nor a rectangle.

39. (c) Plane containing two lines \(\frac{x}{3} = \frac{y}{4} = \frac{z}{2}\) and \(\frac{x}{4} = \frac{y}{2} = \frac{z}{3}\) is given by

\[
\Rightarrow x + 2y + 3z = 0 \Rightarrow 8x - y - 10z = 0 \quad \text{and } \quad 4x + 2y + 3z = 0
\]

Now equation of plane containing the line \(\frac{x}{2} = \frac{y}{3} = \frac{z}{4}\) and perpendicular to the plane \(8x - y - 10z = 0\) is

\[
\Rightarrow -26x + 52y - 26z = 0 \text{ or } x - 2y + z = 0
\]
40. (a) As perpendicular distance of \( x + 2y - 2z = \alpha \) from the point \((1, -2, 1)\) is 5
   \[
   \frac{1 - 4 - 2 - \alpha}{\sqrt{3}} = 5
   \]
   \[\Rightarrow \frac{-5 - \alpha}{3} = 5 \text{ or } -5\]
   \[\Rightarrow \alpha = -20 \text{ or } 10\]
   As \(\alpha > 0\) \(\Rightarrow \alpha = 10\)
   
   \[\therefore\text{ Plane becomes}\ x + 2y - 2z - 10 = 0\]
   
   Equation of PN is \(\frac{x - 1}{1} = \frac{y - 2}{2} = \frac{z - 1}{-2} = \lambda\)
   
   For some value of \(\lambda\), \(N(\lambda + 1, 2\lambda - 2, -2\lambda + 1)\)
   
   It lies on \(x + 2y - 2z - 10 = 0\)
   \[\therefore \lambda + 1 + 4\lambda - 4 + 4\lambda - 2 = 10 \Rightarrow 9\lambda = 15 \Rightarrow \lambda = \frac{5}{3}\]
   \[\therefore N\left(\frac{2}{3}, \frac{4}{3}, \frac{-7}{3}\right)\]

41. (b)
   \[\sin(90 - \alpha) = \frac{|\overrightarrow{AB} \times \overrightarrow{AD}|}{|\overrightarrow{AB}| \cdot |\overrightarrow{AD}|}\]
   
   Where, \(\overrightarrow{AB} \times \overrightarrow{AD} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 10 & 11 \\ -1 & 2 & 2 \end{vmatrix} = -2\hat{j} - 15\hat{j} + 14\hat{k}\)
   
   \[\therefore |\overrightarrow{AB} \times \overrightarrow{AD}| = \sqrt{225 + 196} = \sqrt{425}\]
   
   \[\overrightarrow{AB} = \sqrt{4 + 100 + 121} = \sqrt{225} = 15\]
   
   \[\overrightarrow{AD} = \sqrt{1 + 4 + 4} = 3\]
   
   \[\therefore \sin(90 - \alpha) = \frac{\sqrt{425}}{15 \cdot 3} = \frac{\sqrt{17}}{9} \Rightarrow \cos \alpha = \frac{\sqrt{17}}{9}\]

42. (c) As \(\vec{v}\) lies in the plane of \(\vec{a}\) and \(\vec{b}\)
   \[\therefore \vec{v} = \lambda \vec{a} + \mu \vec{b}\]
   \[\Rightarrow \vec{v} = (\lambda + \mu) \hat{i} + (\lambda - \mu) \hat{j} + (\lambda + \mu) \hat{k}\]
   
   \[\therefore\] Projection of \(\vec{v}\) on \(\vec{c}\) is \(\frac{1}{\sqrt{3}}\)
   
   \[\therefore \frac{\vec{v} \cdot \vec{c}}{|\vec{c}|} = \frac{1}{\sqrt{3}}\]

43. (a) Equation of st. line joining \(Q(2, 3, 5)\) and \(R(1, -1, 4)\) is
   \[\frac{x - 2}{-1} = \frac{y - 3}{-4} = \frac{z - 5}{1} = \lambda\]
   
   Let \(P(-\lambda + 2, -4\lambda + 3, -\lambda + 5)\)
   
   As \(P\) lies on \(5x - 4y - z = 1\)
   \[\therefore -5\lambda + 10 + 16\lambda - 12 - \lambda - 5 = 1\]
   \[\Rightarrow 12\lambda = 8 \Rightarrow \lambda = \frac{2}{3} \Rightarrow P = \left(\frac{4}{3}, \frac{1}{3}, \frac{13}{3}\right)\]

44. (a) The plane passing through the intersection line of given planes is
   \[(x + 2y + 3z - 2) + \lambda(x - y + z - 3) = 0\]
   or \((1 + \lambda)x + (2 - \lambda)y + (3 + \lambda)z + (-2 - 3\lambda) = 0\)
   
   Its distance from the point \((3, 1, -1)\) is \(\frac{2}{\sqrt{3}}\)
   
   \[\frac{|3(1 + \lambda) + 1(2 - \lambda) - 1(3 + \lambda) + (-2 - 3\lambda)|}{\sqrt{(1 + \lambda)^2 + (2 - \lambda)^2 + (3 + \lambda)^2}} = \frac{2}{\sqrt{3}}\]
\[ \Rightarrow \frac{-2\lambda}{\sqrt{3}\lambda^2 + 4\lambda + 14} = \frac{2}{\sqrt{3}} \]
\[ \Rightarrow 3\lambda^2 + 4\lambda + 14 = 3\lambda^2 \Rightarrow \lambda = -\frac{7}{2} \]
\[ \therefore \] Required equation of plane is
\[ (x + 2y + 3z - 2) - \frac{7}{2} (x - y + z - 3) = 0 \]
\[ \text{or} \quad 5x - 11y + z = 17 \]

45. (c) Given that \( \vec{a} \times (2\hat{i} + 3\hat{j} + 4\hat{k}) = (2\hat{i} + 3\hat{j} + 4\hat{k}) \times \vec{b} \)
\[ \Rightarrow (\vec{a} + \vec{b}) \times (2\hat{i} + 3\hat{j} + 4\hat{k}) = \vec{0} \]
But neither \( \vec{a} + \vec{b} \) nor \( 2\hat{i} + 3\hat{j} + 4\hat{k} \) is a null vector
\[ \therefore \quad (\vec{a} + \vec{b}) || (2\hat{i} + 3\hat{j} + 4\hat{k}) \Rightarrow \vec{a} + \vec{b} = \lambda (2\hat{i} + 3\hat{j} + 4\hat{k}) \]
Also given \( |\vec{a} + \vec{b}| = \sqrt{29} \Rightarrow \lambda = \pm 1 \]
\[ \therefore \quad \vec{a} + \vec{b} = \pm (2\hat{i} + 3\hat{j} + 4\hat{k}) \]
\[ \therefore (\vec{a} + \vec{b}), (-7\hat{i} + 2\hat{j} + 3\hat{k}) = \pm 4 \]

46. (c) \( P \), the image of point \( (3, 1, 7) \) in the plane \( x - y + z = 3 \) is given by
\[ \frac{x - 3}{1} = \frac{y - 1}{1} = \frac{z - 7}{1} = \frac{-2(3 - 1 + 7 - 3)}{1^2 + 1^2 + 1^2} \]
\[ \Rightarrow \frac{x - 3}{1} = \frac{y - 1}{1} = \frac{z - 7}{1} = -4 \]
\[ \Rightarrow \quad x = -1, y = 5, z = 3 \]
\[ \therefore \quad P(-1, 5, 3) \]
Now equation of plane through \( (-1, 5, 3) \) and containing the line \( \frac{x}{1} = \frac{y}{2} = \frac{z}{3} \) is
\[ x - y + z = 0 \Rightarrow -x + 4y - 7z = 0 \]
\[ \begin{bmatrix} 1 & 2 & 1 \\ -1 & 5 & 3 \end{bmatrix} = 0 \Rightarrow x - 4y + 7z = 0 \]

D. MCQs with ONE or MORE THAN ONE Correct

1. (e) We are given that, \( \vec{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k} \)
\[ \vec{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k} \quad \vec{c} = c_1\hat{i} + c_2\hat{j} + c_3\hat{k} \]
Then
\[ \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}^2 = (\vec{a} \cdot \vec{b} \cdot \vec{c})^2 \]
\[ = (|\vec{a} \times \vec{b}| \cdot \cos 0)^2 \]
\[ = (\vec{a} \cdot \vec{b})^2 \]
Then \( \vec{c} \) is a unit vector, \( \therefore |\vec{c}| = 1 \)
\[ \Rightarrow \quad \bar{c} = \hat{i} + \hat{j} + \hat{k} \]
Also \( \vec{c} \perp \vec{a} \) as well as to \( \vec{b} \), \( \therefore \vec{c} \perp (\vec{a} \times \vec{b}) \)
\[ = (|\vec{a} \times \vec{b}|)^2 = \left( |\vec{a}||\vec{b}| \sin \frac{\pi}{6} \right)^2 \]
\[ \left[ \therefore \text{angle between } \vec{a} \text{ and } \vec{b} \text{ is } \frac{\pi}{6} \right] \]

2. (b) We know that if \( \vec{n} \) is \( \perp \) to \( \vec{a} \) as well as \( \vec{b} \) then
\[ \vec{n} = \frac{\vec{a} \times \vec{b}}{|\vec{a} \times \vec{b}|} \text{ or } \frac{\vec{b} \times \vec{a}}{|\vec{b} \times \vec{a}|} \]
as \( \vec{a} \times \vec{b} \) and \( \vec{b} \times \vec{a} \) represent two vectors in opp. directions.
\[ \therefore \quad \text{We have two possible values of } \vec{n} \]

3. (a, c) We have
\[ \vec{a} = 2\hat{i} - \hat{j} + \hat{k}, \vec{b} = \hat{i} + 2\hat{j} - \hat{k}, \vec{c} = \hat{i} + \hat{j} - 2\hat{k} \]
Any vector in the plane of \( \vec{b} \) and \( \vec{c} \) is \( \vec{u} = \vec{b} + \lambda \vec{c} \)
\[ = (\hat{i} + 2\hat{j} - \hat{k}) + \lambda (\hat{i} + \hat{j} - 2\hat{k}) \]
\[ = (1 + \lambda)\hat{i} + (2 + \lambda)\hat{j} - (1 + 2\lambda)\hat{k} \]
Given magnitude of projection of \( \vec{u} \) on \( \vec{a} \) is \( \frac{2}{\sqrt{3}} \)
\[ \Rightarrow \frac{2}{\sqrt{3}} = \frac{\vec{a} \cdot \vec{u}}{|\vec{a}|} \Rightarrow \frac{2}{\sqrt{3}} = \frac{2((1 + \lambda) - (2 + \lambda) - (1 + 2\lambda))}{\sqrt{6}} \]
\[ \Rightarrow |\vec{u} - \vec{a}| = 2 \Rightarrow \lambda + 1 = 2 \text{ or } \lambda + 1 = -2 \]
\[ \Rightarrow \lambda = 1 \text{ or } \lambda = -3 \]
\[ \therefore \quad \text{The required vector is either,} \]
\[ 2\hat{i} + 3\hat{j} - 3\hat{k} \text{ or } -2\hat{i} - \hat{j} + 5\hat{k} \]

4. (a, c, d) \[ |\vec{a}|^2 = \frac{1}{9} (4 + 4 + 1) = 1 \Rightarrow |\vec{a}| = 1 \]
Let \( \vec{b} = 2\hat{i} - 4\hat{j} + 3\hat{k} \) then
\[ \cos \theta = \frac{\vec{a} \cdot \vec{b}}{|\vec{a}||\vec{b}|} = \frac{5}{\sqrt{29}} \Rightarrow \theta = \frac{\pi}{3} \]
Let \( \vec{c} = \hat{i} + \hat{j} - \frac{1}{2}\hat{k} = \frac{3}{\sqrt{3}} \Rightarrow \vec{c} \parallel \vec{a} \]
Let \( \vec{d} = 3\hat{i} + 2\hat{j} + 2\hat{k} \) then \( \vec{d} = 0 \Rightarrow \vec{a} \perp \vec{d} \)

5. (d) Given that, \( \vec{a} = \hat{i} + \hat{j} + \hat{k}, \vec{b} = 4\hat{i} + 3\hat{j} + 4\hat{k} \)
and \( \vec{c} = \hat{i} + \hat{j} + \hat{k} \) are linearly dependent,
NOTE THIS STEP:
\[ \vec{c} = l\vec{a} + m\vec{b} \text{ for some scalars } l \text{ and } m \text{ not all zeros.} \]
\[ \hat{i} + \alpha \hat{j} + \beta \hat{k} = (l + 4m)\hat{i} + (l + 3m)\hat{j} + (l + 4m)\hat{k} \]
\[ \Rightarrow l + 4m = 1 \quad (1) \]
\[ l + 3m = \alpha \quad (2) \]
\[ l + 4m = \beta \quad (3) \]
From (1) and (3) we have, \( \beta = 1 \)
Also given that \( |\vec{c}| = \sqrt{3} \Rightarrow 1 + \alpha^2 + \beta^2 = 3 \)
Vector Algebra and Three Dimensional Geometry

Substituting the value of $\beta$ we get $\alpha^2 = 1$

$\Rightarrow \alpha = \pm 1$

6. (c) $[\vec{u} \vec{v} \vec{w}] = [\vec{v} \vec{w} \vec{u}] = [\vec{w} \vec{u} \vec{v}]$

1 2 4

but $[\vec{v} \vec{w} \vec{u}] = -[\vec{u} \vec{v} \vec{w}]$

111

7. (a, c) As dot product of two vectors gives a scalar quantity.

8. (a, c) We have

$\vec{v} = \vec{a} \times \vec{b} = |\vec{a}| |\vec{b}| \sin \theta \hat{n} = \sin \theta \hat{n}$

$[\because \vec{a} \text{ and } \vec{b} \text{ are unit vectors.}]$

$|\vec{v}| = |\sin \theta |$

Now, $\vec{u} = \vec{a} - (\vec{a} \cdot \vec{b}) \vec{b}$

$= \vec{a} - \vec{b} \cos \theta$ (where $\vec{a} \cdot \vec{b} = \cos \theta$)

$\therefore |\vec{u}|^2 = |\vec{a} - \vec{b} \cos \theta|^2 = 1 + \cos^2 \theta - 2 \cos \theta \cos \theta$

$= 1 - \cos ^2 \theta = \sin^2 \theta = |\vec{v}|^2 \Rightarrow |\vec{u}| = |\vec{v}|$

Also, $\vec{u} \cdot \vec{b} - (\vec{a} \cdot \vec{b}) \vec{b} = \vec{a} \cdot \vec{b} - \vec{a} \cdot \vec{b} = 0 \therefore |\vec{u} \vec{b}| = 0$

$\therefore |\vec{v}| = |\vec{u}| + |\vec{u} \vec{b}|$ is also correct

9. (b, d) Normal to plane $P_1$ is

$\vec{n_1} = (2\hat{i} + 3\hat{k}) \times (4\hat{j} - 3\hat{k}) = -18\hat{i}$

Normal to plane $P_2$ is

$\vec{n_2} = (\hat{j} - \hat{k}) \times (3\hat{i} + 3\hat{j}) = 3\hat{i} - 3\hat{j} - 3\hat{k}$

$\therefore \vec{A}$ is parallel to $\pm(\vec{n_1} \times \vec{n_2}) = \pm(-54\hat{j} + 54\hat{k})$

Now, angle between $\vec{A}$ and $2\hat{i} + \hat{j} - 2\hat{k}$ is given by

$\cos \theta = \pm \frac{-54\hat{j} + 54\hat{k}}{\sqrt{23}} = \pm \frac{1}{\sqrt{2}}$

$\therefore \theta = \frac{\pi}{4} \text{ or } \frac{3\pi}{4}$

10. (a, d) Let $\vec{a} = \hat{i} + \hat{j} + 2\hat{k}$, $\vec{b} = \hat{i} + 2\hat{j} + \hat{k}$, $\vec{c} = \hat{i} + \hat{j} + \hat{k}$

$\therefore \vec{c} = \lambda \vec{a} + \mu \vec{b}$

or $\vec{r} = \lambda (\vec{a} + \mu \vec{b}) + 2(\lambda + \mu) \hat{k}$

As $\vec{r} \perp \vec{c} \Rightarrow \vec{r} \vec{c} = 0$

$\therefore \lambda + \mu = 0 \Rightarrow \lambda = -\mu$

$\therefore \vec{r} = \mu (\hat{j} - \hat{k})$

For $\mu = 1$, we get $\vec{r} = \hat{j} - \hat{k}$

and for $\mu = -1$, we get $\vec{r} = -\hat{j} + \hat{k}$

$\therefore a$ and $d$ are the correct options.

11. (b, e) For given lines to be coplanar, we should have

\[
\begin{vmatrix}
2 & 0 & 0 \\
2 & k & 2 \\
5 & 2 & k
\end{vmatrix} = 0 \Rightarrow k = \pm 2
\]

For $k = 2$, obviously the plane $y + 1 = z$ is common in both lines.

For $k = -2$, the plane is given by

\[
\begin{vmatrix}
x - 1 & y + 1 & z \\
2 & -2 & 2 \\
5 & 2 & -2
\end{vmatrix} = 0 \Rightarrow y + z + 1 = 0
\]

12. (b, d) The given lines are

$\ell_1: \frac{x - 3}{1} = \frac{y + 1}{2} = \frac{z}{2} = t$

$\ell_2: \frac{x - 3}{2} = \frac{y - 3}{2} = \frac{z + 1}{1} = s$

Let direction ratios of $\ell$ be $a, b, c$ then as $\ell \perp \ell_1$ and $\ell_2$

$\therefore a + 2b + 2c = 0$

$2a + 2b + c = 0$

$\Rightarrow a = b = c = 0$

$\therefore \ell: \frac{x}{2} = \frac{y}{-3} = \frac{z}{2} = \lambda$

Any point on $\ell$, is $(t + 3, 2t - 1, 2t + 4)$ and any point on $\ell$ is $(2\lambda, 3\lambda, 2\lambda)$

$\therefore \ell = (2, -3, 2) \Rightarrow t = -1, \lambda = 1$

Any point $Q$ on $\ell_2$ is $(2s + 3, 2s + 3, s + 2)$

As per question $PQ = \sqrt{17}$

$\Rightarrow (2s + 1)^2 + (2s + 6)^2 + s^2 = 17$

$\Rightarrow 9s^2 + 28s + 20 = 0 \Rightarrow s = -2, \frac{-10}{9}$

$\therefore \text{Point } Q \text{ can be } (-1, -1, 0) \text{ and } \left(\frac{7}{9}, \frac{7}{9}, \frac{8}{9}\right)$

13. (a, d) $L_1: \frac{x - 5}{0} = \frac{y}{3 - a} = \frac{z}{-2}$

$L_2: \frac{x - a}{0} = \frac{y}{-1} = \frac{z}{2 - a}$

As $L_1, L_2$ are coplanar, therefore

$\begin{vmatrix}
5 - a & 0 & 0 \\
0 & 3 - a & -2 \\
0 & -1 & 2 - a
\end{vmatrix} = 0$

$\Rightarrow (5 - a)[(6 - 5a + a^2 - 2) = 0$

$\Rightarrow (5 - a)(a - 1)(a - 4) = 0 \Rightarrow a = 1, 4, 5.$

14. (a, b, c) $\begin{vmatrix}
x & y & z \\
x & y & z \\
x & y & z
\end{vmatrix} = \sqrt{2}$

Angle between each pair is $\frac{\pi}{3}$

$\therefore \lambda = \left[\begin{array}{c}
\vec{x} \\
\vec{y} \\
\vec{z}
\end{array}\right] \times \left[\begin{array}{c}
\vec{x} \\
\vec{y} \\
\vec{z}
\end{array}\right]$
\[ \lambda \left[ (x \cdot z)(y - (x \cdot y)z) \right] \]
\[ = \lambda \left[ (\sqrt{2/2} \cos \frac{\pi}{3})y - (\sqrt{2/2} \cos \frac{\pi}{3})z \right] \]
\[ = \lambda (\vec{y} \cdot \vec{z}) \]
\[ \vec{b} = \mu \left[ \vec{y} \times (\vec{z} \times \vec{x}) \right] \]
\[ = \mu \left[ (\vec{y} \cdot \vec{x})(\vec{z} - (\vec{y} \cdot \vec{z})\vec{x}) \right] \]
\[ = \mu \left[ (\sqrt{2/2} \cos \frac{\pi}{3}) \vec{z} - (\sqrt{2/2} \cos \frac{\pi}{3}) \vec{x} \right] \]
\[ = \mu (\vec{z} - \vec{x}) \]

Now \( \vec{b} \cdot \vec{z} = \mu \left[ \vec{z} \cdot \vec{x} - \vec{z} \cdot \vec{z} \right] = \mu (2 - 1) = \mu \)
\( \therefore \vec{b} = \begin{pmatrix} \vec{b} \\ \vec{z} \end{pmatrix} \begin{pmatrix} \vec{z} \\ \vec{x} \end{pmatrix} \) is correct

Also \( \vec{a} \cdot \vec{y} = \lambda \left( \vec{y} \cdot \vec{y} - \vec{z} \cdot \vec{y} \right) = \lambda (2 - 1) = \lambda \)
\( \therefore \vec{a} = \begin{pmatrix} \vec{a} \\ \vec{y} \end{pmatrix} \begin{pmatrix} \vec{z} \\ \vec{x} \end{pmatrix} \) is also correct
\( \vec{a} \cdot \vec{b} = \lambda \mu \left( \vec{y} \cdot \vec{x} - \vec{y} \cdot \vec{z} + \vec{z} \cdot \vec{x} \right) \)
\( = \lambda \mu (1 - 2 + 1) = -\lambda \mu = -\begin{pmatrix} \vec{a} \\ \vec{y} \end{pmatrix} \begin{pmatrix} \vec{b} \\ \vec{z} \end{pmatrix} \)
\( \therefore (\text{c}) \) is correct.

\( -\begin{pmatrix} \vec{a} \\ \vec{y} \end{pmatrix} \begin{pmatrix} \vec{z} \\ \vec{x} \end{pmatrix} = \lambda \begin{pmatrix} \vec{z} \\ \vec{y} \end{pmatrix} = -\vec{a} \)

(d) is not correct.

15. (c) Lines are \( x = y, z = 1 \)
or \( \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} = \begin{pmatrix} y \\ 0 \\ 0 \end{pmatrix} = \begin{pmatrix} z \end{pmatrix} = \alpha \quad \text{(1)} \)
and \( y = -x, z = 1 \)
or \( \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 0 \\ y \\ 0 \end{pmatrix} = \begin{pmatrix} z \end{pmatrix} = \beta \quad \text{(2)} \)

Let \( Q(\alpha, \alpha, 1) \) and \( R(-\beta, \beta, -1) \)
Direction ratios of \( PQ \) are \( \lambda - \alpha, \lambda - \alpha, \lambda - 1 \)
and direction ratios of \( PR \) are \( \lambda + \beta, \lambda - \beta, \lambda + 1 \)
\( \therefore PQ \) is perpendicular to line (1)

16. (b, d) \( P : x + \lambda y + z = 0 \)
Also \( \frac{\lambda - 1}{\sqrt{\lambda^2 + 1}} = 1 \Rightarrow \lambda^2 - 2\lambda + 1 = \lambda^2 + 2 \Rightarrow \lambda = -\frac{1}{2} \)
And \( \frac{\alpha + \lambda \beta + \gamma - 1}{\sqrt{\lambda^2 + 1}} = 2 \Rightarrow \frac{\alpha - \frac{1}{2} \beta + \gamma - 1}{\frac{3}{2}} = \pm 2 \)
\( \Rightarrow \alpha - \beta + \gamma - 1 = \pm 2 \Rightarrow 2\alpha - \beta + 2\gamma - 8 = 0 \) or \( 2\alpha - \beta + 2\gamma + 4 = 0 \)

17. (a, b) \( L: \frac{x}{a} = \frac{y}{b} = \frac{z}{c} = \lambda \)
Where \( a + 2b - c = 0 \) \( \text{As } L \text{ is parallel } \)
\( 2a - b + c = 0 \) \( \text{to both } P_1 \text{ and } P_2. \)
\( \Rightarrow \frac{a}{1} = \frac{b}{-3} = \frac{c}{-5} \)
\( \therefore \) Any point on line \( L \) is \( (\lambda, -3\lambda, -5\lambda) \)
Equation of line perpendicular to \( P_1 \) drawn from any point on \( L \) is \( \frac{x - \lambda}{1} = \frac{y + 3\lambda}{2} = \frac{z + 5\lambda}{-1} = \mu \)
\( \therefore M(\mu + \lambda, 2\mu - 3\lambda, -\mu - 5\lambda) \)
But \( M \) lies on \( P_1, \)
\( \therefore \mu + \lambda + 4\mu - 6\lambda + \mu + 5\lambda + 1 = 0 \Rightarrow \mu = -\frac{1}{6} \)
\( \therefore M\left(\frac{-1}{6}, -\frac{3\lambda - 1}{3}, -\frac{5\lambda + 1}{6}\right) \)
For locus of \( M, \)
\( x = \frac{-1}{6}, y = -3\lambda - \frac{1}{3}, z = 5\lambda + \frac{1}{6} \)
\( \Rightarrow \frac{-1}{6} = \frac{y + 1/3}{3} = \frac{z - 1/6}{-5} = \lambda \)

On checking the given point, we find \( \left(0, -\frac{5}{6}, \frac{2}{3}\right) \) and \( \left(-\frac{1}{6}, -\frac{1}{3}, \frac{1}{6}\right) \) satisfy the above eqn.
18. \((a, c, d)\)

\[
\vec{a} + \vec{b} + \vec{c} = \vec{0}
\]

\[
\Rightarrow |\vec{c}|^2 = |\vec{a}|^2 + |\vec{b}|^2 + 2\vec{b} \cdot \vec{c} = |\vec{a}|^2
\]

\[
48 + |\vec{c}|^2 + 48 = 144 \Rightarrow |\vec{c}|^2 = 48 \Rightarrow |\vec{c}| = 4\sqrt{3}
\]

\[
\therefore \frac{|\vec{c}|^2}{2} = \frac{48}{2} = 24 \neq 30
\]

Also \(\vec{b} \cdot \vec{c} = \vec{0} \Rightarrow \triangle Q = \angle R\)

and \(\cos(180 - P) = \frac{\vec{b} \cdot \vec{c}}{|\vec{b}| \cdot |\vec{c}|} = \frac{1}{2}\)

\[
\Rightarrow \angle P = 120^\circ \Rightarrow \angle Q = \angle R = 30^\circ
\]

Again \(\vec{a} + \vec{b} + \vec{c} = \vec{0} \Rightarrow \vec{a} \times (\vec{a} + \vec{b} + \vec{c}) = \vec{0} \Rightarrow \vec{a} \times \vec{b} = \vec{c} \times \vec{a}\)

\[
\therefore \frac{|\vec{a} \times \vec{b} + \vec{c} \times \vec{a}|}{|\vec{b}|} = 2\frac{|\vec{a} \times \vec{b}|}{|\vec{b}|} = 2 \times 12 \times 4\sqrt{3} \times \sin 150 = 48\sqrt{3}
\]

And \(\vec{a} \cdot \vec{b} = 12 \times 4\sqrt{3} \times \cos 150 = -72\)

19. \((b, c, d)\) The coordinates of vertices of pyramid OPQRS will be

\[
O(0, 0, 0), P(3, 0, 0), Q(3, 3, 0), R(0, 3, 0), S\left(\frac{3}{2}, \frac{3}{2}, \frac{3}{2}\right)
\]

dr's of \(OOQ = 1, 1, 0\)

dr's of \(OS = 1, 1, 2\)

\(\therefore\) acute angle between \(OOQ\) and \(OS\)

\[
= \cos^{-1}\left(\frac{2}{\sqrt{2} \times \sqrt{6}}\right) = \cos^{-1}\left(\frac{1}{\sqrt{3}}\right) = \frac{\pi}{3}
\]

Eqn of plane \(OQS\) =

\[
\begin{bmatrix}
x \\
y \\
z
\end{bmatrix}
= \begin{bmatrix}
1 \\
1 \\
1
\end{bmatrix} = 0
\]

\[
\Rightarrow 2x - 2y = 0 \text{ or } x - y = 0
\]

length of perpendicular from \(P(3, 0, 0)\) to plane \(x - y = 0\)

\[
is = \frac{|3 - 0|}{\sqrt{2}} = \frac{3}{\sqrt{2}}
\]

Eqn of \(RS\) =

\[
\frac{x}{3} = \frac{y - 3}{3} = \frac{z}{2} \text{ or } \frac{x}{1} = \frac{y - 3}{-1} = \frac{z}{2} = \lambda
\]

If \(ON\) is perpendicular to \(RS\), then \(N(\lambda, -\lambda + 3, 2\lambda)\)

\[
\therefore \vec{ON} \perp RS \Rightarrow 1\times \lambda - 1(-\lambda + 3) + 2\times 2\lambda = 0
\]

\[
\Rightarrow \lambda = \frac{1}{2} \Rightarrow N\left(\frac{1}{2}, \frac{5}{2}, 1\right)
\]

\[
\therefore \vec{ON} = \frac{1}{\sqrt{\frac{4}{2}}} + \frac{25}{4} + 1 = \frac{15}{2}
\]

20. \((bc)\)

\[
\vec{u} \times \vec{v} = 1 \Rightarrow |\vec{v}| \sin \theta = 1
\]

\[
\Rightarrow \omega: \left(\vec{u} \times \vec{v}\right) = |\vec{v}| \sin \theta \cos \alpha = 1
\]

where \(\alpha\) is the angle between \(\vec{w}\) and a vector \(\perp\) to \(\vec{u} \& \vec{v}\).

From (i) and (ii) \(\cos \alpha = 1 \Rightarrow \alpha = 0^\circ\)

\[
\Rightarrow \vec{w} \perp \text{ the plane containing } \vec{u} \& \vec{v}
\]

\[
\Rightarrow \vec{w} \perp \vec{u}
\]

Clearly there can be infinite many choices for \(\vec{v}\).

Also if \(\vec{u}\) lies in \(xy\) plane, i.e., \(\vec{u} = u_1\hat{i} + u_2\hat{j}\) then \(\vec{w} \cdot \vec{u} = 0\)

\[
\Rightarrow u_1 + u_2 = 0 \Rightarrow |u_1| = |u_2|
\]

Also if \(\vec{u}\) lies in \(xz\) plane, i.e., \(\vec{u} = u_1\hat{i} + u_3\hat{k}\) then \(\vec{w} \cdot \vec{u} = 0\)

\[
\Rightarrow u_1 + 2u_3 = 0 \Rightarrow |u_1| = 2|u_3|
\]

Hence (b) and (c) are the correct options.

E. SUBJECTIVE PROBLEMS

1. Let with respect to \(O\), position vectors of points \(A, B, C, D, E, F\) be \(\vec{a}, \vec{b}, \vec{c}, \vec{d}, \vec{e}, \vec{f}\).

Let perpendiculars from \(A\) to \(EF\) and from \(B\) to \(DF\) meet each other at \(H\). Let position vector of \(H\) be \(\vec{r}: \) we join \(CH\).

In order to prove the statement given in question, it is sufficient to prove that \(CH\) is perpendicular to \(DE\).

Now, as \(OD \perp BC \Rightarrow \vec{a} \cdot (\vec{b} - \vec{c}) = 0\)

\[
\Rightarrow \vec{d} \cdot \vec{b} = \vec{d} \cdot \vec{c}
\]

\(\text{As } OE \perp AC \Rightarrow \vec{e} \cdot (\vec{c} - \vec{a}) = 0 \Rightarrow \vec{e} \cdot \vec{c} = \vec{e} \cdot \vec{a}\)

\(\text{As } OF \perp AB \Rightarrow \vec{f} \cdot (\vec{a} - \vec{b}) = 0 \Rightarrow \vec{f} \cdot \vec{a} = \vec{f} \cdot \vec{b}\)

Also \(AH \perp EF \Rightarrow (\vec{r} - \vec{a}) \cdot (\vec{e} - \vec{f}) = 0\)

\[
\Rightarrow \vec{r} \cdot \vec{e} - \vec{r} \cdot \vec{f} + \vec{a} \cdot \vec{e} + \vec{a} \cdot \vec{f} = 0
\]

and \(BH \perp FD \Rightarrow (\vec{r} - \vec{b}) \cdot (\vec{f} - \vec{d}) = 0\)

\[
\Rightarrow \vec{r} \cdot \vec{f} - \vec{r} \cdot \vec{d} - \vec{b} \cdot \vec{f} + \vec{b} \cdot \vec{d} = 0
\]

Adding (4) and (5), we get

\[
\vec{r} \cdot (\vec{e} - \vec{d}) - \vec{e} \cdot \vec{c} + \vec{d} \cdot \vec{c} = 0
\]

(using (1), (2) and (3))

\[
\Rightarrow \vec{r} \cdot (\vec{e} - \vec{d}) - \vec{c} \cdot (\vec{e} - \vec{d}) = 0 \Rightarrow (\vec{r} - \vec{c}) \cdot (\vec{e} - \vec{d}) = 0
\]

\[
\Rightarrow \vec{CH} \cdot \vec{ED} = 0 \Rightarrow \vec{CH} \perp \vec{ED}
\]

Hence Proved.
2. \( \overline{OA_1}, \overline{OA_2}, \ldots, \overline{OA_n} \) all vectors are of same magnitude, say 'a' and angle between any two consecutive vector is same that is \( \frac{2\pi}{n} \) radians. Let \( \hat{p} \) be the unit vectors \( \perp \) to the plane of the polygon.

\[
\overline{OA_1} \times \overline{OA_2} = a^2 \sin \frac{2\pi}{n} \hat{p} \quad \text{...(i)}
\]

Now, \( \sum_{i=1}^{n-1} \overline{OA_i} \times \overline{OA_{i+1}} = \sum_{i=1}^{n-1} a^2 \sin \frac{2\pi}{n} \hat{p} \)

\( = (n-1)a^2 \sin \frac{2\pi}{n} \hat{p} = -(n-1)(\overline{OA_2} \times \overline{OA_1}) \)

\( = (1-n)(\overline{OA_2} \times \overline{OA_1}) = R.H.S \)

3. \( (\hat{i} + \hat{j} + 3\hat{k})x + (3\hat{i} - 3\hat{j} + \hat{k})y + (-4\hat{i} + 5\hat{j})z \)

\( = \lambda(x\hat{i} + y\hat{j} + z\hat{k}) \)

\( \Rightarrow x + 3y - 4z = \lambda x \Rightarrow (1-\lambda)x + 3y - 4z = 0 \)

\( \Rightarrow x - 3y + 5z = \lambda y \Rightarrow x - (3+\lambda)y + 5z = 0 \)

\( \Rightarrow 3x + y + 2z = \lambda z \Rightarrow 3x + y - \lambda z = 0 \)

All the above three equations are satisfied for \( x, y, z \) not all zero if

\[
\begin{bmatrix}
1 -\lambda & 3 & -4 \\
1 & -(3+\lambda) & 5 \\
3 & 1 & -\lambda
\end{bmatrix} = 0
\]

\( \Rightarrow (1-\lambda)[3\lambda + \lambda^2 - 5] - 3[-\lambda - 15] - 4[1 + 9 + 3\lambda] = 0 \)

\( \Rightarrow \lambda^3 + 2\lambda^2 + \lambda = 0 \Rightarrow \lambda(\lambda + 1)^2 = 0 \Rightarrow \lambda = 0, -1. \)

4. Since vector \( \vec{A} \) has components \( A_1, A_2, A_3 \), in the coordinate system \( OXYZ \),

\[
\vec{A} = \hat{i}A_1 + \hat{j}A_2 + \hat{k}A_3
\]

When given system is rotated through \( \frac{\pi}{2} \), the new x-axis is along old y-axis and new y-axis is along the old negative x-axis z remains same as before. Hence the components of \( A \) in the new system are \( A_2, -A_1, A_3 \).

\( \Rightarrow \vec{A} \) becomes \( A_2\hat{i} - A_1\hat{j} + A_3\hat{k} \).

5. Then \( \overline{AB} = -\hat{i} - 5\hat{j} + 3\hat{k} \), \( \overline{AC} = -4\hat{i} + 3\hat{j} + 3\hat{k} \)

\( \overline{AD} = \hat{i} + 7\hat{j} + (1-\lambda)\hat{k} \)

We know that \( A, B, C, D \) lie in a plane if \( \overline{AB}, \overline{AC}, \overline{AD} \) are coplanar i.e. \( \overline{AB} \cdot \overline{AC} \times \overline{AD} = 0 \)

\[
\begin{bmatrix}
-1 & 5 & -3 \\
-4 & 3 & 3 \\
1 & 7 & 1-\lambda
\end{bmatrix} = 0
\]

\[
\Rightarrow -1(-3 - 3\lambda - 21) - 5(-4 + 4\lambda - 3) - 3(-28 - 3) = 0
\]

\( \Rightarrow 3\lambda + 18 - 20\lambda + 35 + 93 = 0 \Rightarrow 17\lambda = 146 \Rightarrow \lambda = \frac{146}{17} \)

6. Let the position vectors of points \( A, B, C, D \) be \( a, b, c, \) and \( d \) respectively with respect to some origin \( O \).

Then, \( \overline{AB} = \vec{b} - \vec{a} \), \( \overline{AD} = \vec{d} - \vec{a} \), \( \overline{BC} = \vec{c} - \vec{b} \), \( \overline{BD} = \vec{d} - \vec{b} \), \( \overline{CD} = \vec{d} - \vec{c} \), \( \overline{CA} = -\vec{c} + \vec{a} \)

Now, \( |\overline{AB} \times \overline{CD} + \overline{BC} \times \overline{AD} + \overline{CA} \times \overline{BD}| \)

\( = |(\vec{b} - \vec{a}) \times (\vec{d} - \vec{c}) + (\vec{c} - \vec{b}) \times (\vec{d} - \vec{a}) + (\vec{a} - \vec{c}) \times (\vec{d} - \vec{b})| \)

\( = |\vec{b} \times \vec{d} - \vec{a} \times \vec{d} - \vec{b} \times \vec{c} + \vec{a} \times \vec{c} + \vec{c} \times \vec{d} - \vec{c} \times \vec{a}| \)

\( = -\vec{b} \times \vec{d} + \vec{b} \times \vec{a} + \vec{a} \times \vec{c} + \vec{c} \times \vec{d} + \vec{d} \times \vec{c} + \vec{c} \times \vec{a} \)

\( = 2|\vec{b} \times \vec{a} + \vec{c} \times \vec{b} + \vec{a} \times \vec{c}| \quad \text{...(1)} \)

Also Area of \( \triangle ABC \) is

\[
\frac{1}{2} |\overline{BC} \times \overline{BA}| = \frac{1}{2} |(\vec{c} - \vec{b}) \times (\vec{a} - \vec{b})| \]

\( = \frac{1}{2} |(\vec{c} \times \vec{a} - \vec{c} \times \vec{b} - \vec{b} \times \vec{a} + \vec{b} \times \vec{c})| \)

\( = \frac{1}{2} |\vec{b} \times \vec{a} + \vec{c} \times \vec{b} + \vec{a} \times \vec{c}| \quad \text{...(2)} \)

From (1) and (2), we get

\[
|\overline{AB} \times \overline{CD} + \overline{BC} \times \overline{AD} + \overline{CA} \times \overline{BD}| = 2(2.\text{Area}(\triangle ABC)) = 4.\text{Area}(\triangle ABC) \]

Hence Proved.
7. \( OACB \) is a parallelogram with \( O \) as origin. Let with respect to \( O \) position vectors of \( A \) and \( B \) be \( \vec{a} \) and \( \vec{b} \) respectively. Then p.v. of \( C \) is \( \vec{a} + \vec{b} \).

Also \( D \) is mid pt. of \( OA \), therefore position vector of \( D \) is \( \frac{\vec{a}}{2} \).

\( CO \) and \( BD \) intersect each other at \( P \).

Let \( P \) divides \( CO \) in the ratio \( \lambda : 1 \) and \( BD \) in the ratio \( \mu : 1 \)

Then by section theorem, position vector of pt. \( P \) dividing \( CO \) in ratio

\[
\lambda : 1 = \frac{\lambda \times 0 + 1 \times (\vec{a} + \vec{b})}{\lambda + 1} = \frac{\vec{a} + \vec{b}}{\lambda + 1} \quad \ldots(1)
\]

And position vector of pt. \( P \) dividing \( BD \) in the ratio \( \mu : 1 \) is

\[
\mu \left( \frac{\vec{a}}{2} + 1(\vec{b}) \right) + 1(\vec{b}) = \frac{\mu a + 2\vec{b}}{2(\mu + 1)} \quad \ldots(2)
\]

As (1) and (2) represent the position vector of same point, we should have

\[
\frac{\vec{a} + \vec{b}}{\lambda + 1} = \frac{\mu a + 2\vec{b}}{2(\mu + 1)}
\]

Equating the coefficients of \( \vec{a} \) and \( \vec{b} \), we get

\[
\frac{1}{\lambda + 1} = \frac{\mu}{2(\mu + 1)} \quad \ldots(i)
\]

\[
\frac{1}{\lambda + 1} = \frac{1}{\mu + 1} \quad \ldots(ii)
\]

From (ii) we get \( \lambda = \mu \Rightarrow P \) divides \( CO \) and \( BD \) in the same ratio.

Putting \( \lambda = \mu \) in eq. (i) we get \( \mu = 2 \)

Thus required ratio is \( 2 : 1 \).

8. Given that \( \vec{a}, \vec{b}, \vec{c} \) are three coplanar vectors.

\( \therefore \) There exists scalars \( x, y, z \), not all zero, such that

\[
x \vec{a} + y \vec{b} + z \vec{c} = 0
\]

Taking dot product of \( \vec{a} \) and (1), we get

\[
x \cdot \vec{a} \cdot \vec{a} + y \cdot \vec{b} \cdot \vec{a} + z \cdot \vec{c} \cdot \vec{a} = 0
\]

Again taking dot product of \( \vec{b} \) and (1), we get

\[
x \vec{b} \cdot \vec{a} + y \vec{b} \cdot \vec{b} + z \vec{c} \cdot \vec{b} = 0
\]

Now equations (1), (2), (3) form a homogeneous system of equations, where \( x, y, z \) are not all zero.

\( \therefore \) System must have non trivial solution and for this, determinant of coefficient matrix should be zero

\[
\begin{vmatrix}
\vec{a} & \vec{b} & \vec{c} \\
\vec{a} \cdot \vec{a} & \vec{a} \cdot \vec{b} & \vec{a} \cdot \vec{c} \\
\vec{b} \cdot \vec{a} & \vec{b} \cdot \vec{b} & \vec{b} \cdot \vec{c}
\end{vmatrix} = 0 \quad \text{Hence Proved.}
\]

9. With \( O \) as origin let \( \vec{a} \) and \( \vec{b} \) be the position vectors of \( A \) and \( B \) respectively.

Then the position vector of \( E \), the mid point of \( OB \), is \( \frac{\vec{b}}{2} \).

Again since \( AD : DB = 2 : 1 \), the position vector of \( D \) is

\[
\frac{1 \vec{a} + 2 \vec{b}}{1 + 2} = \frac{\vec{a} + 2 \vec{b}}{3}
\]

\( \therefore \) Equation of \( OD \) is

\[
\vec{r} = t \left( \frac{\vec{a} + 2 \vec{b}}{3} \right) \quad \ldots(1)
\]

and Equation of \( AE \) is

\[
\vec{r} = \vec{a} + s \left( \frac{\vec{b}}{2} - \vec{a} \right) \quad \ldots(2)
\]

If \( OD \) and \( AE \) intersect at \( P \), then we will have identical values of \( \vec{r} \). Hence comparing the coefficients of \( \vec{a} \) and \( \vec{b} \), we get

\[
\begin{align*}
t &= 1 - s \\
\frac{t}{3} &= \frac{2s}{2} \Rightarrow \frac{t}{3} = \frac{s}{2} \Rightarrow t &= \frac{3}{5} \quad \text{and} \quad s = \frac{4}{5}
\end{align*}
\]

Putting value of \( t \) in eq. (1) we get position vector of point of intersection \( P \) as

\[
\frac{\vec{a} + 2 \vec{b}}{5}
\]

Now if \( P \) divides \( OD \) in the ratio \( \lambda : 1 \), then p.v. of \( P \) is

\[
\frac{\lambda \left( \frac{\vec{a} + 2 \vec{b}}{3} \right) + 1.0}{\lambda + 1} = \frac{\lambda}{3(\lambda + 1)} \left( \vec{a} + 2 \vec{b} \right) \quad \ldots(4)
\]

From (3) and (4) we get

\[
\frac{\lambda}{3(\lambda + 1)} = \frac{1}{5} \Rightarrow 5\lambda = 3\lambda + 3 \Rightarrow \lambda = \frac{3}{2}
\]

\( \therefore \) \( OP : PD = 3 : 2 \)

10. We are given that \( \vec{A} = 2\hat{i} + \hat{k}, \vec{B} = \hat{i} + \hat{j} + \hat{k} \) and \( \vec{C} = 4\hat{i} - 3\hat{j} + 7\hat{k} \)

and to determine a vector \( \vec{R} \) such that \( \vec{R} \times \vec{B} = \vec{C} \times \vec{B} \) and \( \vec{R} \cdot \vec{A} = 0 \)

Let \( \vec{R} = x\hat{i} + y\hat{j} + z\hat{k} \)

Then \( \vec{R} \times \vec{B} = \vec{C} \times \vec{B} \)

\[
\begin{vmatrix}
\hat{i} & \hat{j} & \hat{k} \\
x & y & z \\
1 & 1 & 1
\end{vmatrix} = 0
\]

\[
\begin{vmatrix}
\hat{i} & \hat{j} & \hat{k} \\
1 & 1 & 1 \\
1 & 1 & 1
\end{vmatrix}
\]
\[
\Rightarrow (y-z)\hat{j} - (x-z)\hat{j} + (x-y)\hat{k} = 10\hat{i} - 11\hat{j} + 7\hat{k}
\]
\[
y - z = -10 \quad \ldots (1)
\]
\[
z - x = -11 \quad \ldots (2)
\]
\[
x - y = 7 \quad \ldots (3)
\]

Also \( \vec{R} \cdot \vec{A} = 0 \)
\[
\Rightarrow 2x + z = 0 \quad \ldots (4)
\]

Substituting \( y = x - 7 \) and \( z = -2x \) from (3) and (4) respectively in eq. (1), we get
\[
\begin{align*}
-7 + 2x - 10 &= 0 \\
3x &= 3 \\
x &= -1 \\
y &= -8 \\
z &= 2
\end{align*}
\]
\[\therefore \vec{R} = -\hat{i} - 8\hat{j} + 2\hat{k}\]

11. We have, \( \vec{a} = cx\hat{i} - 6\hat{j} + 3k, \vec{b} = xi - 2\hat{j} + 2cx\hat{k} \)

Now we know that \( \vec{a} \parallel \vec{b} \Rightarrow \theta = 0 \)

As angle between \( \vec{a} \) and \( \vec{b} \) is obtuse, therefore
\[
\begin{align*}
\cos \theta &< 0 \\
\Rightarrow & cx^2 - 12 + 6cx < 0 \\
& -c^2 - 6cx + 12 > 0, \forall x \in \mathbb{R}
\end{align*}
\]
\[
\Rightarrow c > 0 \text{ and } D < 0 \Rightarrow c < 0 \text{ and } 36c^2 + 48c < 0
\]
\[
\Rightarrow c < 0 \text{ and } c(3c + 4) > 0 \Rightarrow c < 0 \text{ and } (3c + 4) > 0
\]
\[
\Rightarrow c < 0 \text{ and } c > -4/3 \Rightarrow -4/3 < c < 0
\]

12. Let \( \vec{a}, \vec{b}, \vec{c} \) be the position vectors of pt \( A, B \) and \( C \) respectively with respect to some origin.

\( \vec{a} = -\hat{j} + 2\hat{k}, \vec{b} = \hat{j} - 2\hat{k}, \vec{c} = \hat{i} - 8\hat{j} + 2\hat{k} \)

\( \vec{a} \parallel \vec{b} \Rightarrow \vec{a} = m\vec{b} \Rightarrow \vec{a} = \frac{2\vec{b} - 3\hat{k}}{4} \)

\( \vec{a} \parallel \vec{c} \Rightarrow \vec{a} = n\vec{c} \Rightarrow \vec{a} = \frac{3\vec{c} - \hat{k}}{4} \)

\( \vec{b} \parallel \vec{c} \Rightarrow \vec{b} = \frac{\vec{c} - \hat{k}}{3} \)

The position vectors of \( P \) in these two cases are
\[
\begin{align*}
\vec{a} + \frac{3\vec{c} - \hat{k}}{4} & \quad \text{and} \quad \vec{a} + \frac{2\vec{b} - 3\hat{k}}{3} \\
\vec{b} + k\left( \frac{\vec{a} + 3\vec{c}}{4} \right) & \quad \text{and} \quad \vec{b} + m\left( \frac{\vec{b} + 2\vec{c}}{3} \right)
\end{align*}
\]

Equating the position vectors of \( P \) in two cases we get
\[
\begin{align*}
\frac{k}{4(k+1)}\vec{a} + \frac{1}{k+1}\vec{b} + \frac{3k}{4(k+1)}\vec{c} & = \frac{1}{m+1}\vec{a} + \frac{m}{3(m+1)}\vec{b} + \frac{2m}{3(m+1)}\vec{c}
\end{align*}
\]

13. Given that \( \vec{b}, \vec{c}, \vec{d} \) are not coplanar \( \therefore \vec{b}, \vec{c}, \vec{d} \neq 0 \)

Consider, \( (\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d}) + (\vec{a} \times \vec{c}) \times (\vec{d} \times \vec{b}) + (\vec{a} \times \vec{d}) \times (\vec{b} \times \vec{c}) \)

Here, \( (\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d}) = -\vec{c} \times (\vec{d} \times (\vec{a} \times \vec{b})) = -(\vec{c} \cdot \vec{d})\vec{a} + (\vec{c} \cdot \vec{a})\vec{d} \)
\[
= \left[ \frac{\vec{a} \cdot \vec{d}}{\vec{b} \cdot \vec{c}} \right] \vec{b} - \left[ \frac{\vec{b} \cdot \vec{c}}{\vec{a} \cdot \vec{d}} \right] \vec{a} \quad \ldots (1)
\]
\[
(\vec{a} \times \vec{c}) \times (\vec{d} \times \vec{b}) = -(\vec{d} \times \vec{b}) \times (\vec{a} \times \vec{c}) = -(\vec{d} \cdot \vec{b})\vec{a} + (\vec{d} \cdot \vec{c})\vec{b} \)
\[
= [\vec{a} \cdot \vec{d}] \vec{b} - [\vec{b} \cdot \vec{c}] \vec{a} \quad \ldots (2)
\]
\[
(\vec{a} \times \vec{d}) \times (\vec{b} \times \vec{c}) = (\vec{a} \times \vec{c}) \times (\vec{b} \times \vec{d}) = (\vec{a} \cdot \vec{c})\vec{b} - (\vec{a} \cdot \vec{d})\vec{c} \)
\[
= -[\vec{a} \cdot \vec{d}] \vec{b} \quad \ldots (3)
\]

[NOTE: Here we have tried to write the given expression in such a way that we can get terms involving \( \vec{a} \) and other terms similar which can get cancelled.]

Adding (1), (2) and (3), we get
\[
\text{given vector} = -2(\vec{c} \cdot \vec{d})\vec{a}
\]
\[
\Rightarrow \text{given vector} = \text{some constant multiple of } \vec{a}
\]
\[
\Rightarrow \text{given vector is parallel to } \vec{a} .
\]

14. We are given \( AD = 4 \)

Volume of tetrahedron \( = \frac{2\sqrt{2}}{3} \)
\[
\Rightarrow \frac{1}{3} Ar(\Delta ABC) = \frac{2\sqrt{2}}{3}
\]
\[
\Rightarrow \frac{1}{2} |\vec{BA} \times \vec{BC}| = 2\sqrt{2}
\]
\[
\Rightarrow |\vec{BA} \times \vec{BC}| = 2\sqrt{2} \text{ or } |\vec{BA} \times \vec{BC}| = 2\sqrt{2}
\]
\[
\Rightarrow \sqrt{2}p = 2\sqrt{2} \quad \therefore p = 2
\]
Vector Algebra and Three Dimensional Geometry

We have to find the P.V. of point $E$. Let it divides median $AF$ in the ratio $\lambda : 1$

\[ \therefore \text{P.V. of } E = \frac{\lambda \cdot 2 \hat{i} + (\hat{j} + \hat{k})}{\lambda + 1} \] \hspace{1cm} \ldots(2)

\[ \therefore \overline{AE} = \text{P.V. of } E - \text{P.V. of } A = \frac{\lambda}{\lambda + 1} (\hat{j} - \hat{k}) \]

\[ \because |\overline{AE}|^2 = \overline{AE}^2 = \left(\frac{\lambda}{\lambda + 1}\right)^2 \cdot 3 \] \hspace{1cm} \ldots(3)

Now, $p^2 + AE^2 = AD^2$

or \[ 4 + \left(\frac{\lambda}{\lambda + 1}\right)^2 \cdot 3 = 16 \] \[ \therefore 3\left(\frac{\lambda}{\lambda + 1}\right)^2 = 12 \]

or \[ \frac{\lambda}{\lambda + 1} = \pm 2 \]

\[ \therefore \lambda = \pm (2\lambda + 2) \] \hspace{1cm} \therefore \lambda = -2 \text{ or } -2/3

Putting the value of $\lambda$ in (2) we get the P.V. of possible positions of $E$ as $(-1, 3, 3)$ or $(3, -1, -1)$

15. We have, \[ (\overline{A} + \overline{B}) \times (\overline{A} + \overline{C}) \]

\[ = \overline{A} \times \overline{A} + \overline{A} \times \overline{C} + \overline{B} \times \overline{C} \]

\[ = \overline{B} \times \overline{A} \times \overline{A} + \overline{A} \times \overline{C} + \overline{B} \times \overline{C} \]

\[ = \overline{B} \times \overline{A} + \overline{A} \times \overline{C} + \overline{B} \times \overline{C} \] \hspace{1cm} \because \overline{A} \times \overline{A} = 0

Thus, \[ [(\overline{A} + \overline{B}) \times (\overline{A} + \overline{C})] \times (\overline{B} \times \overline{C}) \]

\[ = (\overline{B} \times \overline{A} + \overline{A} \times \overline{C} + \overline{B} \times \overline{C}) \times (\overline{B} \times \overline{C}) \]

\[ = (\overline{B} \times \overline{A}) \times (\overline{B} \times \overline{C}) + (\overline{A} \times \overline{C}) \times (\overline{B} \times \overline{C}) \] \hspace{1cm} \therefore x \times x = 0

\[ = \{(\overline{B} \times \overline{A}) \times \overline{C}\} \overline{B} - \{(\overline{B} \times \overline{A}) \overline{B}\} \overline{C} \]

\[ + \{(\overline{A} \times \overline{C}) \overline{C}\} \overline{B} - \{(\overline{A} \times \overline{C}) \overline{B}\} \overline{C} \]

\[ \therefore (a \times b) \times c = (a . c)b - (b . c)a \]

\[ = [\overline{B} \overline{A} \overline{C}] \overline{B} - [\overline{A} \overline{C} \overline{B}] \overline{B} \]

\[ [\therefore \text{[A B C]}=0 \text{if any two of A, B, C are equal.}] \]

\[ = [\overline{A} \overline{C} \overline{B}] \overline{B} \]

Thus, LHS of the given expression

\[ = [\overline{A} \overline{C} \overline{B}] \{(\overline{B} \times \overline{C}), (\overline{B} + \overline{C})\} \]

\[ = \{[\overline{A} \overline{C} \overline{B}] \cdot (\overline{B} \times \overline{C}) - [\overline{A} \overline{C} \overline{B}] \cdot (\overline{B} + \overline{C})\} \]

\[ = \{0\} \]

\[ \therefore |\overline{B}| = |\overline{C}| \]

16. The P.Vs. of the points $A, B, C, D$ are $A(\overline{\theta}), B(\overline{\theta}), D(\overline{\theta}), C(\overline{\theta} + \overline{b})$

Equations of $AC$ and $BD$ are

\[ r = \lambda (d + tb) \] and \[ r = (1 - \mu) b + \mu d \]

For point of intersection say $T$ compare the coefficients

\[ \lambda + \mu, t\lambda - 1 - \mu = 1 - \lambda \] or $(t + 1)\lambda = 1$

\[ \therefore \lambda = \frac{1}{t + 1} = \mu \]

\[ \therefore \frac{d + tb}{t + 1} \]

Let $R$ and $S$ be mid-points of parallel sides $AB$ and $DC$ then $R$ is $\frac{b}{2}$ and $S$ is $\frac{d + t - b}{2}$.

Equation of $RS$ by $r = a + s(b - a)$ is

\[ r = \frac{b}{2} + s \left[ \frac{d + (t - 1) b}{t} \right] \]

The point $(1)$ will lie on above if,

\[ \frac{d + tb}{t + 1} = \frac{1}{2} + s \left[ \frac{d + (t - 1) b}{2} \right] \]

Comparing the coefficients, we get

\[ \frac{t}{1 + t} = \frac{1 + s (t - 1)}{2} \quad \text{and} \quad \frac{t}{1 + t} = \frac{2 \tau}{1 + \tau} = \frac{t}{1 + t} \]

which is true. Hence proved.

17. (a) We have, \[ \overline{u} \cdot \overline{v} = |\overline{u}| |\overline{v}| \cos \theta \] and \[ \overline{u} \times \overline{v} = |\overline{u}| |\overline{v}| \sin \theta \overline{n} \]

Where $\theta$ is the angle between $\overline{u}$ and $\overline{v}$ and $\overline{n}$ is a unit vector perpendicular to both $\overline{u}$ and $\overline{v}$ and is such that $\overline{u}, \overline{v}, \overline{n}$ form a right handed system.

Thus, \[ |\overline{u} \cdot \overline{v}|^2 = |\overline{u}|^2 |\overline{v}|^2 \cos^2 \theta \]

and \[ |\overline{u} \times \overline{v}|^2 = |\overline{u}|^2 |\overline{v}|^2 \sin^2 \theta \overline{n} \cdot \overline{n} = |\overline{u}|^2 |\overline{v}|^2 \sin^2 \theta \]

\[ \therefore |\overline{u} \cdot \overline{v}|^2 + |\overline{u} \times \overline{v}|^2 = |\overline{u}|^2 |\overline{v}|^2 (\cos^2 \theta + \sin^2 \theta) \]

\[ = |\overline{u}|^2 |\overline{v}|^2 \]

(b) Let $|\overline{u}| = a$, $|\overline{v}| = b$, $\overline{u} \times \overline{v} = ab \sin \theta \overline{n}$, where $\overline{n}$ is perpendicular to both $\overline{u}$ and $\overline{v}$, $|\overline{a}|^2 = a^2$

L.H.S. = $(1 - ab \cos \theta)^2 + (u + v)^2 \times (u \times v)^2$

\[ + 2(u + v)ab \sin \theta \overline{n} \]

\[ = 1 + a^2 b^2 \cos^2 \theta - 2ab \cos \theta + a^2 \]

\[ + b^2 + 2ab \cos \theta + a^2 b^2 \sin^2 \theta \]

as $\overline{n}$ is $\perp$ to both $\overline{u}$ and $\overline{v}$.

\[ = 1 + a^2 b^2 (\cos^2 \theta + \sin^2 \theta) + a^2 + b^2 \]

\[ = 1 + a^2 + b^2 + a^2 b^2 = (1 + a^2)(1 + b^2) \]
18. \[ \vec{u} \times \vec{v} = \begin{vmatrix} \vec{u} & \vec{u} & \vec{w} \\ \vec{v} & \vec{v} & \vec{w} \end{vmatrix} = \begin{vmatrix} \vec{u} \cdot \vec{u} & \vec{u} \cdot \vec{w} \\ \vec{v} \cdot \vec{u} & \vec{v} \cdot \vec{w} \end{vmatrix} \]

Now, \( \vec{u} \cdot \vec{u} = 1 \)
\( \vec{u} \cdot \vec{w} = \vec{u} \cdot (\vec{v} \times \vec{u}) = \vec{u} \cdot \vec{v} \times \vec{u} = [\vec{u} \times \vec{v} \times \vec{v}] = \vec{u} \cdot \vec{v} \)
\( \vec{v} \cdot \vec{v} = \vec{v} \cdot (\vec{v} \times \vec{u}) = \vec{v} \cdot \vec{v} \times \vec{u} = [\vec{v} \times \vec{v} \times \vec{u}] = 1 - [\vec{u} \times \vec{v}] \)

\[ [\vec{u} \times \vec{v}] = \begin{vmatrix} 1 & \cos \theta \\ \cos \theta & 1 - (\vec{u} \times \vec{v}) \end{vmatrix} \]

(\( \theta \) is the angle between \( \vec{u} \) and \( \vec{v} \))
\[ = 1 - [\vec{u} \times \vec{v}] = \cos^2 \theta \]

\[ \therefore [\vec{u} \times \vec{v}] = \frac{1}{2} \sin^2 \theta \leq \frac{1}{2} \]

Equality holds when \( \sin^2 \theta = 1 \) i.e., \( \theta = \pi / 2 \). \[ \therefore \vec{u} \perp \vec{v} \]

19. Let \( \vec{a}, \vec{b}, \vec{c} \) be the position vectors by \( A, B, \) and \( C \) respectively.

Let \( AB, BE \) and \( CF \) be the bisectors of \( \angle A, \angle B, \) and \( \angle C \) respectively.

![Triangle Diagram]

\( a, b, c \) are the lengths of sides \( BC, CA \) and \( AB \) respectively. Now we know by angle bisector theorem that \( AD \) divides \( BC \) in the ratio \( BD : DC = AB : AC = c : b \).

\[ \therefore \text{The position vector of } D \text{ is } \vec{d} = \frac{b \vec{b} + c \vec{c}}{b + c} \]

Let \( I \) be the point of intersection of \( BE \) and \( AD \). Then in \( \Delta ABD, BI \) is bisector of \( \angle B \).

\[ \therefore DI : IA = BD : BA \]

But
\[ \frac{BD}{DC} = \frac{c}{b} \Rightarrow \frac{BD}{BD + DC} = \frac{c}{c + b} \]

\[ \Rightarrow BD = \frac{ac}{b + c} \]

\[ \therefore DI : IA = \frac{ac}{b + c} : c = a : (b + c) \]

\[ \therefore \text{P.V. of } I = \frac{\vec{a} + \vec{a} + \vec{d}(b + c)}{a + b + c} = \frac{a \vec{a} + b \vec{b} + c \vec{c}}{a + b + c} \]

20. Given data is insufficient to uniquely determine the three vectors as there are only 6 equations involving 9 variables.

\[ \therefore \text{We can obtain infinitely many set of three vectors, } \vec{v}_1, \vec{v}_2, \vec{v}_3 \text{ satisfying these conditions.} \]

From the given data, we get
\[ \vec{v}_1 \cdot \vec{v}_1 = 4 \Rightarrow |\vec{v}_1| = 2 \]
\[ \vec{v}_2 \cdot \vec{v}_2 = 2 \Rightarrow |\vec{v}_2| = \sqrt{2} \]
\[ \vec{v}_3 \cdot \vec{v}_3 = 29 \Rightarrow |\vec{v}_3| = \sqrt{29} \]

\[ \therefore \text{Also } \vec{v}_1 \cdot \vec{v}_2 = -2 \Rightarrow |\vec{v}_1| \cdot |\vec{v}_2| \cdot \cos \theta = -2 \]
[where \( \theta \) is the angle between \( \vec{v}_1 \) and \( \vec{v}_2 \)]

\[ \Rightarrow \cos \theta = -\frac{2}{\sqrt{2}} \Rightarrow \theta = 135^\circ \]

Now since any two vectors are always coplanar, let us suppose that \( \vec{v}_1 \) and \( \vec{v}_2 \) are in \( x-y \) plane.

Let \( \vec{v}_1 \) is along the positive direction of \( x \)-axis then \( \vec{v}_1 = 2 \hat{i} \).

\[ |\vec{v}_1| = 2 \]

As \( \vec{v}_2 \) makes an angle 135° with \( \vec{v}_1 \) and lines in \( x-y \) plane,

Also keeping in mind \( |\vec{v}_2| = \sqrt{2} \), we obtain \( \vec{v}_2 = -\hat{i} \pm \hat{j} \)

Again let \( \vec{v}_3 = \alpha \hat{i} + \beta \hat{j} + \gamma \hat{k} \)

\[ \therefore \vec{v}_3 \cdot \vec{v}_1 = 6 \Rightarrow 2\alpha = 6 \Rightarrow \alpha = 3 \]

and \( \vec{v}_3 \cdot \vec{v}_2 = -5 \Rightarrow -\alpha \hat{i} + \beta \hat{j} + \gamma \hat{k} = -5 \Rightarrow \beta = \pm 2 \)

Also \( |\vec{v}_3| = \sqrt{29} \Rightarrow \alpha^2 + \beta^2 + \gamma^2 = 29 \Rightarrow \gamma = \pm 4 \)

Hence \( \vec{v}_3 = 3 \hat{i} \pm 2 \hat{j} \pm 4 \hat{k} \)

Thus, \( \vec{v}_1 = 2 \hat{i} ; \vec{v}_2 = -\hat{i} \pm \hat{j} ; \vec{v}_3 = 3 \hat{i} \pm 2 \hat{j} \pm 4 \hat{k} \) are some possible answers.

21. \( \vec{A}(t) \) is parallel to \( \vec{B}(t) \) for some \( t \in [0,1] \) if and only if

\[ \frac{\vec{f}_1(t)}{\vec{g}_1(t)} = \frac{\vec{f}_2(t)}{\vec{g}_2(t)} \text{ for some } t \in [0,1] \]

or \( \vec{f}_1(t).\vec{g}_2(t) = \vec{f}_2(t).\vec{g}_1(t) \) for some \( t \in [0,1] \)

Let \( h(t) = \vec{f}_1(t).\vec{g}_2(t) - \vec{f}_2(t).\vec{g}_1(t) \)

\[ h(0) = \vec{f}_1(0).\vec{g}_2(0) - \vec{f}_2(0).\vec{g}_1(0) \]

\[ = 2 \times 2 - 3 \times 3 = -5 < 0 \]

\[ h(t) = \vec{f}_1(t).\vec{g}_2(t) - \vec{f}_2(t).\vec{g}_1(t) \]

\[ = 6 \times 6 - 2 \times 2 = 32 > 0 \]

Since \( h \) is a continuous function, and \( h(0).h(1) < 0 \)
Vector Algebra and Three Dimensional Geometry

\[ \Rightarrow \text{There is some } t \in [0,1] \text{ for which } h(t) = 0 \text{ i.e., } \vec{A}(t) \text{ and } \vec{B}(t) \text{ are parallel vectors for this } t. \]

22. \[ \therefore \text{We have } V = [\vec{a} \quad \vec{b} \quad \vec{c}] = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} \]

\[ \Rightarrow \quad V = (a_1b_2c_3 + a_2b_3c_1 + a_3b_1c_2) - (a_1b_3c_2 + a_2b_1c_3 + a_3b_2c_1) \quad \ldots (1) \]

Now we know that \[ AM \geq GM \]

\[ \therefore \frac{a_1 + b_1 + c_1 + a_2 + b_2 + c_2 + (a_3 + b_3 + c_3)}{3} \geq \left[ \frac{(a_1 + b_1 + c_1)(a_2 + b_2 + c_2)(a_3 + b_3 + c_3)}{3} \right]^{1/3} \]

\[ \Rightarrow \frac{3L}{3} \geq \left[ \frac{(a_1 + b_1 + c_1)(a_2 + b_2 + c_2)(a_3 + b_3 + c_3)}{3} \right]^{1/3} \]

\[ \Rightarrow L^3 \geq (a_1 + b_1 + c_1)(a_2 + b_2 + c_2)(a_3 + b_3 + c_3) \]

\[ \Rightarrow L^3 \geq a_1b_2c_3 + a_2b_3c_1 + a_3b_1c_2 + 24 \text{ more such terms} \]

\[ L^3 \geq a_1b_2c_3 + a_2b_3c_1 + a_3b_1c_2 \quad \because r \geq 0 \text{ for } r = 1, 2, 3 \]

\[ L^3 \geq (a_1b_2c_3 + a_2b_3c_1 + a_3b_1c_2) - (a_1b_3c_2 + a_2b_1c_3 + a_3b_2c_1) \quad [\text{same reason}] \]

\[ \therefore L^3 \geq V \quad \text{from (1)} \]

Hence Proved.

23. (i) Plane passing through \((2, 1, 0), (5, 0, 1)\) and \((4, 1, 1)\) is

\[ \begin{vmatrix} x-2 & y-1 & z-0 \\ 5-2 & 0-1 & 1-0 \\ 4-2 & 1-1 & 1-0 \end{vmatrix} = 0 \]

\[ \Rightarrow (x-2)(-1-0)-(y-1)(3-2)+(z-0)(-2) = 0 \]

\[ \Rightarrow x = 2 - y + 1 + 2z \quad \Rightarrow x + y - 2z = 3 \]

(ii) As per question we have to find a pt. \(Q\) such that \(POQ\) is \(\perp\) to the plane \(x + y - 2z = 3\) \(\ldots (1)\)

And mid pt. of \(PQ\) lies on the plane. (Clearly we have to find image of pt. \(P\) with respect to plane).

Let \(Q\) be \((\alpha, \beta, \gamma)\)

\[ x + y - 2z = 3 \]

Eq \(^n\) of \(PM\) passing through \(P(2, 1, 6)\) and \(\perp\) to plane \(x + y - 2z = 3\), is given by

\[ \frac{x-2}{1} = \frac{y-1}{1} = \frac{z-6}{-2} = \lambda \]

For some value of \(\lambda\), \(Q(\alpha, \beta, \gamma)\) lies on \(PM\)

\[ \therefore \frac{\alpha-2}{1} = \frac{\beta-1}{1} = \frac{\gamma-6}{-2} = \lambda \]

\[ \Rightarrow \quad \alpha = \lambda + 2, \quad \beta = \lambda + 1, \quad \gamma = -2\lambda + 6 \]

\[ \therefore \quad \text{Mid pt. of } PQ \]

\[ \text{i.e.} \quad M \left( \frac{2+\lambda+2}{2}, \frac{1+\lambda+1}{2}, \frac{-2+6+2\lambda}{2} \right) \]

\[ \left( \frac{\lambda+4}{2}, \frac{\lambda+2}{2}, \frac{12-2\lambda}{2} \right) \]

But \(M\) lies on plane \((1)\)

\[ \therefore \frac{\lambda+4}{2} + \frac{\lambda+2}{2} - 12 - 2\lambda = 3 \]

\[ \Rightarrow \lambda + 4 + \lambda + 2 - 24 + 4\lambda = 6 \quad \Rightarrow 6\lambda = 24 \quad \Rightarrow \lambda = 4 \]

\[ \therefore \quad Q(4, 2, 4, 1, -8 + 6) = (6, 5, -2) \]

24. Given that \(\vec{u}, \vec{v}, \vec{w}\) are three non co-planar unit vectors. Angle between \(\vec{u}\) and \(\vec{v}\) is \(\alpha\), between \(\vec{v}\) and \(\vec{w}\) is \(\beta\) and between \(\vec{w}\) and \(\vec{u}\) is \(\gamma\). In fig. \(\overrightarrow{OA}\) and \(\overrightarrow{OB}\) represent \(\vec{u}\) and \(\vec{v}\). Let \(P\) be a pt. on angle bisector of \(\angle AOB\) such that \(OAPB\) is a parallelogram.

Also \(\angle POA = \angle BOP = \alpha / 2\) (alt. int. \(\angle\)'s)

\[ \therefore \quad \triangle OAP, OA = AP \]

a unit vector in the direction of \(\overrightarrow{OP}\)

\[ \therefore \quad \overrightarrow{OP} = \overrightarrow{OA} + \overrightarrow{AP} = \vec{u} + \vec{v} \]

\[ \therefore \quad \text{A unit vector in the direction of} \overrightarrow{OP} \]

\[ \overrightarrow{OP} = \frac{\vec{u} + \vec{v}}{\sqrt{\vec{u} \cdot \vec{v}}} \quad \text{i.e.} \quad \tilde{x} = \frac{\vec{u} + \vec{v}}{\sqrt{\vec{u} \cdot \vec{v}}} \]

But \(\vec{u} \cdot \vec{v} = (\vec{u} \cdot \vec{v}) \cdot (\vec{u} \cdot \vec{v}) = 1 + 1 + 2\vec{u} \cdot \vec{v} \quad \because \quad |\vec{u}| = |\vec{v}| = 1 \]

\[ = 2 + 2 \cos \alpha = 4 \cos^2 \alpha / 2 \]

\[ \because \quad |\vec{u} + \vec{v}| = 2 \cos \alpha / 2 \quad \Rightarrow \quad \tilde{x} = \frac{1}{2} (\sec \alpha / 2)(\vec{u} + \vec{v}) \]

Similarly, \(\tilde{y} = \frac{1}{2} \sec \frac{\beta}{2}(\vec{v} + \vec{w})\) and \(\tilde{z} = \frac{1}{2} \sec \frac{\gamma}{2}(\vec{w} + \vec{u})\)

Now consider \((x \times y)(y \times z)z \times x\]

\[= (x \times y)(z \times (y \times z)) \]

\[= (x \times y)(z \times (y \times z)) \]

\[= (x \times y)(z)(y \times z) - (z \times (y \times z)x) \]

[Using def \(n\) of vector triple product.]

\[= (x \times y)(z - 0) \quad \because \quad [\ldots (y \times z) \times 0] \]

\[\therefore \quad [y \times z] = 0 \]
Topic-wise Solved Papers - MATHEMATICS

Eqn. of plane through (1, 1, 1) and having normal vector \( \vec{n} = \hat{i} - \hat{j} - \hat{k} \) is given by \((\vec{r} - \vec{a}) \cdot \vec{n} = 0\)

\( \Rightarrow -l(x-1) - l(y-1) - l(z-1) = 0 \Rightarrow x + y + z = 3 \)

\( \Rightarrow \frac{x + y + z}{3} = 1 \) \( \ldots (1) \)

Now the pts where this plane meets the axes are 
A(3, 0, 0), B(0, 3, 0), C(0, 0, 3)

\( \therefore \) Vol of tetrahedron \( OABC \)

\[ \frac{1}{6} \times \text{Area of base} \times \text{altitude} \]

\[ \frac{1}{6} \times \text{Ar} \triangle ABC \times \text{length of} \ \perp \text{to plane (1)} \]

\[ \frac{1}{6} \times \frac{1}{2} \left[ \sqrt{3} \ 4 \ | \overrightarrow{AB} | \ \right] \times \left[ \left| \frac{-3}{1+1+1} \right| \right] \]

(Note that \( \triangle ABC \) is an equilateral \( \Delta \) here.)

\[ \frac{1}{12} \frac{\sqrt{3}}{4} \times (3\sqrt{2})^2 \times \sqrt{3} = \frac{3 \times 18}{48} = \frac{9}{2} \text{ cubic units.} \]

27. ATQ “S” is the parallelopiped with base points \( A, B, C \) and \( D \) and upper face points \( A', B', C', D' \). Let its vol. be \( V_s \).

By compressing it by upper face \( A', B', C', D' \), a new parallelopiped “T” is formed whose upper face pts are now \( A^*, B^*, C^* \) and \( D^* \). Let its vol. be \( V_T \).

\[ \text{Let } h \text{ be the height of original parallelopiped } S. \]

Then \( V_T = (ar A B C D) \times h \) \( \ldots (1) \)

Let equation of plane \( A B C D \) be

\[ ax + by + cz + d = 0 \ and \ A''(\alpha, \beta, \gamma) \]

Then height of new parallelopiped \( T \) is the length of perpendicular from \( A'' \) to \( A B C D \)

\[ \text{i.e.} \ \frac{a\alpha + b\beta + c\gamma + d}{\sqrt{a^2 + b^2 + c^2}} \]

\[ \therefore \ V_T = (ar A B C D) \times \frac{a\alpha + b\beta + c\gamma + d}{\sqrt{a^2 + b^2 + c^2}} \] \( \ldots (2) \)

But given that,
Vector Algebra and Three Dimensional Geometry

\[ V_T = \frac{90}{100} V_I \]  

From (1), (2) and (3) we get,

\[ a_\alpha + b_\beta + c_\gamma + d = 0.9 h \]

\[ \Rightarrow a_\alpha + b_\beta + c_\gamma + (d - 0.9 h\sqrt{a^2 + b^2 + c^2}) = 0 \]

\[ \therefore \text{Locus of } A'((\alpha, \beta, \gamma) \text{ is } \]

\[ ax + by + cz + (d - 0.9 h\sqrt{a^2 + b^2 + c^2}) = 0 \]

which is a plane parallel to \(ABCD\). Hence proved.

28. Following fig. shows the possible situation for planes \(P_1\) and \(P_2\) and the lines \(L_1\) and \(L_2\)

Now if we choose pts \(A, B, C\) as follows.
\(A\) on \(L_1\), \(B\) on the line of intersection of \(P_1\) and \(P_2\) but other than origin and \(C\) on \(L_2\) again other than origin then we can consider
\(A\) corresponds to one of \(A', B', C'\) and
\(B\) corresponds to one of the remaining of \(A', B', C'\) and
\(C\) corresponds to third of \(A', B', C'\) e.g.
\(A' = C, B' = B, C' = A\)

Hence one permutation of \([ABC]\) is \([CBA]\). Hence Proved.

29. The given line is \(2x - y + z - 3 = 0 = 3x + y + z - 5\)
Which is intersection line of two planes
\(2x - y + z - 3 = 0\) \(\ldots (i)\)
and \(3x + y + z - 5 = 0\) \(\ldots (ii)\)
Any plane containing this line will be the plane passing through the intersection of two planes (i) and (ii).
Thus the plane containing given line can be written as
\[(2x - y + z - 3) + \lambda (3x + y + z - 5) = 0 \]
\[\Rightarrow (3\lambda + 2)x + (\lambda - 1)y + (\lambda + 1)z + (-5\lambda - 3) = 0 \]
As its distance from the pt. (2, 1, -1) is \(\frac{1}{\sqrt{6}}\)
\[\therefore \left| \frac{(3\lambda + 2)(2) + (\lambda - 1)(1) + (\lambda + 1)(-1) + (-5\lambda - 3)}{\sqrt{(3\lambda + 2)^2 + (\lambda - 1)^2 + (\lambda + 1)^2}} \right| = \frac{1}{\sqrt{6}} \]
\[\Rightarrow \left| \frac{\lambda - 1}{\sqrt{11\lambda^2 + 12\lambda + 6}} \right| = \frac{1}{\sqrt{6}} \]

Squaring both sides, we get
\[\frac{(\lambda - 1)^2}{11\lambda^2 + 12\lambda + 6} = \frac{1}{6}\]
\[\Rightarrow 6\lambda^2 - 12\lambda + 6 - 11\lambda^2 - 12\lambda - 6 = 0 \]
\[\Rightarrow 5\lambda^2 + 24\lambda = 0 \Rightarrow \lambda(5\lambda + 24) = 0 \]
\[\Rightarrow \lambda = 0 \text{ or } -24/5 \]
\[\therefore \text{ The required equations of planes are } \]
\[2x - y + z - 3 = 0 \]
and \[\left[ \frac{-24}{5} + 2 \right] x + \left[ -\frac{24}{5} - 1 \right] y + \left[ \frac{24}{5} + 1 \right] z - 5 \left( \frac{-24}{5} \right) - 3 = 0 \]
or \[62x + 29y + 19z - 105 = 0 \]

30. Given that incident ray is along \(\hat{v}\), reflected ray is along \(\hat{w}\) and normal is along \(\hat{a}\), outwards. The given figure can be redrawn as shown.

We know that incident ray, reflected ray and normal lie in a plane, and angle of incidence = angle of reflection.

Therefore \(\hat{a}\) will be along the angle bisector of \(\hat{w}\) and \(-\hat{v}\),
\[\therefore \hat{a} = \frac{\hat{w} + (-\hat{v})}{|\hat{w} - \hat{v}|} \]  
\[\ldots (1) \]
\[\text{[\because \ Angle \ bisector \ will \ along \ a \ vector \ dividing \ in \ same \ ratio \ as \ the \ ratios \ of \ the \ sides \ forming \ that \ angle.]\]
But \(\hat{a}\) is a unit vector.

Where \(|\hat{w} - \hat{v}| = OC = 2OP = 2|\hat{w}| \cos \theta = 2 \cos \theta \)
Substituting this value in equation (1) we get
\[\hat{a} = \frac{\hat{w} - \hat{v}}{2 \cos \theta} \]
\[\therefore \hat{w} = \hat{v} + (2 \cos \theta) \hat{a} = \hat{v} - 2(\hat{a} \cdot \hat{v}) \hat{a} \]  
\[\therefore \hat{a} \hat{v} = - \cos \theta \]

F. Match the Following

1. \( (A) \rightarrow (s); (B) \rightarrow (p); (C) \rightarrow (q), (r); (D) \rightarrow (s) \)
(A) On solving the given equations \(x + y = |a| \) and \(ax - y = 1\), we get
\[x = \frac{1 + |a|}{a + 1} \text{ and } y = \frac{|a| |a - 1|}{a + 1} \]
\[\therefore \text{ Rays intersect each other in I quad}. \]
\[ a + b + c = 0 \]
\[ a^2 + b^2 + c^2 = ab + bc + ca \neq 0 \]
\[ \Delta = 0 \]
(D) We have \( \vec{a} + \vec{b} = -\sqrt{3} \vec{c} \) \( \Rightarrow \) \( |\vec{a} + \vec{b}|^2 = 3 |\vec{c}|^2 \)
\( \Rightarrow (\vec{a} + \vec{b}) \cdot (\vec{a} + \vec{b}) = 3 \vec{c} \cdot \vec{c} \)
\( \Rightarrow a\vec{a} + b\vec{b} + 2a\vec{b} = 3\vec{c} \cdot \vec{c} \) \( \Rightarrow 1 + 2 \cos \theta = 3 \)
(where \( \theta \) is the angle between \( \vec{a} \) and \( \vec{b} \))
\( \Rightarrow \cos \theta = \frac{1}{2} \) \( \Rightarrow \theta = \frac{\pi}{3} \)

4. \( A \rightarrow p; B \rightarrow q,s; C \rightarrow q,r,s,t; D \rightarrow r \)

(A) For the solution of \( xe^{\sin x} - \cos x = 0 \) in \( \left(0, \frac{\pi}{2}\right) \)
Let us consider two functions
\( y = xe^{\sin x} \) and \( y = \cos x \)
The range of \( y = xe^{\sin x} \) is \( \left(0, \frac{\pi e}{2}\right) \), also it is an increasing function on \( \left(0, \frac{\pi}{2}\right) \). Their graph are as shown in the figure below:

Clearly the two curves meet only at one point, therefore the given equation has only one solution in \( \left(0, \frac{\pi}{2}\right) \).

(B) Three given planes are
\[ kx + 4y + z = 0 \]
\[ 4x + ky + 2z = 0 \]
\[ 2x + 2y + z = 0 \]
Clearly all the planes pass through \((0,0,0)\).
\( \therefore \) Their line of intersection also pass through \((0,0,0)\).
Let \( a, b, c \) be the direction ratios of required line, then we should have
\[ ka + 4b + c = 0 \]
\[ 4a + kb + 2c = 0 \]
\[ 2a + 2b + c = 0 \]
For the required line to exist the above system of equations in \( a, b, c \), should have non trivial solution i.e.

\[ \begin{vmatrix} k & 4 & 1 \\ 4 & k & 2 \\ 2 & 2 & 1 \end{vmatrix} = 0 \]
\[ \Rightarrow k(k - 4) - 4(4 - k) + (8 - 2k) = 0 \]
\[ \Rightarrow k^2 - 6k + 8 = 0 \Rightarrow (k - 2)(k - 4) = 0 \]
\[ \Rightarrow k = 2 \text{ or } 4 \]

(C) We have \( f(x) = |x - 1| + |x - 2| + |x + 1| + |x + 2| \)
\[ \begin{align*}
&= -4x, \quad x \leq -2 \\
&= -2x + 4, \quad -2 < x \leq -1 \\
&= 6, \quad -1 < x \leq 1 \\
&= 2x + 4, \quad 1 < x \leq 2 \\
&= 4x, \quad x \geq 2
\end{align*} \]
The graph of the above function is as given below:

Clearly, from graph, \( f(x) \geq 6 \)
\[ \Rightarrow 4k \geq 6 \Rightarrow k \geq \frac{3}{2} \]
\[ \therefore k = 2, 3, 4, 5, 6, \ldots \]

(D) Given that
\[ \frac{dy}{dx} = y + 1 \text{ and } y(0) = 1 \]
\[ \Rightarrow \int \frac{dy}{y + 1} = \int dx \quad \Rightarrow \ln|y + 1| = x + c \]
At \( x = 0, y = 1 \) \( \Rightarrow c = \ln 2 \)
\[ \therefore \ln|y + 1| = x + \ln 2 \quad \Rightarrow y + 1 = 2e^x \quad \Rightarrow y = 2e^x - 1 \]
\[ \therefore y(\ln 2) = 2e^{\ln 2} - 1 = 2 \times 2 - 1 = 3 \]

5. \( A \rightarrow t; \  B \rightarrow p,r; \  C \rightarrow q,s; \  D \rightarrow r \)

Let the line through origin be \( \frac{x}{a} = \frac{y}{b} = \frac{z}{c} \) \(-1\)
then as it intersects
\[ \frac{x - 2}{1} = \frac{y - 1}{-2} = \frac{z + 1}{1} \] \(-2\)
and \[ \frac{x - 8/3}{2} = \frac{y + 3}{-1} = \frac{z - 1}{1} \] \(-3\)
at P and Q, shortest distance of \((1)\) with \((2)\) and \((3)\) should be zero.
\[ x_2 - x_1 \quad y_2 - y_1 \quad z_2 - z_1 \]
\[ a_1 \quad b_1 \quad c_1 \]
\[ a_2 \quad b_2 \quad c_2 \]
\[
\begin{vmatrix}
2 & 1 & -1 \\
1 & 2 & 1 \\
8/3 & -3 & 1 \\
2 & 1 & 1
\end{vmatrix}
\]
\[
\begin{vmatrix}
a & b & c \\
15 & 19 & 5 \\
11 & 8 & 1 \\
5 & 3 & 2
\end{vmatrix}
\]
\[
\begin{vmatrix}
a & b & c \\
15 & 19 & 5 \\
11 & 8 & 1 \\
5 & 3 & 2
\end{vmatrix}
\]

Hence equation (1) becomes:
\[
\frac{x}{5} = \frac{y}{1} = \frac{z}{2} = \lambda
\]

For some value of \( \lambda \), P(5\lambda, -5\lambda, 2\lambda)

which lies on (2) also:
\[
\frac{5\lambda - 2}{1} = \frac{-5\lambda - 1}{-2} = \frac{2\lambda + 1}{1} \Rightarrow \lambda = 1
\]

∴ P(5, -5, 2)

Also for some value of \( \lambda \), Q(5\lambda, -5\lambda, 2\lambda)

which lies on (3) also:
\[
\frac{5\lambda - 8/3}{3} = \frac{-5\lambda + 3}{-1} = \frac{2\lambda - 1}{1} \Rightarrow \lambda = 2/3
\]

∴ Q(10\lambda, -10\lambda, 4\lambda)

Hence \( d^2 = PQ^2 = \left( \frac{25}{9} + \frac{25}{9} + \frac{4}{9} \right) = 6 \)

(B) \( \tan^{-1} (x + 3) - \tan^{-1} (x - 3) = \tan^{-1} \frac{3}{4} \)

\[
\Rightarrow \tan^{-1} \left( \frac{x + 3 - x + 3}{1 + (x + 3)(x - 3)} \right) = \tan^{-1} \left( \frac{3}{4} \right), \quad x^2 - 9 \geq 1
\]

\[
\Rightarrow \frac{6}{x^2 - 8} = \frac{3}{4} \Rightarrow x^2 = 16 \quad \text{or} \quad x = 4, -4
\]

(C) We have \( \vec{c} = \frac{\vec{a} - \mu \vec{b}}{4} \)

Then \( \vec{b} - \vec{a} \cdot (\vec{b} + \vec{c}) = 0 \)

\[
\Rightarrow (\vec{b} - \vec{a}) \left( \vec{b} + \frac{\vec{a} - \mu \vec{b}}{4} \right) = 0
\]

\[
\Rightarrow (\vec{b} - \vec{a}) \left( \frac{4 - \mu}{4} \vec{b} + \frac{\vec{a}}{4} \right) = 0 \Rightarrow \frac{4 - \mu}{4} b^2 - \frac{a^2}{4} = 0
\]

6. A→q, B→p, C→s, D→t

As \( \vec{a} + \vec{b} = \vec{c} \)

∴ The figure is as shown.

\[
\text{Clearly } \cos (180° - \theta) = \frac{\vec{a} \cdot \vec{b}}{||\vec{a}|| \cdot ||\vec{b}||} = \frac{1}{2}
\]
\[ \Rightarrow \cos \theta = \frac{1}{2} \Rightarrow \theta = \frac{2\pi}{3} \]

\[ \Rightarrow A \rightarrow q \]

\[ \int_a^b (f(x) - 3x) \, dx = a^2 - b^2 \]

\[ \Rightarrow \int_a^b f(x) \, dx + \frac{3}{2}(a^2 - b^2) = a^2 - b^2 \]

\[ \Rightarrow \int_a^b f(x) \, dx = -\frac{1}{2}(a^2 - b^2) \]

\[ \Rightarrow \frac{d}{db} \left[ \int_a^b f(x) \, dx \right] = B \Rightarrow f(b) = b \Rightarrow f\left( \frac{\pi}{6} \right) = \frac{\pi}{6} \]

\[ \Rightarrow B \rightarrow p \]

\[ \pi \left[ \frac{\pi}{6} \sec(\pi x) \right] = \frac{\pi^2}{3} \sec(\pi x) \]

\[ = \frac{\pi}{\ln 3} \left[ \ln |\sec \frac{5\pi}{6} + \tan \frac{5\pi}{6}| \right] \]

\[ = \frac{\pi}{\ln 3} \left[ \ln |\sec \frac{5\pi}{6} + \tan \frac{5\pi}{6}| \right] \]

\[ = \frac{\pi}{\ln 3} \left[ \ln \left| \frac{2}{\sqrt{3}} - \frac{1}{\sqrt{3}} \right| - \ln \left| \frac{2}{\sqrt{3}} + \frac{1}{\sqrt{3}} \right| \right] = \frac{\pi}{\ln 3} = \pi \]

\[ \therefore C \rightarrow s \]

For \( |z| = 1 \) and \( z \neq 1 \). Let \( z = e^{i\theta} \)

Then \( 1 - z = 1 - \cos \theta - i \sin \theta = 2 \sin^2 \frac{\theta}{2} - 2i \sin \frac{\theta}{2} \cos \frac{\theta}{2} \)

or \( 1 - z = 2 \sin^2 \frac{\theta}{2} \cos \frac{\theta}{2} \)

\[ \therefore \frac{1}{1 - z} = \frac{1}{2 \sin \frac{\theta}{2}} \]

Here real part of \( \frac{1}{1 - z} \) is always \( \frac{1}{2} \)

\[ \therefore \text{ Locus of } \frac{1}{1 - z} \text{ is } x = \frac{1}{2} \]

For which \( \text{max} \left| \text{Arg} \left( \frac{1}{1 - z} \right) \right| \) is max. value of \( \phi \) i.e. \( \frac{\pi}{2} \).

\[ y = \cos \left( 3 \cos^{-1} x \right) \]

\[ y = \cos \left( 4x^3 - 3x \right) \]

\[ \frac{dy}{dx} = 12x^2 - 3 \text{ and } \frac{d^2y}{dx^2} = 24x \]

\[ \therefore \frac{1}{y} \left( \frac{dy}{dx} \right)^2 + x \frac{dy}{dx} \]

\[ = \frac{1}{4x^3 - 3x} \left( x^2 - 1 \right) 24x + x \left( 12x^2 - 3 \right) \]
\[ \frac{3x^2 - 7x - 6}{9} = 0 \text{ (for } x > 0)\]
\[ \Rightarrow x = 3 \text{ or } x = -\frac{2}{3} \text{ (rejected as } x > 0)\]
\[ \therefore \text{ Only one positive solution is there.}\]

Hence (a) is the correct option.

10. (A) \( q \rightarrow q; \) (B) \( p \rightarrow q; \) (C) \( p, q, s, t; \) (D) \( q \rightarrow q, t \)

(A) \[ \frac{\sqrt{3\alpha + \beta}}{2} = \frac{2\sqrt{3} - \beta}{\sqrt{3}} \]
\[ \Rightarrow \frac{2\sqrt{3} - \beta}{\sqrt{3}} = 2 + \sqrt{3}\beta \Rightarrow \beta = 0 \Rightarrow \alpha = 2 \]

(B) \[ Lf'(1) = -6a \text{ and } Rf'(1) = b \]
\[ -6a = b \quad \ldots(i) \]

Also \( f \) is continuous at \( x = 1, \)
\[ -a - 2 = b + a^2 \]
\[ \Rightarrow a^2 - 3a + 2 = 0 \quad \text{ (using } (i)) \]
\[ \Rightarrow a = 1, 2 \]

(C) \[ (3 - 3\omega + 2\omega^2)^4n + 3 + (2 + 3\omega - 3\omega^2)^4n + 3 + (-3 + 2\omega + 3\omega^2)^4n + 3 = 0 \]
\[ (3 - 3\omega + 2\omega^2)^4n + 3 + \left(\frac{2\omega^2 + 3 - 3\omega}{\omega^2}\right)^{4n+3} \]
\[ + \left(\frac{-3\omega + 2\omega^2 + 3}{\omega}\right)^{4n+3} = 0 \]
\[ \Rightarrow (3 - 3\omega + 2\omega^2)^{4n+3} [1 + \omega^{4n+3} + (\omega^2)^{4n+3}] = 0 \]
\[ \Rightarrow 4n + 3 \text{ should be an integer other than multiple of } 3. \]
\[ \therefore n = 1, 2, 3, 4, 5 \]

(D) \[ \frac{2ab}{a + b} = 4 \Rightarrow ab = 2a + 2b \quad \ldots(i) \]

Also \( a + q = 10 \quad \text{ or } a = 10 - q \)
and \( b + 5 = 2q \quad \text{ or } b = 2q - 5 \)
Putting values of \( a \) and \( b \) in eq**(i)**

\[ q = 4 \text{ or } \frac{15}{2} \Rightarrow a = 6 \text{ or } \frac{5}{2} \]
\[ \therefore |q - a| = 2 \text{ or } 5. \]

11. (A) \( p \rightarrow p, r, s; \) (B) \( p \rightarrow p; \) (C) \( p, q, s; \) (D) \( s \rightarrow t \)

(A) \[ 2(a^2 - b^2) = c^2 \]
\[ \Rightarrow 2(\sin^2 x - \sin^2 y) = \sin^2 z \]
\[ \Rightarrow 2\sin(x + y) \sin(x - y) = \sin^2 z \]
\[ \Rightarrow 2\sin(x - y) = \sin z \quad (\because \sin(x + y) = \sin z) \]
\[ \Rightarrow \frac{\sin(x - y)}{\sin z} = \frac{1}{2} = \lambda \]
\[ \therefore \cos(n\pi\lambda) = 0 \Rightarrow \cos \frac{n\pi}{2} = 0 \Rightarrow n = 1, 3, 5 \]

(B) \[ 1 + \cos 2X - 2\cos 2Y = 2\sin X \sin Y \]
\[ \Rightarrow 2\cos^2 X - 2\cos 2Y = 2\sin X \sin Y \]
\[ \Rightarrow 1 - \sin^2 X - 1 + 2\sin^2 Y = \sin X \sin Y \]
Vector Algebra and Three Dimensional Geometry

\[ \sin^2X + \sin\lambda \sin Y = 2 \sin^2Y = 0 \]
\[ (\sin X - \sin Y)(\sin X + 2 \sin Y) = 0 \]
\[ \Rightarrow \frac{\sin X}{\sin Y} = 1 \text{ or } -2 \]
\[ \therefore \frac{a}{b} = 1. \]

(C) \(X(\sqrt{3}, 1), Y(1, \sqrt{3}), Z(\beta, 1-\beta)\)

By symmetry, acute angle bisector of \(\angle XOY\) is \(y = x\).
\[ \therefore \text{Distance of } Z \text{ from bisector} \]
\[ = \left| \frac{\beta - 1 + \beta}{\sqrt{2}} \right| = \frac{3}{\sqrt{2}} \Rightarrow 2 \beta - 1 = \pm 3 \text{ or } \beta = 2 \text{ or } -1 \]
\[ \therefore |\beta| = 1, 2 \]

(D) For \(\alpha = 0, y = 3\)
For \(\alpha = 1, y = |x - 1| + |x - 2| + x \)

**Case I**

\(F(\alpha)\) is the area bounded by \(x = 0, x = 2, y^2 = 4x\) and \(y = 3\)
\[ \therefore F(\alpha) = \int_0^2 (3 - 2\sqrt{x})dx \]
\[ = \left[ \frac{3x - 4x^{\frac{3}{2}}}{3} \right]_0 = 6 - \frac{8\sqrt{2}}{3} \]
\[ \therefore \frac{F(\alpha)}{3\sqrt{2}} = 6 \]

**Case II**

\(F(\alpha)\) is the area bounded by \(x = 0, x = 2, y^2 = 4x\) and \(y = |x - 1| + |x - 2| + x \)
\[ = \begin{cases} 
3 - x, & 0 \leq x < 1 \\
1 + x, & 1 \leq x \leq 2 
\end{cases} \]
\[ \therefore F(\alpha) = \int_0^3 (3 - x - 2\sqrt{x})dx + \int_1^2 (x + 1 - 2\sqrt{x})dx \]

\[ = \left\{ \frac{3x^2 - x^{\frac{3}{2}}}{2} - \frac{4x^{\frac{3}{2}}}{3} \right\}_0^3 + \left\{ \frac{x^2}{2} + x - \frac{4x^{\frac{3}{2}}}{3} \right\}_1^2 \]
\[ = 3 - 1 - \frac{4}{3} + 2 + 2 - \frac{8\sqrt{2}}{3} - \frac{1}{2} - 1 + \frac{4}{3} = 5 - \frac{8\sqrt{2}}{3} \]
\[ F(\alpha) + \frac{8\sqrt{2}}{3} = 5 \]

**G. Comprehension Based Questions**

1. (b) Vector in the direction of \(L_1 = \hat{n}_1 = 3\hat{i} + \hat{j} + 2\hat{k}\)
Vector in the direction of \(L_2 = \hat{n}_2 = \hat{i} + 2\hat{j} + 3\hat{k}\)
\(\because\) Vector perpendicular to both \(L_1\) and \(L_2\)
\[ = \hat{n}_1 \times \hat{n}_2 = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & 1 & 2 \\ 1 & 2 & 3 \end{vmatrix} = -\hat{i} - 7\hat{j} + 5\hat{k} \]
\[ \therefore \text{Required unit vector} \]
\[ = \hat{n} = \frac{-\hat{i} - 7\hat{j} + 5\hat{k}}{\sqrt{1 + 49 + 25}} = \frac{-\hat{i} - 7\hat{j} + 5\hat{k}}{5\sqrt{3}} \]

2. (d) The shortest distance between \(L_1\) and \(L_2\) is
\[ = \frac{(\vec{a}_2 - \vec{\hat{a}}_1) \cdot \vec{\hat{b}}_2}{|\vec{\hat{b}}_2|} = (\vec{a}_2 - \vec{\hat{a}}_1) \cdot \hat{n} \]
where \(a_1 = -\hat{i} - 2\hat{j} - \hat{k} \quad a_2 = 2\hat{i} - 2\hat{j} + 3\hat{k} \)
\[ \therefore \vec{a}_2 - \vec{\hat{a}}_1 = 3\hat{i} + 4\hat{k} \quad \therefore (\vec{a}_2 - \vec{\hat{a}}_1) \cdot \hat{n} \]
\[ = (3\hat{i} + 4\hat{k}) \left( -\frac{\hat{i} - 7\hat{j} + 5\hat{k}}{5\sqrt{3}} \right) = -\frac{3 + 20}{5\sqrt{3}} = \frac{17}{5\sqrt{3}} \]

3. (c) The plane passing through \((-1, -2, -1)\) and having normal along \(\hat{n}\) is
\[-1(x + 1) - 7(y + 2) + 5(z + 1) = 0 \]
or \(x + 7y - 5z + 10 = 0 \)
\[\therefore\text{Distance of point (1, 1, 1) from the above plane is} \]
\[ = \frac{1 + 7 - 5 + 10}{\sqrt{1 + 49 + 25}} = \frac{13}{75} \]

**H. Assertion & Reason Type Questions**

1. (d) The line of intersection of given plane is
\(3x - 6y - 2z - 15 = 0 = 2x + y - 2z - 5 \)
For \(z = 0\), we obtain \(x = 3\) and \(y = -1 \)
\[\therefore\text{Line passes through (3, -1, 0).} \]
Let \(a, b, c\) be the \(d's\) of line of intersection, then
\(3a - 6b - 2c = 0 \) and \(2a + b - 2c = 0 \)
Solving the above equations using cross product method, we get \( a:b:c = 14:2:15 \)

\[
\begin{align*}
\therefore \quad \text{Eqn. of line is} \quad & \quad \frac{x-3}{14} = \frac{y+1}{2} = \frac{z}{15} = t \\
\text{whose parametric form is} \quad & \quad x = 3 + 14t, y = 1 + 2t, z = 15t \\
\therefore \quad \text{Statement-I is false (value of y is not matching).} \\
\text{Since dr's of line intersection of given planes are} \quad & \quad 14, 2, 15 \\
\therefore \quad 14\hat{i} + 2\hat{j} + 15\hat{k} \quad \text{is parallel to this line.} \\
\therefore \quad \text{Statement 2 is true.}
\end{align*}
\]

2. (c) \[
\frac{\overrightarrow{PQ} \times (\overrightarrow{RS} + \overrightarrow{ST})}{||\overrightarrow{PQ}|| \times ||\overrightarrow{RT}|| \sin 150^\circ} \neq 0
\]

\[
\therefore \text{Statement-1 is true.}
\]

Also, \( \overrightarrow{PQ} \times \overrightarrow{RS} = ||\overrightarrow{PQ}|| \times ||\overrightarrow{RS}|| \sin 120^\circ \times \hat{n}_1 \neq 0 \)

And \( \overrightarrow{PQ} \times \overrightarrow{ST} = ||\overrightarrow{PQ}|| \times ||\overrightarrow{ST}|| \sin 180^\circ \times \hat{n}_2 = 0 \)

\[ \therefore \text{Statement-2 is false.} \]

3. (d) The given planes are

\[
\begin{align*}
P_1 : x - y + z &= 1 \\
P_2 : x + y - z &= -1 \\
P_3 : x - 3y + 3z &= 2
\end{align*}
\]

Line \( L_1 \) is the intersection of planes \( P_2 \) and \( P_3 \).

\[ \therefore L_1 \text{ is parallel to the vector} \]

\[
= \begin{vmatrix}
\hat{i} & \hat{j} & \hat{k} \\
1 & 1 & -1 \\
1 & -3 & 3
\end{vmatrix}
= -4\hat{j} - 4\hat{k}
\]

Line \( L_2 \) is the intersection of \( P_3 \) and \( P_1 \).

\[ \therefore L_2 \text{ is parallel to the vector} \]

\[
= \begin{vmatrix}
\hat{i} & \hat{j} & \hat{k} \\
1 & -1 & 1 \\
1 & -3 & 3
\end{vmatrix}
= -2\hat{j} - 2\hat{k}
\]

Line \( L_3 \) is the intersection of \( P_1 \) and \( P_2 \).

\[ \therefore L_3 \text{ is parallel to the vector} \]

\[
= \begin{vmatrix}
\hat{i} & \hat{j} & \hat{k} \\
1 & -1 & 1 \\
1 & 1 & -1
\end{vmatrix}
= 2\hat{j} + 2\hat{k}
\]

Clearly lines \( L_1, L_2 \) and \( L_3 \) are parallel to each other.

\[ \therefore \text{Statement-1 is False} \]

\textbf{Topic-wise Solved Papers - MATHEMATICS}

Also family of planes passing through the intersection of \( P_1 \) and \( P_2 \) is \( P_1 + \lambda P_2 = 0 \).

If plane \( P_3 \) is represented by \( P_1 + \lambda P_2 = 0 \) for some value of \( \lambda \) then the three planes pass through the same point.

Here \( P_1 + \lambda P_2 = 0 \)

\[
x(1 + \lambda) + y(\lambda - 1) + z(1 - \lambda) = 0
\]

This will be identical to \( P_3 \) if

\[
\frac{1 + \lambda}{1} = \frac{\lambda - 1}{-3} = \frac{1 - \lambda}{2}
\]

Taking \( \frac{1 + \lambda}{1} = \frac{\lambda - 1}{-3}, \) we get \( \lambda = -\frac{1}{3} \) and taking \( \frac{1 + \lambda}{1} = \frac{1 - \lambda}{3}; \) we get \( \lambda = \frac{2}{3} \).

\[ \therefore \text{There is no value of} \lambda \text{which satisfies eq (1).} \]

\[ \therefore \text{The three planes do not have a common point.} \]

\[ \Rightarrow \text{Statement 2 is true.} \]

\[ \therefore \text{(d) is the correct option.} \]

\textbf{I. Integer Value Correct Type}

1. (5) We have \( \overrightarrow{a} = \frac{\hat{i} - 2\hat{j}}{\sqrt{5}}, \overrightarrow{b} = \frac{2\hat{i} + \hat{j} + 3\hat{k}}{\sqrt{14}} \)

Clearly \( |\overrightarrow{a}| = 1 \) and \( \overrightarrow{a} \cdot \overrightarrow{b} = 0 \)

\[
(2\overrightarrow{a} + \overrightarrow{b}) \cdot \left[ (\overrightarrow{a} \times \overrightarrow{b}) \times (\overrightarrow{a} - 2\overrightarrow{b}) \right]
\]

\[
= -(2\overrightarrow{a} + \overrightarrow{b}) \cdot \left[ (\overrightarrow{a} - 2\overrightarrow{b}) \times (\overrightarrow{a} \times \overrightarrow{b}) \right]
\]

\[
= -(2\overrightarrow{a} + \overrightarrow{b}) \cdot \left[ (\overrightarrow{a} - 2\overrightarrow{b}) \cdot (\overrightarrow{a} \times \overrightarrow{b}) \right]
\]

\[
= -(2\overrightarrow{a} + \overrightarrow{b}) \cdot \left[ (\overrightarrow{a} \cdot 2\overrightarrow{b}) \cdot \overrightarrow{a} - (\overrightarrow{a} \cdot \overrightarrow{b}) \cdot \overrightarrow{b} \right]
\]

\[
= -(2\overrightarrow{a} + \overrightarrow{b}) \cdot \left[ -2\overrightarrow{a} \cdot \overrightarrow{b} \right]
\]

\[
= (2\overrightarrow{a} + \overrightarrow{b}) \cdot (2\overrightarrow{a} + \overrightarrow{b}) = 4|\overrightarrow{a}|^2 + |\overrightarrow{b}|^2 \quad (\because \overrightarrow{a} \cdot \overrightarrow{b} = 0)
\]

\[
= 4 + 1 = 5.
\]

2. (6) The equation of the plane containing the lines

\[ \frac{x - 1}{2} = \frac{y - 2}{3} = \frac{z - 3}{4} \]

and \[ \frac{x - 2}{3} = \frac{y - 3}{4} = \frac{z - 4}{5} \]

is

\[
\begin{vmatrix}
x - 1 & y - 2 & z - 3 \\
2 & 3 & 4
\end{vmatrix} = 0 \Rightarrow x - 2y + z = 0
\]

\[ \therefore \text{Distance between} \quad x - 2y + z = 0 \quad \text{and} \quad \overrightarrow{Ax} - 2y + z = d \]

\[
= \text{Perpendicular distance between parallel planes} \quad (\because A = 1)
\]

\[
= \frac{|d|}{\sqrt{6}} = \sqrt{6} \Rightarrow |d| = 6.
\]

\[
\]

\[
\]

\[
\]

\[
\]

\[
\]
3. (9) We have \( \vec{r} \times \vec{b} - \vec{c} \times \vec{b} = 0 \)
\[ \Rightarrow (\vec{r} - \vec{c}) \times \vec{b} = 0 \Rightarrow \vec{r} - \vec{c} \parallel \vec{b} \]
Let \( \vec{r} - \vec{c} = \lambda \vec{b} \) or \( \vec{r} = \vec{c} + \lambda \vec{b} \)
\[ \Rightarrow \vec{r} = \hat{i} + 2\hat{j} + 3\hat{k} - \lambda \hat{i} + \lambda \hat{j} = (1-\lambda)\hat{i} + (2+\lambda)\hat{j} + 3\hat{k} \]
\[ \vec{r} \cdot \vec{a} = 0 \Rightarrow -1 + \lambda - 3 = 0 \Rightarrow \lambda = 4 \]
\[ \therefore \vec{r} = -3\hat{i} + 6\hat{j} + 3\hat{k} \]
\[ \therefore \vec{r} \cdot \vec{b} = 3 + 6 = 9 \]

4. (3) \( \vec{a}, \vec{b}, \vec{c} \) are units vectors such that
\[ |\vec{a} - \vec{b}|^2 + |\vec{b} - \vec{c}|^2 + |\vec{c} - \vec{a}|^2 = 9 \]
\[ \Rightarrow 2(|\vec{a}|^2 + |\vec{b}|^2 + |\vec{c}|^2) - 2(\vec{a} \cdot \vec{b} + \vec{b} \cdot \vec{c} + \vec{c} \cdot \vec{a}) = 9 \]
\[ \Rightarrow \vec{a} \cdot \vec{b} + \vec{b} \cdot \vec{c} + \vec{c} \cdot \vec{a} = \frac{-3}{2} \]
Also \( |\vec{a} + \vec{b} + \vec{c}|^2 = |\vec{a}|^2 + |\vec{b}|^2 + |\vec{c}|^2 + 2(\vec{a} \cdot \vec{b} + \vec{b} \cdot \vec{c} + \vec{c} \cdot \vec{a}) \)
\[ = 1 + 1 + 1 + 2 \times \left( -\frac{3}{2} \right) = 0 \]
\[ \Rightarrow \vec{a} + \vec{b} + \vec{c} = 0 \Rightarrow (\vec{b} + \vec{c}) = -\vec{a} \]
\[ \therefore |2\vec{a} + 5(\vec{b} + \vec{c})| = |2\vec{a} - 5\vec{a}| = |3\vec{a}| = 3 \]

5. (5) Given 8 vectors are
\( (1, 1, 1), (-1, -1, -1); (-1, 1, 1), (1, -1, -1); (1, 1, -1), (-1, -1, 1), (-1, 1, -1), (1, -1, 1) \)
These are 4 diagonals of a cube and their opposites.
For 3 non coplanar vectors first we select 3 groups of diagonals and its opposite in \( ^{4}C_{3} \) ways. Then one vector from each group can be selected in \( 2 \times 2 \times 2 \) ways.
\[ \therefore \text{Total ways} = ^{4}C_{3} \times 2 \times 2 \times 2 = 32 = 2^5 \]
\[ \therefore \quad p = 5 \]

6. (5) Let \( k, k+1 \) be removed from pack.
\[ \therefore (1 + 2 + 3 + \ldots + n) - (k + k + 1) = 1224 \]
\[ \frac{n(n+1)}{2} - 2k = 1225 \Rightarrow k = \frac{n(n+1)-2450}{4} \]
for \( n = 50, k = 25 \quad \therefore \quad k - 20 = 5 \)
\[ \Rightarrow \vec{r} = \vec{a} \times \vec{b} = \vec{b} \times \vec{c} = \vec{c} \times \vec{a} = \cos \frac{\pi}{3} = \frac{1}{2} \]
Given \( p \vec{a} + q \vec{b} + r \vec{c} = a \times \vec{b} + b \times \vec{c} \)
Taking its dot product with \( \vec{a}, \vec{b}, \vec{c} \), we get
\[ p + \frac{1}{2} q + \frac{1}{2} r = \left[ \begin{array}{ccc} a & b & c \end{array} \right] \]... (1)
\[ \frac{1}{2} p + q + \frac{1}{2} r = 0 \]... (2)
\[ \frac{1}{2} p + q + r = \left[ \begin{array}{ccc} a & b & c \end{array} \right] \]... (3)
From (1) and (3), \( p = r \) Using (2) \( q = -p \)
\[ \therefore \frac{p^2 + 2q^2 + r^2}{q^2} = \frac{p^2 + 2p^2 + p^2}{p^2} = 4 \]

8. (9) \( \vec{s} = 4\vec{p} + 3\vec{q} + 5\vec{r} \)
\[ \vec{s} = x(-\vec{p} + \vec{q} + \vec{r}) + y(\vec{p} - \vec{q} + \vec{r}) + z(-\vec{p} - \vec{q} + \vec{r}) \]
\[ \Rightarrow -x + y - z = 4 \]
\[ x - y - z = 3 \]
\[ x + y + z = 5 \]
Solving above equations \( x = 4, y = \frac{9}{2}, z = \frac{-7}{2} \)
\[ \therefore 2x + y + z = 9 \]
1. (a) As the point \((3, 2, 0)\) lies on the given line
\[
\frac{x-4}{1} = \frac{y-7}{5} = \frac{z-4}{4}
\]
\[\therefore \quad x-y+z=1 \] is the required plane.

2. (b) \((\vec{a} \times \vec{b})^2 = |\vec{a}|^2 |\vec{b}|^2 \sin^2 \frac{\pi}{6} = 16 \times 4 \times \frac{1}{4} = 16\]

3. (a) We have, \(\vec{a} \times \vec{b} + \vec{b} \times \vec{c} + \vec{c} \times \vec{a}\)
\[= (\vec{a} \times \vec{b}) \cdot \{(\vec{b} \times \vec{c}) \times (\vec{c} \times \vec{a})\}\]
\[= (\vec{a} \times \vec{b}) \cdot \{(\vec{m} \cdot \vec{c}) \vec{c} - (\vec{m} \cdot \vec{a}) \vec{a}\}\]

(where \(\vec{m} = \vec{b} \times \vec{c}\))
\[= \{(\vec{a} \times \vec{b}) \cdot \vec{c}\} \cdot \{(\vec{a} \cdot \vec{b} \cdot \vec{c})\} = [\vec{a} \cdot \vec{b} \cdot \vec{c}]^2 = 4^2 = 16\]

4. (a) \(\vec{a} + \vec{b} + \vec{c} = 0 \Rightarrow \vec{b} + \vec{c} = -\vec{a}\)
\[\Rightarrow (\vec{b} + \vec{c})^2 = (\vec{a})^2 = 5^2 + 3^2 + 2 \vec{b} \cdot \vec{c} = 25\]
\[\Rightarrow 2|\vec{b}||\vec{c}| \cos \theta = 49 - 34 = 15; \Rightarrow 2 \times 5 \times 3 \cos \theta = 15; \]
\[\Rightarrow \cos \theta = 1/2; \Rightarrow \theta = \frac{\pi}{3} = 60^\circ\]

5. (a) We have, \(\vec{a} + \vec{b} + \vec{c} = 0 \Rightarrow (\vec{a} + \vec{b} + \vec{c})^2 = 0\)
\[\Rightarrow |\vec{a}|^2 + |\vec{b}|^2 + |\vec{c}|^2 + 2(\vec{a} \cdot \vec{b} + \vec{b} \cdot \vec{c} + \vec{c} \cdot \vec{a}) = 0\]
\[\Rightarrow 25 + 16 + 9 + 2(\vec{a} \cdot \vec{b} + \vec{b} \cdot \vec{c} + \vec{c} \cdot \vec{a}) = 0\]
\[\Rightarrow (\vec{a} \cdot \vec{b} + \vec{b} \cdot \vec{c} + \vec{c} \cdot \vec{a}) = -25\]
\[\therefore |\vec{a} \cdot \vec{b} + \vec{b} \cdot \vec{c} + \vec{c} \cdot \vec{a}| = 25\]

6. (a) Since \(\vec{a}, \vec{c}, \vec{b}\) form a right handed system,
\[\therefore \quad \vec{c} = \vec{b} \times \vec{a} = \begin{vmatrix} i & j & k \\ x & y & z \end{vmatrix} = zi - xk
\]

7. (b) We have \(\vec{a} \times \vec{b} = 39 \vec{k} = \vec{c}\)
Also \(|\vec{a}| = \sqrt{34}, |\vec{b}| = \sqrt{45}, |\vec{c}| = 39;\)
\[\therefore |\vec{a}| |\vec{b}| |\vec{c}| = \sqrt{34} \times \sqrt{45} \times 39\]

8. (c) Let \(\vec{a} + \vec{b} + \vec{c} = \vec{r}\). Then
\[\vec{a} \times (\vec{a} + \vec{b} + \vec{c}) = \vec{a} \times \vec{r} \Rightarrow 0 + \vec{a} \times \vec{b} + \vec{a} \times \vec{c} = \vec{a} \times \vec{r}\]
\[\Rightarrow \vec{a} \times \vec{b} - \vec{c} \times \vec{a} = \vec{a} \times \vec{r} \Rightarrow \vec{a} \times \vec{r} = 0\]
Similarly \(\vec{b} \times \vec{r} = 0 \& \vec{c} \times \vec{r} = 0\)
Above three conditions will be satisfied for non-zero vectors if and only if \(\vec{r} = \vec{0}\)

9. (b) Equation of plane through \((1, 0, 0)\) is \(a(x-1) + by + cz = 0\) ...(i)
\((i)\) passes through \((0, 1, 0)\).
\(-a + b = 0 \Rightarrow b = a; \text{Also, cos} 45^\circ\)
\[= \frac{a + a}{\sqrt{2(a^2 + c^2)}} \Rightarrow 2a = \sqrt{2a^2 + c^2} \Rightarrow 2a^2 = c^2\]
\[\Rightarrow c = \sqrt{2a}\]
So d.r of normal are \(a, a, \sqrt{2a}\) i.e. \(1, 1, \sqrt{2}\).

10. (a) since \(\vec{n}\) is perpendicular \(\vec{u}\) and \(\vec{v}\), \(\vec{n} = \frac{\vec{u} \times \vec{v}}{||\vec{u}||} ||\vec{u}||\)
\[\begin{vmatrix} i & j & k \\ 1 & 1 & 0 \\ 1 & -1 & 0 \end{vmatrix} = \frac{-2k}{\sqrt{2 \times \sqrt{2}}} = -\hat{k}
\]
\[\vec{n} = \frac{1}{3} \Rightarrow \vec{a} = (i + 2j + 3k) \Rightarrow ||\vec{a}|| = 3
\]

11. (d) \(\vec{F} + \vec{F}_1 + \vec{F}_2 = 7i + 2j - 4k\)
\(\vec{d} = PV\ of\ \vec{F} - PV\ of\ \vec{A} = 4i + 2j - 2k\)
\(W = \vec{F} \cdot \vec{d} = 28 + 4 + 8 = 40\ \text{unit}\)

12. (d) \(P.V\ of\ \frac{AD}{AD} = \frac{3}{2} + (0 - 2)j + (4 + 4)k = 4i - j + 4k\)
\[= 4i - j + 4k\] or \(AD = \sqrt{16 + 16 + 16} = \sqrt{33}\)

13. (d) Shortest distance = perpendicular distance between the plane and sphere = distance of plane from centre of sphere - radius
\[= \frac{-2 \times 12 + 4 \times 1 + 3 \times 3 - 327}{\sqrt{144 + 9 + 16}} - \sqrt{4 + 9 + 155} = 26 - 13 = 13\]

14. (a) \(\frac{x - b}{a} = \frac{y - c}{b} = \frac{z - d}{c}\) for perpendicularity of lines \(aa' + cc' = 0\)
\[\frac{x_2 - x_1}{y_2 - y_1} + \frac{y_2 - y_1}{z_2 - z_1} = 0\]
\[\begin{pmatrix} l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{pmatrix} = 0\]
16. (c) \[ \vec{a} + \vec{b} + \vec{c} = 0 \Rightarrow (\vec{a} + \vec{b} + \vec{c}).(\vec{a} + \vec{b} + \vec{c}) = 0 \]
\[ |\vec{a}|^2 + |\vec{b}|^2 + |\vec{c}|^2 + 2(\vec{a}\vec{b} + \vec{b}\vec{c} + \vec{c}\vec{a}) = 0 \]
\[ \vec{a} \cdot \vec{b} + \vec{b} \cdot \vec{c} + \vec{c} \cdot \vec{a} = \frac{-1 - 4 - 9}{2} = -7 \]

17. (d)

Centre of sphere \( = (-1, 1, 2) \)
Radius of sphere \( \sqrt{1^2 + 1^2 + 4^2} = 5 \)
Perpendicular distance from centre to the plane
\[ OC = d = \frac{-1 + 2 + 4 + 7}{\sqrt{1 + 4 + 3}} = \frac{12}{3} = 4. \]

\[ AC^2 = AO^2 - OC^2 = 5^2 - 4^2 = 9 \Rightarrow AC = 3 \]

18. (b)
Vector perpendicular to the face OAB
\[ \begin{vmatrix} 
\hat{i} & \hat{j} & \hat{k} \\
1 & 2 & 1 \\
1 & 3 & 1 
\end{vmatrix} = \hat{i} - \hat{j} - 3\hat{k} \]

Vector perpendicular to the face ABC
\[ \begin{vmatrix} 
\hat{i} & \hat{j} & \hat{k} \\
1 & -1 & 2 \\
-2 & -1 & 1 
\end{vmatrix} = \hat{i} - 5\hat{j} - 3\hat{k} \]

Angle between the faces = angle between their normals
\[ \cos \theta = \frac{5 + 5 + 9}{\sqrt{35}} \text{ or } \theta = \cos^{-1}\left(\frac{19}{35}\right) \]

19. (c)
\[ \begin{vmatrix} 
a & a^2 & 1 + a^3 
b & b^2 & 1 + b^3 
c & c^2 & 1 + c^3 
\end{vmatrix} = 0 \Rightarrow \begin{vmatrix} 
a & a^2 & 1 
b & b^2 & 1 
c & c^2 & 1 
\end{vmatrix} \]
\[ \begin{vmatrix} 
1 & a & a^2 
1 & b & b^2 
1 & c & c^2 
\end{vmatrix} \]
\[ As \begin{vmatrix} 
1 & a & a^2 
1 & b & b^2 
1 & c & c^2 
\end{vmatrix} \neq 0 \text{ (given condition)} \therefore abc = -1 \]

20. \( A = (7, -4, 7), B = (1, -6, 10), C = (-1, -3, 4) \)
and \( D = (5, -1, 3) \)
\[ AB = \sqrt{(7-1)^2 + (-4 + 6)^2 + (7 - 10)^2} = \sqrt{36 + 4 + 9} = 7 \]

Similarly \( BC = 7, CD = \sqrt{41}, DA = \sqrt{17} \)

None of the options is satisfied.

21. (c) 
\[ (\vec{u} + \vec{v} - \vec{w}), (\vec{u} \times \vec{v} - \vec{u} \times \vec{w} - \vec{v} \times \vec{v} + \vec{v} \times \vec{w}) \]
\[ = (\vec{u} + \vec{v} - \vec{w}), (\vec{u} \times \vec{v} - \vec{u} \times \vec{w} + \vec{v} \times \vec{w}) = \vec{u} \times \vec{v} - \vec{u} \times \vec{w} + \vec{v} \times \vec{w} - \vec{u} \times \vec{w} \]
\[ = \vec{u} \times \vec{v} - \vec{u} \times \vec{w} + \vec{v} \times \vec{w} \]
\[ = [\vec{u} \wedge \vec{v}] + [\vec{v} \wedge \vec{w}] - [\vec{w} \wedge \vec{u}] = \vec{u} \times \vec{v} - \vec{u} \times \vec{w} + \vec{v} \times \vec{w} \]

22. (a) Eq. of planes be \[ \frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1 \]
\[ \begin{vmatrix} 
\frac{-1}{a^2} & \frac{1}{a^2} & \frac{1}{a^2} \\
\frac{1}{b^2} & \frac{1}{b^2} & \frac{1}{b^2} \\
\frac{1}{c^2} & \frac{1}{c^2} & \frac{1}{c^2} 
\end{vmatrix} = \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} \]

23. (c) The planes are \( 2x + y + 2z - 8 = 0 \) ...(1)
and \( 4x + 2y + 4z + 5 = 0 \)
or \( 2x + y + 2z = 5 \) ...(2)
\[ \therefore \text{Distance between (1) and (2)} = \frac{5 + 8}{\sqrt{2^2 + 1^2 + 2^2}} = \frac{21}{2\sqrt{9}} = \frac{7}{2} \]

24. (b) Let a point on the line \( x = y + a = z \) is \( (\lambda, \lambda - a, \lambda) \) and a point on the line \( x + a = 2y = 2z \) is \( (\mu - a, \frac{\mu}{2}, \frac{\mu}{2}) \), then direction ratio of the line joining these points are \( \lambda - \mu + a, \lambda - a - \frac{\mu}{2}, \lambda - \frac{\mu}{2} \)
If it represents the required line, then
\[ \frac{\lambda - \mu + a}{2} = \frac{\lambda - a - \frac{\mu}{2}}{1} = \frac{\lambda - \frac{\mu}{2}}{2} \]
on solving we get \( \lambda = 3a, \mu = 2a \)
\[ \therefore \text{The required points of intersection are } (3a, 3a-a, 3a) \text{ and } \left( \frac{2a - a}{2}, \frac{2a - a}{2} \right) \]
or \( (3a, 2a, 3a) \text{ and } (a, a, a) \)
25. (d) The given lines are
\[ x - 1 = \frac{y + 3}{-\lambda} = \frac{z - 1}{\lambda} = s \ldots \ldots \text{(1)} \]
and \[ 2x = y - 1 = \frac{z - 2}{-1} = t \ldots \ldots \text{(2)} \]
The lines are coplanar, if
\[
\begin{vmatrix}
0 & -1 & -3 & 1 \\
1 & -\lambda & \lambda & 1 \\
\frac{1}{2} & 1 & -1 & 1 \\
\end{vmatrix} = 0
\]
\[
\begin{vmatrix}
1 & -5 & 1 \\
0 & \lambda & 1 \\
\frac{1}{2} & 0 & -1 \\
\end{vmatrix} = 0
\]
\[ \Rightarrow 5(-1 - \frac{\lambda}{2}) = 0 \Rightarrow \lambda = -2 \]

26. (a) The equations of spheres are
\[ S_1: x^2 + y^2 + z^2 + 7x - 2y - z - 13 = 0 \text{ and} \]
\[ S_2: x^2 + y^2 + z^2 - 3x + 3y + 4z - 8 = 0 \]
Their plane of intersection is
\[ S_1 - S_2 = 0 \Rightarrow 10x - 5y - 5z - 5 = 0 \]
\[ \Rightarrow 2x - y - z = 1 \]

27. (e) Let \( \vec{a} + 2\vec{b} = t\vec{c} \) and \( \vec{b} + 3\vec{c} = s\vec{a} \), where \( t \) and \( s \) are scalars. Adding, we get
\[ \vec{a} + 3\vec{b} + 3\vec{c} = t\vec{c} + s\vec{a} \Rightarrow \vec{a} + 2\vec{b} + 6\vec{c} = t\vec{c} + s\vec{a} - \vec{b} + 3\vec{c} \]
\[ = t\vec{c} + (\vec{b} + 3\vec{c}) - \vec{b} + 3\vec{c} = (t + 6)\vec{c} \]
\[ \text{[using } s\vec{a} = \vec{b} + 3\vec{c}] \]
\[ = \lambda\vec{c}, \text{ where } \lambda = t + 6 \]

28. (d) Resultant of forces \( \vec{F} = 7\vec{i} + 2\vec{j} - 4\vec{k} \)
Displacement \( \vec{d} = 4\vec{i} + 2\vec{j} - 2\vec{k} \)
\[ \therefore \text{Work done } = \vec{F} \cdot \vec{d} = 28 + 4 + 8 = 40 \]

29. (c) Vectors \( \vec{a} + 2\vec{b} + 3\vec{c}, \lambda\vec{b} + 4\vec{c}, \text{ and } (2\lambda - 1)\vec{c} \) are coplanar if
\[
\begin{vmatrix}
1 & 2 & 3 \\
\lambda & 4 & 1 \\
0 & 2\lambda - 1 & 0 \\
\end{vmatrix} = 0
\]
\[ \Rightarrow \lambda(2\lambda - 1) = 0 \Rightarrow \lambda = 0 \text{ or } \frac{1}{2} \]
\[ \therefore \text{Forces are noncoplanar for all } \lambda, \text{ except } \lambda = 0, \frac{1}{2} \]

30. (e) Projection of \( \vec{v} \) along \( \vec{u} \)
\[ \frac{\vec{v} \cdot \vec{u}}{||\vec{u}||} = \frac{\vec{v} \cdot \vec{u}}{2} \]
projection of \( \vec{w} \) along \( \vec{u} \)
\[ \frac{\vec{w} \cdot \vec{u}}{||\vec{u}||} = \frac{\vec{w} \cdot \vec{u}}{2} \]

31. (a) Given \( (\vec{a} \times \vec{b}) \times \vec{c} = \frac{1}{3} |\vec{b}||\vec{c}|\vec{a} \)
Clearly \( \vec{a} \) and \( \vec{b} \) are noncollinear
\[ \Rightarrow (\vec{a} \cdot \vec{c})\vec{b} - (\vec{b} \cdot \vec{c})\vec{a} = \frac{1}{3} |\vec{b}||\vec{c}|\vec{a} \]
\[ \therefore \vec{a} \cdot \vec{c} = 0 \text{ and } -\vec{b} \cdot \vec{c} = \frac{1}{3} |\vec{b}||\vec{c}| \Rightarrow \cos \theta = -\frac{1}{3} \]
\[ \therefore \sin \theta = \sqrt{1 - \frac{1}{9}} = \frac{2\sqrt{2}}{3} \]
[\( \theta \) is acute angle between \( \vec{b} \) and \( \vec{c} \)]

32. (a) \( \overrightarrow{PA} + \overrightarrow{AP} = 0 \) and \( \overrightarrow{PC} + \overrightarrow{CP} = 0 \)
\[ \Rightarrow \overrightarrow{PA} + \overrightarrow{AC} + \overrightarrow{CP} = 0 \text{ and } \overrightarrow{PB} + \overrightarrow{BC} + \overrightarrow{CP} = 0 \]
Adding, we get \( \overrightarrow{PA} + \overrightarrow{PB} + \overrightarrow{AC} + \overrightarrow{BC} + 2\overrightarrow{CP} = 0 \).
Since \( \overrightarrow{AC} = -\overrightarrow{BC} \) \& \( \overrightarrow{CP} = -\overrightarrow{PC} \)
\[ \Rightarrow \overrightarrow{PA} + \overrightarrow{PB} - 2\overrightarrow{PC} = 0. \]

33. (a) If \( \theta \) is the angle between line and plane then
\[ \frac{\pi}{2} - \theta \]
is the angle between line and normal to plane given by
\[ \cos \left( \frac{\pi}{2} - \theta \right) = \frac{(i + 2j + 2k) \cdot (2i - j + \sqrt{\lambda}k)}{3\sqrt{4 + 1 + \lambda}} \]
\[ \cos \left( \frac{\pi}{2} - \theta \right) = \frac{2 - 2 + 2\sqrt{\lambda}}{3\sqrt{5 + \lambda}} \]
\[ \Rightarrow \sin \theta = \frac{2\sqrt{\lambda}}{3\sqrt{5 + \lambda}} \Rightarrow 4\lambda = 5 + \lambda \Rightarrow \lambda = \frac{5}{3} \]

34. (b) The given lines are \( 2x = 3y = -z \)
or \[ \frac{x}{3} = \frac{y}{2} = \frac{z}{-6} \]
and \( 6x = -y = -4z \) [Dividing by 6]
or \( \frac{x}{2} = \frac{y}{-12} = \frac{z}{-3} \)  
\[ \text{[Dividing by 12]} \]

\[ \therefore \text{Angle between two lines is} \]

\[ \cos \theta = \frac{3.2 + 2(-12) + (-6)(-3)}{\sqrt{3^2 + 2^2 + (-6)^2} \sqrt{2^2 + (-12)^2 + (-3)^2}} \]

\[ = 6 - 24 + 18 \]
\[ = \frac{0}{49 \sqrt{157}} = 0 \Rightarrow 0 = 90^\circ \]

35. (c) Centers of given spheres are \((-3, 4, 1)\) and \((5, -2, 1)\). Mid point of centres is \((1, 1, 1)\).

Satisfying this in the equation of plane, we get

\[ 2a - 3a + 4a + 6 = 0 \Rightarrow a = -2 \]

36. (b) A point on line is \((2, -2, 3)\) its perpendicular distance from the plane \(x + 5y + z = 5 = 0\)

\[ = \frac{2 - 10 + 3 - 5}{\sqrt{1 + 25 + 1}} = \frac{10}{3\sqrt{3}} \]

37. (c) Let \( \vec{a} = \vec{x} + \vec{y} + \vec{z} \)

\[ \vec{a} \times \vec{y} = \vec{z} + \vec{k} \Rightarrow (\vec{a} \times \vec{x})^2 = y^2 + z^2 \]

Similarly, \( (\vec{a} \times \vec{y})^2 = x^2 + z^2 \) and \( (\vec{a} \times \vec{k})^2 = x^2 + y^2 \)

\[ \Rightarrow (\vec{a} \times \vec{x})^2 + (\vec{a} \times \vec{y})^2 + (\vec{a} \times \vec{k})^2 = 2a^2 \]

38. (c) \( a, b, c \) are in H.P. \( \Rightarrow \frac{1}{a} \frac{1}{b} \frac{1}{c} \) are in A.P.

\[ \Rightarrow \frac{2}{b} = \frac{1}{a} + \frac{1}{c} \Rightarrow \frac{2}{a} + \frac{1}{a} + \frac{1}{c} = 0 \]

\[ \therefore \frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 0 \] passes through \((1, -2)\)

39. (a) Vector \(\vec{a} + \vec{b} + \vec{c}, \vec{i} + \vec{k} \) and \(\vec{c} + \vec{j} + \vec{b} \) are coplanar

\[
\begin{vmatrix}
  a & a & c \\
  1 & 0 & 1 \\
  c & c & b \\
\end{vmatrix} = 0 \Rightarrow c^2 = ab \Rightarrow c = \sqrt{ab}
\]

\[ \therefore c \text{ is G.M. of } a \text{ and } b. \]

40. (b) \( [\lambda(\vec{a} + \vec{b}) - \lambda^2 \vec{b} - \lambda \vec{c}] = [\vec{a} \vec{b} + \vec{c}] \)

\[ \Rightarrow \lambda^4[\vec{a} + \vec{b} + \vec{c}] = [\vec{a} \vec{b} + \vec{c}] \]

\[ \Rightarrow \lambda^4[\{[\vec{a} \vec{b}] + [\vec{b} \vec{c}]\} = [\vec{a} \vec{b} + \vec{c}] \]

\[ \Rightarrow \lambda^4[\vec{a} \vec{b} + \vec{c}] = [\vec{a} \vec{b} + \vec{c}] \Rightarrow \lambda^4 = -1 \]

\[ \Rightarrow \lambda \text{ has no real values.} \]

41. (d) \(\vec{a} = \vec{i} - \vec{k}, \vec{b} = \vec{x} + \vec{j} + (1-x) \vec{k} \) and \(\vec{c} = \vec{y} + \vec{j} + (1-x) \vec{k} \)

\[ [\vec{a} \vec{b} \vec{c}] = \vec{a} \vec{b} \vec{c} = \begin{vmatrix}
  1 & 0 & -1 \\
  x & 1 & 1-x \\
  y & x & 1+x-y \\
\end{vmatrix} \]

\[= 1[1+y-x-x^2] = [-x^2-y] \]

\[= 1 - y + x^2 - x^2 + y = 1 \]

Hence \( [\vec{a} \vec{b} \vec{c}] \) is independent of \(x\) and \(y\) both.

42. (b) Perpendicular distance of centre \((\frac{1}{2}, 0, -\frac{1}{2})\)

from \(x + 2y - 2 = 4\) is given by

\[ \frac{1 + 1 - 4}{\sqrt{2}} = \frac{3}{\sqrt{2}} \]

radius of sphere

\[= \frac{1 + 1 + 2}{\sqrt{2}} = \frac{5}{\sqrt{2}} \]

\[\therefore \text{radius of circle} = \frac{5 \frac{3}{\sqrt{2}}}{2} = 1. \]

43. (d) \(\vec{a} \times \vec{b} \times \vec{c} = \vec{a} \times (\vec{b} \times \vec{c}) \), \(\vec{a}, \vec{b} \neq 0\), \(\vec{b}, \vec{c} \neq 0\)

\[\Rightarrow (\vec{a} \vec{c}).\vec{b} - (\vec{b} \vec{c})\vec{a} = (\vec{a} \vec{c}).\vec{b} - (\vec{b} \vec{e})\vec{c} \]

\[\Rightarrow (\vec{a} \vec{b}).\vec{c} = (\vec{b} \vec{e})\vec{a} \Rightarrow \vec{a} \parallel \vec{c} . \]

44. (a) \( \vec{c} = (2-a)i + 2j; \)

\[\vec{b} = (1-a)i - 6k \]

\[\vec{a} \vec{c} \vec{b} = 0 \Rightarrow (2 - a)(1 - a) = 0 \]

\[\Rightarrow a = 2, 1 \]

45. (a) Equation of lines \(\frac{x-b}{a} = \frac{y}{c} = \frac{z-d}{1} \)

\[\frac{x-b'}{a'} = \frac{y}{c'} = \frac{z-d'}{1} \]

Line are perpendicular \(\Rightarrow aa' + 1 + cc' = 0 \)

46. (d) Eq of PN:-

\[\frac{x+1}{1} = \frac{y-3}{-2} = \frac{z-4}{0} = \lambda \]

\[N(\lambda - 1, -2\lambda + 3 - 4) \]

It lies on \(x + y = 0\)

\[\Rightarrow \lambda - 1 + 4\lambda - 6 = 0 \]

\[\Rightarrow \lambda = 7/5 \]

\[N\left(\frac{2}{5}, \frac{1}{5}, 4\right) \]

N is mid point of PP'

\[\therefore \frac{a-4}{5}, \frac{b+3}{5}, \frac{r+4}{5} = 8 \]

\[\Rightarrow a = \frac{9}{5}, b = \frac{-13}{5}, r = 4 \]

\[\therefore \text{Image is} \left(\frac{9}{5}, \frac{-13}{5}, 4\right) \]

47. (b) Let the angle of line makes with the positive direction of z-axis is \(\alpha\) direction cosines of line with the +ve directions of x-axis, y-axis, and z-axis is \(l, m, n\) respectively.
52. (d) \[ \overrightarrow{a} \text{ lies in the plane of } \overrightarrow{b} \text{ and } \overrightarrow{c} \]
\[ \overrightarrow{a} \parallel \overrightarrow{b} + \lambda \overrightarrow{c} \]
\[ \Rightarrow \overrightarrow{a} + 2 \overrightarrow{j} + \beta \overrightarrow{k} = \overrightarrow{i} + \lambda (j + k) \]
\[ \Rightarrow \alpha = 1, \beta = \lambda \Rightarrow \alpha = 1, \beta = 1 \]

53. (d) Clearly \[ \overrightarrow{a} = -\frac{8}{7} \overrightarrow{c} \]
\[ \Rightarrow \overrightarrow{a} || \overrightarrow{c} \text{ and are opposite in direction} \]
\[ \therefore \text{ Angle between } \overrightarrow{a} \text{ and } \overrightarrow{c} \text{ is } \pi \]

54. (c) Equation of line through \((5, 1, a)\) and
\[ (3, b, 1) \text{ is } \frac{x - 5}{-2} = \frac{y - 1}{b - 1} = \frac{z - a}{1 - a} = \lambda \]
\[ \therefore \text{ Any point on this line is } \left[ -2\lambda + 5, (b - 1) \lambda + 1, 1 - \lambda + a \right] \]
It crosses \(yz\) plane where \(-2\lambda + 5 = 0\)
\[ \lambda = \frac{5}{2} \Rightarrow \left( 0, (b - 1) \frac{5}{2} + 1, (1 - \lambda) \frac{5}{2} + a \right) = \left( 0, \frac{17}{2}, -\frac{13}{2} \right) \]
\[ \Rightarrow (b - 1) \frac{5}{2} + 1 = \frac{17}{2} \text{ and } (1 - \lambda) \frac{5}{2} + a = -\frac{13}{2} \]
\[ \Rightarrow b = 4 \text{ and } a = 6 \]

55. (a) The two lines intersect if shortest distance between them is zero i.e.
\[ \frac{(\overrightarrow{a} - \overrightarrow{a_1}) \cdot \overrightarrow{b_1} \times \overrightarrow{b_2}}{|\overrightarrow{b_1} \times \overrightarrow{b_2}|} = 0 \Rightarrow (\overrightarrow{a} - \overrightarrow{a_1}) \cdot \overrightarrow{b_1} \times \overrightarrow{b_2} = 0 \]
where \[ \overrightarrow{a_1} = \overrightarrow{i} + 2\overrightarrow{j} + 3\overrightarrow{k}, \overrightarrow{b_1} = \overrightarrow{k} + 2\overrightarrow{j} + 3\overrightarrow{k} \]
\[ \overrightarrow{a_2} = 2\overrightarrow{i} + 3\overrightarrow{j} + \overrightarrow{k}, \overrightarrow{b_2} = 3\overrightarrow{i} + \overrightarrow{k} + 2\overrightarrow{k} \]
\[ \begin{vmatrix} 1 & 1 & -2 \\ 1 & 2 & 3 \\ x & 2 & -1 \end{vmatrix} = 0 \Rightarrow k = 2 \text{ and } a = 6 \]
\[ k = 2 \text{ is an integer, therefore } k = -5 \]

56. (a) \[ \text{ The line } \frac{x - 2}{3} = \frac{y - 1}{5} = \frac{z + 2}{2} \text{ lie in the plane } \]
\[ x + 3y - \alpha z + \beta = 0 \]
\[ \therefore \text{ Pr} (2, 1, -2) \text{ lies on the plane } \]
i.e. \[ 2 + 3 + 2\alpha + \beta = 0 \text{ or } 2\alpha + \beta + 5 = 0 \]
Also normal to plane will be perpendicular to line,
\[ \therefore \left[ 3 \times 1 \times 5 \times 2 \times (-\alpha) \right] = 0 \Rightarrow \alpha = -6 \]
From equation (i) then, \(\beta = 7 \)
\[ (\alpha, \beta) = (-6, 7) \]

57. (b) Let \(P(x_1, y_1, z_1)\) and \(Q(x_2, y_2, z_2)\) be the initial and final points of the vector whose projections on the three coordinate axes are 6, 3, 2
then
\[ x_2 - x_1 = 6; \quad y_2 - y_1 = -3; \quad z_2 - z_1 = 2 \]

So that direction ratios of \(PQ\) are 6, -3, 2
58. (d) \[3\vec{u}\cdot \vec{p} \cdot \vec{o} - [\vec{p} \cdot \vec{v} \cdot \vec{o} - [2\vec{v} \cdot \vec{q} \cdot \vec{p} = 0\]
\[\Rightarrow (3p^2 - pq + 2q^2)[\vec{u} \cdot \vec{v} \cdot \vec{o}] = 0\]
\[\Rightarrow 3p^2 - pq + 2q^2 = 0 \quad (\because [\vec{u} \cdot \vec{v} \cdot \vec{o} \neq 0)\]
\[\Rightarrow 2p^2 + p^2 - pq + \frac{q^2}{4} + \frac{7q^2}{4} = 0\]
\[\Rightarrow 2p^2 + \left(\frac{p - \frac{q}{2}}{2}\right)^2 + \frac{7}{4}q^2 = 0\]
\[\Rightarrow p = 0, q = 0, p = \frac{q}{2} \Rightarrow p = 0, q = 0\]
\[\therefore \text{Exactly one value of}\ (p, q)\]

59. (d) \[\vec{c} = \vec{b} \times \vec{a} \Rightarrow \vec{b} \cdot \vec{c} = \vec{b} \cdot (\vec{b} \times \vec{a}) \Rightarrow \vec{b} \cdot \vec{c} = 0\]
\[\Rightarrow (b_1\hat{i} + b_2\hat{j} + b_3\hat{k}) \cdot (\hat{i} - \hat{j} - \hat{k}) = 0,\]
where \(\vec{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}\)
\[b_1 - b_2 - b_3 = 0 \quad \text{...(i)}\]
and \(\vec{a} \cdot \vec{b} = 3 \Rightarrow (\hat{j} - \hat{k}) \cdot (b_1\hat{i} + b_2\hat{j} + b_3\hat{k}) = 3\]
\[\Rightarrow b_2 - b_3 = 3\]
From equation (i)
\[b_1 = b_2 + b_3 = (3 + b_3) + b_3 = 3 + 2b_3\]
\[\vec{b} = (3 + 2b_3)\hat{i} + (3 + b_3)\hat{j} + b_3\hat{k}\]

60. (d) Since, \(\vec{a}, \vec{b}\) and \(\vec{c}\) are mutually orthogonal
\[\therefore \vec{a} \cdot \vec{b} = 0, \quad \vec{b} \cdot \vec{c} = 0, \quad \vec{c} \cdot \vec{a} = 0\]
\[\Rightarrow 2\lambda + 4 + \mu = 0 \quad \text{...(i)}\]
\[\lambda - 1 + 2\mu = 0 \quad \text{...(ii)}\]
On solving (i) and (ii), we get \(\lambda = -3, \mu = 2\)

61. (a) \(A(1, 0, 7); B(1, 6, 3)\)
Mid-point of AB = \((2, 2, 5)\) lies on the plane.
and d.r’s of AB = \((2, -2, 2)\)
d.r’s of normal to plane = \((1, -1, 1)\).
Direction ratio of AB and normal to the plane are proportional therefore,
AB is perpendicular to the plane
\(\therefore\) A is image of B
Statement-2 is correct but it is not correct explanation.

62. (b) Direction cosines of the line:
\[\ell = \cos 45^\circ = \frac{1}{\sqrt{2}}, \quad m = \cos 120^\circ = -\frac{1}{2}, \quad n = \cos 0\]
where \(\theta\) is the angle, which line makes with positive z-axis.
Now \(\ell^2 + m^2 + n^2 = 1\)
\[\Rightarrow \frac{1}{2} + \frac{1}{4} + \cos^2 \theta = 1, \quad \cos^2 \theta = \frac{1}{4}\]
\[\Rightarrow \cos \theta = \frac{1}{2} \quad \text{(\(\theta\) being acute)} \Rightarrow \theta = \frac{\pi}{3}\]

63. (d) If \(\theta\) be the angle between the given line and plane, then
\[\sin \theta = \frac{1 \times 1 \times 2 \times 2 + 2 \times \lambda \times 3}{\sqrt{1^2 + 2^2 + \lambda^2} \times \sqrt{1^2 + 2^2 + 3^2}} = \frac{5 + 3\lambda}{\sqrt{14} \sqrt{5 + \lambda^2}}\]
But it is given that \(\theta = \cos^{-1} \frac{\sqrt{5}}{\sqrt{14}} \Rightarrow \sin \theta = \frac{3}{\sqrt{14}}\]
\[\therefore \frac{5 + 3\lambda}{\sqrt{14} \sqrt{5 + \lambda^2}} = \frac{3}{\sqrt{14}} \Rightarrow \lambda = \frac{2}{3}\]

64. (d) We have \(\vec{a} \cdot \vec{b} = 0, \quad \vec{a} \cdot \vec{a} = 1, \quad \vec{b} \cdot \vec{b} = 1\)
\[(2\vec{a} - \vec{b}) \cdot [(\vec{a} \times \vec{b}) \times (\vec{a} \times \vec{b})]\]
\[= (2\vec{a} - \vec{b}) \cdot [(\vec{a} \cdot \vec{b} + 2\vec{b}) \vec{b} - (\vec{b} \cdot \vec{a} + 2\vec{a}) \vec{a}]\]
\[= (2\vec{a} - \vec{b}) \cdot [\vec{b} - \vec{a}] = 4\vec{a} \cdot \vec{b} - \vec{b} \cdot \vec{b} - 4\vec{a} \cdot \vec{a} = -5\]

65. (c) \(\vec{a} \vec{b} \neq 0, \quad \vec{a} \vec{d} = 0\)
Now, \(\vec{b} \times \vec{c} = \vec{b} \times \vec{d}\)
\[\Rightarrow \vec{a} \vec{b} \vec{c} = \vec{a} \vec{b} \vec{d}\]
\[\Rightarrow (\vec{b} \vec{c}) \vec{b} - (\vec{a} \vec{b}) \vec{c} = (\vec{a} \vec{d}) \vec{b} - (\vec{a} \vec{b}) \vec{d}\]
\[\Rightarrow (\vec{a} \vec{b}) \vec{d} = -(\vec{a} \vec{c}) \vec{b} + (\vec{a} \vec{b}) \vec{c}\]
\[\vec{a} \vec{d} = \vec{c} - \left(\frac{\vec{a} \vec{c}}{\vec{a} \vec{b}}\right) \vec{b}\]

66. (a) The direction ratios of the line segment joining points A(1, 0, 7) and B(1, 6, 3) are 0, 6, -4.
The direction ratios of the given line are 1, 2, 3. Clearly \(1 \times 0 + 2 \times 6 + 3 \times (-4) = 0\)
So, the given line is perpendicular to line AB. Also, the mid point of A and B is (1, 3, 5) which lies on the given line.
So, the image of B in the given line is A, because the given line is the perpendicular bisector of line segment joining points A and B, But statement-2 is not a correct explanation for statement-1.

67. (c) Let \(\vec{c} = \vec{a} + 2\vec{b}\) and \(\vec{d} = 5\vec{a} - 4\vec{b}\)
Since \(\vec{c}\) and \(\vec{d}\) are perpendicular to each other
\[\therefore \vec{c} \vec{d} = 0 \Rightarrow \left(\vec{a} + 2\vec{b}\right) \left(5\vec{a} - 4\vec{b}\right) = 0\]
\[\Rightarrow 5 + 6\vec{a} \vec{b} - 8 = 0 \quad (\because \vec{a} \vec{a} = 1)\]
\[\Rightarrow 5 + \frac{6}{2} = 0 \Rightarrow 0 = \frac{\pi}{3}\]

68. (a) Given equation of a plane is \(x - 2y + 2z - 5 = 0\)
So, Equation of parallel plane is given by
\(x - 2y + 2z + d = 0\)
Now, it is given that distance from origin to the parallel plane is 1.
\[ \frac{d}{\sqrt{1^2 + 2^2 + 2^2}} = 1 \Rightarrow d = \pm 3 \]

So equation of required plane \( x - 2y + 2z = 0 \)

69. (c) Given lines in vector form are
\[ \vec{r} = (i - j + k) + \lambda(2i + 3j + 4k) \]
and \( \vec{r} = (3i + k) + \mu(i + 2j + k) \)
These will intersect if shortest distance between them = 0
i.e. \((a_2 - a_1) \cdot b_1 \times b_2 = 0\)
\[ \begin{vmatrix} 3 - 1 & k + 1 & -1 \\ 2 & 3 & 4 \\ 1 & 2 & 1 \end{vmatrix} = 0 \]
\[ 2(-5) - (k+1)(-2) - 1(1) = 0 \]
\[ \Rightarrow k = 9/2 \]

70. (b) Let \( ABCD \) be a parallelogram such that
\[ \overline{AB} = \vec{q}, \overline{AD} = \vec{p} \text{ and } \angle BAD \text{ be an acute angle.} \]
We have
\[ \overline{AX} = \left( \frac{\vec{p} \cdot \vec{q}}{|\vec{p}|} \right) \left( \frac{\vec{p}}{|\vec{p}|} \right) = \frac{\vec{p} \cdot \vec{q}}{|\vec{p}|^2} \vec{p} \]

Let \( \vec{r} = \overline{BX} = \overline{BA} + \overline{AX} = -\vec{q} + \frac{\vec{p} \cdot \vec{q}}{|\vec{p}|^2} \vec{p} \)

71. (e) \( 2x + y + 2z - 8 = 0 \) ...(Plane 1)
\( 2x + y + 2z + \frac{5}{2} = 0 \) ...(Plane 2)
Distance between Plane 1 and 2
\[ \left| \frac{-8 - \frac{5}{2}}{\sqrt{2^2 + 1^2 + 2^2}} \right| = \frac{-21}{6} = \frac{7}{2} \]

72. (e) Given lines will be coplanar
\[ \begin{vmatrix} 1 & -1 & 1 \\ 1 & 1 & -k \\ 1 & 2 & 1 \end{vmatrix} = 0 \]
\[ \Rightarrow -1(1 + 2k) - (1 + k^2) + 1(2 - k) = 0 \]
\[ \Rightarrow k = 0, 3 \]

73. (e) \( \because M \) is mid point of \( BC \)
\[ \Rightarrow \frac{\overline{AM}}{2} \overline{(AB + AC)} \]
\[ = 4i + j + 4k \]
Length of median \( AM \)

74. (c) \( A(1, 3, 4) \)
\[ \vec{p} \quad \vec{q} \]
\[ (a, b, c) \]
\[ \vec{r} = 3\vec{i} + \vec{j} - 5\vec{k} \]
\[ \Rightarrow \frac{a-1}{2} = \frac{b-3}{-1} = \frac{c-4}{1} = \lambda \text{ (let)} \]
\[ \Rightarrow a = 2\lambda + 1 \]
\[ b = 3 - \lambda \]
\[ c = 4 + \lambda \]
\[ P = \left( \frac{a + 1}{2}, \frac{b + 3}{2}, \frac{c + 4}{2} \right) \]
\[ = \left( \lambda + 1, \frac{6 - \lambda}{2}, \frac{\lambda + 8}{2} \right) \]
\[ \Rightarrow 2(\lambda + 1) - 6 - \lambda + \lambda + 8 = 3 = 0 \]
\[ 3\lambda + 6 = 0 \Rightarrow \lambda = -2 \]
a = -3, b = 5, c = 2

Required line is \[ \frac{x + 3}{3} = \frac{y - 5}{1} = \frac{z - 2}{-5} \]

75. (c) Given
\( l + m + n = 0 \) and \( l^2 = m^2 + n^2 \)
Now, \( (-m-n)^2 = m^2 + n^2 \)
\[ \Rightarrow mn = 0 \Rightarrow m = 0 \text{ or } n = 0 \]
If \( m = 0 \) then \( l = -n \)

We know \( l^2 + m^2 + n^2 = 1 \) \( \Rightarrow n = \pm \frac{1}{\sqrt{2}} \)

i.e. \( (l_1, m_1, n_1) = \left( -\frac{1}{\sqrt{2}}, 0, \frac{1}{\sqrt{2}} \right) \)

If \( n = 0 \) then \( l = -m \)
l^2 + m^2 + n^2 = 1 \( \Rightarrow 2m^2 = 1 \)
\[ \Rightarrow m = \pm \frac{1}{\sqrt{2}} \]

Let \( m = \frac{1}{\sqrt{2}} \) \( \Rightarrow l = -\frac{1}{\sqrt{2}} \) and \( n = 0 \)
\[ (l_2, m_2, n_2) = \left( -\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 0 \right) \]
\[ \Rightarrow \cos \theta = \frac{1}{2} \Rightarrow \theta = \frac{\pi}{3} \]
76. (b) L.H.S. = \((\vec{a} \times \vec{b}) \cdot [(\vec{b} \times \vec{c}) \times (\vec{c} \times \vec{a})] \)
\[= (\vec{a} \times \vec{b}) \cdot [(\vec{b} \times \vec{c}) \cdot \vec{c} - (\vec{b} \times \vec{c}) \cdot \vec{a}] \]
\[= (\vec{a} \times \vec{b}) \cdot [(\vec{b} \times \vec{c}) \cdot \vec{c}] \quad [\because \vec{b} \times \vec{c} \cdot \vec{c} = 0] \]
\[= [\vec{a} \cdot \vec{b} \cdot \vec{c}] \cdot [(\vec{a} \times \vec{b}) \cdot \vec{c}] = [\vec{a} \cdot \vec{b} \cdot \vec{c}]^2 \]
\[\vec{a} \times \vec{b} \cdot \vec{c} \times \vec{a} = [\vec{a} \cdot \vec{b} \cdot \vec{c}]^2 \]
So \(\lambda = 1\)

77. (c) \((\vec{a} \times \vec{b}) \times \vec{c} = \frac{1}{3} |\vec{b}| |\vec{c}| \vec{a} \Rightarrow -\vec{c} \times (\vec{a} \times \vec{b}) = \frac{1}{3} |\vec{b}| |\vec{c}| \vec{a}\)
\[\Rightarrow -\vec{c} \cdot \vec{b} \vec{a} + (\vec{c} \cdot \vec{a}) \vec{b} = \frac{1}{3} |\vec{b}| |\vec{c}| \vec{a}\]
\[\Rightarrow -|\vec{b}| |\vec{c}| \cos \theta \vec{a} + (\vec{c} \cdot \vec{a}) \vec{b} = \frac{1}{3} |\vec{b}| |\vec{c}| \vec{a}\]
\[\therefore \vec{a}, \vec{b}, \vec{c} \text{ are non collinear, the above equation is possible}
\]
only when
\[-\cos \theta = \frac{1}{3} \text{ and } \vec{c} \cdot \vec{a} = 0\]
\[\Rightarrow \cos \theta = -\frac{1}{3} \Rightarrow \sin \theta = \frac{2\sqrt{2}}{3} ; \theta \in \text{II quad}\]

78. (a) Equation of the plane containing the lines
\[2x - 5y + z = 3 \text{ and } x + y + 4z = 5 \text{ is} \]
\[2x - 5y + z - 3 + \lambda(x + y + 4z - 5) = 0 \]
\[\Rightarrow (2 + \lambda)x + (-5 + \lambda)y + (1 + 4\lambda)z + (-3 - 5\lambda) = 0 \quad \ldots (i) \]
Since the plane (i) parallel to the given plane \(x + 3y + 6z = 1\)
\[\therefore \frac{2 + \lambda}{1} = \frac{-5 + \lambda}{-3} = \frac{1 + 4\lambda}{6} \Rightarrow \lambda = -\frac{11}{2} \]
Hence equation of the required plane is
\[\left(2 - \frac{11}{2}\right)x + \left(-5 - \frac{11}{2}\right)y + \left(1 - \frac{44}{2}\right)z + \left(-3 + \frac{55}{2}\right) = 0 \]
\[\Rightarrow x + 3y + 6z = 7 \]

79. (b) General point on given line = \(P(3r + 2, 4r - 1, 12r + 2)\)
Point P must satisfy equation of plane
\[(3r + 2) - (4r - 1) + (12r + 2) = 16 \]
\[11r + 5 = 16 \]
\[r = 1 \]

80. (b) Line lies in the plane \(\Rightarrow (3, -2, -4) \text{ lie in the plane} \)
\[\Rightarrow 3\ell - 2m + 4 = 9 \text{ or } 3\ell - 2m = 5 \quad \ldots (1) \]
Also, \(\ell, m, -1 \text{ are dr's of line perpendicular to plane} \text{ and}
2, -1, 3 \text{ are dr's of line lying in the plane} \)
\[\Rightarrow 2\ell - m - 3 = 0 \text{ or } 2\ell - m = 3 \quad \ldots (2) \]
Solving (1) and (2) we get \(\ell = 1 \text{ and } m = -1\)
\[\Rightarrow \ell^2 + m^2 = 2 \]

81. (b) \[\vec{a} \times (\vec{b} \times \vec{c}) = \frac{\sqrt{3}}{2} (\vec{b} + \vec{c}) \]
\[\Rightarrow (\vec{a} \cdot \vec{c})\vec{b} - (\vec{a} \cdot \vec{b})\vec{c} = \frac{\sqrt{3}}{2} \vec{b} + \frac{\sqrt{3}}{2} \vec{c} \]
On comparing both sides
\[\vec{a} \cdot \vec{b} = -\frac{\sqrt{3}}{2} \Rightarrow \cos \theta = \frac{-\sqrt{3}}{2} \]
\[\therefore \vec{a} \text{ and } \vec{b} \text{ are unit vectors} \]
where \(\theta \) is the angle between \(\vec{a} \) and \(\vec{b}\)
\[\theta = \frac{5\pi}{6} \]

82. (d)

![Diagram](image)

**P(1, -5, 9)**
\[x = y = z \]
\[eq^a \text{ of PO : } \frac{x - 1}{1} = \frac{y + 5}{1} = \frac{z - 9}{1} = \lambda \]
\[\Rightarrow x = \lambda + 1; \ y = \lambda - 5; \ z = \lambda + 9. \]
Putting these in eq^a of plane :-
\[\lambda + 1 - 5 + \lambda + 9 = 5 \]
\[\Rightarrow \lambda = -10 \]
\[\Rightarrow O \text{ is } (-9, -15, -1) \]
\[\Rightarrow \text{ distance OP} = 10\sqrt{3}. \]

A. Fill in the Blanks

1. Let \( E_1 = \text{face 1 has turned up} \), \( E_2 = \text{face 1 or 2 has turned up} \).
   
   By the given data,
   \[ P(E_2) = 0.1 + 0.32 = 0.42, \quad P(E_1 \cap E_2) = P(E_1) = 0.1 \]
   
   Given that \( E_2 \) has happened and we have to find the probability of happening of \( E_1 \).

   \[ P(E_1 / E_2) = \frac{P(E_1 \cap E_2)}{P(E_2)} = \frac{0.1}{0.42} = \frac{10}{42} = \frac{5}{21}. \]

2. Given that \( P(A \cup B) = P(A \cap B) \)
   
   \[ P(A) + P(B) - P(A \cap B) = P(A \cap B) \]
   
   \[ \Rightarrow [P(A) - P(A \cap B)] + [P(B) - P(A \cap B)] = 0 \]
   
   But \( P(A) = P(A \cap B) \geq 0 \)

   \[ \Rightarrow P(A \cap B) = 0 \quad \text{and} \quad P(B) - P(A \cap B) = 0 \]

   \[ \therefore \quad \text{Sum of two non-negative no's can be zero only when these no's are zeros} \]

   \[ \Rightarrow P(A) = P(B) = P(A \cap B) \]

   which is the required relationship.

3. Let \( A \) be the event that max. number on the two chosen tickets in not more than 10, and \( B \) is the event that min. number on them is 5. We have to find \( P(B / A) \).

   We know that \( P(B / A) = \frac{P(B \cap A)}{P(A)} \)

   Total ways to select two tickets out of 100 = \( 100C_2 \).

   Number of ways favourable to \( A \)

   = number of ways of selecting any 2 numbers from 1 to 10

   = \( 10C_2 = 45 \)

   \( A \cap B \) contains one number 5 and other greater than 5 and \( \leq 10 \)

   So ways favourable to \( A \cap B \) = \( 5C_1 = 5 \)

   Therefore, \( P(A) = \frac{45}{100C_2} \quad \text{and} \quad P(B \cap A) = \frac{5}{100C_2} \)

   Thus, \( P(B / A) = \frac{5}{45} \cdot \frac{100C_2}{100C_2} = \frac{5}{45} = \frac{1}{9} \)

4. Let \( P(A) = \frac{1+3p}{3}, \quad P(B) = \frac{1-p}{4}, \quad P(C) = \frac{1-2p}{2} \)

   As \( A, B \) and \( C \) are three mutually exclusive events

   \[ \therefore \quad P(A) + P(B) + P(C) \leq 1 \]

   \[ \Rightarrow \quad \frac{1+3p}{3} + \frac{1-p}{4} + \frac{1-2p}{2} \leq 1 \]

   \[ \Rightarrow \quad 4+12p+3-3p+6-12p \leq 12 \]

   \[ \Rightarrow \quad 3p \geq 1 \quad \Rightarrow \quad p \geq 1/3 \quad \text{...}(i) \]

   Also, \( 0 \leq P(A) \leq 1 \)

   \[ \Rightarrow \quad 0 \leq 1+3p \leq 1 \]

   \[ \Rightarrow \quad 0 \leq 1+3p \leq 3 \]

   \[ \Rightarrow \quad \frac{1}{3} \leq p \leq \frac{2}{3} \quad \text{...}(ii) \]

5. There may be following cases:
   
   **Case I**: Red from \( A \) to \( B \) and red from \( B \) to \( A \) then prob. of drawing a red ball from \( A \) = \( \frac{6}{10} \times \frac{5}{11} = \frac{30}{110} = \frac{18}{110} \)

   **Case II**: Red from \( A \) to \( B \) and black from \( B \) to \( A \) then prob. of drawing a red ball from \( A \) = \( \frac{6}{10} \times \frac{5}{11} = \frac{30}{110} = \frac{18}{110} \)

   **Case III**: Black from \( A \) to \( B \) and red from \( B \) to \( A \) then prob. of drawing red ball from \( A \) = \( \frac{4}{10} \times \frac{7}{11} = \frac{28}{110} = \frac{14}{55} \)

   **Case IV**: Black from \( A \) to \( B \) and black from \( B \) to \( A \) then prob. of drawing red ball from \( A \) = \( \frac{4}{10} \times \frac{7}{11} = \frac{28}{110} = \frac{14}{55} \)

   \[ \therefore \quad \text{The required prob.} = \frac{18}{110} + \frac{18}{110} + \frac{56}{550} = \frac{144}{110} + \frac{56}{550} = \frac{90}{550} + \frac{56}{550} = \frac{32}{55} \]

6. Probability of getting a sum of \( 5 = \frac{4}{36} = \frac{1}{9} = P(A) \) as favourable cases are \{1, 4\}, \{4, 1\}, \{2, 3\}, \{3, 2\}.

   Similarly, favourable cases of getting a sum of 7 are \{1, 6\}, \{6, 1\}, \{2, 5\}, \{5, 2\}, \{3, 4\}, \{4, 3\}.

   \[ \therefore \quad \text{Prob. of getting a sum of 7} = \frac{6}{36} = \frac{1}{6} \]

   \[ \therefore \quad \text{Prob. of getting a sum of 5 or 7} = \frac{1}{6} + \frac{5}{18} \quad \text{[as events are mutually exclusive]} \]

   \[ \therefore \quad \text{Prob. of getting neither a sum of 5 nor of 7} = \frac{1}{9} - \frac{5}{18} = \frac{13}{18} = \frac{13}{18} \]

   Now we get a sum of 5 before a sum of 7 if either we get a sum of 5 in first chance or we get neither a sum of 5 nor of 7 in first chance and a sum of 5 in second chance and so on. Therefore the required prob. is

   \[ = \frac{1}{9} + \frac{13}{18} + \frac{13}{18} + \frac{13}{18} + \cdots = \frac{1}{9} + \frac{13}{18} + \cdots = \frac{1}{9} + \frac{13}{18} + \cdots = \frac{2}{5} \]

7. \( P(A \cup B) = 0.8 \)

   \[ \Rightarrow \quad P(A \cup B) = P(A) + P(B) - P(A \cap B) \]

\[ P(A \cup B) = P(A) + P(B) - P(A \cap B) \]

[As \( A \) and \( B \) are independent events]

\[ \Rightarrow 0.8 = 0.3 + P(B) - 0.3 \times P(B) \]

\[ \Rightarrow 0.5 = 0.7 P(B) \Rightarrow P(B) = \frac{5}{7} \]

8. For a binomial distribution, we know,

mean = np and variance = npq

\[ \therefore np = 2; \text{ npq = 1 } \Rightarrow q = 1/2 \]

\[ \Rightarrow p = 1/2 \text{ and } n = 4 \]

\[ \therefore P(X = 1) = P(X = 2) + P(X = 3) + P(X = 4) \]

\[ = 1 - P(X = 0) - P(X = 1) \]

\[ = 1 - 4 \binom{4}{0} \left( \frac{1}{2} \right)^0 \left( \frac{1}{2} \right)^4 - 4 \binom{4}{1} \left( \frac{1}{2} \right)^1 \left( \frac{1}{2} \right)^3 = 1 - \frac{1}{16} - \frac{4}{16} = \frac{11}{16} \]

9. Sample space = \{Y, Y, Y, R, R, B\} where \( Y \) stands for yellow colour, \( R \) for red and \( B \) for blue.

Prob. that the colours yellow, red and blue appear in the first second, and third tosses respectively

\[ = \frac{3 \times 2 \times 1}{6} = \frac{6}{36} \]

10. Given that \( P(A') = 0.3, P(B) = 0.4 \) and \( P(A \cap B') = 0.5 \)

then \( P[B/(A \cap B')] = \frac{P[B \cap (A \cap B')]}{P(A \cap B')} \)

\[ = \frac{P((B \cap A) \cup (B \cap B'))}{P(A \cap B')} = \frac{P(A \cap B)}{P(A) + P(B') - P(A \cap B')} \]

\[ = \frac{1 - P(A') + 1 - P(B')}{1 - P(A') + 1 - P(B')} \]

\[ = \frac{1 - 0.3 - 0.5}{1 - 0.3 + 1 - 0.4 - 0.5} = \frac{0.2}{0.8} = 0.25 \]

B. True / False

1. Let \( E \) be the event "No two S's occur together".

\( A, A', I, N \) can be arranged in \( \frac{4!}{2!} = 12 \) ways.

\(- A - A' - I - N \) - Creating 5 places for 4 S. Out of 5 places 4 can be selected in \( \binom{5}{4} = 5 \) ways.

\[ \therefore \text{No two S's occur together in } 12 \times 5 = 60 \text{ ways} \]

Total no. of arranging all letters of word 'assassin' = \( \frac{8!}{4!2!} = 840 \)

\[ \therefore \text{Req. prob. } = \frac{60}{840} = \frac{1}{14} \therefore \text{Statement is False}. \]

2. \( P(A \cup B) = P(A) + P(B) - P(A \cap B) \)

\[ = P(A) + P(B) - P(A) P(B) \]

\[ \therefore A \text{ and } B \text{ are independent events} \]

\[ = 0.2 + 0.3 - 0.2 \times 0.3 = 0.5 - 0.06 = 0.44 \neq 0.5 \]

\[ \therefore \text{The statement is false}. \]

C. MCQs with ONE Correct Answer

1. (d) The two events can happen simultaneously e.g., (2, 3)

\[ \therefore \text{not mutually exclusive}. \]

Also are not dependent on each other.

\[ P(A \cup B) = P(A) + P(B) - P(A \cap B) \]

\[ = 0.25 + 0.50 - 0.14 = 0.61 \]

\[ \therefore P(A' \cap B') = P((A \cup B)) = 1 - P(A \cup B) \]

\[ = 1 - 0.61 = 0.39 \]

3. (b) \( p = 0.4, n = 3, P(X = 1) = ? \Rightarrow q = 0.6 \)

\[ \therefore P(X \geq 1) = 1 - P(X = 0) = 1 - 3 \binom{3}{0} (0.4)^3 (0.6)^3 = 1 - 0.216 = 0.784 \]

4. (c) \[ P(\overline{A} \cup \overline{B}) = \frac{P(\overline{A} \cup \overline{B})}{P(B)} = \frac{P(A \cap B)}{P(B)} = 1 - P(A \cup B) \]

5. (c) \( n = 7 \)

Prob. of getting any no. out 1, 2, 3, ..., 9 is \( p = 9/15 \)

\[ \therefore q = 6/5 \]

\[ P(x = 7) = 7C_7 p^7 q^0 \quad \text{[Binomial distribution]} \]

\[ = \left( \frac{9}{15} \right)^7 = \left( \frac{3}{5} \right)^7 \]

6. (b) Favourable cases = 6; \{(1, 1, 1), (2, 2, 2), ... (6, 6, 6)\}

Total cases = \( 6 \times 6 \times 6 = 216 \therefore \text{Req. prob. } = \frac{6}{216} = \frac{1}{36} \]

7. (c) Prob. of getting a white ball in a single draw

\[ p = \frac{12}{24} = \frac{1}{2} \]

Prob. of getting a white ball 4th time in the 7th draw

\[ = P(\text{getting 3 W in 6 draws}) \times P(\text{getting W ball at 7th draw}) \]

\[ = \frac{6}{32} \times \frac{5}{32} = \frac{5}{32} \]

8. (d) Prob. of one coin showing head = \( p \)

\[ \therefore \text{Prob. of one coin showing tail } 1 - p \]

ATQ coin is tossed 100 times and prob. of 50 coins showing head = prob of 51 coins showing head.

Using binomial prob. distribution

\[ P(X = r) = \binom{r}{n} p^r q^{n-r} \]

we get, \( \binom{100}{50} p^{50} (1-p)^{50} = \binom{100}{51} p^{51} (1-p)^{49} \)

\[ \therefore \frac{1 - p}{p} = \frac{\binom{100}{50} p^{50} (1-p)^{50}}{\binom{100}{51} p^{51} (1-p)^{49}} \]

\[ = \frac{50!}{51!} \frac{51!}{50!} \]

\[ \Rightarrow 101 p = 51 \Rightarrow p = \frac{51}{101} \]

9. (b) \( P(\text{at least } 7 \text{ pts}) = P(\text{7 pts}) + P(\text{8 pts}) \)

\[ \therefore \text{At most 8 pts can be scored.} \]

Now 7 pts can be scored by scoring 2 pts in 3 matches and 1 pt. in one match, similarly 8 pts can be scored by scoring 2 pts in each of the 4 matches.

\[ \therefore \text{Req. prob. } = 4 \binom{3}{1} [P(2 \text{pts})]^3 P(1 \text{pt}) + [P(2 \text{pts})]^4 \]

\[ = 4 \times (0.5)^3 \times 0.05 + (0.5)^4 = 0.0250 + 0.0625 = 0.0875 \]

10. (a) The min. face value is not less than 2 and max. face value is not greater than 5 if we get any of the numbers 2, 3, 4, 5, while total possible out comes are 1, 2, 3, 4, 5 and 6.

\[ \therefore \text{In one thrown of die, prob. of getting any no.} \]

Out of 2, 3, 4 and 5 is \( \frac{4}{6} = \frac{2}{3} \)

If the die is rolled four times, then all these events being independent, the required prob. \( \left( \frac{2}{3} \right)^4 = \frac{16}{81} \)
12. \( b \) Given that \( P(\text{India wins}) = p = 1/2 \)
\( \therefore \) \( P(\text{India loses}) = p' = 1/2 \)
Out of 5 matches India’s second win occurs at third test
\( \Rightarrow \) India wins third test and simultaneously it has won one match from first two and lost the other.
\( \therefore \) Required prob. = \( P(LWW) + P(WLW) \)
\[ \frac{1}{2} \times \frac{1}{2} + \frac{1}{2} \times \frac{1}{2} = \frac{1}{4} \]

13. \( c \) Out of 6 vertices 3 can be chosen in \( ^6 C_3 \) ways.
\( \Delta \) will be equilateral if it is \( \Delta ACE \) or \( \Delta BDF \) (2 ways)
\[ \therefore \] Required prob. = \( \frac{2}{^6 C_3} = \frac{2}{20} = \frac{1}{10} \]

14. \( a \) We know that \( P(\text{exactly one of } A \text{ or } B \text{ occurs}) \)
\[ = P(A) + P(B) - 2P(A \cap B). \]
Therefore, \( P(A) + P(B) - 2P(A \cap B) = p \) \( \text{ ... (1)} \)
Similarly, \( P(B) + P(C) - 2P(B \cap C) = p \) \( \text{ ... (2)} \)
and \( P(C) + P(A) - 2P(C \cap A) = p \) \( \text{ ... (3)} \)
Adding (1), (2) and (3) we get
\[ 2[P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(C \cap A)] = 3p \]
\[ \Rightarrow P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(C \cap A) = \frac{3p}{2} \]
\( \text{ ... (4)} \)
We are also given that,
\[ P(A \cap B \cap C) = p^2 \] \( \text{ ... (5)} \)
Now, \( P(\text{at least one of } A, B \text{ and } C) \)
\[ = P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(C \cap A) - P(A \cap B \cap C) \]
\[ = \frac{3p}{2} + p^2 = \frac{3p + 2p^2}{2} \]

15. \( a \) We know that,
\( 7! = 7, 7^2 = 49, 7^3 = 343, 7^4 = 2401, 7^5 = 16807 \)
\( \therefore \) \( 7^k \) (where \( k \in \mathbb{Z} \)), results in a number whose unit’s digit is 7 or 9 or 3 or 1.
Now, \( 7^m + 7^n \) will be divisible by 5 if unit’s place digit of resulting number is 5 or 0 clearly it cannot be 5.
But it can be 0 if we consider values of \( m \) and \( n \) such that the sum of unit’s place digits become 0. And this can be done by choosing
\[ m = 1, 5, 9, \ldots \ 
\text{and correspondingly \( \text{ ... (25 options each)} \text{ ... (7 + 3 = 10)} \)
\[ n = 3, 7, 11, \ldots 99 \]
\[ \text{and \( \text{ ... (25 options each)} \text{ ... (9 + 1 = 10)} \)
\[ m = 2, 6, 10, \ldots \ldots \ 98 \]
\[ \text{and \( \text{ ... (25 options each)} \text{ ... (9 + 1 = 10)} \)
\[ n = 4, 8, 12, \ldots \ldots \ 100 \]
\( \text{Case 1: Thus } m \text{ can be chosen in 25 ways and } n \text{ can be chosen in 25 ways} \)
\( \text{Case II : } m \text{ can be chosen in 25 ways and } n \text{ can be chosen in 25 ways} \)
\( \therefore \) Total no. of selections of \( m, n \) so that \( 7^m + 7^n \) is divisible by \( 5 = (25 \times 25 \times 25 \times 25) \times 2 \)
Note we can interchange values of \( m \) and \( n \).
Also no. of total possible selections of \( m \) and \( n \) out of \( 100 = 100 \times 100 \)
\( \therefore \) Req. prob. = \( \frac{2(25 \times 25 \times 25 \times 25) \times 2}{100 \times 100} = \frac{1}{4} \)

16. \( d \) The minimum of two numbers will be less than 4 if at least one of the numbers is less than 4.
\( \therefore \) \( P(\text{at least one no. is } < 4) \)
\[ = 1 - P(\text{both the no’s are } \geq 4) \]
\[ = 1 - \frac{3 \times 2}{6 \times 5} = 1 - \frac{6}{30} = 1 - \frac{1}{5} = \frac{4}{5} \]

17. \( a \) Given that \( P(B) = 3/4, P(A \cap B \cap C) = 1/3 \)
\( P(\overline{A \cap B \cap C}) = 1/3 \)
\( \text{From venn diagram, we see} \)
\[ A \cap B \cap C = B - (A \cap B \cap C) - (\overline{A \cap B \cap C}) \]
\[ P(A \cap B \cap C) = P(B) - P(A \cap B \cap C) - P(\overline{A \cap B \cap C}) \]
\[ = \frac{3}{4} - \frac{1}{3} = \frac{9 - 4 - 4}{12} = \frac{1}{12} \]

18. \( d \) If a no. is to be divisible by both 2 and 3. It should be divisible by their L.C.M.
\( \therefore \) L.C.M. of (2 and 3) = 6
\( \therefore \) Numbers are = 6, 12, 18 \ldots 96.
Total numbers are = 16
\( \therefore \) Probability = \( \frac{16 \times ^{C_3}}{100 \times ^{C_3}} = \frac{4}{1155} \)

19. \( a \) In single throw of a dice, probability of getting 1 is \( \frac{1}{6} \)
and prob. of not getting 1 is \( \frac{5}{6} \).
Then getting 1 in even no. of chances = getting 1 in 2nd chance or in 4th chance or in 6th chance and so on
\( \therefore \) Req. Prob. = \( \frac{5}{6} \times \frac{1}{6} + \left( \frac{5}{6} \right)^3 \times \frac{1}{6} + \left( \frac{5}{6} \right)^5 \times \frac{1}{6} + \ldots \infty \)
\[ = \frac{5}{36} \left[ \frac{1}{1 - \frac{25}{36}} \right] = \frac{5}{36} \times \frac{36}{11} = \frac{5}{11} \]
20. (c) Let $E_1 =$ The Indian man is seated adjacent to his wife.  
$E_2 =$ Each American man is seated adjacent to his wife.

Then $P(E_1 / E_2) = \frac{P(E_1 \cap E_2)}{P(E_2)}$

Now $E_1 \cap E_2 =$ All men are seated adjacent to their wives.

∴ We can consider the 5 couples as single-single objects which can be arranged in a circle in $4! \times 2!$ ways. But for each couple, husband and wife can interchange their places in $2!$ ways.

∴ Number of ways when all men are seated adjacent to their wives $= 4! \times (2!)^5$

Also in all 10 persons can be seated in a circle in $9!$ ways.

∴ $P(E_1 \cap E_2) = \frac{4! \times (2!)^5}{9!}$

Similarly if each American man is seated adjacent to his wife, considering each American couple as single object and Indian woman and man as separate objects there are 6 different objects which can be arranged in a circle in $5!$ ways. Also for each American couple, husband and wife can interchange their places in $2!$ ways.

So the number of ways in which each American man is seated adjacent to his wife.

$$= 5! \times (2!)^4 \therefore P(E_2) = \frac{5! \times (2!)^4}{9!}$$

So $P(E_1 / E_2) = \frac{(4! \times (2!)^5)}{9!} = \frac{2}{5}$

21. (c) $P(E^c \cap F^c / G) = P(E \cup F)^c / G)

1 - P(E \cup F / G)

= 1 - P(E / G) - P(F / G) + P(E \cap F / G)

= 1 - P(E) - P(F) + O

∴ E, F, G are pairwise independent and $P(E \cap F \cap G) = 0$

⇒ $P(E)P(F) = 0$ as $P(G > 0) = P(E^c) - P(F)$

22. (d) We have $n(S) = 10$, $n(A) = 4$

Let $n(B) = x$ and $n(A \cap B) = y$

Then for A and B to be independent events

$P(A \cap B) = P(A)P(B)$

⇒ $y = \frac{4}{10} \times \frac{x}{10} \Rightarrow x = \frac{10}{2} \times \frac{y}{10}$

∴ $y$ can be 2 or 4 so that $x = 5$ or 10

∴ $n(B) = 5 \text{ or } 10$

23. (c) If $\omega$ is a complex cube root of unity then, we know that

$$\omega^{3m} + \omega^{3n+1} + \omega^{3p+2} = 0$$

where m, n, p are integers.

∴ $r_1, r_2, r_3$ should be of the form $3m, 3n + 1$ and $3p + 2$ taken in any order. As $r_1, r_2, r_3$ are the numbers obtained on die, these can take any value from 1 to 6.

∴ $m$ can take values 1 or 2, $n$ can take values 0 or 1, $p$ can take values 0 or 1

24. (c) Let $G =$ original signal is green ⇒ $P(G) = 4/5$

$E_1 =$ A receives the signal correctly $P(E_1) = 3/4$

$E_2 =$ B receives the signal correctly $P(E_2) = 3/4$

$E =$ Signal received by B is green.

Then E can happen in the following ways

<table>
<thead>
<tr>
<th>Original Signal</th>
<th>Received at A</th>
<th>Received at B</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>Red</td>
<td>Green</td>
</tr>
<tr>
<td>Red</td>
<td>Green</td>
<td>Green</td>
</tr>
<tr>
<td>Green</td>
<td>Green</td>
<td>Green</td>
</tr>
<tr>
<td>Green</td>
<td>Red</td>
<td>Green</td>
</tr>
</tbody>
</table>

∴ $P(E) = (P(G \cap E_1 \cap \bar{E}_2) + P(G \cap \bar{E}_1 \cap \bar{E}_2))$

$$+ P(G \cap E_1 \cap E_2) + P(G \cap \bar{E}_1 \cap \bar{E}_2)$$

$$= \frac{1}{5} \times \frac{3}{4} \times \frac{1}{4} + \frac{1}{5} \times \frac{3}{4} \times \frac{1}{4} + \frac{4}{5} \times \frac{3}{4} \times \frac{1}{4} + \frac{4}{5} \times \frac{1}{4} \times \frac{1}{4}$$

$$= \frac{3 + 3 + 3 + 1}{80} = \frac{46}{80} = \frac{23}{40}$$

∴ $P(G / E) = \frac{P(G \cap E)}{P(E)} = \frac{P(G \cap E_1 \cap E_2) + P(G \cap \bar{E}_1 \cap \bar{E}_2)}{P(E)}$

$$= \frac{4 \times \frac{3}{4} \times \frac{2}{4} + \frac{4}{5} \times \frac{1}{4} \times \frac{1}{4}}{23/40} = \frac{40/80}{23/40} = \frac{20}{23}$$

25. (a) $D_4$ can show a number appearing on one of $D_1, D_2,$ and $D_3$ in the following cases.

Case I : $D_4$ shows a number which is shown by only one of $D_1, D_2,$ and $D_3$.

$D_4$ shows a number in $6C_1$ ways. One out of $D_1, D_2,$ and $D_3$ can be selected in $3C_1$ ways.

The selected die shows the same number as on $D_4$ in one way and rest two dice show the different number in 5 ways each.

∴ Number of ways to happen case I

$$= 6C_1 \times 3C_1 \times 1 \times 5 \times 5 = 450$$

Case II : $D_4$ shows a number which is shown by only two of $D_1, D_2,$ and $D_3$.

As discussed in case I, it can happen in the following number of ways

$$= 6C_1 \times 3C_2 \times 1 \times 1 \times 5 = 90$$

Case III : $D_4$ shows a number which is shown by all three dice $D_1, D_2,$ and $D_3$.

Number of ways it can be done

$$= 6C_1 \times 3C_3 \times 1 \times 1 \times 1 = 6$$

∴ Total number of favourable ways $= 450 + 90 + 6 = 546$

Also total ways $= 6 \times 6 \times 6 \times 6$

∴ Required Probability $= \frac{546}{6 \times 6 \times 6 \times 6} = \frac{91}{216}$
26. (a) According to given condition, we can have the following cases
   (I) GGBBBB  (II) BGGBB
   (III) GGBBB  (IV) BGBGB
   (V) GBGBB
   i.e., the two girls can occupy two of the first three places (case I, II, III) or second and fourth (case IV) or first and fourth (case V) places.
   Thus, the total of the three cases are: 3 \times 2! \times 3! + 2 \times 2! \times 3! = 60
   Total ways in which 5 persons can be seated is 5! = 120
   \[ \frac{60}{120} = \frac{1}{2} \]
   \[ P(T_1) = \frac{20}{100}, \quad P(T_2) = \frac{80}{100} \]
   \[ P(D) = \frac{7}{100} \]
   Let \[ P\left(\frac{D}{T_2}\right) = x \]
   \[ P\left(\frac{D}{T_1}\right) = 10x \]

27. (c) \[ P(T_1) = \frac{20}{100}, \quad P(T_2) = \frac{80}{100}, \quad P(D) = \frac{7}{100} \]
   Let \[ P\left(\frac{D}{T_2}\right) = x \]
   Then \[ P\left(\frac{D}{T_1}\right) = 10x \]
   Also, \[ P(D) = P(T_1) P\left(\frac{D}{T_1}\right) + P(T_2) P\left(\frac{D}{T_2}\right) \]
   \[ \Rightarrow 7 = \frac{20}{100} \times 10x + \frac{80}{100} \times x \]
   \[ \Rightarrow \frac{7}{280} = x \] or \[ x = \frac{1}{40} \]
   \[ P\left(\frac{D}{T_1}\right) = \frac{10}{40} \quad \text{and} \quad P\left(\frac{D}{T_2}\right) = \frac{1}{40} \]
   \[ \Rightarrow P\left(\frac{D}{T_1}\right) = \frac{30}{40} \quad \text{and} \quad P\left(\frac{D}{T_2}\right) = \frac{39}{40} \]

3. (c) If \[ P(A \sim B) = 0.6 \quad \text{and} \quad P(A \sim B) = 0.2 \]
   Then, \[ P\left(\frac{\bar{A}}{B}\right) + P\left(\frac{\bar{B}}{A}\right) = 1 - P(A) + 1 - P(B) \]
   \[ = 2 - P(A) - P(B) - P(A \cap B) \]
   \[ = 2 - P(A) - P(B) - [P(A \cap B) + P(A \sim B)] \]
   \[ = 2 - [0.6 + 0.2] = 0.2 \]

D. MCQs with ONE or MORE THAN ONE Correct

1. (a, c, d) Given that M and N are any two events. To check the probability that exactly one of them occurs. We check all the options one by one.

   (a) \[ P(M) + P(N) - 2P(M \cap N) \]
   \[ = P(E) - P(E \cap F) \]
   \[ = 1 - P(E) - P(F) \]

2. (c) Let \[ A, B, C \] be the events that the student passes test I, II, III respectively.
   Then, \[ P(A) = p; \quad P(B) = q; \quad P(C) = \frac{1}{2} \]

3. (c) If \[ P(A \sim B) = 0.6 \quad \text{and} \quad P(A \sim B) = 0.2 \]
   \[ \Rightarrow P\left(\frac{\bar{A}}{B}\right) + P\left(\frac{\bar{B}}{A}\right) = 1 - P(A) + 1 - P(B) \]
   \[ \Rightarrow \quad P\left(\frac{\bar{A}}{B}\right) + P\left(\frac{\bar{B}}{A}\right) = 1 \]

4. (a, b, c) We know that,
   \[ P(A \sim B) = P(A) + P(B) - P(A \cap B) \quad \ldots (1) \]
   Also, \[ P(A \cap B) \leq 1 \]
   \[ \Rightarrow -P(A \cap B) \geq -1 \quad \ldots (2) \]
   \[ \Rightarrow P(A \cap B) \geq P(A) + P(B) - 1 \quad \quad \text{[Using (1) and (2)]} \]
   \[ \Rightarrow \text{a is true. Again} \quad P(A \cap B) \geq 0 \]
   \[ \Rightarrow -P(A \sim B) \leq 0 \quad \ldots (3) \]
   \[ \Rightarrow P(A \cap B) \leq P(A) + P(B) \quad \quad \text{[Using (1) and (3)]} \]
   \[ \Rightarrow \text{b is also correct.} \]
   \[ \text{From (1) (c) is true and (d) is not correct.} \]

5. (b, c, d) Since \[ E \text{ and } F \] are independent events,
   \[ P(E \cap F) = P(E) \cdot P(F) \quad \ldots (1) \]
   \[ \Rightarrow P(E \cap F) = P(E) \cdot P(F) \quad \text{[Using (1)]} \]
   \[ = P(E) \cdot [1 - P(F)] = P(E) \cdot P(F^c) \]
   \[ \Rightarrow E^c \text{ and } F^c \text{ are independent.} \]
   \[ \Rightarrow P(E^c \cap F^c) = P(E^c) \cdot P(F^c) = 1 - P(E \sim F) \]
   \[ = 1 - P(E) - P(F) + P(E \cap F) \]
   \[ = (1 - P(E))(1 - P(F)) = P(E)^c \cdot P(F)^c \]
   \[ \Rightarrow E^c \text{ and } F^c \text{ are independent.} \]
   \[ \Rightarrow P(E^c \cap F^c) = P(E^c) \cdot P(F^c) \]
   \[ = P(F)(P(E) + P(E^c)) \]
   \[ = P(F)(P(E) + P(E^c)) \]
   \[ = P(F) \]
   \[ = P(F) \]
6. \( \text{For any two events } A \text{ and } B \)

\[
(a) \quad P(A/B) = \frac{P(A \cap B)}{P(B)}
\]

Now we know \( P(A \cup B) \leq 1 \)

\[
P(A) + P(B) - P(A \cap B) \leq 1
\]

\[
\Rightarrow P(A \cap B) \geq P(A) + P(B) - 1
\]

\[
\Rightarrow \frac{P(A \cap B)}{P(B)} \geq \frac{P(A) + P(B) - 1}{P(B)} \quad \text{[As } P(B) \neq 0] \quad \therefore (a) \text{ is correct statement.}
\]

(b) \( \quad \text{is incorrect statement.} \)

(c) \( \quad P(A \cup B) = P(A) + P(B) - P(A \cap B) \)

\[
= 1 - P(\bar{A}) + 1 - P(\bar{B}) - P(A \cap B)
\]

\[
\quad \text{[} A \text{ & } B \text{ are independent events]} \]

\[
= 2 - P(\bar{A}) - P(\bar{B}) - [1 - P(\bar{A})][1 - P(\bar{B})]
\]

\[
= 2 - P(\bar{A}) - P(\bar{B}) - 1 + P(\bar{A}) + P(\bar{B}) - P(\bar{A})P(\bar{B})
\]

\[
= 1 - P(\bar{A})P(\bar{B}) \quad \therefore (c) \text{ is the correct statement.}
\]

(d) \( \quad \text{For disjoint events } P(A \cup B) = P(A) + P(B) \)

\[
\therefore (d) \text{ is the incorrect statement.}
\]

7. \( \text{(a, d) Let } P(E) = x \text{ and } P(F) = y \)

\[
\text{ATQ, } P(E \cap F) = \frac{1}{12}
\]

As \( E \) and \( F \) are independent events

\[
\Rightarrow \frac{1}{12} = xy \quad \Rightarrow xy = \frac{1}{12} \quad \text{(1)}
\]

Also \( P(\bar{E} \cap \bar{F}) = P(\bar{E})P(\bar{F}) = 1 - P(E \cup F) \)

\[
\Rightarrow \frac{1}{2} = 1 - [P(E) + P(F) - P(E)P(F)]
\]

\[
x + y - xy = \frac{1}{2} \Rightarrow x + y = \frac{7}{12} \quad \text{(2)}
\]

Solving (1) and (2) we get

either \( x = \frac{1}{3} \) and \( y = \frac{1}{4} \) or \( x = \frac{1}{4} \) and \( y = \frac{1}{3} \)

\( \therefore (a) \) and \( (d) \) are the correct options.

8. \( \text{(c, d) } P(A \cup B) = 1 - P(\bar{A} \cup \bar{B}) \)

\[
= 1 - [P(A) + P(B) - P(A \cap B)]
\]

\[
= 1 - P(A) - P(B) + P(A)P(B)
\]

Also \( P(A \cup B) = P(A) + P(B) - P(A)P(B) \)

\[
\Rightarrow P(A \cup B) = P(A) + P(B)
\]

\[
\therefore P(A/B) = \frac{P(A \cap B)}{P(B)} = \frac{P(A)P(B)}{P(B)} = P(A)
\]

9. \( \text{(a) } P(2 \text{ white and 1 black}) \)

\[
= P(W_1 \cap W_2 \cap B_3) + P(W_1 \cap W_3 \cap B_2) + P(W_2 \cap W_3 \cap B_1)
\]

\[
= P(W_1)P(W_2)P(B_3) + P(W_1)P(W_3)P(B_2) + P(W_2)P(W_3)P(B_1)
\]

\[
= \frac{3}{4} \cdot \frac{3}{4} \cdot \frac{1}{4} + \frac{3}{4} \cdot \frac{1}{4} \cdot \frac{2}{4} + \frac{1}{4} \cdot \frac{1}{4} \cdot \frac{1}{4} = \frac{1}{32} \quad (9 + 3 + 1) = \frac{13}{32}
\]

\[
10. \text{(a, d) We have,}
\]

\[
P(E/F) + P(\bar{E}/F) = P(E \cap F) + P(\bar{E} \cap F)
\]

\[
\frac{P(E \cap F)}{P(F)} + \frac{P(\bar{E} \cap F)}{P(F)} = \frac{P(F)}{P(F)} = 1
\]

\( \therefore (a) \text{ holds.} \)

Also

\[
P(E/F) + P(E/\bar{F}) = \frac{P(E \cap F)}{P(F)} + \frac{P(E \cap \bar{F})}{P(F)}
\]

\[
= \frac{P(E \cap F)[1 - P(F)] + P(F)[P(E \cap \bar{F})]}{P(F)P(\bar{F})}
\]

\[
= \frac{P(E \cap \bar{F}) + P(F)[P(E \cap \bar{F})] - P(E \cap \bar{F})}{P(F)P(\bar{F})} \neq 1
\]

\( \therefore (b) \text{ does not hold. Similarly we can show that (c) does not hold but (d) holds.} \)

11. \( \text{(b) The probability that only two tests are needed} \)

\( = \) (probability that the second machine tested is faulty given the first machine tested is faulty) = \( \frac{2}{4} \times \frac{1}{3} = \frac{1}{6} \)

12. \( \text{(d) Given that } P(E) \leq P(F) \text{ and } P(E \cap F) > 0. \text{ It doesn’t necessarily mean that } E \text{ is the subset of } F. \)

\( \therefore \text{ The choices (a), (b), (c) do not hold in general.} \)

Hence (d) is the right choice here.

13. \( \text{(a) The event that the fifth toss results in a head is independent of the event that the first four tosses result in tails.} \)

\( \therefore \text{ Probability of the required event } = \frac{1}{2}. \)

14. \( \text{(b) The no. of ways of placing 3 black balls without any restriction is } {10 \choose 3}. \text{ Now the no. of ways in which no two black balls put together is equal to the no of ways of choosing 3 places marked out of eight places.} \)

\(-W-W-W-W-W-W-W-W-
\)

This can be done in \( 8 \choose 3 \) ways. Thus, probability of the required event = \( \frac{8 \times 7 \times 6}{10 \times 9 \times 8} = \frac{7}{15}. \)

\( \therefore (b) \text{ is the correct option.} \)

15. \( \text{(b, c) According to the problem,} \)

\[
m + p + c - mp - mc - pc + mp = \frac{3}{4} \quad \text{(1)}
\]

\[
mp(1 - c) + mc(1 - p) + pc(1 - m) = \frac{2}{5} \quad \text{(2)}
\]

or \( mp + mc + pc = 3mpc = \frac{2}{5} \text{ \quad } \text{(2)} \)

\[
\text{Also } mp + mc + pc - 2mpc = \frac{1}{2} \quad \text{(3)}
\]

\( \text{Solving (2) and (3) } \Rightarrow mpc = \frac{1}{2} - \frac{2}{5} = \frac{1}{10} \)

\[
\therefore mp + mc + pc = \frac{2}{5} + \frac{3}{10} = \frac{7}{10}
\]

\[
m + p + c = \frac{3}{4} + \frac{7}{10} + \frac{1}{20} = \frac{15 + 14 - 2}{20} = \frac{27}{20} \]
16. (a, d) ∴ E and F are independent events
\[ \therefore P(E \cap F) = P(E) \cdot P(F) \tag{1} \]

Given that \( P(E \cap \bar{F}) + P(\bar{E} \cap F) = \frac{11}{25} \)

\[ \Rightarrow P(E) P(\bar{F}) + P(\bar{E}) P(F) = \frac{11}{25} \]

\[ \Rightarrow P(E)(1 - P(F)) + (1 - P(E))P(F) = \frac{11}{25} \]

\[ \Rightarrow P(E) - P(E)P(F) + P(F) - P(E)P(F) = \frac{11}{25} \]

\[ \Rightarrow P(E) + P(F) - 2P(E)P(F) = \frac{11}{25} \]

\[ \Rightarrow \frac{2}{25} \Rightarrow P(\bar{E})P(\bar{F}) = \frac{2}{25} \]

\[ \Rightarrow 1 - P(E)P(F) + P(E)P(F) = \frac{2}{25} \]

Adding equation (2) and (3) we get
\[ \Rightarrow 1 - P(E)P(F) + P(F) = \frac{2}{25} \]

Using the result in equation (2) we get
\[ P(E) + P(F) = \frac{35}{25} \]

Solving (4) and (5) we get
\[ P(E) = \frac{3}{5} \text{ and } P(F) = \frac{4}{5} \text{ or } P(E) = \frac{4}{5} \text{ and } P(F) = \frac{3}{5} \]

∴ (a) and (d) are the correct options.

17. (b, d)

We have \( P(X_1) = \frac{1}{2}, \quad P(X_2) = \frac{1}{4}, \quad P(X_3) = \frac{1}{4} \)

\( P(X) = P(\text{at least 2 engines are functioning}) \)

\[ = P(X_1 \cap X_2 \cap X_3) + P(X_1 \cap X_2^C \cap X_3) + P(X_1^C \cap X_2 \cap X_3) \]

\[ \quad + P(X_1^C \cap X_2^C \cap X_3) + P(X_1 \cap X_2 \cap X_3) \]

\[ = \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} + \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} + \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} + \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} + \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} \]

(a) \( P(X_1^C / X) = \frac{P(X_1^C \cap X)}{P(X)} \)

\[ = \frac{P(X_1^C \cap X_2 \cap X_3) + P(X_1 \cap X_2^C \cap X_3) + P(X_1 \cap X_2 \cap X_3^C)}{P(X)} \]

\[ \frac{1}{2} \times \frac{1}{4} \times \frac{1}{4} = \frac{1}{8} \]

(b) \( P[(\text{Exactly two engines are functioning}) / X] \)

\[ = \frac{P(X_1^C \cap X_2 \cap X_3) + P(X_1 \cap X_2^C \cap X_3) + P(X_1 \cap X_2 \cap X_3^C)}{P(X)} \]

\[ = \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} + \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} + \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} + \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} + \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} \]

\[ = \frac{1}{8} \]

18. (a, b)

We know \( P(Y/X) = \frac{P(X \cap Y)}{P(Y)} \Rightarrow \frac{1}{2} = \frac{1}{6} / P(Y) \Rightarrow P(Y) = \frac{1}{3} \)

Similarly, \( P(Y/X) = \frac{P(Y \cap X)}{P(X)} \Rightarrow \frac{1}{3} = \frac{1}{6} / P(X) \Rightarrow P(X) = \frac{1}{2} \)

Also \( P(X \cap Y) = P(X)P(Y) \)

∴ \( X \) and \( Y \) are independent events.

∴ \( X^C \) and \( Y \) are also independent events.

∴ \( P(X^C \cap Y) = P(X)^C \cap P(Y) = \frac{1}{2} \times \frac{1}{3} = \frac{1}{6} \)

19. (a)

\( P(\text{at least one of them solves the problem} \}

\[ = 1 - P(\text{none of them solves it}) \]

\[ = 1 - \frac{1}{2} \times \frac{1}{4} \times \frac{1}{4} \times \frac{1}{4} = \frac{235}{256} \]

E. Subjective Problems

1. To draw 2 black, 4 white and 3 red balls in order is same as arranging two black balls at first 2 places, 4 white at next 4 places, (3rd to 6th place) and 3 red at still next 3 places (7th to 9th place), i.e., \( B_1B_2, W_1W_2W_3W_4W_5, R_1R_2R_3 \), which can be done in \( 2! \times 4! \times 3! \) ways. And total ways of arranging all \( 2 + 4 + 3 = 9 \) balls is \( 9! \)

∴ Required probability = \( \frac{2! \times 4! \times 3!}{9!} = \frac{1}{1260} \)

2. (i)

6 boys and 6 girls sit in a row randomly.

Total ways of their seating = 12!

No. of ways in which all the 6 girls sit together = \( 6! \times 7! \)

(considering all 6 girls as one person)
Probability of all girls sitting together

\[ \frac{6! \times 6!}{720} = \frac{6! \times 6!}{12!} = \frac{12 	imes 11 	imes 10 \times 9 \times 8}{132} \]

(ii) Staring with boy, boys can sit in 6! ways leaving one place between every two boys and one a last.
\[ B_B_B_B_B_B \]
These left over places can be occupied by girls in 6! ways.
\[ . \text{ If we start with boys, no. of ways of seating boys and girls alternately} = 6! \times 6! \]
In the similar manner, if we start with girl, no. of ways of seating boys and girls alternately
\[ = 6! \times 6! \]
Thus total ways of alternate seating arrangements
\[ = 6! \times 6! + 6! \times 6! \]
\[ = 2 \times 6! \times 6! \]
\[ . \text{ Probability of making alternate seating arrangement for 6 boys and 6 girls} \]
\[ = \frac{2 \times 6! \times 6!}{12!} = \frac{2 \times 720}{12 \times 11 \times 10 \times 9 \times 8 \times 7} = \frac{1}{462} \]

3. (a) Let us define the events as:
\[ E_1 = \text{First shot hits the target plane,} \]
\[ E_2 = \text{Second shot hits the target plane} \]
\[ E_3 = \text{Third shot hits the target plane,} \]
\[ E_4 = \text{Fourth shot hits the target plane} \]
Then E_2 \cap E_3 \cap E_4 = \text{None of the shots hits the plane}
\[ \Rightarrow P(\overline{E}_1) = 1 - 0.4 = 0.6; P(\overline{E}_2) = 1 - 0.3 = 0.7 \]
\[ P(\overline{E}_3) = 1 - 0.2 = 0.8; P(\overline{E}_4) = 1 - 0.1 = 0.9 \]
(where \( \overline{E}_i \) denotes not happening of \( E_i \))

Now the gun hits the plane if at least one of the four shots hit the plane.
Also, \( \overline{P} \) (at least one shot hits the plane).
\[ = 1 - P \] (none of the shots hits the plane)
\[ = 1 - P(\overline{E}_1 \cap \overline{E}_2 \cap \overline{E}_3 \cap \overline{E}_4) \]
\[ = 1 - P(\overline{E}_1) \cdot P(\overline{E}_2) \cdot P(\overline{E}_3) \cdot P(\overline{E}_4) \]
[Using multiplication thm for independent events]
\[ = 1 - 0.6 \times 0.7 \times 0.8 \times 0.9 = 0.3024 = 0.6976 \]

4. Let \( A \) denote the event that the candidate is selected and \( B \) the event that \( B \) is selected.
It is given that
\[ P(A) = 0.5 \quad \text{... (1)} \]
\[ P(A \cap B) \leq 0.3 \quad \text{... (2)} \]
Now, \( P(A) + P(B) - P(A \cap B) = P(A \cup B) \leq 1 \)
or \[ 0.5 + P(B) - P(A \cap B) \leq 1 \] [Using (1)]
or \[ P(B) \leq 0.5 + P(A \cap B) \leq 0.5 + 0.3 \] [Using (2)]
or \[ P(B) \leq 0.8 \ldots P(B) \text{ cannot be 0.9} \]

5. We must have one ace in \( n - 1 \) attempts and one ace in the nth attempt. The probability of drawing one ace in first
\[ (n - 1) \text{ attempts is } \frac{4 \times 48}{52} \text{ and other one ace in the} \]
\[ \text{nth attempt is, } \frac{3 \times 51}{52 - (n - 1)} = \frac{3}{53 - n} \]
Hence the required probability,

\[ = \frac{4.48!}{(n - 1)!} \times \frac{(53 - n)}{52!} = \frac{3}{53 - n} \]

6. Given that
\[ P(A) = 0.3, P(B) = 0.4, P(C) = 0.8 \]
\[ P(AB) = 0.08, P(AC) = 0.28, P(ABC) = 0.09 \]
\[ P(A \cup B \cup C) \geq 0.75 \]
To find \( P(BC) = x \) (say)
Now we know,
\[ P(A \cup B \cup C) = P(A) + P(B) + P(C) \]
\[ - P(AB) - P(BC) - P(CA) + P(ABC) \]
\[ \Rightarrow P(A \cup B \cup C) = 0.3 + 0.4 + 0.8 - 0.08 - x = 1.23 - x \]
Also we have,
\[ P(A \cup B \cup C) \geq 0.75 \text{ and } P(A \cup B \cup C) \leq 1 \]
\[ \Rightarrow 0.75 \leq 1.23 - x \leq 1 \]
\[ \Rightarrow 0.23 \leq x \leq 0.48 \]

7. Let \( P(A) \) denotes the prob. of people reading newspaper \( A \) and \( P(B) \) that of people reading newspaper \( B \)
Then,
\[ P(A) = \frac{25}{100} = 0.25 \]
\[ P(B) = \frac{20}{100} = 0.20, \quad P(AB) = \frac{8}{100} = 0.08 \]
Prob. of people reading the newspaper \( A \) but not \( B \) is \( P(AB^c) = P(A) - P(AB) = 0.25 - 0.08 = 0.17 \)
Similarly, \( P(A^cB) = P(B) - P(AB) = 0.20 - 0.08 = 0.12 \)
Let \( E \) be the event that a person reads an advertisement.

Therefore, ATQ, \( P(E / AB) = \frac{30}{100}, \quad P(E / A^cB) = \frac{40}{100} \)
\[ P(E / AB) = \frac{50}{100} \]
\[ . \text{ By total prob. theorem (as } AB^c, A^cB \text{ and } AB \text{ are mutually exclusive)} \]
\[ P(E) = P(E / AB)P(AB) + P(E / A^cB)P(A^cB) + P(E / AB) \cdot P(AB) \]
\[ = \frac{30}{100} \times 0.17 + \frac{40}{100} \times 0.12 + \frac{50}{100} \times 0.08 \]
\[ = 0.051 + 0.048 + 0.04 = 0.139. \]
Thus the population that reads an advertisement is 13.9%.

8. The total number of ways of ticking the answers in any one attempt \( = 2^4 - 1 = 15 \).
The student is taking chance at ticking the correct answer. It is reasonable to assume that in order to derive maximum benefit, the three solutions which he submit must be all different.
\[ . \quad n = \text{total no. of ways} = 15C_3 \]
\[ m = \text{the no. of ways in which the correct solution is excluded} = 14C_3 \]
Hence the required probability \( = 1 - \frac{14C_3}{15C_3} = 1 - \frac{4}{5} = \frac{1}{5} \)

9. Let \( A_1 \) be the event that the lot contains 2 defective articles and \( A_2 \) the event that the lot contains 3 defective articles. Also let \( A \) be the event that the testing procedure ends at the twelfth testing. Then according to the question:
13. Let \( A = \{ a_1, a_2, a_3, \ldots, a_6 \} \)

For each \( a_i \), \( 1 \leq i \leq n \), there arise 4 cases

(i) \( a_i \in P \) and \( a_i \in Q \) (ii) \( a_i \notin P \) and \( a_i \in Q \)

(iii) \( a_i \in P \) and \( a_i \notin Q \) (iv) \( a_i \notin P \) and \( a_i \notin Q \)

\[ \therefore \] Total no. of ways of choosing \( P \) and \( Q \) is \( 4^n \). Here case (i) is not favourable as \( P \cap Q = \phi \)

\[ \therefore \] For each element there are 3 favourable cases and hence total no. of favourable cases is \( 3^n \).

Hence prob. \( (P \cap Q = \phi) = \frac{3^n}{4^n} = \left( \frac{3}{4} \right)^n \).

14. Let us define the events:

\( A_1 = \) the examinee guesses the answer,

\( A_2 = \) the examinee copies the answer

\( A_3 = \) the examinee knows the answer

\( A = \) the examinee answers correctly.

Then, \( P(A_1) = \frac{1}{3}; \ P(A_2) = \frac{1}{6} \)

As any one happens out of \( A_1, A_2, A_3 \), these are mutually exclusive and exhaustive events.

\[ P(A_1) + P(A_2) + P(A_3) = 1 \]

\[ \Rightarrow P(A_1) = 1 - \frac{1}{3} \times \frac{1}{6} \times \frac{6 - 2 - 1}{6} = \frac{3}{6} = \frac{1}{2} \]

Also we have, \( P(A/A_1) = \frac{1}{4} \)

[\( \therefore \) out of 4 choices only one is correct] \( P(A/A_2) = \frac{1}{8} \)

(given) \( P(A/A_3) = 1 \)

[If examinee knows the ans., it is correct. i.e. true event]

To find \( P(A/A) / (A) = \)

\[ P(A/A_1)P(A_1) + P(A/A_2)P(A_2) + P(A/A_3)P(A_3) \]

\[ = \frac{1}{2} \times \frac{1}{3} + \frac{1}{2} \times \frac{1}{6} \times \frac{48}{29} = \frac{24}{29} \]

15. Let \( X = \) defective and \( Y = \) non defective. Then all possible outcomes are \( \{XX, XY, YX, YY\} \)

Also \( P(XX) = \frac{50}{100} \times \frac{50}{100} = \frac{1}{4} \)

\( P(YX) = \frac{50}{100} \times \frac{50}{100} = \frac{1}{4} \)

\( P(YY) = \frac{50}{100} \times \frac{50}{100} = \frac{1}{4} \)

Here, \( A = XX \cup XY; B = XY \cup YY; C = XX \cup YY \)

\[ \therefore \]

\( P(A) = P(XX) + P(XX) = \frac{1}{4} + \frac{1}{4} = \frac{1}{2} \)

\( \therefore \)

\( P(B) = P(YY) + P(YY) = \frac{1}{4} + \frac{1}{4} = \frac{1}{2} \)

\( \therefore \)

\( P(C) = P(XX) + P(YY) = \frac{1}{4} + \frac{1}{4} = \frac{1}{2} \)
Now, \( P(AB) = P(XY) = \frac{1}{4} = P(A) \cdot P(B) \)

\[ \therefore A \text{ and } B \text{ are independent events.} \]

\( P(BC) = P(YX) = \frac{1}{4} = P(B) \cdot P(C) \)

\[ \therefore B \text{ and } C \text{ are independent events.} \]

\( P(CA) = P(XY) = \frac{1}{4} = P(C) \cdot P(A) \)

\[ \therefore C \text{ and } A \text{ are independent events.} \]

\( P(ABC) = 0 \quad \text{(impossible event)} \)

\[ \therefore A, B, C \text{ are dependent events.} \]

Thus we can conclude that \( A, B, C \) are pairwise independent but \( A, B, C \) are dependent events.

16. The given numbers are 00, 01, 02, …, 99. These are total 100 numbers, out of which the numbers, the product of whose digits is 18, are 29, 36, 63 and 92.

\[ \therefore p = P(E) = \frac{4}{100} = \frac{1}{25} \Rightarrow q = 1 - p = \frac{24}{25} \]

From Binomial distribution \( P(E \text{ occurring at least 3 times}) = P(E \text{ occurring 3 times}) + P(E \text{ occurring 4 times}) \)

\[ 4 C_p^3 q + 4 C_p^4 p^4 = 4 \times \left( \frac{1}{25} \right)^3 \left( \frac{24}{25} \right)^4 + \left( \frac{1}{25} \right)^4 = \frac{97}{(25)^4} \]

17. \( E_1 \equiv \text{number noted is 7, } E_2 \equiv \text{number notes is 8,} \)

\( H \equiv \text{getting head on coin, } T \equiv \text{getting tail on coin.} \)

Then by total probability theorem,

\[ P(E_1) = P(H) P(E_1|H) + P(T) P(E_1|T) \]

and \( P(E_2) = P(H) P(E_2|H) + P(T) P(E_2|T) \)

where \( P(H) = \frac{1}{2} ; P(T) = \frac{1}{2} \)

\[ P(E_1|H) = \text{prob. of getting a sum of 7 on two dice. Here favourable cases are } \{1, 6, 6, 1, 2, 5, 5, 2, 3, 4, 3\} \]

\[ \therefore P(E_1|H) = \frac{6}{36} = \frac{1}{6} \]

Also \( P(E_1|T) = \text{prob. of getting '7' numbered card out of 11 cards} \)

\[ P(E_2|H) = \text{Prob. of getting a sum of 8 on two dice. Here favourable cases are } \{2, 6, 6, 2, 4, 4, 5, 3, 5\} \]

\[ \therefore P(E_2|H) = \frac{5}{36} \]

\( P(E_2|T) = \text{prob. of getting '8' numbered card out of 11 cards} \)

\[ P(E_2|T) = \frac{1}{11} \]

\[ \therefore P(E_1) = \frac{1}{2} \cdot \frac{1}{6} + \frac{1}{2} \cdot \frac{1}{11} = \frac{1}{12} + \frac{1}{22} = \frac{11 + 6}{132} = \frac{17}{132} \]

\[ P(E_2) = \frac{1}{2} \cdot \frac{5}{36} + \frac{1}{2} \cdot \frac{1}{11} = \frac{55 + 36}{396} = \frac{91}{792} \]

Now \( E_1 \) and \( E_2 \) are mutually exclusive events therefore

\[ P(E_1 \text{ or } E_2) = P(E_1) + P(E_2) = \frac{17}{132} + \frac{91}{792} \]

18. We have 14 seats in two vans. And there are 9 boys and 3 girls. The no. of ways of arranging 12 people on 14 seats without restriction is \( 14 R_{12} = \frac{14!}{2!} = 7(131!) \)

Now the no. of ways of choosing back seats is 2. And the no. of ways of arranging 3 girls on adjacent seats is 2 (3!). And the no. of ways of arranging 9 boys on the remaining 11 seats is \( 11 P_9 \)

Therefore, the required number of ways

\[ = 2. (2.3!) \cdot 11 P_9 = \frac{4.3! \cdot 11!}{2} = 12! \]

Hence, the probability of the required event \( = \frac{12!}{7.13!} = \frac{1}{91} \)

19. The required probability is \( 1 - \) (probability of the event that the roots of \( x^2 + px + q = 0 \) are non-real if and only if \( p^2 - 4q < 0 \) i.e. if \( p^2 < 4q \).

We enumerate the possible values of \( p \) and \( q \), for which this can happen in the following table.

<table>
<thead>
<tr>
<th>( q )</th>
<th>( p )</th>
<th>Number of pairs of ( p,q )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>1,2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>1,2,3</td>
<td>3</td>
</tr>
<tr>
<td>4</td>
<td>1,2,3</td>
<td>3</td>
</tr>
<tr>
<td>5</td>
<td>1,2,3,4</td>
<td>4</td>
</tr>
<tr>
<td>6</td>
<td>1,2,3,4</td>
<td>4</td>
</tr>
<tr>
<td>7</td>
<td>1,2,3,4,5</td>
<td>5</td>
</tr>
<tr>
<td>8</td>
<td>1,2,3,4</td>
<td>5</td>
</tr>
<tr>
<td>9</td>
<td>1,2,3,4,5</td>
<td>5</td>
</tr>
<tr>
<td>10</td>
<td>1,2,3,4,5,6</td>
<td>6</td>
</tr>
</tbody>
</table>

Thus, the number of possible pairs = 38. Also, the total number of possible pairs is \( 10 \times 10 = 100 \).

\[ \therefore \text{The required probability} = 1 - \frac{38}{100} = 1 - 0.38 = 0.62 \]

20. Given that \( p \) is the prob. that coin shows a head then \( 1 - p \) will be the prob. that coin shows a tail.

Now, \( \alpha = P(A) \text{ gets the 1st head in 1st try} \)

\[ + P(A) \text{ gets the 1st head in 2nd try} + \ldots \]

\[ \Rightarrow \alpha = P(H) + P(T) P(T) P(T) P(H) + \ldots \]

\[ = P(T) P(H) + P(T) P(T) P(T) P(T) P(T) P(H) \]

\[ = p + (1-p)^2 + (1-p)^3 + \ldots \ldots \]

\[ = p \left[ 1 + (1-p)^2 + (1-p)^3 + \ldots \right] = \frac{p}{1-(1-p)^3} \]

Similarly \( \beta = P(B) \text{ gets the 1st head in 1st try} \)

\[ + P(B) \text{ gets the 1st head in 2nd try} + \ldots \]

\[ = P(T) P(H) + P(T) P(T) P(T) P(T) P(T) P(H) + \ldots \]

\[ = (1-p) p + (1-p)^4 p + \ldots \ldots = \frac{p}{1-(1-p)^3} \]

From (i) and (ii) we get \( \beta = (1-p) \alpha \)

Also (i) and (ii) give expression for \( \alpha \) and \( \beta \) in terms of \( p \).

Also \( \alpha + \beta + \gamma = 1 \) (exhaustive events and mutually exclusive events)

\[ \Rightarrow \gamma = 1 - \alpha - \beta = 1 - (1-p) \alpha \]
\[= 1 - (2 - p) \alpha = 1 - (2 - p) \frac{p}{1 - (1 - p)^3}\]
\[= \frac{1 - (1 - p)^3 - (2p - p^2)}{1 - (1 - p)^3}\]
\[= 1 + p^3 + 3p(1 - p) - 2p + p^2\]
\[= \frac{p^3 - 2p^2 + p}{1 - (1 - p)^3}\]
\[= \frac{p(1 - p)^2}{1 - (1 - p)^3}\]
\[= \frac{m}{m + n} + \frac{m}{m + n + k} = \frac{m}{m + n}\]
\[= \frac{m(n + m + k)}{(m + n)(m + n + k)} = \frac{m}{m + n}\]

24. The total no. of outcomes = 6^n

We can choose three numbers out of 6 in \(6 \binom{C_3}{3}\) ways. By using three numbers out of 6 we can get 3^n sequences of length n. But these include sequences of length n which use exactly two numbers and exactly one number. The number of n-sequences which use exactly two numbers = \(3 \binom{C_3}{2} (2^n - 1^n) = 3 \binom{C_3}{2} (2^n - 2)\) and the number of n sequences which are exactly one number = \(3C_1 (1^n) = 3\).

Thus, the number of sequences, which use exactly three numbers
\[= 3 \binom{C_3}{3} [3^n - 3 (2^n - 2) - 3] = 3 \binom{C_3}{3} [3^n - 3 (2^n) + 3]\]
\[\therefore \text{Probability of the required event, } \frac{3 \binom{C_3}{3} [3^n - 3 (2^n) + 3]}{6^n}\]

25. Let \(E_1\) be the event that the coin drawn is fair and \(E_2\) be the event that the coin drawn is biased.

\[\because \quad P(E_1) = \frac{m}{N} \quad \text{and} \quad P(E_2) = \frac{N - m}{N}\]

\(A\) is the event that on tossing the coin the head appears first and then appears tail.

\[\because \quad P(A) = P(E_1 \cap A) + P(E_2 \cap A)\]
\[= P(E_1) P(A/E_1) + P(E_2) P(A/E_2)\]
\[= \frac{m}{N} \left( \frac{1}{2} \right)^2 + \frac{N - m}{N} \left( \frac{2}{3} \right) \left( \frac{1}{3} \right) \]

We have to find the probability that \(A\) has happened because of \(E_1\)

\[\because \quad P(E_1/A) = \frac{P(E_1 \cap A)}{P(A)}\]
\[= \frac{m}{N} \left( \frac{1}{2} \right)^2 \]
\[= \frac{m}{N} \left( \frac{1}{2} \right)^2 + \frac{N - m}{N} \left( \frac{2}{3} \right) \left( \frac{1}{3} \right) \]
\[= \frac{m}{N} \frac{4}{9} + \frac{N - m}{N} \frac{9m}{9} \]
\[= \frac{m}{N} \frac{4}{9} + \frac{N - m}{N} \frac{9m}{9} \]

26. Let us consider

\(E_1 = \text{event of passing I exam.}\)
\(E_2 = \text{event of passing II exam.}\)
\(E_3 = \text{event of passing III exam.}\)

Then a student can qualify in anyone of the following ways
1. He passes first and second exam.
2. He passes first, fails in second but passes third exam.
3. He fails in first, passes second and third exam.

\[\therefore \text{Required probability} = P(E_1) P(E_2/E_1) + P(E_2) P(E_3/E_2) + P(E_3)\]
\[P(E_2/E_1) + P(E_3/E_2) + P(E_3)\]
\[\text{[as an event is dependent on previous one]}\]

\[= px + px(1 - p) \left( \frac{p}{2} \right)^2\]
\[= px + px \left( \frac{p}{2} \right)^2\]
\[= p^2 + p^2 \left( \frac{p}{2} \right)^2 + \left( \frac{p}{2} \right)^3\]
\[= 2p^2 - p^3\]
27. Let us consider the events

\[ E_1 = A \text{ hits } B \quad \text{Then } P(E_1) = \frac{2}{3} \]

\[ E_2 = B \text{ hits } A \quad P(E_2) = \frac{1}{2} \]

\[ E_3 = C \text{ hits } A \quad P(E_3) = \frac{1}{3} \]

\[ E = A \text{ is hit} \]

\[ P(E) = P(E_2 \cup E_3) = 1 - P(E_2 \cap E_3) \]

\[ = 1 - P(E_2) \cdot P(E_3) = 1 - \frac{1}{2} \cdot \frac{1}{3} = \frac{2}{3} \]

To find \( P(E_2 \cap E_3) / P(E) \)

\[ \frac{P(E_2 \cap E_3)}{P(E)} \quad [\because P(E_2 \cap E_3 \cap E) = P(E_2 \cap E_3) \text{ i.e., } B \text{ hits } A \text{ and } A \text{ is hit } = B \text{ hits } A] \]

\[ = \frac{1}{2 \times 3 / 2} = \frac{1}{2} \]

28. Given that \( A \) and \( B \) are two independent events. \( C \) is the event in which exactly of \( A \) or \( B \) occurs.

Let \( P(A) = x, P(B) = y \)

then \( P(C) = P(A \cap B) + P(A \cap B) = P(A)P(B) + P(A)P(B) \)

\[ = [P(A) + P(B) - P(A)P(B)] [P(A)P(B)] \]

\[ = x(y - xy)(1 - x)(1 - y) \]

\[ = x(1 - x)(1 - y) + y(1 - x)(1 - y) \]

\[ = x(1 - x)(1 - y) + y(1 - x)(1 - y) \]

\[ = x^2(1 - y) + y^2(1 - x) \leq x(1 - x)(1 - y) \]

\[ \therefore x, y \in (0, 1) \]

Thus \( P(C) \geq P(A \cup B)P(A \cap B) \) is proved.

29. Let us define the following events

\( A = 4 \) white balls are drawn in first six draws

\( B = 5 \) white balls are drawn in first six draws

\( C = 6 \) white balls are drawn in first six draws

\( E = \) exactly one white ball is drawn in next two draws (i.e., one white and one red)

Then \( P(E) = P(E/A)P(A) + P(E/B)P(B) + P(E/C)P(C) \)

But \( P(E/C) = 0 \) [As there are only 6 white balls in the bag.]

\[ P(E) = P(E/A)P(A) + P(E/B)P(B) \]

\[ = \frac{10C_1}{12C_2} \times \frac{12C_2}{18C_6} + \frac{12C_2}{18C_6} \times \frac{11C_1}{12C_2} \times \frac{12C_2}{18C_6} \times \frac{6C_5}{18C_6} \]

30. Let us define the following events

\( C = \) person goes by car,

\( S = \) person goes by scooter,

\( B = \) person goes by bus,

\( T = \) person goes by train,

\( L = \) person reaches late

Then we are given in the question

\[ P(C) = \frac{1}{7}, P(S) = \frac{3}{7}, P(B) = \frac{2}{7}, P(T) = \frac{1}{7} \]

31. Topic-wise Solved Papers - MATHEMATICS

\[ P(L/C) = \frac{2}{9}; P(L/S) = \frac{1}{9}; P(L/B) = \frac{4}{9}; P(L/T) = \frac{1}{9} \]

To find the prob. \( P(C \cap L) \) [\( C \cap L \) : reaches in time = not late]

Using Baye’s theorem

\[ P(C \cap L) = \frac{P(C \cap L)P(C)}{P(C \cap L)P(C) + P(L/S)P(S) + P(L/B)P(B) + A(L/T)P(T)} \]

Now, \( P(C \cap L) = \frac{2}{9} \); \( P(L/S) = \frac{1}{9} \)

\[ P(L/B) = \frac{4}{9}; P(L/T) = \frac{1}{9} \]

Substituting these values in eqn. (i) we get

\[ P(C \cap L) = \frac{\frac{2}{9} \times \frac{1}{9}}{\frac{2}{9} \times \frac{1}{9} + \frac{1}{9} \times \frac{8}{9} + \frac{4}{9} \times \frac{1}{9} + \frac{1}{9} \times \frac{8}{9}} \]

\[ = \frac{7}{74 + 10 + 8} = \frac{7}{49} = \frac{1}{7} \]

G. Comprehension Based Questions

1. (b) \( P(u_i) \propto i \Rightarrow P(u_i) = ki \), But \( \sum P(u_i) = 1 \)

\[ \Rightarrow \sum ki = 1 \Rightarrow k \sum i = 1 \Rightarrow k = \frac{2}{n(n+1)} \Rightarrow P(u_i) = \frac{2i}{n(n+1)} \]

By total prob. theorem

\[ P(w) = \sum_{i=1}^{n} P(u_i)P(w/u_i) = \sum_{i=1}^{n} \frac{2i}{n(n+1)} \times \frac{i}{n+1} \]

\[ = \frac{2}{n(n+1)^2} \times \frac{n(n+1)(2n+1)}{6} = \frac{2n+1}{3n+3} \]

\[ \therefore \lim_{n \rightarrow \infty} P(w) = \lim_{n \rightarrow \infty} \frac{2n+1}{3n+3} = \frac{2}{3} \]

2. (a) \( P(u_i) = c \)

Using Baye’s theorem, \( P(u_i/w) = \frac{P(w/u_i)P(u_i)}{\sum_{i=1}^{n} P(w/u_i)P(u_i)} \)

\[ = \frac{c \times \frac{n}{n+1}}{\frac{n+1}{n+1} + \frac{2}{n+1} + \ldots + \frac{n}{n+1}} \]

\[ = \frac{n}{n+1} \times \frac{n+1}{n+1} = \frac{2}{n+1} \]

3. (b) \( P(w/E) = \frac{P(w \cap E)}{P(E)} \)

\[ = \frac{1 \times \frac{2}{n} + rac{4}{n+1} + \frac{6}{n+1} + \ldots + \frac{n}{n+1}}{\frac{1}{n} + \frac{1}{n} + \ldots + \frac{1}{n \times \frac{n}{2} \text{ times}}} \]

\[ = \frac{2}{n(n+1)} \times \frac{1+2+3+\ldots+n}{n} \]

\[ = \frac{1 \times n \times n}{n \times \frac{n}{2}} \]

\( n \) being even
4. (a) \[ P(X = 3) = \left( \frac{n}{2} \right) \left( \frac{n+1}{2} \right) \times \left( \frac{2}{2(n+1)} \right) = \frac{n+2}{2(n+1)} \]

5. (b) \[ P(X \geq 3) = 1 - (X < 3) = 1 - [P(X = 1) + P(X = 2)] = 1 - \frac{1 + 5 \times 1}{6 \times 6} = 1 - \frac{11}{36} = \frac{25}{36} \]

6. (d) Let us define the events \[ A = X \geq 6 \text{ and } B = X > 3 \text{ so that } A \cap B = X \geq 6 = A \]

Now \[ P(A) = \left( \frac{5}{6} \right)^5 \times \frac{1}{6} + \left( \frac{5}{6} \right)^6 \times \frac{1}{6} + \ldots \infty \]

\[ = \left( \frac{5}{6} \right)^5 \times \frac{1}{6} + \frac{5^2}{6} \times \frac{1}{6} + \ldots \infty = \left( \frac{5}{6} \right)^5 \times \left( \frac{1}{6} - \frac{5}{6} \right) = \left( \frac{5}{6} \right)^5 \]

and \[ P(B) = \left( \frac{3}{6} \right)^3 \times \frac{1}{6} + \left( \frac{4}{6} \right)^3 \times \frac{1}{6} + \ldots \infty = \left( \frac{5}{6} \right)^3 \]

\[ P(A \mid B) = \frac{P(A \cap B)}{P(B)} = \frac{P(A)}{P(B)} = \frac{\left( \frac{5}{6} \right)^5}{\left( \frac{5}{6} \right)^3} = \frac{25}{36} \]

7. (b) \[ P(\text{white}) = P(\text{H white}) + P(\text{T white}) = P(\text{H}) P(\text{white/H}) + P(\text{T}) P(\text{white/T}) \]

\[ = \frac{1}{2} \times \frac{\left( \frac{3}{5} \times 1 + \frac{2}{5} \times 1 \right)}{\frac{3}{5} + \frac{2}{5}} + \frac{1}{2} \times \frac{\left( \frac{3}{5} \times 1 + \frac{2}{5} \times 1 \right)}{\frac{3}{5} + \frac{2}{5}} \]

\[ = \left( \frac{3}{5} \times 1 + \frac{2}{5} \times 1 \right) \times \frac{1}{5} + \left( \frac{3}{5} \times 1 + \frac{2}{5} \times 1 \right) \times \frac{1}{5} \]

\[ = \frac{3}{10} \times 2 + \frac{1}{30} \times 12 = \frac{4}{10} = \frac{23}{30} \]

8. (d) \[ P(H/\text{white}) = \frac{P(H \cap \text{white})}{P(\text{white})} = \frac{1}{2} \times \frac{\left( \frac{3}{5} \times 1 + \frac{2}{5} \times 1 \right)}{\frac{3}{5} + \frac{2}{5}} \]

\[ = \frac{4}{10} = \frac{12}{23} \]

9. (a) Probability that all balls are of same colour

\[ = P(\text{all red}) + P(\text{all white}) + P(\text{all black}) \]

\[ = \frac{3}{6} \times \frac{3}{9} + \frac{4}{6} \times \frac{2}{12} + \frac{5}{6} \times \frac{1}{12} = \frac{82}{648} \]

10. (d) \[ B_1 = \begin{array}{c} 1W \ 2R \ 3B \ 4W \ 5R \ 6B \\ 2B \ 3R \ 4B \ 5R \ 6B \end{array} \]

Let \( E_1, E_2, E_3 \) be the events that bag \( B_1, B_2 \) and \( B_3 \) is selected respectively.

Let \( E \) be the event that one white and one red ball is selected.

Then by Baye’s theorem,

\[ P(E \mid E_2) = \frac{P(E \cap E_2)P(E_2)}{P(E \cap E_1)P(E_1) + P(E \cap E_2)P(E_2) + P(E \cap E_3)P(E_3)} \]

\[ = \frac{2 \times 3}{9C_2 + 9C_2 + 12C_2} = \frac{55}{181} \]

11. (b) \( x_1 + x_2 + x_3 \) will be odd

If two are even and one is odd or all three are odd.

\[ ⊙ \text{ Required probability} = \frac{P(EOO) + P(EOE) + P(OEO) + P(OOO)}{8 + 9 + 12 + 24} = \frac{53}{105} \]

12. (c) If \( x_1, x_2, x_3 \) are in AP then \( 2x_2 = x_1 + x_3 \)

\[ \therefore \text{LHS is even, } x_1 \text{ & } x_3 \text{ can be both even or both odd. } x_1 \text{ & } x_3 \text{ both can be even in } 1 \times 3 = 3 \text{ ways } x_1 \text{ & } x_3 \text{ both can be odd in } 2 \times 4 = 8 \text{ ways } \]

\[ \therefore \text{Total favourable ways } = 3 \times 8 = 11 \]

Also one number from each box can be drawn in \( 3 \times 5 \times 7 \) ways

\[ \therefore \text{Total ways } = 105 \]

Hence required probability = \( \frac{11}{105} \)

13. (a,b) Let \( E_1 = \text{box } I \text{ is selected } \)

\( E_2 = \text{box } II \text{ is selected } \)

\( E = \text{ball drawn is red } \)

\[ P(E_2/E) = \frac{n_3 \times 1}{n_3 + n_4 \times 2} = \frac{1}{3} \]

\[ n_1 + n_2 + n_3 + n_4 \]

\[ = \frac{n_3}{n_1 + n_2 + n_3 + n_4} = \frac{1}{3} \]

On checking the options we find (a) and (b) are the correct options.

14. (c, d) \( E_1 = \text{Red ball is selected from box I } \)

\( E_2 = \text{Black ball is selected from box I } \)

\( E = \text{Second ball drawn from box I is red } \)

\[ \therefore P(E) = P(E_1)P(E/E_1) + P(E_2)P(E/E_2) \]

\[ = \frac{n_1 - 1}{n_1 + n_2 + n_3 + n_4} + \frac{n_2}{n_1 + n_2 + n_3 + n_4} \]

\[ = \frac{n_1 - 1 + n_2}{n_1 + n_2 + n_3 + n_4} \]

On checking the options, we find (c) and (d) have the correct values.
For (Q. 15 - 16)
(X, Y) = {(6, 0), (4, 1), (3, 3), (2, 2), (4, 4), (0, 6)}

15. (b) \( P(X > Y) = P(T_1\ \text{wins}\ \text{2 games or } T_1\ \text{win one game other}\ \text{is a draw}) \)

\[
= \frac{1\times1 + \left(1\times1\times1\times1\right)}{2\times2\times2\times2\times2\times2} = \frac{1\times1}{4\times6\times12} = \frac{6 + 1}{36} = \frac{13}{36}
\]

16. (c) \( P(X = Y) = P(T_1\ \text{wins}\ \text{1 game loses other game or both the games draw}) \)

\[
= \frac{\left(\frac{1\times1 + \left(1\times1\times1\times1\right)}{2\times2\times2\times2\times2\times2}\right) + \frac{1\times1}{6\times6}}{3 + \frac{1}{36}} = \frac{13}{36}
\]

\[
M\left(\frac{3}{2}, \sqrt{6}\right)
\]

\[
F_1(-1, 0)
\]

\[
F_2(1, 0)
\]

\[
N\left(\frac{3}{2}, -\sqrt{6}\right)
\]

H. Assertion & Reason Type Questions

1. We know \( P(H_i/E) = \frac{P(H_i \cap E)}{P(E)} = \frac{P(E \mid H_i)P(H_i)}{P(E)} \)

\[
P(H_i/E)P(E) = P(E / H_i)P(H_i) \Rightarrow P(E) = \frac{P(E / H_i)P(H_i)}{P(H_i / E)}
\]

Now given that \( 0 < P(E) < 1 \) \( \Rightarrow 0 < \frac{P(E / H_i)P(H_i)}{P(H_i / E)} < 1 \)

\[
P(E/H_i)P(H_i) < P(H_i/E) \text{ But if } P(H_i \cap E) = 0 \text{ then } P(H_i/E) = P(H_i) = 0 \text{ or } P(E/H_i) = 0 \text{ then } P(E/H_i)P(H_i) < P(H_i/E) \text{ is not true.}
\]

\[
\therefore \text{ Statement - 1 is not always true.}
\]

Also as \( H_1, H_2, \ldots H_n \) are mutually exclusive and exhaustive

\[
\sum_{i=1}^{n} P(H_i) = 1. \therefore \text{Statement - 2 is true.}
\]

\[
\text{Section-B JEE Main/ AIEEE}
\]

1. (a) \( P(E_1) = \frac{1}{2}, P(E_2) = \frac{1}{3} \) and \( P(E_3) = \frac{1}{4} \)

\[
P(E_1 \cup E_2 \cup E_3) = 1 - P(E_1)P(E_2)P(E_3)
\]

\[
= 1 - \left(1 - \frac{1}{2}\right)\left(1 - \frac{1}{3}\right)\left(1 - \frac{1}{4}\right) = 1 - \frac{1}{2} \times \frac{2}{3} \times \frac{3}{4} = \frac{3}{4}
\]

2. (a) \( P(A \cup B) = P(A) + P(B) - P(A \cap B) \)

\[
\Rightarrow \frac{3}{4} = 1 - P(A \cap B) \Rightarrow P(A \cap B) = \frac{1}{4}
\]

\[
\Rightarrow 1 - \frac{2}{3} + P(B) \Rightarrow P(B) = \frac{2}{3}
\]

Now, \( P(A \cap B) = P(B) - P(A \cap B) = \frac{2}{3} \times \frac{1}{4} = \frac{5}{12} \).
3. (d) The event follows binomial distribution with $n=5, p=\frac{3}{6}=\frac{1}{2}$.

$q = 1 - p = 1/2$; \hspace{1em} \therefore \hspace{1em} \text{Variance} = npq = 5/4.

4. (b) $np = 4 \Rightarrow q = \frac{1}{2}, p = \frac{1}{2}, n = 8$

$p(X = 1) = 8 \choose 1 \left( \frac{1}{2} \right)^1 \left( \frac{1}{2} \right)^{7} = \frac{8}{2^7} = \frac{1}{2^5} = \frac{1}{32}$

5. (b) $P(A) = \frac{3x+1}{3}, P(B) = \frac{1-x}{4}, P(C) = \frac{1-2x}{2}$

\text{\therefore} \hspace{1em} \text{For any event} \ E, 0 \leq P(E) \leq 1

$\Rightarrow 0 \leq \frac{3x+1}{3} \leq 1, \ 0 \leq \frac{1-x}{4} \leq 1 \ \text{and} \ \ 0 \leq \frac{1-2x}{2} \leq 1$

$\Rightarrow -1 \leq 3x \leq 2, -3 \leq x \leq 1 \ \text{and} \ -1 \leq 2x \leq 1$

$\Rightarrow -\frac{1}{3} \leq x \leq \frac{2}{3} \leq -3 \leq x \leq 1, \ \text{and} \ \ -\frac{1}{2} \leq x \leq \frac{1}{2}$

Also for mutually exclusive events $A, B, C$,

$P(A \cup B \cup C) = P(A) + P(B) + P(C)$

$\Rightarrow P(A \cup B \cup C) = \frac{3x+1}{3} + \frac{1-x}{4} + \frac{1-2x}{2}$

\text{\therefore} \hspace{1em} 0 \leq \frac{1+3x}{3} + \frac{1-x}{4} + \frac{1-2x}{2} \leq 1

$0 \leq 13 - 3x \leq 12 \Rightarrow 1 \leq 3x \leq 13 \Rightarrow \frac{1}{3} \leq x \leq \frac{13}{3}$

Considering all inequations, we get

$\max \left\{ -\frac{1}{3}, -3, -\frac{1}{2}, \frac{1}{3} \right\} \leq x \leq \min \left\{ \frac{2}{3}, \frac{1}{2}, \frac{13}{3} \right\}$

$\Rightarrow \frac{1}{3} \leq x \leq \frac{1}{2} \Rightarrow x \in \left[ \frac{1}{3}, \frac{1}{2} \right]$.

6. (a) Let 5 horses are $H_1, H_2, H_3, H_4,$ and $H_5$. Selected pair of horses will be one of the 10 pairs (i.e., $5 \choose 2$): $H_1 \ H_2, H_3 \ H_4, H_1 \ H_3, H_2 \ H_3, H_2 \ H_4, H_2 \ H_5, H_3 \ H_4, H_3 \ H_5, H_4 \ H_5$.

Any horse can win the race in 4 ways.

For example: Horses $H_2$, win the race in 4 ways $H_1 \ H_2, H_2 \ H_3, H_2 \ H_4, H_2 \ H_5$.

Hence required probability $= \frac{4}{10} = \frac{2}{5}$

7. (c) $A$ and $B$ will contradict each other if one speaks truth and other false. So, the required probability

$P = \frac{4}{5} \left( 1 - \frac{3}{4} \right) + \left( 1 - \frac{4}{5} \right) \frac{3}{4}$

$= \left( \frac{1}{5} \times \frac{1}{4} \right) + \left( \frac{1}{5} \times \frac{3}{4} \right) = \frac{7}{20}$

8. (b) $P(E) = P(2 \ or \ 3 \ or \ 5 \ or \ 7)$

$= 0.23 + 0.12 + 0.20 + 0.07 = 0.62$

$P(F) = P(1 \ or \ 2 \ or \ 3) = 0.15 + 0.23 + 0.12 = 0.50$

$P(E \cap F) = P(2 \ or \ 3) = 0.23 + 0.12 = 0.35$

\therefore $P(E \cup F) = P(E) + P(F) - P(E \cap F)$

$= 0.62 + 0.50 - 0.35 = 0.77$

9. (a) mean $= np = 4$ and variance $= npq = 2$

\therefore $p = \frac{1}{2}$ and $n = 8$

\therefore $P(2 \ success) = \frac{8}{2^2} \left( \frac{1}{2} \right)^6 \left( \frac{1}{2} \right)^2 = \frac{28}{256}$

10. (b) For a particular house being selected

$\text{Probability} = \frac{1}{3}$

$P(\text{all the persons apply for the same house})$

$= \left( \frac{1}{3} \times \frac{1}{3} \times \frac{1}{3} \right) = \frac{1}{9}$

11. (c) According to Poisson distribution, prob. of getting $k$ successes is

$P(x = k) = e^{-\lambda} \frac{\lambda^k}{k!}$

$P(x \geq 2) = 1 - P(x = 0) - P(x = 1)$

$= 1 - e^{-\lambda} - e^{-\lambda} \frac{\lambda}{1} = 1 - e^{-\lambda}$

12. (c) $P(A \cup B) = \frac{1}{6}, P(A \cap B) = \frac{1}{4}$ and $P(\bar{A}) = \frac{1}{4}$

\therefore $P(\bar{A} \cap B) = \frac{5}{6}, P(A) = \frac{3}{4}$

Also \ $\Rightarrow P(A \cup B) = P(A) + P(B) - P(A \cap B)$

\therefore $P(B) = \frac{3}{6} + \frac{1}{4} - \frac{1}{3}$

$\Rightarrow P(A) \ P(B) = \frac{3}{4} \times \frac{1}{3} = \frac{1}{4}$\hspace{1em} P(A \cap B)

Hence $A$ and $B$ are independent but not equally likely.

13. (d) $P(X = r) = \frac{e^{-\mu} \mu^r}{r!}$

$P(\text{at most 1 phone call})$

$= P(X \leq 1) = P(X = 0) + P(X = 1)$

$= e^{-\mu} + 5 \times e^{-\mu} = \frac{6}{e^{5}}$

14. (d) Given: Probability of aeroplane $I$, scoring a target correctly i.e., $P(I) = 0.3$ probability of scoring a target correctly by aeroplane $II$, i.e. $P(II) = 0.2$

\therefore $P(\bar{I} \cap II) = P(\bar{I}) \ P(II) = 0.3 \times 0.2 = 0.14$

15. (b) A pair of fair dice is thrown, the sample space $S = (1, 1), (1, 2), (1, 3), ..., (6, 6)$

Possibility of getting 9 are (5, 4), (4, 5), (6, 3), (3, 6)

\therefore Probability of getting score 9 in a single throw

$= \frac{4}{36} = \frac{1}{9}$

\therefore Probability of getting score 9 exactly twice

$= \binom{3}{2} \times \binom{\frac{1}{9}}{2} \times \binom{1}{2} \frac{1}{9} \times \frac{1}{9} \times \frac{8}{9}$

$= \binom{3}{2} \times \frac{1}{9} \times \frac{1}{9} \times \frac{8}{9} = \frac{243}{9}$
16. (b) \(P(A) = \frac{1}{4}, P(A/B) = \frac{1}{2}, P(B/A) = \frac{2}{3}\)

By conditional probability,
\[P(A \cap B) = P(A)P(B/A) = P(B)P(A/B)\]
\[\Rightarrow \frac{1}{4} \times \frac{2}{3} = P(B) \times \frac{1}{2}\]
\[\Rightarrow P(B) = \frac{1}{3}\]

17. (c) \( \equiv \) number is greater than 3 \( \Rightarrow P(A) = \frac{3}{6} = \frac{1}{2}\)

\(B \equiv \) number is less than 5 \( \Rightarrow P(B) = \frac{2}{6} = \frac{1}{3}\)

\(A \cap B \equiv \) number is greater than 3 but less than 5.
\[\Rightarrow P(A \cap B) = \frac{1}{6}\]
\[\therefore P(A \cup B) = P(A) + P(B) - P(A \cap B)\]
\[= \frac{1}{2} + \frac{2}{3} - \frac{1}{6} = \frac{3 + 4 - 1}{6} = 1\]

18. (d) We have
\[P(x \geq 1) \geq \frac{9}{10} \Rightarrow 1 - P(x = 0) \geq \frac{9}{10}\]
\[\Rightarrow 1 - 9^n \cdot 4^n / \left(4^n \cdot 3^n \right) \geq \frac{9}{10}\]
\[\Rightarrow \frac{1}{2} - \frac{9}{4} \cdot \frac{3}{4} \leq \frac{1}{2} \cdot \frac{1}{10}\]

Taking log to the base 3/4, on both sides, we get
\[n \log_{3/4} \left(\frac{3}{4}\right) \geq n \log_{3/4} \left(\frac{1}{10}\right)\]
\[\Rightarrow n \geq \frac{1}{\log_{3/4} \left(\frac{3}{4}\right) - \log_{10} 10}\]

19. (d) Let \(A \equiv \) Sum of the digits is 8

\(B \equiv \) Product of the digits is 0

Then \(A = \{08, 17, 26, 35, 44\}\)

\(B = \{00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 20, 30, 40, \}\)

\(A \cap B = \{08\}\)

\[\therefore \quad P(A/B) = \frac{P(A \cap B)}{P(B)} = \frac{\frac{1}{30}}{\frac{14}{30}} = \frac{1}{14}\]

20. (b) \(n(S) = 20C_4\)

Statement - 1:
common difference is 1; total number of cases = 17
common difference is 2; total number of cases = 14
common difference is 3; total number of cases = 11
common difference is 4; total number of cases = 8
common difference is 5; total number of cases = 5
common difference is 6; total number of cases = 2

Prob. = \(\frac{20C_4}{85}\)

Statement - 2 is false, because common difference can be 6 also.

21. (a) \(n(S) = 9C_4, n(E) = 3C_1 \times 4C_1 \times 2C_1\)

\[\frac{3 \times 4 \times 2 \times 24 \times 3! \times 24 \times 6 \times 9!}{9C_4 \times 9 \times 8 \times 7} = \frac{2}{7}\]

22. (b) \(p \geq \frac{31}{32}\)
Section-A : JEE Advanced/ IIT-JEE

A 1. n
B 1. F

A. Fill in the Blanks

1. Frequency for variable \(x\) is \(n \cdot x^{-1}C_x\)
   where \(x=0, 1, 2, \ldots, n\).
   Mode is the variable for which freq. is max.
   Now, \(nC_x\) is max for \(r=n/2\), if \(n\) is even
   \[r = \frac{n+1}{2}\] if \(n\) is odd.
   If \(n+x-1\) is even then for max value of \(n \cdot x^{-1}C_x\),
   \[x = \frac{n+x-1}{2} \Rightarrow x = n-1\], : freq \(2n-2C_{n-1}\)
   If \(n+x-1\) is odd then for max value of \(n \cdot x^{-1}C_x\),
   \[x = \frac{n+x-1+1}{2} \Rightarrow x = n\], : freq \(2n-1C_n\)
   But we know \(2n-1C_n = \frac{2n-1}{n}C_{n-1}\)
   i.e., \(2n-1C_n > 2n-2C_{n-1}\)
   : Mode should be \(n\).

B. True / False

1. Given that, \(x \star y = x - y + \sqrt{2}\)
   Consider \(x = 2\sqrt{2}\), \(y = \sqrt{2}\)
   then \(x \star y = 2\sqrt{2} - \sqrt{2} + \sqrt{2} = 3\sqrt{2}\) (irrational)
   and \(y \star x = \sqrt{2} - 2\sqrt{2} + \sqrt{2} = 0\) (rational)
   \(\therefore x \star y \neq y \star x\)
   Hence \(\star\) is not symm. \(\Rightarrow \star\) is not an equivalence relation

C. MCQs with ONE Correct Answer

1. (c) \(X \cap (X \cup Y) = X \cap (X^C \cap Y^C) = (X \cap X^C) \cap Y^C = \phi \cap Y^C = \phi\)

2. (b) \[
\frac{12}{(3 + \sqrt{5}) + 2\sqrt{2}} \times \frac{(3 + \sqrt{5}) - 2\sqrt{2}}{(3 + \sqrt{5}) + 2\sqrt{2}} \times \frac{(3 + \sqrt{5}) - 2\sqrt{2}}{9 + 6\sqrt{5} - 8}
\]
\[
= \frac{12[3 + \sqrt{5} - 2\sqrt{2}]}{(3 + \sqrt{5})^2 - 2\sqrt{2})^2} \times \frac{\sqrt{5} - 1}{6(\sqrt{5} + 1)}
\]
\[
= \frac{12[3 + \sqrt{5} - 2\sqrt{2}]}{\sqrt{5} - 1}
\]
\[
= 2[\sqrt{5} + 5 - 2\sqrt{10} - 3 - \sqrt{5} + 2\sqrt{2}]
\]
\[
= \frac{5 - 1}{2} = 1 + \sqrt{2} + \sqrt{5} - \sqrt{10}
\]
3. (b) If each of n observations is multiplied by a constant C, the standard deviation also gets multiplied by C.
4. (c) If s. d. = 0, statements like (a) and (b) cannot be given.
5. (c) Given that \(x_1 < x_2 < x_3 < \ldots < x_{201} \)

\[ \therefore \text{Median of the given observation} = \frac{201 + 1}{2} \text{th item} = 101 \text{th item} = x_{101} \]

Now, deviations will be minimum if taken from the median.
\[ \therefore \text{Mean deviation will be min if} x = x_{101}. \]
6. (d) If any of the inequalities hold, it must hold for any real numbers \(x_1, x_2, \ldots, x_n\) and any \(n \in \mathbb{N}. \)

\[ \therefore: \text{let} \ x_1 = 1, x_2 = 2, x_3 = 3; n = 3 \text{ then we can check none of the inequalities (a), (b) or (c) are satisfied.} \]
7. (d) \(S = \{1, 2, 3, 4\} \)

Let P and Q be disjoint subsets of S
Now for any element \(a \in S\), following cases are possible
\[ a \in P \text{ and } a \notin Q, a \notin P \text{ and } a \in Q, a \notin P \text{ and } a \notin Q \]
\[ \Rightarrow \text{For every element there are three option} \]
\[ \therefore \text{Total options} = 3^n = 81 \]
Here \(P = Q\) except when \(P = Q = \emptyset \)
\[ \therefore 80 \text{ ordered pairs } (P, Q) \text{ are there for which } P \neq Q. \]
Hence total number of unordered pairs of disjoint subsets \(\frac{80}{2} + 1 = 41 \)
8. (d) \(P = \{ \theta : \sin \theta - \cos \theta = \sqrt{2} \cos \theta \} \)
\[ \therefore \sin \theta = (\sqrt{2} + 1) \cos \theta, \tan \theta = \sqrt{2} + 1 \]
\[ Q = \{ \theta : \sin \theta + \cos \theta = \sqrt{2} \sin \theta \} \]
\[ \cos \theta = (\sqrt{2} - 1) \sin \theta \text{ or } \tan \theta = \sqrt{2} + 1 \]
\[ \therefore P = Q \]

**D. MCQs with ONE or MORE THAN ONE Correct**

1. (c) Let \(n\) be the number of newspapers which are read. Then \(600 = (300) (5) \Rightarrow n = 25 \)
2. (b, c, d)

Given side of square \(S_1 = 10 \text{ cm} \)
As it is same as diagonal of \(S_2 \)
\[ \therefore \text{Side of square } S_2 = \left( \frac{10}{\sqrt{2}} \right) \text{ cm} \]
Similarly, side of square \(S_3 = \frac{10}{\sqrt{2}}^2 \text{ cm} \)
In the same manner, side of square \(S_n = \frac{10}{\sqrt{2}}^{n-1} \text{ cm} \)
\[ \therefore \text{Area of square of side } S_n = \left( \frac{10}{\sqrt{2}}^{n-1} \right)^2 = \left( \frac{10}{\sqrt{2}}^{n-1} \right)^{2} < 1 \]

**E. Subjective Problems**

1. We have \(n(U) = 100\), where \(U\) stands for universal set
\(n(M \cap C \cap T) = 10; n(M \cap C) = 20; \)
\(n(C \cap T) = 30; n(M \cap T) = 25; \)
\(n(M \text{ only}) = 12; n(\text{only} C) = 5; n(\text{only} T) = 8 \)
Filling all the entries we obtain the Venn diagram as shown:

\[ \therefore n(M \cap C \cap T) = 12 + 10 + 5 + 15 + 10 + 20 + 8 = 80 \]
\[ n(M \cap C \cap T) = 100 - 80 = 20 \]

2. (a) To construct a \( \Delta \) with base = 9 cm, altitude = 4 cm and ratio of the other two sides as \(2:1\).

**Steps of Construction:**
1. Draw \(BC = 9 \text{ cm}\)
2. Divide \(BC\) internally at \(P\) and externally at \(Q\) in the ratio \(2:1\).
3. Draw a semicircle on \(PQ\).
4. Draw a line \(\parallel BQ\) at a distance of 4 cm from intersecting semicircle at \(A\) and \(A'\).
5. \(ABC\) and \(A'BC\) are the required \(A\)’s.

(b) To construct a \( \Delta \) with perimeter = 15 cm, base angles \(60^\circ\) and \(45^\circ\).

**Steps of Construction:**
1. Draw \(PQ = 15 \text{ cm}\)
2. At \(P\) draw \(\angle RPQ = 60^\circ\) and \(\angle XPQ = \frac{60^\circ}{2} = 30^\circ\)

and at \(Q\) draw \(\angle SQP = 45^\circ\) and \(\angle YQP = \frac{45^\circ}{2} = 22\frac{1}{2}^\circ\)

3. \(PX\) and \(QY\) meet each other at \(A\).
4. Through \(A\) draw \(AB \parallel PR\) and \(AC \parallel QS\).
5. \(ABC\) is the required \(A\).

**Justification:** \(\therefore AB \parallel PR\) and \(PA\) transversal
\[ \therefore \angle PAB = \angle PRA = \frac{1}{2} \times 60^\circ = 30^\circ \]
\[ \angle APB = \angle BAP = 30^\circ \Rightarrow AB = PB \]
MISCELLANEOUS (Sets, Relations, Statistics & Mathematical Reasoning)

Similarly \( AC = CQ \)

\[ A + BC + CA = PB + BC + CQ = 15 \text{ cm} \]
Also \( \angle ABC = \angle PBC = 60^\circ \) and \( \angle ACB = \angle QCS = 45^\circ \)

3. Slant height of frustum \( A = \sqrt{(4^2-2^2) + 3^2} = \sqrt{13} \)

\[ \text{Curved surface area of frustum} = \pi(4+2)\sqrt{13} \]
\[ = 6\sqrt{13}\pi \text{ m}^2 \]

Also slant height of cone \( B = \sqrt{2^2 + 2^2} = 2\sqrt{2} \)

\[ \text{Curved surface area of cone} = \pi \times 2 \times 2\sqrt{2} = 4\sqrt{2}\pi \text{ m}^2 \]

\[ \text{Area of canvas required} = 6\sqrt{13}\pi + 4\sqrt{2}\pi \]
\[ = 2(3\sqrt{13} + 2\sqrt{2}) \pi \text{ m}^2. \]

4. Let the remaining 9 readings be \( x_1, x_2, x_3, \ldots, x_9 \) and tenth is taken by the student as 52.

\[ \text{Incorrect mean} = \frac{x_1 + x_2 + \ldots + x_9 + 52}{10} = 45 \]

\( \Rightarrow \) \( x_1 + x_2 + \ldots + x_9 = 450 - 52 = 398 \) \ldots (1)

\( \therefore \) \( \text{Correct mean} = \frac{x_1 + x_2 + \ldots + x_9 + 25}{10} = 398 + 25 \]
\[ \Rightarrow \text{Correct mean} = 42.3 \]

Incorrect variance \[= \frac{\Sigma (x_i - \bar{x})^2}{n} \]
\[= \frac{(x_1-45)^2 + (x_2-45)^2 + \ldots + (x_9-45)^2 + (52-45)^2}{10} \]
\[= \frac{(x_1-45)^2 + (x_2-45)^2 + \ldots + (x_9-45)^2 + 16}{10} \]
\[= \frac{(x_1^2 + x_2^2 + \ldots + x_9^2) - 90(x_1 + x_2 + \ldots + x_9) + 9(45^2) + 16}{10} \]
\[= \frac{111 + 90 \times 398 - 9 \times (45^2) + 17706}{10} \]
\[= \frac{17706 - 84.6 \times 398 + 16103.61 + 299.29}{10} \]
\[= \frac{34108.9 - 33670.8}{10} = \frac{438.1}{10} = 43.81 \]

5. The rough figure is as shown, let \( 2x \) be the side of square.
In \( \triangle OBC \) \( r^2 = x^2 + 4x^2 \)

Now on number line we locate \( M \) such that \( OM = \sqrt{5} \)
Divide \( OM \) in five equal parts and take a point \( C \) on it such that
\[ OC : CM = 3 : 2 \]. So, that \( OC = \frac{3}{5} \sqrt{5} \)
Now, draw a line segment \( PQ = 6 \text{ cm} \) whose mid-point is \( O \).

From this cut a line segment \( OC = \frac{3\sqrt{5}}{5} \) and \( OD = \frac{3\sqrt{5}}{5} \) on opposite sides of \( O \).

At \( C \) and \( B \) draw perpendiculars to \( PQ \). With \( O \) as centre and \( OP \) as radius, draw a semicircle intersecting the perpendiculars draw at \( C \) & \( D \) at \( A \) and \( P \) respectively. Join \( AB \). \( ABCD \) is the required square.

6. Here we are given two points \( C \) and \( D \) on the same side of line \( L \). To find a point \( P \) on \( L \) such that \( PC \) and \( PD \) are equally inclined to \( L \).

Steps of Construction:
1. From \( C \) draw \( CE \perp L \) and produce it to \( C' \) such that \( EC' = EC \).
2. Join \( C' \) \& \( D \) intersecting \( L \) at \( P \). Also join \( CP \).
3. By simple geometry \( \angle 1 = \angle 2 \) and \( \angle 2 = \angle 3 \Rightarrow \angle 1 = \angle 3 \)
   \[ \therefore \text{PC and PD are the required lines inclined equally to L.} \]

7. (i) \( n(A) = 3 \), \( n(B) = 6 \)
   We know that \( n(A \cup B) \geq \max (n(A), n(B)) \)
   \[ \Rightarrow n(A \cup B) \geq 6 \]
   \[ \therefore \text{Min number of element that } A \cup B \text{ can have is 6.} \]

(ii) Here \( R \times (P \cap Q) = R \times (P \cap Q) \)

\[ (R \times P) \cap (R \times Q) \]
8. We are given that \[ \bigcup_{i=1}^{30} A_i = \bigcup_{j=1}^{30} B_j = S \] ...(1)

Each \( A_i \) contains 5 elements, so \( \bigcup_{i=1}^{30} A_i \) contains \( 5 \times 30 = 150 \) elements (with repetition) out of which each element is repeated 10 times, (as given that each element of S belongs to \( 10 A_i \))

\[ \therefore \text{ Number of different elements in } \bigcup_{i=1}^{30} A_i = \frac{150}{10} = 15 \]

\[ \therefore \text{ From eqn (1) we can say S contains } 15 \text{ elements} \] \( ...(2) \)

Again each \( B_j \) contains 3 elements, so \( \bigcup_{j=1}^{n} B_j \) contains \( 3 \times n = 3n \) elements (with repetition), out of which each element is repeated 9 times (as each element of S belongs to \( 9 B_j \))

\[ \therefore \text{ No. of different elements in } \bigcup_{j=1}^{n} B_j = \frac{3n}{9} = \frac{n}{3} \]

\[ \therefore \text{ From eqn (1) we can say S contains } \frac{n}{3} \text{ elements} \] \( ...(3) \)

From (2) and (3) we get \( \frac{n}{3} = 15 \Rightarrow n = 45 \)

9. Given that : Mean square deviation for the observations \( x_1, x_2, \ldots, x_n \) about a point c is given by \( \frac{1}{n} \sum_{i=1}^{n} (x_i - c)^2 \).

Also given that mean square deviations about 1 and +1 are 7 and 3 for a particular set of observations.

\[ \frac{1}{n} \sum_{i=1}^{n} (x_i + 1)^2 = 7 \text{ and } \frac{1}{n} \sum_{i=1}^{n} (x_i - 1)^2 = 3 \]

\[ \sum_{i=1}^{n} (x_i^2 + 2x_i + 1) = 7n \text{ and } \sum_{i=1}^{n} (x_i^2 - 2x_i + 1) = 3n \]

\[ \sum x_i^2 + 2 \sum x_i + n = 7n \text{ and } \sum x_i^2 - 2 \sum x_i + n = 3n \]

\[ \Rightarrow \sum x_i^2 + 2 \sum x_i + n = 7n \quad \text{NOTES THIS STEP} \]

\[ \sum x_i^2 - 2 \sum x_i + n = 3n \]

\[ \Rightarrow \sum x_i^2 + 2 \sum x_i = 6n \] \( ...(1) \)

and \( \sum x_i^2 - 2 \sum x_i = 2n \) \( ...(2) \)

Subtracting (2) from (1), we get

\[ 4 \sum x_i = 4n \Rightarrow \sum x_i = n \Rightarrow x = 1 \]

Now standard deviation for same set of observations

\[ \begin{align*}
\left[ \frac{1}{n} \sum_{i=1}^{n} (x_i - \bar{x})^2 \right] &= \left[ \frac{1}{n} \sum_{i=1}^{n} (x_i - 1)^2 \right] = \sqrt{3} \\
\text{(using the given value)}
\end{align*} \]

10. \( n = 40, \bar{x} = 40, \text{Var} = 49 \)

\[ \sum \frac{f_i x_i}{40} = \bar{x} = 40 \Rightarrow \sum f_i x_i = 1600 \quad \text{...(1)} \]

Also \( \text{Var} = 49 = \frac{1}{40} \sum f_i (x_i - \bar{x})^2 \)

\[ \Rightarrow 49 = \frac{1}{40} \sum f_i x_i^2 - 2 \sum f_i x_i + 40 \sum f_i \]

\[ \Rightarrow 49 = \frac{1}{40} \sum f_i x_i^2 - 2 \times 1600 + 40 \times 40 \]

\[ \Rightarrow \frac{1}{40} \sum f_i x_i^2 = 1649 \quad \text{...(2)} \]

Let \( 21 - 30 \) and \( 31 - 40 \) denote the \( k^{th} \) and \( (k + 1)^{th} \) class intervals respectively.

Then if before correction \( f_k \) and \( f_{k+1} \) are the frequencies of these intervals then after correction (2 observations are shifted from \( 31 - 40 \) to \( 21 - 30 \)), frequency of \( k^{th} \) intervals becomes \( f_k + 2 \) and frequency of \( (k + 1)^{th} \) interval becomes \( f_{k+1} - 2 \).

Then, we get

\[ x_{\text{new}} = \frac{1}{40} \sum_{i=1}^{40} f_i x_i + \frac{2}{40} (x_k - x_{k+1}) \]

\[ = \frac{1}{40} \sum_{i=1}^{40} f_i x_i + \frac{1}{20} (-10) = 40 - 0.5 = 39.5 \]

\[ \text{Var}_{\text{new}} = \frac{1}{40} \left[ \sum_{i=1}^{40} f_i (x_i - 39.5)^2 + f_k (x_k - 39.5)^2 \right] \]

\[ + f_{k+1} (x_{k+1} - 39.5)^2 \]

\[ = \frac{1}{40} \left[ \sum_{i=1}^{40} \left( f_i x_i^2 - 79 f_i x_i + 39.5 f_i \right) \right] \]

\[ + \frac{1}{40} \left[ f_k x_k^2 - 79 f_k x_k + (39.5)^2 f_k \right] + f_{k+1} x_{k+1}^2 + (39.5)^2 f_{k+1} \]

\[ = \frac{1}{40} \sum_{i=1}^{40} f_i x_i^2 - 79 \cdot \frac{1}{40} \sum_{i=1}^{40} f_i x_i + (39.5)^2 \cdot \frac{1}{40} \sum_{i=1}^{40} f_i \]

\[ = 1649 - 3160 + 1560.25 = 49.25 \quad \text{[Using eqn. (1) and (2)]} \]

11. Given that \( z_1, R, z_2 \) iff \( z_1 - z_2 \) is real.

To show that \( R \) is an equivalence relation.

Reflexivity : For \( z_1 = z_2 = z \) (say)

\[ z_1 - z_2 = z - z = 0 \quad \text{which is real} \]

\[ z_1 + z_2 = z + z \]

\[ \therefore z \in R \quad \forall z \]

\[ \therefore R \text{ is reflexive.} \]

Symmetric : Let \( z_1, R, z_2 \Rightarrow \frac{z_1 - z_2}{z_1 + z_2} \text{ is real } \Rightarrow \left( \frac{z_1 - z_2}{z_1 + z_2} \right) \text{ is also real} \]
\[ z_2 - z_1 \] is real \( \Rightarrow z_2 R z_1 \) \( \Rightarrow \) \( R \) is symmetric.

**Transitivity:** Let \( z_1 R z_2 \) and \( z_2 R z_3 \)
\( \Rightarrow z_1 - z_2 \) is real and \( z_2 - z_3 \) is also real \( \Rightarrow z_1 R z_3 \).

Now, \( \frac{z_1 - z_2}{z_1 + z_2} \) is real \( \Rightarrow I_m \left( \frac{z_1 - z_2}{z_1 + z_2} \right) = 0 \)
\( \Rightarrow I_m \left( \frac{x_1 - x_2 + i(y_1 - y_2)}{x_1 + x_2 + i(y_1 + y_2)} \right) = 0 \)
\( \Rightarrow P^2 \left( (x_1 - x_2) + i(y_1 - y_2) \right) \left( (x_1 + x_2) - i(y_1 + y_2) \right) = 0 \)
\( \Rightarrow (x_1 + x_2) (y_1 - y_2) - (x_1 - x_2) (y_1 + y_2) = 0 \)
\( \Rightarrow x_2 y_1 - x_1 y_2 = 0 \)
\( \Rightarrow \frac{x_1}{y_1} = \frac{x_2}{y_2} \) \( \cdots \) (1)

Similarly, \( I_m \left( \frac{z_2 - z_3}{z_2 + z_3} \right) = 0 \) \( \Rightarrow \frac{x_2}{y_2} = \frac{x_3}{y_3} \) \( \cdots \) (2)

From (1) and (2) we get \( \frac{x_1}{y_1} = \frac{x_3}{y_3} \)
\( \Rightarrow I_m \left( \frac{z_1 - z_3}{z_1 + z_3} \right) = 0 \) \( \Rightarrow \frac{z_1 - z_3}{z_1 + z_3} \) is real
\( \Rightarrow z_1 R z_3 \). \( \therefore \) \( R \) is transitive.

Thus \( R \) is reflexive, symmetric and transitive. Hence \( R \) is an equivalence relation.

F. Match the Following

1. \( A \rightarrow (s), B \rightarrow (t), C \rightarrow (r), D \rightarrow (r) \)

Let \( z = x + iy \) where and \( x^2 + y^2 = 1 \) and \( x \neq \pm 1 \)

Then \( \text{Re} \left( \frac{2iz}{1 - z^2} \right) = \text{Re} \left( \frac{2i(x + iy)}{1 - (x^2 - y^2 - 2ixy)} \right) \)
\( = \text{Re} \left( \frac{-2y + 2ix}{1 - x^2 - y^2 - 2ixy} \right) = \text{Re} \left( \frac{-2y + 2ix}{2y(y - ix)} \right) \)
\( = \frac{-1}{y} \)

where \(-1 \leq y \leq 1 \) \( \Rightarrow -1 \leq \frac{-1}{y} \leq 1 \)

\( \therefore \) \( \text{Re} \left( \frac{2iz}{1 - z^2} \right) \in (-\infty, -1] \cup [1, \infty) \) \( \therefore A \rightarrow s \)

(B) For the domain of \( f(x) = \sin^{-1} \left( \frac{8(3)^{x-2}}{1 - 3^2(x-1)} \right) \)

We should have
\( -1 \leq \frac{8(3)^{x-2}}{1 - 3^2(x-1)} \leq 1 \) \( \Rightarrow -1 \leq \frac{8 \cdot 3^x}{9 - 3^2x} \leq 1 \)

Let \( 3^x = t \) then \(-1 \leq \frac{8t}{9 - t^2} \leq 1 \)
\( \Rightarrow \frac{8t}{9 - t^2} \geq -1 \) and \( \frac{8t}{9 - t^2} \leq 1 \)
\( \Rightarrow \frac{8t + 9 - t^2}{9 - t^2} \geq 0 \) and \( \frac{8t - 9 + t^2}{9 - t^2} \leq 0 \)

\[ \Rightarrow \frac{t^2 - 8t - 9}{t^2 - 9} \geq 0 \) and \( \frac{t^2 + 8t - 9}{t^2 - 9} \geq 0 \)
\( \Rightarrow \frac{(t - 9)(t + 1)}{t^2 - 9} \geq 0 \) and \( \frac{(t + 9)(t - 1)}{t^2 - 9} \geq 0 \)

Also \( t = 3^x \) can not be \(-ve\)
\( \therefore t \in (0, 3) \cup [9, \infty) \) and \( t \in (0, 1) \cup [3, \infty) \)
\( \Rightarrow x \in (-\infty, 1) \cup [2, \infty) \) and \( x \in (-\infty, 0] \cup (1, \infty) \)

Combining the two, we get \( x \in (-\infty, 0] \cup [2, \infty) \)

\( \therefore B \rightarrow t \)

(C) \( f(\theta) = \left| \begin{array}{ccc} 1 & \tan \theta & 1 \\ -\tan \theta & 1 & 1 \\ -1 & -\tan \theta & 1 \end{array} \right| \)
\( R_1 + R_3 \)
\( = \left| \begin{array}{ccc} 0 & 0 & 2 \\ -\tan \theta & 1 & \tan \theta \\ -1 & -\tan \theta & 1 \end{array} \right| \)
\( = 2 (1 + \tan^2 \theta) = 2 \sec^2 \theta \in [2, \infty) \) for \( 0 \leq \theta < \frac{\pi}{2} \)

\( \therefore C \rightarrow r \)

(D) \( f(x) = x^{3/2} (3x - 10), x \geq 0 \)
\( \therefore f'(x) = \frac{3}{2} \sqrt{x} (3x - 10) + 3x \sqrt{x} \)

For \( f(x) \) to be increasing \( f'(x) \geq 0 \)
\( \Rightarrow 3 \sqrt{x} [3x - 10 + 2x] \geq 0 \)
\( \Rightarrow \sqrt{x} (5x - 10) \geq 0 \) but \( x \geq 0 \Rightarrow x \geq 2 \)
\( \therefore f(x) \) is increasing on \([2, \infty) \)
\( \therefore D \rightarrow r. \)

I. Integer Value Correct Type

1. \( (4) \) Let \( \sqrt[3]{\frac{4 - \frac{1}{3\sqrt{2}}} {4 - \frac{1}{3\sqrt{2}}} \frac{4 - \frac{1}{3\sqrt{2}}} {4 - \frac{1}{3\sqrt{2}}} \cdots} = y \)
\[ \Rightarrow 4 - \frac{1}{3\sqrt{2}} \frac{4 - \frac{1}{3\sqrt{2}}} {4 - \frac{1}{3\sqrt{2}}} \frac{4 - \frac{1}{3\sqrt{2}}} {4 - \frac{1}{3\sqrt{2}}} \cdots = y^2 \]
\( \Rightarrow 4 - \frac{y}{3\sqrt{2}} = y^2 \Rightarrow y^2 + \frac{y}{3\sqrt{2}} - 4 = 0 \)
\( \Rightarrow 3\sqrt{2} y^2 + y - 12\sqrt{2} = 0 \Rightarrow y = -1 + \sqrt{1 + \frac{288}{6\sqrt{2}}} \) (rejecting -ve value as \( y \) is a +ve square)
\( \Rightarrow y = -1 + \frac{17}{6\sqrt{2}} = \frac{8}{3\sqrt{2}} \)
\( \therefore \) The required value is
\( 6 + \log_{3/2} \left( \frac{1}{3\sqrt{2}} \times \frac{8}{3\sqrt{2}} \right) = 6 + \log_{3/2} \frac{4}{9} \)
\( = 6 + \frac{2 \log_{2/3}}{\log_{3/2}} = 6 - 2 = 4 \)
1. (b) Total student = 100;
   for 70 stds. total marks = 75 × 70 = 5250
   \[ \Rightarrow \text{Total marks of girls} = 7200 - 5250 = 1950 \]
   Average of girls = \[ \frac{1950}{30} = 65 \]

2. (a) Given \[ P + Q = 18 \]
   \[ P^2 + Q^2 + 2PQ \cos \alpha = 144 \] ......(1)
   \[ \tan 90^\circ = \frac{Q \sin \alpha}{P + Q \cos \alpha} \]
   \[ \Rightarrow P + Q \cos \alpha = 0 \] ......(3)
   From (2) and (3),
   \[ Q^2 - P^2 = 144 \Rightarrow (Q - P)(P + Q) = 144 \]
   \[ \therefore Q - P = \frac{144}{18} = 8 \]
   From (1), On solving, we get \[ Q = 13, P = 5 \]

3. (b) \[ \angle TQW = 180^\circ - \theta \]
   \[ \angle RQW = 2\theta \]
   \[ \angle RQT = 180^\circ - \theta \]

Applying Lami's theorem at \( Q \),
\[ \frac{T}{\sin 2\theta} = \frac{R}{\sin 180^\circ - \theta} = \frac{W}{\sin (180^\circ - \theta)} \]
\[ \Rightarrow R = W \text{ and } T = 2W \cos \theta \]

4. (a) \( n = 9 \) then median term = \( \left( \frac{9+1}{2} \right)^{th} \) term. Last four observations are increased by 2. The median is 5th observation which is remaining unchanged.
   \[ \therefore \text{there will be no change in median.} \]

5. (c) \[ \vec{G} = \vec{r} \times \vec{p} \]
   \[ |\vec{G}| = rp \sin \theta \]
   \[ |\vec{H}| = rp \cos \theta \left[ \therefore \sin(90^\circ + \theta) = \cos \theta \right] \]
   \[ G = rp \sin \theta \] ......(1)
   \[ H = rp \cos \theta \] ......(2)
   \[ x = rp \sin (\theta + \alpha) \] ......(3)
   From (1), (2) & (3), \[ x = G \cos \alpha + H \sin \alpha \cdot \]

6. (c) \[ R^2 = P^2 + Q^2 + 2PQ \cos \theta \] ......(1)
   \[ 4R^2 = P^2 + 4Q^2 + 4PQ \cos \theta \] ......(2)
   \[ 4R^2 = P^2 + Q^2 - 2PQ \cos \theta \] ......(3)
   On (1) + (3), \[ 5R^2 = 2P^2 + 2Q^2 \] ......(4)

On (3) × 2 + (2), \[ 12R^2 = 3P^2 + 6Q^2 \] ........(5)
\[ 2P^2 + 2Q^2 - 5R^2 = 0 \] ........(6)
\[ 3P^2 + 6Q^2 - 12R^2 = 0 \] ........(7).

\[ \frac{P^2}{24 + 30} = \frac{Q^2}{24 - 15} = \frac{R^2}{12 - 6} \]
\[ \frac{P^2}{6} = \frac{Q^2}{9} = \frac{R^2}{2} \]

7. (a) Let the body travels from \( A \) to \( B \) with constant acceleration \( t \) and from \( B \) to \( C \) with constant retardation \( r \).

If \( AB = x, BC = y \), time taken from \( A \) to \( B = t_1 \) and time taken from \( B \) to \( C = t_2 \), then \( s = x + y \) and \( t = t_1 + t_2 \)

For the motion from \( A \) to \( B \)

\[ v^2 = u^2 + 2as \Rightarrow v^2 = 2fx \left( \because u = 0 \right) \]
\[ \Rightarrow x = \frac{v^2}{2f} \] ....(1)

and \[ v = u + at \]
\[ \Rightarrow t_1 = \frac{v}{f} \] ....(2)

For the motion from \( B \) to \( C \)

\[ t_2 = \frac{v}{r} \]

Adding equations (1) and (3), we get
\[ x + y = \frac{v^2}{2} \left[ \frac{1}{f} + \frac{1}{r} \right] = s \]

Adding equations (2) and (4), we get
\[ t_1 + t_2 = \frac{v}{f} \left[ \frac{1}{f} + \frac{1}{r} \right] = t \]
\[ t_2 = \frac{v^2}{2} \left[ \frac{1}{f} + \frac{1}{r} \right]^2 \]
\[ \Rightarrow t = \sqrt{\frac{2s}{\frac{1}{f} + \frac{1}{r}}} \]

8. (a) For the stone projected horizontally, for horizontal motion, using distance

\[ = \text{speed} \times \text{time} \Rightarrow R = ut \]

and for vertical motion

\[ h = 0 \times t + \frac{1}{2} gt^2 \Rightarrow t = \sqrt{\frac{2h}{g}} \]

\[ \therefore \text{We get } R = u \sqrt{\frac{2h}{g}} \] ....(1)
For the stone projected at an angle $\theta$, for horizontal and vertical motions, we have

$$R = u \cos \theta \times t \quad \ldots \text{(2)}$$

and

$$h = -u \sin \theta \times t + \frac{1}{2} g t^2 \quad \ldots \text{(3)}$$

From (1) and (2) we get

$$\Rightarrow \quad u = \frac{2h}{g} \cos \theta \times t \quad \Rightarrow \quad t = \frac{1}{\cos \theta} \sqrt{\frac{2h}{g}}$$

Substituting this value of $t$ in eq (3) we get

$$h = -u \sin \theta \sqrt{\frac{2h}{g}} + \frac{1}{2} g \left( \frac{2h}{g} \cos^2 \theta \right)$$

$$h = -u \frac{2h}{g} \tan \theta + h \sec^2 \theta$$

$$h = -u \frac{2h}{g} \tan \theta + h \tan^2 \theta + h$$

$$\tan^2 \theta - u \frac{2h}{g} \tan \theta = 0 \quad \therefore \quad \tan \theta = u \sqrt{\frac{2h}{g}}$$

9. (a) We can consider the two velocities as $\vec{v}_1 = u \hat{i}$

and $\vec{v}_2 = (f t \cos \alpha) \hat{i} + (f t \sin \alpha) \hat{j}$

$\therefore \quad \text{Relative velocity of second with respect to first}$

$$\vec{v} = \vec{v}_2 - \vec{v}_1 = (f t \cos \alpha - u) \hat{i} + (f t \sin \alpha) \hat{j}$$

$$\Rightarrow \quad |\vec{v}|^2 = (f t \cos \alpha - u)^2 + (f t \sin \alpha)^2$$

$$= f^2 t^2 + u^2 - 2uf \cos \alpha$$

For $|\vec{v}|^2$ to be min we should have

$$\frac{d|\vec{v}|^2}{dt} = 0 \Rightarrow 2f^2 t - 2uf \cos \alpha = 0 \Rightarrow t = \frac{u \cos \alpha}{f}$$

Also

$$\frac{d^2|\vec{v}|^2}{dt^2} = 2f^2 = +ve$$

$\therefore \quad |\vec{v}|^2$ and hence $|\vec{v}|$ is least at the time $\frac{u \cos \alpha}{f}$

10. (c)

$$\therefore \quad \theta = \alpha + \beta, \beta = \tan^{-1}\left( \frac{3}{5} \right) \quad \text{or} \quad \beta = \theta - \alpha$$

$$\Rightarrow \quad \tan \beta = \frac{\tan \theta - \tan \alpha}{1 + \tan \theta \cdot \tan \alpha} \quad \text{or} \quad \frac{3}{5} = \frac{40}{160 + 40 \cdot 160} \frac{h}{h}$$

$$h^2 - 200h + 6400 = 0 \Rightarrow h = 40 \text{ or } 160 \text{ metre}$$

$\therefore \quad$ possible height $= 40 \text{ metre}$

11. (a) Let $\beta$ be the inclination of the plane to the horizontal and $u$ be the velocity of projection of the projectile

$$R_1 = \frac{u^2}{g(1 + \sin \beta)} \quad \text{and} \quad R_2 = \frac{u^2}{g(1 - \sin \beta)}$$

$$\frac{1}{R_1} + \frac{1}{R_2} = \frac{2g}{u^2} \quad \text{or} \quad \frac{1}{R_1} + \frac{1}{R_2} = \frac{2}{R} \quad \therefore \quad R = \frac{u^2}{g}$$

$\therefore \quad R_1, R_2 \text{ are in H.P.}$

12. (b) $\Sigma x = 170, \Sigma x^2 = 2830$ increase in $\Sigma x = 10 \Rightarrow \Sigma x' = 170 + 10 = 180$

$\Sigma x^2 = 900 - 400 = 500 \Rightarrow \Sigma x'^2 = 2830 + 500 = 3330$

Variance $= \frac{1}{n} \Sigma x^2 - \left( \frac{1}{n} \Sigma x \right)^2 = \frac{1}{15} \times 3330 - \left( \frac{1}{15} \times 180 \right)^2$

$$= 222 - 144 = 78$$

13. (c) $\therefore (1, 1) \notin R \Rightarrow R$ is not reflexive $(2, 3) \in R$ but $(3, 2) \notin R$$

$\therefore \quad R$ is not symmetric

14. (c) Only first $(A)$ and second $(B)$ statements are correct.

15. (c) Clearly mean $A = 0$

Standard deviation $\sigma = \sqrt{\frac{\sum (x - A)^2}{2n}}$

$$= \sqrt{\frac{(a - 0)^2 + (a - 0)^2 + \ldots + (0 - a)^2 + \ldots}{2n}} = \sqrt{\frac{a^2 + 2n}{2n}} = |a|$$

Hence $\frac{a}{2} = 2$

16. (c) Let forces be $P$ and $Q$, then $P + Q = 4 \quad \ldots \text{(1)}$

and $P^2 + Q^2 = 3^2 \quad \ldots \text{(2)}$

Solving we get the forces

$$\left( 2 + \frac{\sqrt{2}}{2} \right) N \quad \text{and} \quad \left( 2 - \frac{\sqrt{2}}{2} \right) N$$

17. (c) Since, the moment about $A$ is zero, hence $\vec{F}$ passes through $A$. Taking $A$ as origin. Let the line of action of force $\vec{F}$ be $y = mx$. (see figure)

Moment about $B = \frac{3m}{\sqrt{1 + m^2}} |\vec{F}| = 9 \quad \ldots \text{(1)}$
22. (a) Reflexive and transitive only.
e.g. (3, 3), (6, 6), (9, 9), (12, 12) [Reflexive]
(3, 6), (6, 12), (3, 12) [Transitive].
(3, 6) ∈ R  but (6, 3) ∉ R [ non symmetric]

23. (c) Similar to Question 18

24. (d) Mode + 2Mean = 3 Median

25. (c) Let the lizard catches the insect after time t then distance
covered by lizard = 21 cm + distance covered by insect
⇒ \( \frac{1}{2} t^2 = 4 \times t + 21 \) \( \Rightarrow \frac{1}{2} \times 2 \times t^2 = 20 \times t + 21 \)
⇒ \( t^2 - 20t - 21 = 0 \) \( \Rightarrow t = 21 \) sec

26. (d) \( A \frac{u+v}{t+m} \frac{s+n}{v} \)

As per question if point B moves s distance in t time
then point A moves (s + n) distance in time (t + m) after
which both have same velocity v.
Then using equation \( v = u + at \) we get
\( v = f(t + m) = f' t \) \( \Rightarrow t = \frac{f}{f'} \)

Using equation \( v^2 = u^2 + 2as \), we get
\( v^2 = 2f(s + n) = 2f's \) \( \Rightarrow s = \frac{fn}{f' - f} \)

Also for point B using the eqn \( s = ut + \frac{1}{2} at^2 \), we get
\( s = \frac{1}{2} f't^2 \)
Substituting values of t and s from equations (1) and
(2) in the above relation, we get
\( \frac{fn}{f - f'} = \frac{1}{2} f' \) \( \frac{f^2m^2}{(f' - f)^2} \) \( \Rightarrow (f - f')n = \frac{1}{2} ff'm^2 \)

27. (b) Let A and B be displaced by a distance x
then Change in moment of \((A + B) = \text{applied moments} \)
⇒ \( (A + B) \times x = H \) \( \Rightarrow x = \frac{H}{A + B} \)

28. (b) We know that for positive real numbers \( x_1, x_2, \ldots, x_n \),
A.M. of \( k^{th} \) powers of \( x_i's \) ≥ \( k^{th} \) the power of A.M. of \( x_i's \)
\( \Rightarrow \sum_{n} x_i \geq \left( \frac{\sum_{n} x_i}{n} \right)^2 \geq \frac{400}{n} \geq \left( \frac{80}{n} \right)^2 \)
\( \Rightarrow n \geq 16 \). So only possible value for n = 18

29. (d) \( u \cos 60^\circ = v \cos 30^\circ \)
as (horizontal component of velocity remains the same)
\( \Rightarrow u \cdot \frac{1}{2} = v \cdot \frac{\sqrt{3}}{2} \) or \( v = \frac{\sqrt{3}}{3} u \)

\( \theta = 60^\circ \)
30. (d) Let \( F \) be the larger force

Given \( R = \frac{F}{3} \)

Resolving \( F \) in horizontal and vertical direction

\[ R = F \cos \theta \Rightarrow \cos \theta = \frac{1}{3} \]

\[ F' = F \sin \theta = F \times \frac{2\sqrt{2}}{3} \]

\[ \therefore F : F' = 3 : 2\sqrt{2} \]

31. (d) If we consider unit vectors \( \hat{i} \) and \( \hat{j} \) in the direction \( AB \) and \( AC \) respectively, then as per question, forces along \( AB \) and \( AC \) respectively are

\[ \left( \frac{1}{AB} \right) \hat{i} \text{ and } \left( \frac{1}{AC} \right) \hat{j} \]

\( \therefore \) Their resultant along \( AD = \left( \frac{1}{AB} \right) \hat{i} + \left( \frac{1}{AC} \right) \hat{j} \)

Magnitude of resultant is

\[ = \sqrt{\left( \frac{1}{AB} \right)^2 + \left( \frac{1}{AC} \right)^2} = \frac{BC}{AB \times AC} \]

But from figure \( \triangle ABC \sim \triangle DBC \)

\[ \Rightarrow \frac{BC}{AB} = \frac{AC}{AD} \Rightarrow \frac{BC}{AB} \times AC = \frac{1}{AD} \]

\( \therefore \) The required magnitude of resultant becomes \( \frac{1}{AD} \).

32. (b) Clearly \((x, x) \in R \forall x \in W \). So \( R \) is reflexive.

Let \((x, y) \in R \), then \((y, x) \in R \) as \( x \) and \( y \) have at least one letter in common. So, \( R \) is symmetric.

But \( R \) is not transitive for example

Let \( x = \text{INDIA}, y = \text{BOMBAY} \) and \( z = \text{JOKER} \)

then \((x, y) \in R (A \text{ is common}) \) and \((y, z) \in R (O \text{ is common}) \) but \((x, z) \notin R \). (as no letter is common)

33. (a) \( \sigma_x^2 = \frac{\sum d_i^2}{n} \) (Here deviations are taken from the mean).

Since \( A \) and \( B \) both have 100 consecutive integers, therefore both have same standard deviation and hence the variance.

34. (b) For two velocities \( u \) and \( v \) at an angle \( \theta \) to each other the resultant is given by

\[ R^2 = u^2 + v^2 + 2uv \cos \theta = 2u^2 (1 + \cos \theta) \]

\[ \Rightarrow R^2 = 4u^2 \cos^2 \frac{\theta}{2} \text{ or } R = 2u \cos \frac{\theta}{2} \]

Now in second case, the new resultant \( AE \) (i.e., \( R' \)) bisects \( \angle CAB \) , therefore using angle bisector theorem in \( \triangle ABC \), we get

\[ \frac{AB}{BE} = \frac{AC}{EC} \Rightarrow \frac{u}{u/2} = \frac{2u}{u/2} \Rightarrow R = 2u \cos \frac{\theta}{2} = u \]

\[ \Rightarrow \cos \frac{\theta}{2} = \frac{1}{2} \Rightarrow \theta = 60^\circ \text{ or } \theta = 120^\circ \]

35. (a) Using \( h = \frac{1}{2}gt^2 \) and \( h + 400 = \frac{1}{2}g(t + 4)^2 \)

Subtracting, we get \( 400 = 8g + 4gt \)

\[ \Rightarrow t = 8 \text{ sec} \]

\[ \therefore h = \frac{1}{2} \times 10 \times 64 = 320 \text{ m} \]

\( \therefore \) Desired height = 320 + 400 = 720 m

36. (c) Given : Force \( Pn = Pn \), \( Q = 3n \), resultant \( R = 7n \) & \( P = Pn \), \( Q = (-3)n \), \( R = \sqrt{19}n \)

We know that \( R^2 = P^2 + Q^2 + 2PQ \cos \alpha \)

\[ (\sqrt{19})^2 = p^2 + (-3)^2 + 2 \times P \times 3 \cos \alpha \]

\[ 49 = p^2 + 9 + 6P \cos \alpha \]

\[ 40 = p^2 + 6P \cos \alpha \]

and \( (\sqrt{19})^2 = p^2 + (-3)^2 + 2P \times -3 \cos \alpha \)

\[ 19 = p^2 + 9 - 6P \cos \alpha \]

\[ 10 = p^2 - 6P \cos \alpha \]

Adding (i) and (ii) \( 50 = 2p^2 \)

\[ \Rightarrow P^2 = 25 \Rightarrow P = 5n \]

37. (a) Let \( B \) be the top of the wall whose coordinates will be \((a, b)\). Range \((R) = c\)
\[ y = x \tan \alpha - \frac{1}{2} g \frac{x^2}{u^2 \cos^2 \alpha} \]

\[ \Rightarrow b = a \tan \alpha - \frac{1}{2} g \frac{a^2}{u^2 \cos^2 \alpha} \]

\[ = a \tan \alpha \left[ 1 - \frac{1}{2} \frac{g a}{u^2 \cos^2 \alpha \tan \alpha} \right] \]

\[ = a \tan \alpha \left[ 1 - \frac{a}{2u^2 \cos^2 \alpha \sin \alpha \cos \alpha} \right] \]

\[ = a \tan \alpha \left[ 1 - \frac{a}{u^2 \sin 2\alpha} \right] \]

\[ = a \tan \alpha \left[ 1 - \frac{a}{R} \right] \]

\[ \Rightarrow b = a \tan \alpha \left[ 1 - \frac{a}{c} \right] \Rightarrow b = a \tan \alpha \cdot \left( \frac{c-a}{c} \right) \]

\[ \Rightarrow \tan \alpha = \frac{bc}{a(c-a)} \]

The angle of projection, \( \alpha = \tan^{-1} \frac{bc}{a(c-a)} \)

38. (a) Let the number of boys be \( x \) and that of girls be \( y \).
\[ \Rightarrow 52x + 42y = 50(x+y) \Rightarrow 52x - 50x = 50y - 42y \]

\[ \Rightarrow 2x = 8y \Rightarrow \frac{x}{y} = \frac{4}{1} \quad \text{and} \quad \frac{x}{x+y} = \frac{4}{5} \]

Required % of boys = \( \frac{x}{x+y} \times 100 = \frac{4}{5} \times 100 = 80\% \)

39. (a) \[ A \]

\[ \angle 13m \]

\[ C \]

\[ 12m \]

\[ \angle B13m \]

\[ 13 \text{ kg} \]

\[ \Rightarrow 13^2 = 5^2 + 12^2 \Rightarrow AB^2 = AC^2 + BC^2 \]

\[ \Rightarrow \angle ACB = 90^\circ \]

\[ Q \] is mid point of the hypotenuse \( AB \), therefore \( MA = MB = MC \Rightarrow \angle A = \angle ACM = \theta \)

Applying Lami’s theorem at \( C \), we get

\[ \frac{T_1}{\sin(180-\theta)} = \frac{T_2}{\sin(90+\theta)} = \frac{13\text{ kg}}{\sin 90^\circ} \]

\[ \Rightarrow T_1 = 13 \sin \theta \] and \( T_2 = 13 \cos \theta \)

40. (d) Mean of \( a, b, 8, 5, 10 \) is 6
\[ \Rightarrow \frac{a+b+8+5+10}{5} = 10 \Rightarrow a+b = 7 \quad \text{...(i)} \]

Variance of \( a, b, 8, 5, 10 \) is 6.80
\[ \Rightarrow \frac{(a-6)^2 + (b-6)^2 + (8-6)^2 + (5-6)^2 + (10-6)^2}{5} = 6.80 \]

\[ \Rightarrow a^2 - 12a + 36 + (b-6)^2 + 21 = 34 \quad \text{[using eq. (i)]} \]

\[ \Rightarrow a^2 - 12a + 24 = 0 \Rightarrow a^2 - 7a + 12 = 0 \]

\[ \Rightarrow a = 3 \text{ or } 4 \quad \Rightarrow b = 4 \text{ or } 3 \]

\[ \therefore \] The possible values of \( a \) and \( b \) are \( a = 3 \) and \( b = 4 \) or, \( a = 4 \) and \( b = 3 \)

41. (None)

\( p : x \) is an irrational number
\( q : y \) is a transcendental number
\( r : x \) is a rational number if \( y \) is a transcendental number.

Clearly \( r \iff p \iff q \)

Let us use truth table to check the equivalence of ‘\( r \)’ and ‘\( q \) or \( p \)’; ‘\( r \)’ and ‘\( \sim (p \iff q) \)

\[
\begin{array}{cccccc}
1 & 2 & 3 \\
\hline
p & q & \neg p & \neg q & p \iff q & \neg (p \iff q) \\
T & T & F & F & T & T \\
T & F & T & T & F & T \\
F & T & F & T & T & T \\
F & F & T & T & F & T \\
\end{array}
\]

From columns (1), (2) and (3), we observe, none of the these statements are equivalent to each other.

\[ \therefore \] Statement 1 as well as statement 2 both are false.

\[ \therefore \] None of the options is correct.

42. (d) Let us make the truth table for the given statements, as follows:

\[
\begin{array}{cccccccc}
p & q & p \lor q & \neg p & q & p \iff q & \neg (p \iff q) \\
T & T & T & F & T & T & T \\
T & F & F & F & T & T & T \\
F & T & T & T & F & T & T \\
F & F & T & F & T & T & T \\
\end{array}
\]

From table we observe

\( p \iff (q \iff p) \) is equivalent to \( p \iff (p \lor q) \)

43. (b) The truth table for the logical statements, involved in statement 1, is as follows:

\[
\begin{array}{cccccccc}
p & q & \neg q & p \iff q & \neg (p \iff q) & p \iff q & \neg (p \iff q) \\
T & T & F & F & T & T & T \\
T & F & T & T & F & F & F \\
F & T & F & T & F & F & F \\
F & F & T & T & F & T & T \\
\end{array}
\]

We observe the columns for \( \neg (p \iff q) \) and \( p \iff q \)

are identical, therefore

\( \neg (p \iff q) \) is equivalent to \( p \iff q \)

But \( \neg (p \iff q) \) is not a tautology as all entries in its column are not \( T \).

\[ \therefore \] Statement-1 is true but statement-2 is false.

44. (c) For the numbers 2, 4, 6, 8, \ldots, \ldots, 2n

\[
\bar{x} = \frac{2\left[n(n+1)\right]}{2n} = (n+1)
\]
MISCELLANEOUS (Sets, Relations, Statistics & Mathematical Reasoning)

50. (b) \( x - y \) is an integer.
\( \therefore x - x = 0 \) is an integer \( \Rightarrow A \) is reflexive.
Let \( x - y \) is an integer
\( \Rightarrow y - x \) is an integer
\( \Rightarrow A \) is symmetric
Let \( x - y, y - z \) are integers
\( \Rightarrow x - y + y - z \) is also an integer
\( \Rightarrow x - z \) is an integer
\( \Rightarrow A \) is transitive
\( \therefore A \) is an equivalence relation.
Hence statement 1 is true.
Also \( B \) can be considered as
\( x y \) if \( \frac{x}{y} = \alpha \), a rational number
\( \therefore \frac{x}{y} = 1 \) is a rational number
\( \Rightarrow B \) is reflexive
But \( \frac{x}{y} = \alpha \), a rational number need not imply \( \frac{y}{x} = \frac{1}{\alpha} \), a rational number because
\( \frac{0}{1} \) is rational \( \Rightarrow \frac{1}{0} \) is not rational
\( \therefore B \) is not an equivalence relation.

51. (a) Suman is brilliant and dishonest if and only if Suman is rich is expressed as
\( Q \leftrightarrow (P \land \sim R) \)
Negation of it will be \( \sim (Q \leftrightarrow (P \land \sim R)) \)

52. (b) Median is the mean of 25th and 26th observation
\( \therefore M = \frac{25a + 26a}{2} = 25.5a \)
\( M.D (M) = \frac{\sum |x_i - M|}{N} \)
\( \Rightarrow 50 = \frac{1}{50} [2 \times |a| \times (0.5 + 1.5 + 2.5 + \ldots .24.5)] \)
\( \Rightarrow 2500 = 2|a| \times \frac{25}{2} (25) \Rightarrow |a| = 4 \)

53. (a) Let \( p : I \) become a teacher.
\( q : I \) will open a school
Negation of \( p \rightarrow q \) is \( \sim (p \rightarrow q) = p \land \sim q \)
i.e. I will become a teacher and I will not open a school.

54. (d) KEY CONCEPT: If each observation is multiplied by \( k \), mean gets multiplied by \( k \) and variance gets multiplied by \( k^2 \). Hence the new mean should be \( 2x \) and new variance should be \( k^2 \sigma^2 \).
So statement-1 is true and statement-2 is false.

55. (b) Let \( X = \{1, 2, 3, 4, 5\} \)
Total no. of elements = 5
Each element has 3 options. Either set \( Y \) or set \( Z \) or none. \( (\because Y \land Z = \phi) \)
So, number of ordered pairs = \( 3^5 \)

56. (c) Given
\( n(A) = 2, n(B) = 4, n(A \times B) = 8 \)
Required number of subsets =
\( 8C_3 + 8C_4 + \ldots . + 8C_8 = 2^8 - 8C_0 - 8C_1 - 8C_2 \)
\( = 256 - 1 - 8 - 28 = 219 \)
57. (b) **Statement-2:** \((p \rightarrow q) \iff (\neg q \rightarrow \neg p)\)  
\[ \iff (p \rightarrow q) \iff (p \leftrightarrow q) \]  
which is always true.  
So statement 2 is true.  
**Statement-1:** \((p \land \neg q) \land (\neg p \land q) = p \land \neg q \land \neg p \land q\)  
\[ = p \land \neg p \land \neg q \land q = f \land f = f \]  
So statement-1 is true.

58. (d) If initially all marks were \(x_i\) then \(\sigma_1^2 = \frac{\sum (x_i - \bar{x})^2}{N}\)  
Now each is increased by 10  
\[ \sigma_2^2 = \frac{\sum [(x_i + 10) - (\bar{x} + 10)]^2}{N} = \frac{\sum (x_i - \bar{x})^2}{N} = \sigma_1^2 \]  
Hence, variance will not change even after the grace marks were given.

59. (b) \(4^n - 3n - 1 = (1 + 3)^n - 3n - 1\)  
\[ = \left[ {\binom{n}{0} \cdot 3^0 + \binom{n}{1} \cdot 3^1 + \binom{n}{2} \cdot 3^2 + \cdots + \binom{n}{n} \cdot 3^n} \right] - 3n - 1 \]  
\[ = 9 \left[ {\binom{n}{0} \cdot 3^0 + \binom{n}{1} \cdot 3^1 + \binom{n}{2} \cdot 3^2} \right] \]  
\[ \therefore 4^n - 3n - 1 \text{ is a multiple of } 9 \text{ for all } n.\]  
\(X = \{ x : x \text{ is a multiple of } 9 \}\)  
Also, \(Y = \{ 9(n - 1): n \in \mathbb{N} \} = \{ \text{All multiples of } 9 \}\)  
Clearly \(X \subseteq Y. \therefore X \cap Y = Y\)

60. (d) First 50 even natural numbers are 2, 4, 6, ..., 100  
Variance = \[ \frac{\sum x_i^2}{N} - \bar{x}^2 \]  
\[ \therefore \sigma^2 = \frac{2^2 + 4^2 + \ldots + 100^2 - \left( \frac{2 + 4 + \ldots + 100}{50} \right)^2}{50} \]  
\[ = \frac{4(1^2 + 2^2 + 3^2 + \ldots + 50^2) - 51^2}{50} \]  
\[ = \frac{4\left( \frac{50 \times 51 \times 101}{6} \right) - 51^2}{50} - 3434 - 2601 \]  
\[ \therefore \sigma^2 = 833 \]

61. (c)

Clearly equivalent to \(p \leftrightarrow q\)

62. (e) \(n(A) = 4, n(B) = 2 \Rightarrow n(A \times B) = 8\)  
The number of subsets of \(A \times B\) having at least 3 elements = \(2^8 - 8 \cdot C_8^3 - \cdots - 8 \cdot C_8^1\)  
\[ = 2^8 - 8 \cdot C_8^3 - 8 \cdot C_8^2 - \cdots - 8 \cdot C_8^1 \]  
\[ = 256 - 1 - 8 = 248 \]  
\[ = 256 - 1 - 8 \cdot 28 = 219 \]

63. (b)  
\[ \neg \neg s \iff (\neg \neg s) \]  
\[ = s \iff (\neg \neg s) \]  
\[ = s \iff (\neg \neg s) \]  
\[ = (s \land \neg \neg s) \]  
\[ = (s \land (s \land \neg \neg s)) \]  
\[ = (s \land \neg \neg s) \]  
\[ = (s \
\n64. (b) Sum of 16 observations = 16 \times 16 = 256  
Sum of resultant 18 observations = 256 - 16 + (3 + 4 + 5)  
\[ = 252 \]

65. (a)  
\[ f(x) + 2f \left( \frac{1}{x} \right) = 3x \quad \ldots \text{(1)} \]  
\[ f \left( \frac{1}{x} \right) + 2f(x) = \frac{3}{x} \quad \ldots \text{(2)} \]  
Adding (1) and (2) \(\Rightarrow f(x) + f \left( \frac{1}{x} \right) = x + \frac{1}{x} \)  
Subtracting (1) from (2) \(\Rightarrow f(x) - f \left( \frac{1}{x} \right) = \frac{3}{x} - 3x \)  
On adding the above equations \(\Rightarrow f(x) = \frac{2}{x} - x \)  
\[ f(x) = f(-x) \Rightarrow \frac{2}{x} - x = -\frac{2}{x} + x \Rightarrow x = \frac{2}{x} \]  
\[ x^2 = 2 \quad \therefore x = \sqrt{2}, -\sqrt{2} \].

66. (a)  
\( (p \land \neg q) \land q \lor \neg q \lor \neg p \land q \)  
\( \Rightarrow (p \lor q) \land (\neg q \lor q) \lor (\neg p \land q) \)  
\( \Rightarrow (p \lor q) \lor (\neg p \land q) \)  
\( \Rightarrow (p \lor q) \lor (p \lor q) \land (p \lor q) \)  
\( \Rightarrow p \lor q \)  
\( \Rightarrow x = \frac{2 + 3 + a + 11}{4} = a + 4 \)  
\( \therefore \sigma = \sqrt{\frac{\sum x_i^2}{n} - \bar{x}^2} \)  
\[ = \sqrt{\frac{4(9 + a^2 + 121) - \left( \frac{a + 4}{4} \right)^2}{16}} \]  
\[ = \sqrt{49} \cdot (a^2 + 256 + 32a) \]  
\[ = \frac{4(134 + a^2) - (a + 4)^2}{16} \]  
\[ = 3a^2 - 32a + 8 = 0 \]  
\[ \Rightarrow 3a^2 - 32a + 84 = 0 \]  
\[ \Rightarrow a = \sqrt{3} \]  
\[ \Rightarrow a = \sqrt{3} \]  
From (1) and (2) \(3a = x + a \Rightarrow x = 2a \)  
Here, the speed is uniform  
\[ \therefore \text{Time taken to cover } a = \frac{10}{2} \text{ minutes} = 5 \text{ minutes} \]
